vp sundry stalkes, beset with like leaues, but smaller, and of a cubit high, diuiding themselves into many small armes or branches, bearing diuers little white floures, spotted most curiously with bloody specks or prickles, inso-much that if you marke the admirable workmanship of the same wrought in such glorious manner, it must needs put euery creature in minde of his Creator: the floures are in smell like the May floures or Hawthorne: the seed is small and blacke, contained in small pointals like vnto white Saxifrage: the root is scaly and full of strings.

2 The second kind of Sanicle, which *Clusius* calleth *Pinguicula*, not before his time remembered, hath small thicke leaues, fat and full of iuyce, being broad towards the root, and sharpe towards the point, of a faint Greene colour, and bitter in taste: out of the middest wherof sprouteth or shooteth vp a naked slender stalke, nine inches long, euery stalke bearing one floure and no more, sometimes white, and commonly of a blewish purple colour, fashioned like vnto the common *Consolida regalis*, hauing the like spur or Larks heele annexed thereto.

3 The third kinde of mountaine Sanicle some

some Herbarists haue called *Sanicula alpina flore rubro*: the leaues shoot forth in the beginning of the Spring, very thicke and fat, and are like a purse or round lumpe at their first comming out of the ground; and when it is spred abroad, the vpper part thereof is full of veines or sinewes, and ho- uen vp or curled like *Ranunculus Lusitanicus*, or like the crumpling of a cabbage leafe, and are not onely indented about the edges, but each leafe is diuided into six or more iaggies or cuts, deeply hacked, greenish aboue, and of an ouerworne greene colour vnderneath, hot in taste; from the mid- dle whereof shooteth forth a bar or naked stalke, six inches long, somewhat purple in colour, bea- ring at the top a tuft of small hollow floures, looking or hanging downwards like little bells, not vnlike in forme to the common Cowslips, but of a fine deepe red colour tending to purple, hauing in the middle a certainering or circle of white, and also certaine pointals or strings, which turne into an head wherein is contained seed. The whole plant is couered as it were with a rough wool- lineffe: the root is fibrous and threddy.

¶ *The Place.*

These plants are strangers in England; their naturall countrey is the Alpish mountains of Hel- uetia: they grow in my garden, where they flourish exceedingly, except Butterwort, which grow- eth in our English squally wet grounds, and will not yeeld to any culturing or transplanting: it groweth especially in a field called Crag-Close, and at Crosby, Rauenswaith, in Westmerland, vpon Ingleborow fells twelue miles from Lancaster, and in Harwood in the same countie neere to Blackburne, ten miles from Preston in Aundernesse vpon the bogs and marish grounds, and in the boggie medowes about Bishops Hatfield; and also in the fens in the way to Wittles meare from London, in Huntingdonshire. ‡ It groweth also in Hampshire, and abundantly in many places of Wales. ‡

¶ *The Time.*

They floure and flourish from May to the end of Iuly.

¶ *The Names.*

The first is called *Sanicula guttata*, taken from the spots wherewith the floures are marked: of *Le- bel*, *Geum Alpinum*, making it a kind of Auens: in English, spotted Sanicle: of our London dames, Pratling Parnell.

The second is called *Pinguicula*, of the fatnesse or fulnesse of the leafe, or of fatning: in Yorke- shire, where it doth especially grow, and in greatest abundance, it is called Butterworts, Butter- root, and white root; but the last name belongeth more properly to Solomons Seale.

¶ *The Temperature and Vertues.*

They are hot and dry in the third degree.

The husbandmens wiues of Yorkshire do vse to anoint the duggs of their kine with the fat and A oilous iuyce of the herbe Butterwort, when they are bitten with any venomous worme, or chapped, rifted, and hurt by any other meanes.

They say it rots their sheepe, when for want of other food they eat thereof. B

CHAP. 277. Of Fox-Gloues.

¶ *The Description.*

1 **F**Ox-gloue with the purple floure is most common; the leaues whereof are long, nicked in the edges, of a light greene, in manner like those of Mullein, but lesser, and not so downie: the stalke is straight, from the middle whereof to the top stand the floures, set in a course one by another vpon one side of the stalke, hanging downwards with the bottome vpward, in forme long, like almost to finger stalks, whereof it tooke his name *Digitalis*, of a red purple colour, with certaine white spots dasht within the floure; after which come vp round heads, in which lies the seed, somewhat browne, and as small as that of Time. The roots are many slender strings.

2 The Fox-gloue with white floures differs not from the precedent but in the colour of the floures; for as the others were purple, these contrariwise are of a milke-white colour.

3 We haue in our gardens another sort hereof, which bringeth forth most pleasant yellow floures, and somewhat lesse than the common kinde, wherein they differ. ‡ This also differs from the common kind in that the leaues are much smother, narrower, and greener, hauing the nerues or vrines running alongst it, neither are the nerues snipt, nor sinuated on their edges. ‡

4 We haue also another sort, which we call *Digitalis ferruginea*, whose floures are of the co- lour of rusty iron; whereof it tooke his name, and likewise maketh the difference. ‡ Of this sort there is a bigger and a lesser; the bigger hath the lower leaues some foot long, of a darke green colour, with veines running along them; the stalks are some yard and halfe high: the floures large, and

1 *Digitalis purpurea.*
Purple Fox-gloues.

2 *Digitalis alba.*
White Fox-gloues.

3 *Digitalis lutea.*
Yellow Fox-gloues.

4 *Digitalis ferruginea.*
Dusky Fox-gloues.

and ending in a sharpe turned vp end as you see in the figure, and they are of a rustie colour, mixed of a yellow and red.

5 The lesse duskie Fox-gloue hath much lesse leaues and those narrow, smooth, and exceeding Greene: amongst which comes vp a stalke some foot high, hauing small floures of the colour of the last described. This I obserued the last yeare 1632, in floure with M^r. John Tradescant in the middle of Iuly. It may fitly be called *Digitalis ferruginea minor*, Small duskie Fox-gloues. ‡

¶ The Place.

Fox-gloue groweth in barren sandie grounds, and vnder hedges almost euery where.

Those with white floures do grow naturally in Landesdale, and Crauen, in a field called Cragge close, in the North of England: likewise by Colchester in Essex; neere Excester in the West parts, and in some few other places. The other two are strangers in England, neuerthelesse they do grow with the others in my garden.

¶ The Time.

They floure and flourish in Iune and Iuly.

¶ The Names.

Fox-gloues some call in Greeke *ὑῤῷ*, and make it to be *Verbasci speciem*, or a kinde of Mullein: in Latine, *Digitalis*: in High Dutch, *Fingerhut*, and *Fingerkraut*; in Low Dutch, *Wingerhoet*; in French, *Gantes nostre dame*: in English, Fox-gloues. ‡ *Fabius Columna* thinks it to be that *Ephemeron* of *Dioscorides* described in his fourth booke, and cap. 75. ‡

¶ The Temperature.

The Fox-gloues in that they are bitter, are hot and drie, with a certaine kinde of clenfing qualitie ioined therewith; yet are they of no vse, neither haue they any place amongst medicines, according to the Antients.

¶ The Vertues.

Fox-gloue boiled in water or wine, and drunken, doth cut and consume the thicke roughnesse of A grosse and slimie flegme and naughtie humours; it openeth also the stopping of the liuer, spleene, and milt, and of other inward parts.

The same taken in like manner, or boiled with honied water or sugar, doth scoure and cleanse the B brest, ripeneth and bringeth forth tough and clammy flegme.

They serue for the same purposes whereunto Gentian doth tend, and hath beene vsed in stead C thereof, as *Galen* saith.

‡ Where or by what name *Galen* either mentions, or affirms this which our Authour cites D him for, I must confesse I am ignorant. But I probably coniecture that our Authour would haue said *Fuchs*: for I onely finde him to haue these words set downe by our Authour, in the end of his Chapter of *Digitalis*. ‡

CHAP. 278. Of *Baccharis* out of *Dioscorides*.

¶ The Description.

I A Bout this plant *Baccharis* there hath beene great contention amongst the old and new writers; *Matthiolus* and *Dodonæus* haue mistaken this plant, for *Coniza maior*, or *Coniza Helenitis Cordi*; *Virgil* and *Athenæus* haue confounded *Baccharis*, and *Azarum* together: but following the antient writers, it hath many blackish rough leaues, somewhat bigger than the leaues of Primrose: amongst which riseth vp a stalke two cubits high, bearing at the top little chaffie or scalie floures in small bunches, of a darke yellowish or purple colour, which turne into downe, and are carried away with the winde, like vnto the kindes of thistles: the root is thick, grosse, and fat, spreading about in the earth, full of strings: the fragrant smell that the root of this plant yeeldeth, may well be compared vnto the sauour of Cinnamon, *Helenium*, or *Enula Campana*, beeing a plant knowne vnto very many or most sorts of people, I meane in most parts of England.

¶ The Place.

Baccharis delighteth to grow in rough and craggy places, and in a leane soile where no moisture is:

Baccharis Monspeliensium.
Plowmans Spikenard.

Dioscorides his *Baccharis* is. † This plant here described is the *Conizamaior* of *Matthiolum*, *Tragus*, and others. †

is: it groweth very plentifully about Montpellier in France, and diuers places in the West parts of England.

¶ *The Time.*

It springeth vp in April, it floureth in Iune, and perfecteth his seed in August.

¶ *The Names.*

The learned Herbarists of Montpellier haue called this plant *Baccharis*: the Grecians, *βακχαρις*, or after others, *μαρις*, by reason of that sweet and aromaticall sauour which his root containeth and yeeldeth: in English it may be called the Cinamom root, or Plowmans Spikenard: *Virgill* in his seuenth Eclogue of his *Bucolicks* maketh mention of *Baccharis*, and doth not onely shew that it is a Garland plant, but also such a one as preuaileth against enchantments, saying,

— *Bacchare frontem*

Cingite, ne vati noceat mala lingua futuro.

With Plowmans Nard my forehead girt,
Lest euill tongue thy Poet hurt.

Baccharis is likewise an ointment in *Athenais*, in his 15 booke, which may take his name of the sweet herbe *Baccharis*: for as *Pliny* writeth, *Aristophanes* of old, being an antient comical Poet witneseth, that ointments were wont to bee made of the root thereof: to bee briefe, *Crataeus* his *Asarum* is the same that

¶ *The Temperature.*

Baccharis or Plowmans Spikenard is of temperature very astringent or binding.

¶ *The Vertues.*

- A *Baccharis*, or the decoction of the root, as *Paulus Aegineta* briefly setteth downe, doth open the pipes and passages that are stopped, prouoketh vrine, and bringeth downe the desired sicknesse: the leaues thereof for that they are astringent or binding, stop the course of fluxes and rheumes.
- B *Baccharis* is a singular remedie to heale inflammations and Saint Anthonies fire, called *Ignis sacer*, and the smell thereof prouoketh sleepe.
- C The decoction of the roots of *Baccharis* helpeth ruptures and convulsions, those also that haue falne from an high place, and those that are troubled with the shortnesse of breath.
- D It helpeth also the old cough, and difficultie to make water.
- E When it is boiled in wine it is giuen with great profit against the bitings of Scorpions, or any venomous beast, being implastered and applied thereto.
- F A bath made thereof and put into a close stoole, and receiued hot, mightily voideth the birth, and furthereth those that haue extreame labour in their childing, causing them to haue easie deliuerance.

CHAP. 279: Of Elecampane.

¶ *The Description.*

Elecampane bringeth forth presently from the root great white leaues, sharpe pointed, almost like those of great Comfrey, but soft, and couered with a hairie downe, of a whitish Greene colour,

Helenium.
Elecampane.

Allant wortele : in Italian, *Enoa*, and *Enola* : in Spanish, *Raiz del alla* : in French, *Enula Campana* : in English, Elecampane, and Scab-woort, and Horfe-heale : some report that this plant tooke the name *Helenium* of *Helena* wife to *Menelaus*, who had her hands full of it when *Pandarus* stole her away into Phrygia.

¶ *The Temperature.*

The root of this Elecampane, is marvellous good for many things, being of nature hot and drie in the third degree, especially when it is drie : for being greene and as yet full of iuice, it is full of superfluous moisture, which somewhat abateth the hot and drie qualitie thereof.

¶ *The Vertues.*

It is good for shortnesse of breath, and an old cough, and for such as cannot breathe vnlesse they hold their necks vpright.

It is of great vertue both giuen in a looch, which is a medicine to be licked on, and likewise prescribed, as also otherwise giuen to purge and void out thicke, tough, and clammy humours, which sticke in the chest and lungs.

The root preserved is good and wholesome for the stomack : being taken after supper it doth not onely helpe digestion, but also keepeth the belly soluble.

The iuice of the same boiled, driueth forth all kinde of wormes of the belly, as *Pliny* teacheth : who also writeth in his twentieth booke, and fift chapter, the same being chewed fasting, doth fasten the teeth.

The root of Elecampane is with good successe mixed with counterpoisons : it is a remedie against the bitings of serpents, it resisteth poison : it is good for them that are bursten, and troubled with cramps and convulsions.

Some also affirme, that the decoction thereof, and likewise the same beaten into powder and mixed with honie in manner of an ointment, doth cleanse and heale vp old vlcers.

Galen saith, that herewith the parts are to be made red, which be vexed with long & cold griefs : as are diuers passions of the huckle bones, called the *Sciatica*, and little and continual bunnies and loosenesse of certaine ioints, by reason of overmuch moisture.

The

lour, and are more white vnderneath, sleightly nicked in the edges : the stalke is a yard and a halfe long, about a finger thicke, nor without downe, diuided at the top into diuers branches, vpon the top of euery sprig stand great floures broad and round, of which not only the long small leaues that compasse round about are yellow, but also the middle ball or circle, which is filled vp with an infinit number of threds, and at length is turned into fine downe ; vnder which is slender and long seed : the root is vneuen, thicke, and as much as a man may gripe, not long, oftentimes blackish without, white within, and full of substance, sweet of smell, and bitter of taste.

¶ *The Place.*

It groweth in meadowes that are fat and fruitfull : it is also oftentimes found vpon mountains, shadowie places, that be not altogether drie : it groweth plentifully in the fields on the left hand as you go from Dunstable to Puddle hill : also in an orchard as you go from Colbrook to Ditton ferry, which is the way to Windsor, and in sundry other places, as at Lidde, and Folkestone, neere to Douer by the sea side.

¶ *The Time.*

The floures are in their brauerie in Iune & Iuly : the roots be gathered in Autumne, and oftentimes in Aprill and May.

¶ *The Names.*

That which the Græcians name *ἑλένιον*, the Latines call *Inula* and *Enula* : in shops *Enula campana* : in high Dutch, *Allantwurtz* ; in low Dutch,

- H The decoction of *Enula* drunken, prouoketh vrine, and is good for them that are grieved with inward burstings, or haue any member out of ioint.
- I The root taken with honie or sugar, made in an electuarie, clenseth the brest, ripeneth tough flegme, and maketh it easie to be spet forth, and preuaileth mightily against the cough and shortnesse of breath, comforteth the stomacke also, and helpeth digestion.
- K The roots condited after the manner of *Eringos* serueth for the purposes aforesaid.
- L The root of *Enula* boiled very soft, and mixed in a mortar with fresh butter and the pouder of Ginger, maketh an excellent ointment against the itch, scabs, mangineffe, and such like.
- M The roots are to be gathered in the end of September, and kept for sundrie vses, but it is especially preferred by those that make Succade and such like.

CHAP. 280. Of Sauce alone, or Lacke by the hedge.

Alliaria.

Sauce alone.

¶ The Description.

Sauce alone hath affinitie with Garlicke in name, not because it is like it in forme, but in smell: for if it be bruised or stamped it smelleth altogether like Garlicke: the leaues hereof are broad, of a light green colour, nicked round about, and sharpe pointed: the stalke is slender, about a cubit high, about the branches whereof grow little white floures; after which come vp slender smal and long cods, & in these black seed: the root is long, slender, and something hard.

¶ The Place.

It groweth of it selfe by garden hedges, by old wals, by highwaies sides, or oftentimes in the borders of fields.

¶ The Time.

It floureth chiefly in Iune and Iuly, the seed waxeth ripe in the meane season. The leaues are vfed for a sauce in March or Aprill.

¶ The Names.

The later writers call it *Alliaria*, and *Alliaris*: of some, *Rima Maria*: it is not *Scordium*, or water Germander, which the apothecaries in times past mistooke for this herbe: neither is it *Scordij species*, or a kinde of water Germander, whereof wee haue written: it is named of some, *Pes Asininus*: it is called in High Dutch, *Knoblauch kraut* *Leuchel*, and *Satzkraut*: and in Low Dutch, *Looch sonder Looch*: you may name it in Latine, *Allium*

non bulbosum: in French, *Alliayre*: in English, Sauce alone, and Lacke of the hedge.

¶ The Temperature.

Lacke of the hedge is hot and drie, but much lesse than Garlicke, that is to say, in the end of the second degree, or in the beginning of the third.

¶ The Vertues.

- A We know not what vse it hath in medicine: diuers eat the stamped leaues hereof with Salt-fish, for a sauce, as they do those of Ramsons.
- B Some also boile the leaues in clisters which are vfed against the paine of the collicke and stone, in which not only winde is notably wasted, but the pain also of the stone mitigated and very much eased.

CHAP.

CHAP. 281. Of Dittany:

¶ The Description.

1 **D**ittanie of Crete now called Candie (as *Dioscorides* saith) is a hot and sharpe hearbe, much like vnto Penni-roiall, sauing that his leaues be greater and somewhat hoary, couered ouer with a soft downe or white woollie cotton: at the top of the branches grow small spikie eares or scaly aglets, hanging by little small stemmes, resembling the spiky tufts of Marierome, of a white colour: amongst which scales there doe come forth small floures like the flowering of wheat, of a red purple colour, which being past, the knop is found full of small seed, contrarie to the saying of *Dioscorides*, who saith, it neither beareth floure nor seed, but my selfe haue seene it beare both in my Garden: the whole plant perished in the next VVinter following.

1 *Dictamnium Creticum.*
Dittanie of Candie.

2 *Pseudodictamnium.*
Bastard Dittanie.

2 The second kind called *Pseudodictamnium*, that is, Bastard Dittanie, is much like vnto the first sauing that it is not sweet of smell, neither doth it bite the tongue, hauing round soft woolly stalks with knots and ioints, and at euery knot two leaues somewhat round, soft, woolly, and somewhat bitter: the floures be of a light purple color, compassing the stalks by certain spaces like garlands or wharles, and like the floures of Peni-roiall. The root is of a wooddie substance: the whole plant groweth to the height of a cubite and an halfe, and lasteth long.

¶ The Place.

The first Dittanie commeth from Crete, an Iland which we call Candie, where it growes naturally: I haue sowne it in my garden, where it hath floured and borne seed, but it perished by reason of the iniurie of our extraordinarie cold winter that then happened: neuerthelesse *Dioscorides* writeth

writeth against all truth, that it neither beareth floures nor seed : after *Theophrastus*, *Virgil* witnesseth that it doth beare floures in the twelfth of his *Aeneidos*.

*Dictamnus genitrix Cretæa carpit ab Ida,
Puberibus caulem folijs, & flore comantem
Purpureo.* ———

In English thus :

His mother from the Cretæan Ida crops

Dictamnus hauing soft and tender leaues,

And purple floures vpon the bending tops, &c.

¶ The Time.

They floure and flourish in the Sommer moneths, their seed is ripe in September.

¶ The Names.

It is called in Greeke *διδάμνιον* : in Latine, *Dictamnus* and *Dictamnium* : of some, *Pulegium sylvestre*, or wilde Pennie-roiall : the Apothecaries of Germanie for *Dictamnium* with *c*, in the first syllable, doe read *Diptamnium* with *p* : but (saith *Dodonaus*) this error might haue beene of small importance, if in stead of the leaues of Dittanie, they did not vse the rootes of *Fraxinella* for Dittany, which they falsely call *Dictamnium* : in English, Dittanie, and Dittanie of Candie.

The other is called *Pseudodictamnium*, or bastard Dittanie, of the likenesse it hath with Dittanie, it skilleth not, though the shoppes know it not : the reason why let the Reader guesse.

¶ The Temperature.

These plants are hot and drie of nature.

¶ The Vertues.

- A Dittanie beeing taken in drinke, or put vp in a pessarie, or vsed in a fume, bringeth away dead children : it procureth the monethly termes, and driueth forth the secondine or the after-birth.
- B The iuice taken with wine is a remedie against the stinging of serpents.
- C The same is thought to be of so strong an operation, that with the very smell also it driueth away venomous beasts, and doth astonish them.
- D It is reported likewise that the wilde Goats and Deere in Candie when they be wounded with arrowes, do shake them out by eating of this plant, and heale their wounds.
- E It preuaileth much against all wounds, and especially those made with inuened weapons, arrowes shot out of guns, or such like, and is very profitable for Chirurgians that vse the sea and land wars, to carry with them and haue in readinesse : it draweth forth also splinters of wood, bones, or such like.
- F The bastard Dittanie, or *Pseudodictamnium*, is somewhat like in vertues to the first, but not of so great force, yet it serueth exceeding well for the purposes aforesaid.

CHAP. 282. Of Borage.

¶ The Description.

1 Borage hath broad leaues, rough, lying flat vpon the ground, of a blacke or swart green colour : among which riseth vp a stalke two cubits high, diuided into diuers branches, whereupon do grow gallant blew floures, composed of five leaues apiece, out of the middle of which grow forth blacke threds ioined in the top, and pointed like a broch or pyramide : the root is threddie, and cannot away with the cold of winter.

2 Borage with white floures is like vnto the precedent, but differeth in the floures, for those of this plant are white, and the others of a perfect blew colour, wherein is the difference.

† 3 Neuer dying Borage hath manie verie broad leaues, rough and hairie, of a blacke darke Greene colour : among which rise vp stiffe hairie stalkes, whereupon doe grow faire blew floures, somewhat rounder pointed than the former : the root is blacke and lasting, hauing leaues both winter and Sommer, and hereupon it was called *Semper virens*, and that very properly, to distinguish it from the rest of this kinde, which are but annuall. ‡

4 There

1 *Borago hortensis.*
Garden Borage.

2 *Borago flore albo.*
White flowered Borage.

3 *Borago semper vivens.*
Neuer dying Borage.

4 There is a fourth sort of Borage that hath leaues like the precedent, but thinner and lesser, rough and hairy, diuiding it selfe into branches at the bottom of the plant, whereupon are placed faire red floures, wherein is the chiefest difference between this and the last described. ‡ The figure which belonged to this description was put hereafter for *Lycopsis Anglica*. ‡

¶ The Place.

These grow in my garden, and in others also.

¶ The Time.

Borage floures and flourishes most part of all Summer, and till Autumne be far spent.

¶ The Names.

Borage is called in shops *Borago*: of the old Writers, *Εὐφράσιον*, which is called in Latine *Lingua Bubula*: Pliny calleth it *Euphrosinum*, because it maketh a man merry and ioyfull: which thing also the old verse concerning Borage doth testifie:

Ego Borago gaudra semper ago.

I Borage bring alwaies courage.

It is called in high Dutch *Burretsch*: in Italian, *Boragine*: in Spanish, *Boraces*: in low Dutch, *Bernagie*: in English, Borage.

¶ The Temperature.

It is evidently moist, and not in like sort hot, but seemes to be in a meane betwixt hot and cold.

¶ The Vertues.

Those of our time do vse the floures in fallads, to exhilarate and make the mind glad. There be also many things made of them, vsed euery where for the comfort of the heart, for the driuing away of sorrow, and encreasing the ioy of the minde.

- B** The leaues boyled among other pot-herbes do much preuaile in making the belly soluble, they being boyled in honied water be also good against the roughnesse of the throat, and hoarsenesse, as *Galen* teacheth.
- C** The leaues and floures of Borage put into Wine make men and women glad and merry, and driue away all sadnesse, dulnesse, and melancholy, as *Dioscorides* and *Pliny* affirme.
- D** Syrrup made of the floures of Borage comforteth the heart, purgeth melancholy, and quieteth the phrenticke or lunaticke person.
- E** The floures of Borage made vp with sugar do all the aforesaid with greater force and effect.
- F** Syrrup made of the iuyce of Borage with sugar, adding thereto pouders of the bone of a Stags heart, is good against swouning, the cardiacke passion of the heart, against melancholy and the falling sicknesse.
- G** The root is not vsed in medicine: the leaues eaten raw ingender good blood, especially in those that haue been lately sicke.

CHAP. 283. Of Buglosse.

¶ The Kindes.

Like as there be diuers sorts of Borage, so are there sundry of the Buglosses; notwithstanding after *Dioscorides*, Borage is the true Buglosse: many are of opinion, and that rightly, that they may be both referred to one kinde; yet will we diuide them according to the custome of our time, and their vsuall denominations.

1 *Buglossa vulgaris*.
Common Buglosse, or Garden Buglosse.

2 *Buglossum luteum*.
Lang de beefe.

¶ The Description.

1 **T**hat which the Apothecaries call Buglosse bringeth forth leaues longer than those of Borage, sharpe pointed, longer than the leaues of Beets, rough and hairy. The stalke groweth vp to the height of two cubits, parted aboue into sundry branches, whereon are orderly placed blewish floures, tending to a purple colour before they be opened, and afterward more blew. The root is long, thicke, and grosse, and of long continuance.

2 Lang

- † 3 *Buglossa sylvestris minor.*
Small wilde Buglosse.

2 *Lang de Beeſe* is a kinde hereof, altogether leſſer, but the leaues hereof are rougher, like the rough tongue of an oxe or cow, whereof it tooke his name. † The leaues of *Lang-de-Beeſe* are very rough, the ſtalke ſome cubit and halfe high, commonly red of colour: the tops of the branches carry floures in ſcaly rough heads: theſe floures are compoſed of many ſmall yellow leaues in manner of thoſe of *Dandelion*, and flie away in down like as they do: the floures are of a verie bitter taſte, whence *Lobel* calls it *Bugloſſum echioides luteum Hieracio cognatum*. *Tabernamontanus* hath fitly called it *Hieracium echioides*.

3 There is another wilde Bugloſſe which *Dodonaeus* hath by the name of *Bugloſſa ſylveſtris*: it hath a ſmall white root, from which ariſes a ſlender ſtalke ſome foot and halfe high ſet with ſmal rough leaues ſinuated or cut in on the edges: the ſtalke at the top are diuided into three or foure ſmall branches, bearing ſmall blew floures in rough huſkes. †

¶ *The Place.*

Theſe do grow in gardens euery where. † The *Lang-de-Beeſe* growes wilde in many places; as betweene Redriffe and Deptford by the waterie ditch ſides. The little wilde Bugloſſe growes vpon the drie ditch bankes about Pickadilla, and almoſt euery where. †

¶ *The Time.*

They floure from May, or Iune, euen to the end of Sommer. The leaues periſh in Winter, and new come vp in the Spring.

¶ *The Names.*

The Garden Bugloſſe is called of the later Herbariſts *Bugloſſa*, and *Bugloſſa Domestica*: or garden Bugloſſe.

Lang-de Beeſe is called in Latine *Lingua bovis*, and *Bugloſſum Luteum Hieracio cognatum*, and alſo *Bugloſſa ſylveſtris*, or wilde Bugloſſe.

† Small wilde Bugloſſe is called *Borago ſylveſtris* by *Tragus*; *Echium Germanicum Spinoſum* by *Fuchſius*; and *Bugloſſa ſylveſtris* by *Dodonaeus*. †

¶ *The Temperature and Vertues.*

The root, ſaith *Dioſcorides*, mixed with oile, cureth greenewounds, and adding thereto a little A barley meale, it is a remedie againſt Saint Anthonies fire.

It cauſeth ſweat in agues, as *Plinie* ſaith, if the iuice be mixed with a little *Aqua vita*, and the bo- B dy rubbed therewith.

The Phyſitions of the later time uſe the leaues, floures, and roots in ſtead of *Borage*, and put C them both into all kindes of medicines indifferently, which are of force and vertue to driue away ſorrow and penſiueneſſe of the minde, and to comfort and ſtrengthen the heart. The leaues are of like operation with thoſe of *Borage*, and are yſed as potherbes for the purpoſes aforeſaid, as wel Bugloſſe as *Lang-de-Beeſe*, and alſo to keepe the belly ſoluble.

CHAP. 284. Of *Alkanet* or wilde Bugloſſe.

¶ *The Deſcription.*

THEſe herbes comprehended vnder the name of *Anchuſa*, were ſo called of the Greeke word *ἄνχυναι* (i) *Illinere ſucco, vel pigmentis*, that is, to colour or paint any thing: whereupon theſe plants

† 1 *Anchusa Alcibiadion.*
Red Alkanet.

† 2 *Anchusa lutea.*
Yellow Alkanet.

† 3 *Anchusa minor.*
Small Alkanet.

plants were called *Anchusa* of that flourishing and bright red colour which is in the root, even as red as pure and cleere blood: for that is the onely marke or note whereby to distinguish these herbes from those which be called *Echium*, *Lycopsis*, and *Buglossa*, whereto they haue a great resemblance: I haue therefore expressed foure differences of this plant *Anchusa* or Alkanet from the other kindes, by the leaues, floures, and bignesse.

1 The first kinde of Alkanet hath many leaues like *Echium*, or small Buglosse, couered ouer with a prickie hoarinesse, hauing commonly but one stalke, which is round, rough, and a cubite high. The cups of the floures are of a skie colour tending to purple, not vnlike the floures of *Echium*; the seed is small, somewhat long, and of a pale colour: the root is a finger thicke, the pith or inner part thereof is of a wooddie substance, dying the hands or whatsoever toucheth the same, of a bloudie colour, or of the colour of saunders.

2 The second kinde of *Anchusa* or Alkanet is of greater beautie and estimation than the first; the branches are lesse and more bushie in the toppe: it hath also greater plentie of leaues, and those more woollie or hairie: the stalke groweth to the height of two cubites: at the top grow floures of a yellow colour, far different from the other: the root is more shining, of an excellent delicate purplish colour, and more full of iuice than the first.

3 There

3 There is a small kinde of Alkanet, whose root is greater and more full of iuice and substance than the roots of the other kindes: in all other respects it is lesse, for the leaues are narrower, smaller, tenderer, and in number more, very Greene like vnto Borage, yeelding forth many little tender stalks: the floures are lesse than of the small Buglosse, and red of colour: the seed is of an ashe colour, somewhat long and slender, hauing the taste of Buglosse.

4 There is also another kinde of Alkanet, which is as the others before mentioned, a kinde of wilde Buglosse, notwithstanding for distinctions sake I haue separated and seuered them. This last *Anchusa* hath narrow leaues, much like vnto our common Sommer Sauorie. The stalkes are two handfulls high, bearing very smal floures, and of a blewish or skie colour: the root is of a dark brownish red colour, dying the hands little or nothing at all, and of a wooddie substance.

¶ The Time.

These plants do grow in the fields of Narbone, and about Montpellier and many other parts of France: I found these plants growing in the Isle of Thanet neere vnto the sea, betwixt the house sometime belonging to Sir *Henrie Crispe*, and Margate; where I found some in their naturall ripenesse, yet scarcely any that were come to that beautifull colour of Alkanet: but such as is sold for very good in our Apothecaries shops I found there in great plentie.

† I doubt whether our Authour found any of these in the place heere set downe, for I haue sought it but failed of finding; yet if he found any it was onely the first described, for I think the other three are strangers. †

¶ The Time.

The Alkanets floure and flourish in the Sommer moneths: the roots doe yeeld their bloudie iuice in haruest time, as *Dioscorides* writeth.

¶ The Names.

Alkanet is called in Greeke *αλκανη*: in Latine also *Anchusa*: of diuers, *Fucus herba*, and *Onocleia*, *Buglossa Hispanica*, or Spanish Buglosse: in Spanish, *Soagena*: in French, *Orchanet*: and in English likewise *Orchanet* and *Alkanet*.

¶ The Temperature.

The roots of Alkanet are cold and drie, as *Galen* writeth, and binding, and because it is bitter it clenseth away cholericke humours: the leaues bee not so forceable, yet doe they likewise binde and drie.

¶ The Vertues.

Dioscorides saith, that the root being made vp in a cerote, or searecloth with oile, is very good for A old vlcers; that with parched barley meale it is good for the leprey, and for tetters and ring-worms.

That being vsed as a pessarie it bringeth forth the dead birth. B

The decoction being inwardly taken with Mead or honied water, cureth the yellow iaundise, C diseases of the kidneies, the spleene and agues.

It is vsed in ointments for womens paintings: and the leaues drunke in wine is good against the D laske.

Diuers of the later Physitions do boile with the root of Alkanet and wine, sweet butter, such as E hath in it no salt at all, vntill such time as it becommeth red, which they call red butter, and giue it not onely to those that haue salne from some high place, but also report it to be good to driue forth the meafels and small pox, if it be drunke in the beginning with hot beere.

The roots of these are vsed to color sirrups, waters, gellies, & such like confections as Turnsole is. F

Iohn of Arden hath set down a composition called *Sanguis Veneris*, which is most singular in deep G punctures or wounds made with thrusts, as follows: take of oile oliue a pint, the root of Alkanet two ounces, earth worms purged, in number twenty, boile them together & keep it to the vse aforesaid.

The Gentlewomen of France do paint their faces with these roots, as it is said. H

† The two figures that were formerly here were both of the ordinary Buglosse, whereof the first might well enough serue, but the 2. was much different from that it should haue been.

CHAP. 285. Of Wall and Vipers Buglosse.

¶ The Description.

1 **L***ycopsis Anglica*, or wilde Buglosse, so called for that it doth not grow so commonly elsewhere, hath rough and hairie leaues, somewhat lesser than the garden Buglosse: the floures grow for the most part vpon the side of the slender stalke, in fashion hollow like a little bell, whereof some be blew, and others of a purple colour.

2 There is another kinde of *Echium* that hath rough and hairy leaues likewise, much like vnto the former; the stalke is rough, charged full of little branches, which are laden on euery side with diuers small narrow leaues, sharp pointed, and of a brown colour: among which leaues grow floures, each floure being composed of one leafe diuided into five parts at the top, lesse, and not so wide open as that of *Lycopsis*; yet of a sad blew or purple colour at the first, but when they are open they shew to be of an azure colour, long and hollow, hauing certaine smal blew threds in the middle: the seed is small and black, fashioned like the head of a snake or viper: the root is long, and red without.

† 1 *Lycopsis Anglica.*
Wall Buglosse.

† 2 *Echium vulgare.*
Vipers Buglosse.

† 3 *Echium pullo flore.*
Rough Vipers Buglosse!

† 4 *Echium rubro flore.*
Red flowered Vipers Buglosse!

‡ 3 This hath a crested very rough and hairy stalke some foot high; the leaues are like those of Vipers Buglosse, and couered ouer with a soft downinesse, and grow disorderly vpon the stalke, which towards the top is parted into sundry branches, which are diuided into diuers foot-stalkes carrying small hollow floures diuided by fīue little gashes at their tops; and they are of a darke purple colour, and contained in rough cups lying hid vnder the leaues. The seed, as in other plants of this kinde, resembles a Vipers head: the root is long, as thicke as ones little finger, of a dusky colour on the outside, and it liues diuers yeares. This floures in May, and growes in the dry medowes and hilly grounds of Austria. *Clusius* calls it *Echium pullo flore*.

4 This other being also of *Clusius* his description hath long and narrow leaues like those of the common Vipers Buglosse, yet a little broader: the stalkes rise vp some cubit high, firme, crested, and hairy; vpon which grow abundance of leaues, shorter and narrower than those below; and amongst these towards the top grow many floures vpon short foot-stalks, which twine themselves round like a Scorpions taile: these floures are of an elegant red colour, and in shape somewhat like those of the common kinde; and such also is the seed, but somewhat lesse: the root is lasting, long also, hard, wooddy, and blacke on the outside, and it sometimes sends vp many, but most vsually but one stalke. It floures in May, and was found in Hungary by *Clusius*, who first set it forth by the name of *Echium rubro flore*. ‡

¶ The Place.

Lycopsis groweth vpon stone walls, and vpon dry barren stony grounds.

Echium groweth where Alkanet doth grow, in great abundance.

¶ The Time.

They flourish when the other kindes of Buglosses do floure.

¶ The Names.

It is called in Greeke *Echium*, and *Ἀλκυβιάδου*, of *Alcibiades* the finder of the vertues thereof: of some it is thought to be *Anchuse species*, or a kinde of Alkanet: in high-Dutch, wilde *Ochsen-zungen*: in Spanish, *Yerna de la Binora*, or *Chupamel*: in Italian, *Buglossa saluatica*: in French, *Buglosse sauvage*: in English, Vipers Buglosse, Snakes Buglosse; and of some, Vipers herbe, and wilde Buglosse the lesser.

¶ The Temperature.

These herbes are cold and dry of complexion.

¶ The Vertues.

The root drunke with wine is good for those that be bitten with Serpents, and it keepeth such A from being stung as haue drunk of it before: the leaues and seeds do the same, as *Dioscorides* writes. *Nicander* in his book of Treacles makes Vipers Buglosse to be one of those plants which cure the biting of serpents, and especially of the Viper, and that driue serpents away.

If it be drunke in wine or otherwise it causeth plenty of milke in womens breasts. B

The herbe chewed, and the iuyce swallowed downe, is a most singular remedie against poyson C and the bitings of any venomous beast; and the root so chewed and layd vpon the sore workes the same effect.

† That figure which formerly stood in the second place, vnder the title of *Onosma*, and whereof there was no more mention made by our Author, neither in description, name, nor otherwise, I take to be nothing else than the *Lycopsis* which lies with long leaues spread vpon the ground before it comes to send vp the stalke; as you may see it exprest apart by it selfe in the figure we giue you; which is the true figure of that plant our Author described and meant: for the figure which he gaue was nothing but of the common Borage with narrower leaues, which he described in the fourth place of the chapter of Borage, as I haue formerly noted.

CHAP. 286. Of Hounds-tongue.

¶ The Description.

I **T**He common Hounds tongue hath long leaues much like the garden Buglosse, but broader, and not rough at all, yet hauing some fine hoarinesse or softnesse like veluet. These leaues stinke very filthily, much like to the pisse of dogs; wherefore the Dutch men haue called it *Hounds pisse*, and not Hounds tongue. The stalkes are rough, hard, two cubits high, and of a browne colour, bearing at the top many floures of a darke purple colour: the seed is rough, cleauing to garments like Agrimonie seed: the root is blacke and thicke. ‡ These plants for one yeare after they come vp of seed bring forth onely leaues, and those pretty large; and the second yere they send vp their stalks, bearing both floures and seed, and then vsually the root perisheth. I haue therefore presented you with the figures of it, both when it floures, and when it sendeth forth onely leaues. ‡

1 *Cynoglossum maius vulgare sine flore.*
Hounds-tongue without the floure.

1 *Cynoglossum maius cum flore & semine.*
Hounds-tongue with the floure and seed.

2 *Cynoglossum Creticum 1.*
The first Candy Dogs-tongue.

3 *Cynoglossum Creticum alterum.*
The other Candy Dogs-tongue.

2 We haue receiued another sort hereof from the parts of Italy, hauing leaues like Woade; somewhat rough, and without any manifest smell, wherein it differeth from the common kinde; the seed hereof came vnder the title *Cynoglossum Creticum*, Hounds-tongue of Candy. ‡ The floures are lesser and of a lighter colour than those of the former; the seeds also are rough, and grow foure together, with a point comming out of the middle of them as in the common kind, but yet lesser; the root is long and whitish. *Clusius* hath this by the name of *Cynoglossum Creticum* 1.

3 This second *Cynoglossum Creticum* of *Clusius* hath leaues some handfull long, and some inch and better broad: among which, the next yeare after the sowing, comes vp a stalke some cubit or more high, crested, stiffe, and straight, and somewhat downy as are also the leaues, which grow vpon the same, being somewhat broad at their setting on, and of a yellowish Greene colour. The top of the stalke is diuided into sundry branches, which twine or turne in their tops like as the Scorpion grasse, and carry shorter yet larger floures than the ordinarie kinde, and those of a whitish colour at the first, with many small purplish veines, which after a few dayes become blew. The seeds are like the former in their growing, shape, and roughnesse. ‡

4 We haue another sort of Hounds-tongue like vnto the common kinde, sauing it is altogether lesser: the leaues are of a shining Greene colour.

‡ 4 *Cynoglossum minus folio virente.*

Small Greene leaued Hounds-tongue.

¶ The Place.

The great Hounds-tongue growes almost euery where by high-ways and vntoiled ground: the small Hounds-tongue groweth very plentifully by the waies side as you ride Colchester highway from Londonward, betweene Esterford and Wittam in Essex.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

Hounds-tongue is called in Greeke, *κυνόγλωσσον*: in Latine, *Lingua canis*: of Pliny, *Cynoglossos*; and he sheweth two kinds thereof: in English, Hounds-tongue, or Dogs-tongue, but rather Hounds-pisse, for in the world there is not any thing smelleth so like vnto Dogs-pisse as the leaues of this Plant doe.

¶ The Nature.

Hounds-tongue, but especially his root, is cold and dry.

¶ The Vertues.

The roots of Hounds-tongue roasted in the A
embers and layd to the fundament, healeth the hemorrhoides, and the disease called *Ignis sacer*, or wilde-fire.

The iuyce boiled with honey of roses and B
Turpentine, to the forme of an vnguent, is most singular in wounds and deepe vlcers.

Dioscorides saith, That the leaues boyled C
in wine and drunk, do mollifie the belly, and

that the leaues stamped with old swines grease are good against the falling away of the haire of the head, which proceedeth of hot sharpe humors.

Likewise they are a remedie against scaldings or burnings, and against the biting of dogs, as the D
same Author addeth.

CHAP. 287. Of Comfrey, or great Consound.

¶ The Description.

1 THe stalke of this Comfrey is cornered, thicke, and hollow like that of Sow-thistle: it groweth two cubits or a yard high: the leaues that spring from the root, and those that grow

1 *Consolida maior flore purpureo.*
Comfrey with purple floures.

4 *Simphytum parvum Boraginis facie.*
Borage-floured Comfrey.

3 ‡ *Simphytum tuberosum.*
Comfrey with the knobby root.

grow vpon the stalkes are long, broad, rough, and pricking withall, something hairie, and being handled make the hands itch; very like in colour and roughnes to those of Borage, but longer, and sharpe pointed, as be the leaues of Elecampane: from out the wings of the stalkes appeare the floures orderly placed, long, hollow within, of a light red colour: after them groweth the seed, which is blacke. The root is long and thick, blacke without, white within, hauing in it a clammy iuice, in which root consisteth the vertue.

2 The great Comfrey hath rough hairy stalks, and long rough leaues much like the garden Buglosse, but greater and blacker: the floures be round and hollow like little bells, of a white colour: the root is blacke without, and white within, and very slimy. ‡ This differeth no way from the former but onely in the colour of the floure, which is yellowish or white, when as the other is reddish or purple. ‡

3 There is another kinde of Comfrey which hath leaues like the former, sauing that they be lesser: the stalks are rough and tender: the floures be like the former, but that they be of an ouerworn yellow colour: the roots are thicke, short, blacke without, and tuberous, ‡ which in the figure are not expressed so large and knobby as they ought to haue been. ‡

4 This

‡ 4 This pretty plant hath fibrous and blackish roots, from which rise vp many leaues like those of Borage, or Comfrey, but much smaller and greener, the stalkes are some eight inches high, and on their tops carry pretty floures like those of Borage, but not so sharpe pointed, but of a more pleasing blew colour. This floures in the spring and is kept in some choise Gardens. Lobell calls it *Symphytum pumilum repens Borraginis facie, sine Borrago minima Herbariorum*. ‡

¶ The Place.

Comfrey joyeth in watery ditches, in far and fruitfull medowes; they grow all in my Garden.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

It is called in Greeke *ζιζανιον*: in Latine *Symphytum*, and *Solidago*: in shops, *Consolida maior*, and *Symphytum maius*: of Scribonius Largus, *Inula rustica*, and *Alus Gallica*: of others, *Osteocollon*: in high Dutch, *Walwurtz*: in low Dutch, *Waelworstele*: in Italian, *Consolida maggiore*: in Spanish, *Suelda maior*, and *Consuelda maior*: in French, *Consue*, and *Oreille d'asne*: in English, Comfrey, Comfrey Confound; of some, Knit backe, and Blackewoort.

¶ The Temperature.

The root of Comfrey hath a cold quality, but yet not much: it is also of a clammie and gluing moisture, it causeth no itch at all, neither is it of a sharpe or biting taste, vnfauory, and without any qualitie that may be tasted; so far is the tough and gluing moisture from the sharpe clamminesse of the sea Onion, as that there is no comparison betweene them. The leaues may cause itching not through heate or sharpenesse, but through their ruggednesse, as we haue already written; yet lesse than those of the Nettle.

¶ The Vertues.

The rootes of Comfrey stamped, and the juice drunke with wine, helpeth those that spit bloud, and healeth all inward wounds and burstings. A

The same bruised and laid to in manner of a plaister, doth heale all fresh and greene woundes, and are so glutenatiue, that it will sodder or glew together meate that is chopt in peeces seething in a pot, and make it in one lump. B

The rootes boiled and drunke, doe cleanse the brest from flegme, and cure the griefes of the lungs, especially if they be confect with sugar and syrrop; it preuaileth much against ruptures or burstings. C

The slimie substance of the root made in a posset of ale, and giuen to drinke against the paine in the backe, gotten by any violent motion, as wrastring, or ouermuch vse of women, doth in foure or fve daies perfectly cure the same: although the inuoluntary flowing of the seed in men be gotten thereby. D

The roots of Comfrey in number foure, Knotgrasse and the leaues of Clarie of each an handfull, being stamped all together, and strained, and a quart of Muscadell put thereto, the yolkes of three egges, and the powder of three Nutmegs, drunke first and last, is a most excellent medicine against a Gonorrhæa or running of the reines, and all paines and consumptions of the backe. E

There is likewise a syrrop made hereof to be vsed in this case, which staieth voiding of bloud: tempereth the heate of agues: allaieth the sharpenesse of flowing humors: healeth vp vlcers of the lungs, and helpeth the cough: the receipt whereof is this: Take two ounces of the roots of great Comfrey, one ounce of Liquorice; two handfulls of Folefoot, roots and all; one ounce and an halfe of Pine-apple kernells; twenty iuiubes; two drams or a quarter of an ounce of Mallow seed; one dram of the heads of Poppy; boile all in a sufficient quantitie of water, till one pinte remaine, straine it, and adde to the liquor strained six ounces of very white sugar, and as much of the best hony, and make thereof a syrrop that must be thoroughly boiled. F

The same syrrop cureth the vlcers of the kidnies, though they haue been of long continuance; and stoppeth the bloud that commeth from thence. G

Moreouer, it staieth the ouermuch flowing of the monethly sicknesse, taken euery day for certaine daies together. H

It is highly commended for woundes or hurts of all the rest also of the intrailles and inward parts, and for burstings or ruptures. I

The root stamped and applied vnto them, taketh away the inflammation of the fundament, and ouermuch flowing of the hemorrhoides. K

CHAP. 288. Of Cowslips of Ierusalem.

$\frac{2}{1}$ *Pulmonaria maculosa.*
1 Spotted Cowslips of Ierusalem.

$\frac{2}{1}$ *Pulmonaria felijs Echij.*
Buglosse Cowslips.

3 *Pulmonaria angustifolia* η . *Clusij.*
Narrow leaved Cowslips of Ierusalem.

¶ The Description.

1 Cowslips of Ierusalem, or the true and right Lungwort, hath rough, hairy, and large leaues, of a brown green color, confusedly spotted with diuers spots, or drops of white: amongst which spring vp certaine stalkes, a span long, bearing at the top many fine floures, growing together in bunches like the floures of cowslips, sauing that they be at the first red, or purple, and sometimes blew, and oftentimes al these colours at once. The floures being fallen, there come small buttons full of seed. The root is blacke and threddy. ‡ This is sometimes found with white floures. ‡

2 The second kinde of Lungwort is like vnto the former, but greater in each respect: the leaues bigger than the former, resembling wilde Buglosse, yet spotted with white spots like the former: the floures are like the other, but of an exceeding shining red colour.

3 *Carolus Clusius* setteth forth a third kinde of Lungwoort, which hath rough and hairie leaues, like vnto wilde Buglosse, but narrower: among which rises vp a stalke a foot high, bearing at the top a bundle of blew floures, in fashion like vnto those of Buglosse or the last described.

¶ The

¶ The Place.

These plants do grow in moist shadowie woods, and are planted almost every where in gardens.
 ‡ M^r. Goodyer found the *Pulmonaria folijs Echij*, being the second, May 25. Anno 1620. flourishing in a wood by Holbury house in the New Forrest in Hampshire. ‡

¶ The Time.

They floure for the most part in March and Aprill.

¶ The Names.

Cowslips of Ierusalem, or Sage of Ierusalem, is called of the Herbarists of our time, *Pulmonaria*, and *Pulmonalis*; of *Cordus*, *Symphitum sylvestre*, or wilde Comfrey: but seeing the other is also of nature wilde, it may aptly be called *Symphitum maculosum*, or *Maculatum*: in high Dutch, *Lungenkraut*: in low Dutch, *Onser vrouwen melcrut*: in English, spotted Comfrey, Sage of Ierusalem, Cowslip of Ierusalem, Sage of Bethlem, and of some Lungwort; notwithstanding there is another Lungwort, of which we will intreat among the kindes of Mosses.

¶ The Temperature.

Pulmonaria should be of like temperature with the great Comfrey, if the roote of this were clammy: but seeing that it is hard and woody, it is of a more drying quality, and more binding.

¶ The Vertues.

The leaues are vsed among pot-herbes. The roots are also thought to be good against the infirmities and vlcers of the lungs, and to be of like force with the great Comfrey.

† The figure which formerly was in the fourth place of this Chapter, was onely of the first described with white floures. But the Title *Pulmonaria Galorum*, and the description fitted to it (though little to the purpose, and therefore omitted) were intended for the *Pulmonaria Galorum flore aurea*, whereof I haue in the due place largely treated, as you may see in this booke, pag. 304. chap. 36.

CHAP. 289. Of Clote Burre, or Burre Docke.

1. *Bardana maior.*

The great Burre Docke.

2. *Bardana minor.*

The lesse Burre Docke.

¶ The Description.

1 **C**lot Burre bringeth forth broad leaues and hairie, far bigger than the leaues of Gourds, and of greater compasse, thicker also, and blacker, which on the vpper side are of a darke Greene colour, and on the nether side somewhat white: the stalke is cornered, thicke, beset with like leaues, but far lesse, diuided into very many wings and branches, bringing forth great Burres round like bullets or balls, which are rough all ouer, and full of sharpe crooking prickles, taking hold on mens garments as they passe by; out of the tops whereof groweth a floure thrummed, or all of threds, of colour purple: the seed is perfected within the round ball or bullet, and this seed when the burres open, and the winde bloweth, is caried away with the winde: the root is long, white within, and blacke without.

† There is another kinde hereof which hath lesser and softer heads, with weaker prickles; these heads are also hairy or downy, and the leaues and whole plant somewhat lesse, yet otherwise like the fore described; *Lobell* calls this *Arctium montanum*, and *Lappa minor Galeni*: it is also the *Lappa minor altera* of *Matthiolus*. *Lobell* found this growing in Somersetshire three miles from Bath, neere the house of one M^r. *John Colt*.

2 The lesser Burre hath leaues farre smaller than the former, of a grayish ouerworne colour like to those of Orach, nicked round about the edges: the stalke is a foot and a halfe high, full of little blacke spots, diuiding it selfe into many branches: the floures before the Burres come forth do compasse the small stalkes round about; they are but little, and quickly vade away: then follow the Burres or the fruit out of the bosome of the leaues, in forme long, on the tops of the branches, as big as an Oliue or a Cornell berry, rough like the balles of the Plane tree, and being touched cleaue fast vnto mens garments: they do not open at all, but being kept close shut bring forth long feeds. The root is fastened with very many strings, and groweth not deepe.

¶ The Place.

The first groweth euery where: the second I found in the high way leading from Draiton to Iuer, two miles from Colbrooke, since which time I haue found it in the high way betweene Stanes and Egham. † It also groweth plentifully in Southwick sheet in Hampshire, as I haue been enformed by M^r. *Goodyer*. †

¶ The Time.

Their season is in Iuly and August.

¶ The Names.

The great Burre is called in Greeke *ἀρτίον*: in Latine, *Personata*, *personata*, and *Arcium*: in shops, *Bardana*, and *Lappa maior*: in high Dutch, *Groszkletten*: in low Dutch, *Groote clissen*: in French, *Glouteron*: in English, Great Burre, Burre Docke, or Clot Burre: *Apuleius* besides these doth also set downe certaine other names belonging to Clot Burre, as *Dardana*, *Bacchion*, *Elephantosis*, *Nephelion*, *Manisfolium*.

The lesser Burre Docke is called of the Græcians *ἔλδιον*: in Latine, *Xanthium*: in shops, *Lappa minor*, *Lappa inuersa*, and of diuers, *Strumaria*: *Galen* saith it is also called, *Phasganion*, and *Phasganon*, or herbe victory, being but bastard names, and therefore not properly so called: in English, Louse Burre, Ditch Burre, and lesser Burre Docke: it seemeth to be called *Xanthium* of the effect, for the Burre or fruite before it be fully withered, being stamped and put into an earthen vessell, and afterwards when need requireth the weight of two ounces thereof and somewhat more, being steeped in warme water and rubbed on, maketh the haire of the head red; yet the head is first to be dressed or rubbed with niter, as *Dioscorides* writeth.

¶ The Temperature.

The leaues of Clot Burre are of temperature moderately dry and waisting; the root is something hot.

The seed of the lesser Burre, as *Galen* saith, hath power to digest, therefore it is hot and dry.

¶ The Vertues.

- A The roots being taken with the kernels of Pine Apples, as *Dioscorides* witnesseth, are good for them that spit bloud and corrupt matter.
- B *Apeleius* saith that the same being stamped with a little salt, and applied to the biting of a mad dog, cureth the same, and so speedily setteth free the sicke man.
- C He also teacheth that the juice of the leaues giuen to drinke with hony, procureth vrine, and taketh away the paines of the bladder; and that the same drunke with old wine doth wonderfully helpe against the bitings of serpents.
- D *Columella* declareth, that the herbe beaten with salt and laid vpon the scarifying, which is made with the launcet or raser, draweth out the poison of the viper: and that also the root being stamped is more auailable against serpents, and that the root in like maner is good against the Kings euill.

The stalke of Clot-burre before the burres come forth, the rinde pilled off, being eaten raw with salt and pepper, or boyled in the broth of fat meate, is pleasant to be eaten: being taken in that manner it increaseth seed and stirreth vp lust.

Also it is a good nourishment, especially boyled: if the kernell of the Pine Apple be likewise added it is the better, and is no lesse available against the vlcer of the lungs, and spitting of bloud, than the root is.

The root stamped and strained with a good draught of Ale is a most approued medicine for a G windie or cold stomacke.

Treacle of Andromachus, and the whites of egges, of each a like quantitie, laboured in a leaden H mortar, and spred vpon the Burre leafe, and so applied to the gout, haue been proued many times most miraculously to appease the paine thereof.

Dioscorides commendeth the decoction of the root of *Arcion*, together with the seed, against the I tooth-ache, if it be holden awhile in the mouth: also that it is good to foment therewith both burnings and kided heeles; and affirmeth that it may be drunke in wine against the strangury and paine in the hip.

Dioscorides reporteth that the fruit is very good to be laid vnto hard swellings.

The root cleane picked, washed, stamped and strained with Malmesey, helpeth the running of K the reines, the whites in women, and strengthneth the backe, if there be added thereto the yelks of L egges, the pouders of acornes and nutmegs brued or mixed together, and drunke first and last.

CHAP. 290. Of Colts-foot, or Horse-foot.

I *Tussilago florens.*
Colts-foot in floure.

I *Tussilaginifolia.*
The leaues of Colts-foot.

The Description.

I **T**ussilago or Fole-foot hath many white and long creeping roots, somewhat fat, from which rise vp naked stalke (in the beginning of March and Aprill) about a spanne long, bearing at the top yellow floures, which change into down, and are caried away with the winde: when the stalke and seed is perished, there appeare springing out of the earth many

many broad leaues, green aboue, and next the ground of a white hoarie or grayish colour, fashioned like an horse foot; for which cause it was called Fole-foot, and Horse-hoofe: seldome or neuer shall you find leaues and floures at once, but the floures are past before the leaues come out of the ground; as may appeare by the first picture, which setteth forth the naked stalkes and floures; and by the second, which pourtraiteth the leaues onely.

‡ 2 Besides the commonly growing and described Colts-foot, there are other two small mountaine Colts-feet described by *Clusius*; the first whereof I will here present you with, but the second you shall finde hereafter in the chapter of *Asarum*, by the name of *Asarina Matthioli*. This here delineated hath five or six leaues not much vnlike those of Alehoofe, of a darke shining green colour aboue, and very white and downy below: the stalke is naked some handfull high, hollow and downy, bearing one floure at the top composed of purplish threds, and flying away in downe: after which the stalke falls away, and so the leaues onely remaine during the rest of the yeare: the root is small and creeping. It growes on the tops of the Austrian and Stirian mountaines, where it floures in Iune or August. Brought into gardens it floures in Aprill. *Clusius* calls it *Tussilago Alpina* 1. and he hath giuen two figures thereof, both which I here giue you by the same titles as he hath them. ‡

‡ 2 *Tussilago Alpina flore aperto.*
Mountaine Colts-foot full in floure.

‡ 2 *Tussilago Alpina flore evanido.*
Mountaine Colts-foot with the
floure fading.

¶ *The Place.*

This groweth of it selfe neere vnto Springs, and on the brinckes of brookes and riuers, in wet furrowes, by ditches sides, and in other moist and watery places neere vnto the sea, almost euery where.

¶ *The Time.*

The floures, which quickly fade, are to be seene in the end of March, and about the Calends of Aprill, which speedily wither together with the stems: after them grow forth the leaues, which remaine greene all Sommer long: and hereupon it came that Colts-foot was thought to be without floures; which thing also *Pliny* hath mentioned in his sixe and twentieth booke, cap. 6.

¶ *The Names.*

Folefoot is called in Greeke *Βήχων*: of the Latines likewise *Bechion*, and *Tussilago*: in shops, *Farfara*, and *Vngula Caballana*: of diuers, *Pata equina*: in Italian, *Vnghia di Cavallo*: in Spanish, *unha d'asno*: in French, *Pas d'asne*: in English, Fole-foot, Colts-foot, Horse-hoofe, and Bull-foot. The same is also *Chamaleuce*, which *Pliny* in his twenty eighth booke, and fifteenth chapter reporteth to be likewise called *Farfugium*, and *Farranum*, if there be not an error in the copy: which thing also *Aëtius* in his first booke affirmeth, pretermittting the name of *Bechium*, and attributing vnto it all the vertues and faculties of *Bechium* or Colts-foot. Whose opinion *Orabasius* seemeth to be of, in his fifteenth booke of his medicinable Collections, making mention of *Chamaleuce*: only *Pliny* also

also agreeth with them; shewing that some thinke, that *Bechium* is called by another name *Chamæleuce*, in his twenty sixth booke, cap. 6. and it may be that *Dioscorides* hath written of one and the selfe same herbe in fundry places, and by diuers names. *Bechium* and *Tussilago*, which may also be Englished Coughwort, so called of the effect, and *Farfara*, of the white Poplar tree, to whose leaues it is like; which was named of the Antients *Farfarus*, as *Plautus* writeth in his Comedie called *Pœmilus*:

— *viscum legioni dedi.*
fundasque eos prosternebam ut folia Farfari.

To the company I gaue both lime bush and sling.

That to the ground as Poplar leaues I might them sling.

‡ *Dodonaus* (from whom our Author tooke this) sets downe this place in *Plautus* as you finde it here, but not well; for the last verse should be *Fundasque, eo prosternebant folia Farfari*. Thus it is in most editions of *Plautus*, and that rightly, as the ensuing words in that place declare. ‡

The white Poplar tree is called in Greeke *Alnus*, and hereupon *Bechion* or Colts-foot was also called *Chamæleuce*.

¶ The Temperature and Vertues.

The leaues of Colts-foot being fresh and Greene are something cold, and haue withall a drying A
qualitie; they are good for vlcers and inflammations: but the dried leaues are hot and drie, and
somewhat biting.

A decoction made of the Greene leaues and roots, or else a syrrup thereof, is good for the cough B
that proceedeth of a thin rheume.

The green leaues of Fole-foot pound with hony, do cure and heale the hot inflammation called C
Saint Anthonies fire, and all other inflammations.

The fume of the dried leaues taken through a funnell or tunnell, burned vpon coles, effectually D
helpeth those that are troubled with the shortnesse of breath, and fetch their winde thicke and of-
ten, and breaketh without perill the impostumes of the brest.

Being taken in manner as they take Tobacco, it mightily preuaileth against the diseases afore- E
said.

CHAP. 291. Of Butter-Burre.

¶ The Description.

Butter-Burre doth in like manner bring forth floures before the leaues, as doth Colts-
foot, but they are small, mossie, tending to a purple colour; which being made vp into
a big eare as it were, do quickly (together with the stem, which is thicke, full of sub-
stance, and brittle) wither and fall away: the leaues are very great like to a round cap or hat, called
in Latine *Petasus*, of such a widenesse, as that of it selfe it is big and large enough to keepe a mans
head from raine, and from the heate of the Sunne: and therefore they be greater than the leaues of
the Clot-burre, of colour somewhat white, yet whiter vnderneath: euery stem beareth his leafe;
the stem is oftentimes a cubit long, thicke, full of substance; vpon which standeth the leafe in the
centre or middlemost part of the circumference, or very neere, like to one of the greatest Mush-
rooms, but that it hath a cleft that standeth about the stem, especially when they are in perishing
and withering away: at the first the vpper superficiall or outside of the Mushrooms standeth out,
and when they are in withering standeth more in; and euen so the leafe of Butter-bur hath on the
outside a certaine shallow hollownesse: the root is thicke, long, blacke without, white within, of
taste somewhat bitter, and is oftentimes worme-eaten.

¶ The Place.

This groweth in moist places neere vnto riuers sides, and vpon the brinks and banks of lakes and
ponds, almost euery where.

¶ The Time.

The eare with the floures flourish in Aprill or sooner: then come vp the leaues, which continue
till Winter, with new ones still growing vp.

1 *Petasites florens.*
Butter-Burre in floure.

1 *Petasitis folia.*
The leaues of Butter-burre.

¶ The Names.

Butter-bur is called in Greeke *πιδαντις*, of the hugenessse of the leafe that is like to *πιδαντις*, or a hat: the Latines call it *Petasites*: in high-Dutch, *Pestilentzwurt*: in low-Dutch, *Dockbladeren*: in English it is named Butter-Burre: it is very manifest that this is like to Colts-foot, and of the same kinde.

¶ The Temperature.

Butter-Burre is hot and dry in the second degree, and of thinn parts.

¶ The Vertues.

- A The roots of Butter-burre stamped with ale, and giuen to drinke in pestilent and burning Feuers, mightily cooleth and abateth the heate thereof.
- B The roots dried and beaten to pouder, and drunke in wine, is a soueraigne medicine against the plague and pestilent feuers, because it prouoketh sweat, and driueth from the heart all venome and ill heate: it killeth wormes, and is of great force against the suffocation of the mother.
- C The same cureth all naughty filthy vlcers, if the pouder be strewed therein.
- D The same kills wormes in the belly: it prouokes vrine, and brings downe the monthly termes.

‡ CHAP. 292. Of Mountaine Horse-foot.

¶ The Description.

‡ 1 **T**His plant (which the moderne Writers hane referred to the *Cacalia* of the Antients, and to the kindes of Colts-foot) I haue thought good to name in English, Horse-foot, for that the leaues exceed Colts-foot in bignesse, yet are like them in shape: and of this plant *Clusius* (whom I here chiefly follow) hath described two sorts: the first of these hath many leaues almost like vnto those of Colts-foot, but larger, very round, and snipt about the edges, of a light greene colour aboue, and hoarie vnderneath, hauing also many veines or nerues running vp and downe them; and these leaues are of an vngratefull taste, and grow vpon long purplish crested stalkes: The stemme is some two cubits high, crested likewise, and of a purplish colour, set also at certaine spaces with leaues very like vnto the other, but lesser than those

next

† 1 *Cacalia incano folio.*
Hoarie leaved Horfe-foot.

† 2 *Cacalia folio glabro.*
Smooth leaved Horfe-foot.

next the ground, and more cornered and sharper pointed; the tops of the stalkes and branches carrie bunches of purple floures, as in an vmbell: and commonly in each bunch there are three little floures consisting of foure leaues a peece, and a forked pestell, and these are of a purple colour, and a weake, but not vnpleasant smell, and they at length turne into downe, amongst which lies hid a longish seed: the root, if old, sends forth diuers heads, as also store of long whitish fibres.

2 The leaues of this are more thin, tough and hard, and of a deeper Greene on the vpper sides, neither are they whitish below, nor come so round or close whereas they are fastened to their stalks (which are not crested as those of the other, but round and smooth) they are also full of veines, and nickt about the edges, and of somewhat an vngratefull hot and bitter taste. The stalkes are also smoother, and the floures of a lighter colour.

¶ The Place.

Both these grow in the Austrian and Stirian Alpes vnder the sides of woods, among bushes and such shadowie places: but not in England, that I haue yet heard of.

¶ The Time.

I find it not set downe when these floure and seed, but iudge it about the same time that Colts-foot doth.

¶ The Names.

This by *Clusius*, *Lobel* and others, hath beene called *Cacalia*, and referred to that described by *Dioscorides*, lib. 4. cap. 123. which is thought to be that set forth by *Galen* by the name of *Cancanus*. In the *Historia Lugd.* pag. 1052. The later of these two here described is figured by the name of *Tussilago Alpina* sive *montana*, and the former is there, page 1308, by the name of *Cacalia*, but the floures are not rightly exprest: and if my iudgement faile me not, the figure which is in the seuenteenth page of the *Appendix* of the same Authour, by the title of *Aconitum Pardalianches primum*, is of no other than this very plant. But because I haue not as yet seene the plant, I will not positiuely affirme it: but referre this my opinion to those that are iudicious and curious, to know the plant that raised such controuersie between *Matthiolus* and *Gesner*, and whereof neither *Camerarius* nor *Bauhine*, who haue set forth *Matthiolus* his Commentaries, haue giuen vs any certain or probable knowledge.

¶ The Temperature and Vertues, out of the Antients.

A The root of *Cacalia* is void of any biting qualitie, and moderately dries, and it is of a grosse and emplaisticke substance, wherefore steeped in wine and so taken it helps the cough, the roughnesse of the Arterie or hoarsnes, like as *Tragacanth*: neither if you chew it and swallow downe the iuice doth it lesse auaille against those effects than the iuice of *Liquorice*. ‡

CHAP. 293. Of small Celandine or Pile-woort.

¶ The Kindes.

T Here be two Kindes of Celandine, according to the old writers, much differing in forme and figure: the one greater, the other lesser, which I intende to diuide into two distinct chapters, marshalling them as neere as may be with their like, in forme and figure, and first of the small Celandine.

Chelidonium minus.

Pile-woort.

¶ The Description.

T He lesser Celandine hath Greene round leaues, smooth, slipperie, and shining, lesse than the leaues of the Iuie: the stalks are slender, short, and for the most part creeping vpon the ground: they bring forth little yellow flours like those of Crow-foot; and after the floures there springeth vp a little fine knop or head full of seede: the root consisteth of slender strings, on which doe hang as it were certaine graines, of the bignes of wheat cornes, or bigger.

¶ The Place.

It groweth in meadows, by common waies, by ditches and trenches, and it is common euery where, in moist and dankish places.

¶ The Time.

It commeth forth about the Calends of March, and floureth a little after: it beginneth to fade away in Aprill, it is quite gone in May, afterwards it is hard to be found, yea scarcely the root.

¶ The Names.

It is called in Greeke *χελιδών*: of the Latines *Chelidonium minus*, and *Hirundinaria minor*: of diuers, *Scrophularia minor*, *Ficaria minor*: of *Scrapio*, *Memiren*: in Italian, *Fauscello*: in High Dutch, *Feigwurtzenkraut*: in French, *Ecolere*, and *Petit Bassinet*: in English, little Celandine, Fig-woort, and Pile-woort.

¶ The Temperature.

It is hot and drie, also more biting and hotter than the greater: it commeth neereft in facultie to the Crow foot.

‡ This which is here, and by most Authours set forth for *Chelidonium minus*, hath no such great heat and Acrimonie as *Dioscorides* and *Galen* affirme to be in theirs; making it hot in the fourth degree, when as this of ours scarce exceeds the first, as farre as wee may coniecture by the taste. ‡

¶ The Vertues.

B It presently, as *Galen* and *Dioscorides* affirme, exulcerateth or blistereth the skin: it maketh rough and corrupt nailes to fall away.

B The iuice of the roots mixed with honie, and drawne vp into the nostrils, purgeth the head of foule and filthie humours.

Th

The later age vse the roots and graines for the piles, which being often bathed with the iuice C mixed with wine, or with the sickmans vrine, are drawne together and dried vp, and the paine quite taken away.

There be also who thinke, that if the herbe be but carried about one that hath the piles, the pain D forthwith ceaseth.

CHAP. 294. Of Marsh Marigold.

¶ The Description.

1 **M**arsh Marigold hath great broad leaues somewhat round, smooth, of a gallant Greene colour, sleightly indented or purld about the edges: among which rise vp thicke fat stalkes, likewise Greene; whereupon doe grow goodly yellow floures, glittering like gold, and like to those of Crow-foot, but greater: the root is small, composed of verie manie strings.

1 *Caltha palustris maior.*
The great Marsh Marigold.

2 *Caltha palustris minor.*
The small Marsh Marigold.

2 The smaller Marsh Marigold hath many round leaues spred vpon the ground, of a darke Greene colour: amongst which rise vp diuers branches, charged with the like leaues: the floures grow at the toppes of the branches, of a most shining yellow colour: the root is also like the former.

3 The great Marsh Marigold with double floures is a stranger in England, his native Countrey should seeme to be in the furthest part of Germanie, by the relation of a man of those Countreies that I haue had conference withall the which hee thus described: it hath (saith hee) leaues, roots, and stalkes like those of our common sort, and hath double floures like those of the garden Marigold, wherein consisteth the difference.

† *Camerarius* writes iust contrarie to that which our Authour here affirms; for hee saith, *In Anglia sua sponte non solum plenis, sed oderat is etiam floribus passim sese offert.* But I feare that both our Authour

3 *Caltha palustris multiplex.*
Double flowered Marsh Marigold.

CHAP. 295. Of Frogge-bit.

Morsus Rana.
Frogge-bit.

Authour and *Camerarius* were deceiued by trusting the report of some lying, or else ignorant persons, for I could neuer finde it growing wilde with double floures here, nor *Camerarius* there: yet I do not denie but by chance some one with double floures may be found both here & there, but this is not euery where. ‡

¶ The Place.

They ioy in moist and marish grounds, and in watery medowes. ‡ I haue not found the double one wilde, but seene it preserued in diuers gardens for the beautie of the floure. ‡

¶ The Time.

They floure in the Spring when the Crow-foots doe, and oftentimes in Sommer: the leaues keepe their greenenesse all the Winter long.

¶ The Names.

Marsh Marigold is called of *Valerius Cordus*, *Caltha palustris*: of *Tabernamontanus*, *Populago*: but not properly: in English, Marsh Marigolds: in Cheshire and those parts it is called Bootes.

¶ The Temperature and Vertues.

Touching the faculties of these plants, wee haue nothing to say, either out of other mens writings, or our owne experiences

¶ The Description.

There floteth or swimmeth vpon the vpper parts of the water a small plant, which wee vsually call Frog-bit, hauing little round leaues, thicke and full of iuice, very like to the leaues of wall Peniwoort: the floures grow vpon long stems among the leaues, of a white colour, with a certaine yellow thrum in the middle, consisting of three leaues: in stead of roots it hath slender strings, which grow out of a short and small head, as it were, from whence the leaues spring, in the bottom of the water: from which head also come forth sloopwise certaine strings, by which growing forth it multiplieth it selfe.

¶ The Place.

It is found swimming or floating almost in euery ditch, pond, poole, or standing water, in all the ditches about Saint George his fields, and in the ditches by the Thames side neere to Lambeth Marsh, where any that is disposed may see it.

¶ The Time.

It flourisheth and floureth most part of all the yeare.

¶ The Names.

It is called of some *Rana morsus*, and *Morsus Ranae*, and *Nymphaeaparna*.

¶ The

¶ The Temperature and Vertues.

It is thought to be a kinde of Pond-weed (or rather of Water Lillie) and to haue the same faculties that belong vnto it.

CHAP. 296. Of Water Lillie.

¶ The Description.

THe white water Lillie or *Nenuphar* hath great round leaues, in shape of a Buckler, thick, fat, and full of iuice, standing vpon long round and smooth foot-stalkes, full of a spongi-ous substance, which leaues do swim or flote vpon the top of the water: vpon the end of each stalk groweth one floure onely, of colour white, consisting of many little long sharpe pointed leaues, in the midst whereof bee many yellow threds: after the floure it bringeth forth a round head, in which lieth blackish glittering seed. The roots be thicke, full of knots, black without, white and spongie within, out of which groweth a multitude of strings, by which it is fastened in the bot-tome.

1 *Nymphaea alba.*
White Water Lillie.

2 *Nymphaea lutea.*
Yellow Water Lillie.

2 The leaues of the yellow water Lillie be like to the other, yet are they a little longer. The stalkes of the floures and leaues be like: the floures be yellow, consisting onely of five little short leaues something round, in the midst of which groweth a small round head, or button, sharpe to-wards the point, compassed about with many yellow threds, in which, when it is ripe, lie also glit-tering seeds, greater than those of the other, and lesser than wheat cornes. The roots be thick, long, set with certaine dents, as it were white both within and without, of a spongi-ous substance.

3 The smal white water Lillie floreteth likewise vpon the water, hauing a single root, with some few fibres fastened thereto: from which riseth vp many long, round, smooth, and soft foot-stalkes, some of which doe bring forth at the end faire broad round buckler leaues like vnto the prece-
dent,

dent, but lesser : on the other foot-stalkes stand prettie white floures, consisting of five small leaues apeece, hauing a little yellow in the middle thereof.

3 *Nymphaea alba minor.*
The small white Water Lillie.

5 *Nymphaea lutea minima.*
Dwarfe Water Lillie.

4 The small yellow water Lillie hath a little threddie root, creeping in the bottome of the water, and dispersing it selfe far abroad : from which rise small tender stalkes, smooth and soft, whereon do grow little buckler leaues like the last described : likewise on the other small stalke standeth a tuft of many floures likewise floting vpon the water as the others do. ‡ This hath the floures larger than those of the next described, wherefore it may be fitly named *Nymphaea lutea minor flore amplo.* ‡

5 This dwarfe water Lillie differeth not from the other small yellow water Lillie, sauing that, that this kinde hath sharper pointed leaues, and the whole plant is altogether lesser, wherein lieth the difference. ‡ This hath the floures much lesse than those of the last described, wherefore it is fitly for distinction sake named *Nymphaea lutea minor flore paruo.* ‡

¶ The Place.

These herbes do grow in fennes, standing waters, broad ditches, and in brookes that run flowly, and sometimes in great riuers.

¶ The Time.

They floure and flourish most of the Sommer moneths.

¶ The Names.

Water Lillie is called in Greeke *Νύμφη* : and in Latine also *Nymphaea*, so named because it loues to grow in waterie places, as *Dioscorides* saith : the Apothecaries call it *Nenuphar* : of *Apuleius*, *Mater Herculania*, *Alga palustris*, *Papauer palustre*, *Clavus veneris*, and *Digitus veneris* : *Marcellus* a very old writer reporteth, that it is called in Latine *Claua Herculis* : in French, *Badittin* : in high Dutch, *waasser Mahem* : in low Dutch, *Blompen* : in English, Water Lillie, water Rose.

¶ The Temperature.

Both the root and seed of water Lillie haue a drying force without biting.

¶ The Vertues.

A Water Lillie with yellow floures stoppeth laskes, the ouerflowing of seed which commeth away by dreames or otherwise, and is good for them that haue the bloudie flux.

But

But water Lillie which hath the white floures is of greater force, insomuch as it staieth the whites: but both this and the other that hath the black root must be drunke in red wine: they have also a scouring quality, therefore they both cleanse away the morpew, and be also good against the pilling away of the haire of the head: against the morpew they are steeped in water, and for the pilling away of the haire in Tarre: but for these things that is fitter which hath the black root, and for the other, that which hath the white root.

Theophrastus saith, that being stamped and laid vpon the wound, it is reported to stay the bleeding.

The Physicians of our age do commend the floures of white *Nymphaea* against the infirmities of the head which come of a hot cause: and do certainly asirme, that the root of the yellow cureth hot diseases of the kidnies and bladder, and is singular good against the running of the reines.

The root and seed of the great water Lillie is very good against venery or fleshly desire, if one do drinke the decoction thereof, or vse the seed or root in powder in his meates, for it dryeth vp the seed of generation, and so causeth a man to be chaste, especially vsed in broth with flesh.

The conferue of the floures is good for the diseases aforesaid, and is good also against hot burning feuers.

The floures being made into oile, as yee do make oile of roses, doth coole and refrigerate, causing sweate and quiet sleepe, and putteth away all venereous dreames: the temples of the head and palmes of the hands and feet, and the brest being annointed for the one, and the genitors vpon and about them for the other.

The greene leaues of the great water Lillie, either the white or the yellow laid vpon the region of the backe in the small, mightily cease the inuoluntary flowing away of the seed called *Gonorrhoea*, or running of the raines, being two or three times a day remooued, and fresh applied thereto.

CHAP. 297. Of Pond-weed, or water Spike:

1 *Potamogeton latifolium*.
Broad leaved Pondweed.

2 *Potamogeton angustifolium*.
Narrow leaved Pondweed.

¶ The Description.

1 Pond-weed hath little stalkes, slender, spreading like those of the vine, and jointed: the leaues be long, smaller than the leaues of Plantaine, and harder, with manifest veines running alongst them as in Plantains, which standing vpon slender and long stems or foot-stalkes, shew themselves aboue the water, and lie flat along vpon the superficiall or vpper part thereof, as do the leaues of the water Lillie: the floures grow in short eares, and are of a light red purple colour, like those of Red-thankes or Bistort: the seed is hard.

2 This (whose figure was formerly vnfitly put by our Authour to the following description) hath longer, narrower, and sharper pointed leaues than those of the last described, hauing the veines running from the middle rib to the sides of the leaues, as in a willow leafe, which they somewhat resemble; at the tops of the stalkes grow reddish spikes or eares like those of the last described: the root is long, jointed, and fibrous. ‡

‡ 3 *Potamogeton 3 Dodonai.*
Small Pondweed.

‡ 4 *Potamogeton longis acutis folijs.*
Long sharpe leaued Pondweed.

3 There is another Pondweed described thus; it shooteth forth into many slender and round stems, which are distributed into sundry branches: his leaues are broad, long, and sharpe pointed, yet much lesse than the first kinde: out of the bosomes of the branches and leaues there spring certaine little stalkes which beare sundry small white mossie floures, which doe turne into plaine and round seeds, like the common Tare or Vetch: his root is fibrous, thoroughly fastened in the ground.

4 There is also another Pondweed, which hath whitish and jointed roots creeping in the bottome of the water, and sending downe some fibres, but sending vp slender jointed and long stalkes, small below, and bigger aboue, hauing long narrow and very stiffe sharpe pointed leaues. The floures grow in a reddish spike like those of the first described. This is the *Potamogeton altera* of *Dodonaeus*. ‡

¶ The Place.

These herbes do grow in standing waters, pooles, ponds, and ditches, almost euery where.

¶ The Time.

They do floure in Iune and Iuly.

¶ The Names.

It is called of the Grecians, *ποταμογέτων*: in Latine, *Fontalis*, and *Spicata*: in high Dutch, *Zamkraut*: in low Dutch, *Fonteyncrypt*: in French, *Espe d'eau*: in English, Pondweed, and water Spike.

¶ The

¶ The Temperature.

Pondweed, saith *Galen*, doth binde and coole, like as doth Knot-grasse, but his essence is thicker than that of Knot-grasse.

¶ The Vertues.

It is good against the itch, and consuming or eating Vicers, as *Dioscorides* writeth. A
Also it is good being applied to the inflammation of the legges, wherein *Ignis sacer* hath gotten B
the superioritie.

CHAP. 298. Of Water Saligot, water Caltrops, or water Nuts.

¶ The Description.

1 **W**ater Caltrops haue long slender stalkes, growing vp, and rising from the bottome of the water, and mounting aboue the same: the root is long, hauing here and there vnder the water certaine tassels full of small strings and threddie haire: the stem towards the top of the water, is very great in respect of that which is lower, the leaues are large and somewhat round, not vnlike those of the Poplar or Elme tree leaues, a little crenised or notched about the edges: amongst and vnder the leaues groweth the fruit, which is triangled, hard, sharpe pointed, and prickly: in shape like those hurtfull engines in the warres, cast in the passage of the enemy to annoy the feet of their horses, called Caltrops, whereof this tooke its name: within these heads or Nuts is contained a white kernell, in taste almost like the Chef-nut, which is reported to be eaten greene, and being dried and ground to serue in stead of bread.

‡ There are two other plants which are found growing in many ponds and ditches of this kingdome, both about London and else-where, and I will here giue you the figures out of *Lobel* and *Clusius*, and their descriptions as they were sent me by M^r. *Goodyer*, who hath saued me the labour of describing them.

Tribulus aquaticus minor quercus floribus, *Clus. p. 252.*
Pusillum fontilapathum, *Lobelij.*

2 This water herbe bringeth forth from the root, thin, flat, knottie stalkes, of a reddish colour, two or three cubits long, or longer, according to the depth of the water (which when they are drie, are pliant and bowing) diuided towards the top into many parts or branches, bearing but one leafe at euery ioint, sometimes two inches long, and halfe an inch broad, thin, and as it were shining, so wrinkled and crumpled by the sides that it seemeth to be torne, of a reddish greene colour: the foot-stalkes are something long and thicke, and rise vp from amongst those leaues, which alwaies grow two one opposit against another, in a contrarie manner to those that grow below on the stalk: neere the top of which foot-stalke groweth small grape-like huskes, out of which spring very small reddish floures, like those of the Oke, euery floure hauing foure very small round topped leaues: after euery floure commeth commonly foure sharpe pointed graines growing together, containing within them a little white kernell. The lower part of the stalke hath at euery ioint small white threddie roots, somewhat long, whereby it taketh hold in the mudde, and draweth nourishment vnto it. The whole plant is commonly couered ouer with water. It floureth in Iune and the beginning of Iuly. I found it in the standing pooles or fish-ponds adioyning to a dissolued Abbey called Dursford, which ponds diuide Hampshire and Suffex, and in other standing waters elsewhere. This description was made vpon sight of the plant the 2. of Iune, 1622.

Tribulus aquaticus minor, muscatella floribus.

3 This hath not flat stalkes like the other, but round, kneed, and alwaies bearing two leaues at euery ioint, one opposite against another, greener, shorter and lesser than the other, sharpe pointed, not much wrinkled and crumpled by the edges. *Clusius* saith, that they are not at all crumpled. I neuer obserued any without crumples and wrinkles: the floures grow on short small foot-stalkes, of a whitish green colour, like those of *Muscataella Cordi*, called by *Gerard*, *Radix caua minima viridi flore*: viz. two floures at the top of euery foot-stalke, one opposite against another, euery floure containing foure small leaues: which two floures beeing past there come vp eight small huskes

1 *Tribulus aquaticus.*
Water Caltrops.

2 *Tribulus aquaticus minor quercus floribus.*
Small water Caltrops, or Frogs-lettuce.

3 *Tribulus aquaticus minor, Muscatella floribus.*
Small Frogs-Lettuce.

husks making six feveral waies a square of flours. The roots are like the former. This groweth abundantly in the riuer by Droxford in Hampshire. It floureth in Iune and Iuly when the other doth, and continueth couered ouer with water, greene, both winter and Sommer. *John Goodyer.* ‡

¶ The Place.

Cordus saith that it groweth in Germany in myrie lakes; and in citie ditches that haue mud in them: in Brabant and in other places of the Low-countries, it is found oftentimes in standing waters, and springs: *Matthiolus* writeth, that it groweth not only in lakes of sweet water, but also in certaine ditches by the sea neere vnto Venice.

¶ The Time.

It flourisheth in Iune, Iuly, and August.

¶ The Names.

The Grecians call it *tribulus*: the Latins, *Tribulus aquaticus*, and *aquaticus*, and *Tribulus lacustris*: the Apothecaries, *Tribulus marinus*: in High Dutch, *wasser musz*: the Brabanders, *water noten*: and of the likenesse of yron nailles, *Nieckijfers*:

the

the French men, *Macres*: in English it is named water Caltrops, Saligot, and Water-nuts: most do call the fruit of this Caltrops, *Castanea aquatiles*, or water Chef-nuts.

¶ *The Temperature.*

Water Caltrop is of a cold nature, it consisteth of a moist essence, which in this is more watery than in the land Caltrops, wherein an earthie cold is predominant, as *Galen* saith.

¶ *The Vertues.*

The herbe vsed in manner of a pultis, as *Dioscorides* teacheth, is good against all inflammations A or hot swellings: boiled with honie and water, it perfectly healeth cankers in the mouth, sore gums, and the Almonds of the throat.

The Thracians, saith *Plinie*, that dwell in Strymona, do fatten their horses with the leaues of Sa- B ligot, and they themselves do feed of the kernels, making very sweet bread thereof, which bindeth the belly.

The green nuts or fruit of *Tribulus aquaticus*, or Saligot, being drunke in wine, is good for them C which are troubled with the stone and grauell.

The same drunke in like manner, or laied outwardly to the place, helpeth those that are bitten D with any venomous beast, and resisteth all venome and poison.

The leaues of Saligot be giuen against all inflammations and vlcers of the mouth, the putrifa- E ction and corruption of the iawes, and against the Kings euill.

A pouder made of the nuts is giuen to such as pisse bloud, and are troubled with grauell, and F it doth bind the belly very much.

‡ The two lesser water Caltrops here described are in my opinion much agreeable in temper G to the great one, and are much fitter *Succidanea* for it then Aron, which some in the composition of *Vnguentum Agrippa* haue appointed for it. ‡

CHAP. 299. Of water Sengreene, or fresh water Soldier.

Militaris Aizoides.
Fresh water Soldier.

¶ *The Description.*

Fresh water Soldier or water Housleeke, hath leaues like those of the herbe Aloe, or *Semper-vivum*, but shorter and lesser, set round about the edges with certaine stiffe and short prickles: amongst which commeth forth diuers cases or huskes, verie like vnto crabbes clawes: out of which when they open grow white floures, consisting of three leaues, altogether like those of Frogs-bit, hauing in the middle little yellowish threds: in stead of roots there be long strings, round, white, verie like to great Harp-strings, or to long wormes, which falling downe from a short head that brought forth the leaues, go to the bottom of the water, and yet be they seldome there fastened: there also grow from the same other strings aslope, by which the plant is multiplied after the manner of Frogs-bit.

¶ *The Place.*

‡ I found this growing plentifully in the ditches about Rotsey a smal village in Holder- nesse. And my friend Mr. *William Broad* obserued it in the Fennes in Lincolne-shire. ‡ The leaues and floures grow vpon the top of the water, and the roots are sent downe through the water to the mud.

¶ *The Time.*

It floures in Iune, and sometimes in August.

¶ The Names.

It may be called *Sedum aquatile*, or water Sengreen, that is to say, of the likenesse of herbe Aloe, which is also called in Latine *Sedum*: of some, *Cancris chela*, or *Cancris forficula*: in English, VVater Housleeke, Knights Pondwoort, and of some, Knights water Sengreen, fresh water Soldier, or wading Pondweed: it seemeth to be *Stratiotes aquatilis*, or *Stratiotes potamios*, or Knights water Woundwoort, which may also be named in Latine *Militaris aquatica*, and *Militaris Aizoides*, or Soldiers Yarrow, for it groweth in the water, and floteth vpon it, and if those strings which it sendeth to the bottome of the water be no-roots, it also liueth without roots.

¶ The Temperature.

This herbe is of a cooling nature and temperament.

¶ The Vertues.

A This Housleeke staieth the blood which commeth from the kidneies, it keepeth green wounds from being inflamed, and it is good against S. Antonies fire and hot swellings, being applied vnto them: and is equall in the vertues aforesaid with the former.

CHAP. 300. Of Water Yarrow, and water Gillofloure.

1 *Viola palustris*.
Water Violet.

‡ *Viola Palustris tenuifolia*.
The smaller leaved water violet.

¶ The Description.

1 **W**ater Violet hath long and great iagged leaues, very finely cut or rent like Yarrow, but smaller: among which come vp small stalkes a cubit and a halfe high, bearing at the top small white floures like vnto stocke Gillofloures, with some yellownes in the middle. The roots are long and small like blacke threds, and at the end whereby they are fastened to the ground they are white, and shining like Chrystall.

‡ There is another varietie of this plant, which differs from it only in that the leaues are much smaller, as you may see them exprest in the figure. ‡

2 Water Milfoile, or water Yarrow hath long and large leaues deeply cut with many diuisions like Fennell, but finelier iagged, swimming vpon the water. The root is single, long, and round, which brings vp a right straight and slender stalke, set in sundry places with the like leaues, but smaller. The floures grow at the top of the stalke tuft fashion, and like vnto the land Yarrow.

3 This water Milfoile differeth from all the kindes aforesaid, hauing a root in the bottom of the water, made of many hairy strings, which yeeldeth vp a naked slender stalke within the water, and the rest of the stalke which floteth vpon the water diuideth it selfe into sundry other branches and wings, which are bedasht with fine small iagged leaues like vnto Cammomill, or rather resembling hairy tassels or fringe, than leaues. From the bosomes whereof come forth small and tender branches, euery branch bearing one floure like vnto water Crow-foot, white of colour, with a little yellow in the midst: the whole plant resembleth water Crow-foot in all things saue in the broad leaues.

† 4 There is another kinde of water violet very like the former, sauing that his leaues are much longer, somewhat resembling the leaues of Fennell, fashioned like vnto wings, and the floures are somewhat smaller, yet white, with yellowesse in their middles, and shaped like those of the last described. And the seed also growes like vnto that of the Water *Ranunculus*, last described.

5 There is also another kinde of water Milfoile, which hath leaues very like vnto water Violet, smaller, and not so many in number: the stalke is small and tender, bearing yellow gaping floures fashioned like a hood or the small Snapdragon, which caused *Pena* to put vnto his name this additament *Galericulatum*, that is, hooded. The roots are small and threddy, with some few knobs hanging thereat like the sounds of fish.

2 *Milfolium aquaticum*.
Water Yarrow.

3 *Millefolium, sine maratriphyllon, flore & semine*
Ranunculi aquatici, Hepatica facie.
Crow-foot, or water Milfoile.

† 6 To these may we adde a small water Milfoile, set forth by *Clusius*. It hath round Greene stalkes set with many ioynts, whereout come at their lower ends many hairy fibres, whereby it taketh hold of the mud: the tops of these stems stand some handfull aboue the water, and at each ioynt stand five long finely winged leaues, very Greene, and some inch long; which wax lesse and lesse,

lesse, as they stand higher or neerer the top of the stalke : and at each of these leaues at out the top of the stem growes one small white floure consisting of six little leaues ioyned together, and not opening themselves : and these at length turne into little knobs, with foure little pointals standing out of them. *Clusius* calls this *Myriophyllum aquaticum minus*. ‡

‡ 4 *Millefolium tenuifolium*.
Fennell leaved water Milfoile.

‡ 5 *Millefolium palustre galericulatum*.
Hooded water Milfoile.

¶ The Place.

They be found in lakes and standing waters, or in waters that run slowly : I haue not found such plenty of it in any one place, as in the water ditches adioyning to Saint George his field neere London.

¶ The Time.

They floure for the most part in May and Iune.

¶ The Names.

The first is called in Dutch water *Uolerian*, that is to say, *Viola aquatilis* : in English, Water Gillofloure, or water Violet : in French, *Gyrosflees d'eau* : *Matthiolus* makes this to be also *Myriophylli* species, or a kinde of Yarrow, although it doth not agree with the description thereof, for neither hath it one stalke onely, nor one single root, as *Myriophyllum* or Yarrow is described to haue ; for the roots are full of strings, and it bringeth forth many stalkes.

The second is called in Greeke *Μυριόφυλλον* : in Latine, *Millefolium*, and *Myriophyllum*, and also *Su-percilium Veneris* : in shops it is vnkowne. This Yarrow differeth from that of the land : the rest are sufficiently spoken of in their titles.

¶ The Nature and Vertues.

- A Water Yarrow, as *Dioscorides* saith, is of a dry facultie ; and by reason that it taketh away hot inflammations and swellings, it seemeth to be of a cold nature ; for *Dioscorides* affirmeth, that water Yarrow is a remedie against inflammations in greene wounds, if with vineger it be applied greene or dry : and it is giuen inwardly with vineger and salt, to those that haue fallen from a high place.
- B Water Gillofloure or water Violet is thought to be cold and dry, yet hath it no vse in physicke at all.

CHAP. 301. Of Ducks meate.

Lens palustris.
Ducks meate.

¶ The Description.

DVckes meate is as it were a certaine Greene mosse, with very little round leaues of the bignesse of Lentils: out of the midst whereof on the nether side grow downe very fine threds like haire, which are to them in stead of roots: it hath neither stalke, floure, nor fruit.

¶ The Place.

It is found in pounds, lakes, city ditches, and in other standing waters euery where.

¶ The Time.

The time of Ducks meate is knowne to all.

¶ The Names.

Duckes meate is called in Latine *Lens lacustris*, *Lens aquatilis*, and *Lens palustris*: of the Apothecaries it is named *Aqua Lenticula*: in high-Dutch, *Heerlinsen*: in low-Dutch, *Waterlinsen*, and more vsually *Enden gruen*, that is to say, *Anatum herba*, Ducks herbe, because Ducks doe feed thereon; whereupon also in English it is called Ducks meate: some terme it after the Greeke water Lentils, and of others it is named Graines. The Italians call it *Lent di palude*: in French, *Lentille d'eau*: in Spanish, *Lenteas de agua*.

¶ The Temperature.

Galen sheweth that it is cold and moist after a sort in the second degree.

¶ The Vertues.

Dioscorides saith that it is a remedie against all manner of inflammations, Saint Anthonies fire,

and hot Agues, if they be either applied alone, or else vsed with parched barley meale. It also knitteth ruptures in young children.

Ducks meate mingled with fine wheaten floure and applied, preuaileth much against hot swellings, as Phlegmons, Erisipelas, and the paines of the ioynts.

The same doth helpe the fundament fallen downe in yong children.

CHAP. 302. Of Water Crow-foot.

Ranunculus aquatilis.
Water Crow-foot.

¶ The Description.

1 **W**ater Crow-foot hath slender branches trailing far abroad, whereupon grow leaues vnder the water most finely cut and iagged like those of Cammomill. Those above the water are somewhat round, indented about the edges, in forme not vnlike the smal tender leaues of the mallow, but lesser: among which do grow the floures, small, and white of colour, made of fine little leaues, with some yellownesse in the middle like the floures of the Straw-berry, and of a sweet smell: after which there come round rough and prickly knaps like those of the field Crow-foot. The roots be very small hairy strings.

† There is sometimes to be found a varietie of this, with the leaues lesse, and diuided into three parts after the manner of an Iuy leafe; and the floures are also much lesser, but white of colour, with a yellow bottome. I question whether this be not the *Ranunculus hederaceus* Dalechampi, pag. 1031. of the *hist. Lugd.* †

2 There is another plant growing in the water, of smal moment, yet not amisse to be remembred, called *Hederula aquatica*, or water Iuie: the which is very rare to finde; neuerthelesse I found it once in a ditch by Bermondsey house neere to London, and neuer elsewhere: it hath small threddy strings in stead of roots and stalkes, rising from the bottome of the water to the top; wherunto are fastned small leaues swimming or floating vpon the water, triangled or three cornered like to those of barren Iuie, or rather noble Liuerwort: barren of floures and seeds.

2 *Hederula aquatica.*
Water Iuie.

† 3 *Stellaria aquatica.*
Water Starwort.

3 There is likewise another herbe of small reckoning that floteth vpon the water, called *Stellaria aquatica*, or water Star-wort, which hath many small grassie stems like threds, comming from the bottome of the water vnto the vpper face of the same: whereupon do grow smal double floures of a greenish or herby colour. † I take this *Stellaria* to be nothing else but a water Chickweed, which growes almost in euery ditch, with two long narrow leaues at each ioynt, and halfe a dozen or more lying close together at the top of the water, in fashion of a starre: it may be seene in this shape in the end of Aprill and beginning of May: I haue not yet obserued either the floure or seed thereof. †

¶ The Place.

Water Crow-foot groweth by ditches and shallow Springs, and in other moist and plashie places.

¶ The Time.

It floureth in Aprill and May, and sometimes in Iune.

¶ The Names.

Water Crow-foot is called in Latine *Ranunculus aquatilis*, and *Polyanthemum aquatile*: in English, Water Crow-foot, and white water Crow-foot: most Apothecaries and Herbarists do erroneously name it *Hepatica aquatica*, and *Hepatica alba*; and with greater error they mix it in medicines in stead of *Hepatica alba*, or grasse of Parnassus. ‡ I know none that commit this great error here mentioned, neither haue I knowne either the one or the other euer vsed or appointed in medicine with vs in England, though *Dodoneus* (from whom our Author had this and most else) doe blame his countrey men for this mistake and error. ‡

¶ The Temperature and Vertues.

Water Crow-foot is hot, and like to common Crow-foot.

CHAP. 303. Of Dragons.

I *Dracontium maius*.
Great Dragons.† *Dracontium minus*.
Small Dragons.

¶ The Description.

THe great Dragon riseth vp with a straight stalke a cubit and a halfe high or higher, thicke, round, smooth, sprinkled with spots of diuers colours, like those of the adder or snake: the leaues are great and wide, consisting of seuen or more ioyned together in order, euery one of which is long and narrow, much like to the leaues of Docke, smooth and flipperie: out of the top of the stalke groweth a long hose or huske greater than that of the Cuckow pintle, of a greenish colour without, and within crimson, with his pestell which is blackish, long, thicke, and pointed like a horne; the skin or filme whereof when the seed waxeth big, being stretched

1 *Dracunculus aquaticus.*
Water Dragons.

stretched or broken asunder, there appeareth the fruit, like to a bunch or cluster of grapes: the berries whereof at the first be Greene, afterwards red and full of iuyce, in which is contained seed that is somewhat hard: The root continueth fresh, thicke, like to a knob, white, couered with a thin pilling, oftentimes of the bignesse of a meane apple, full of white little threds appendant thereunto.

2 The lesser Dragon is like *Aron* or wake Robin, in leaues, hose, or huske, pestell, and berries, yet are not the leaues sprinkled with blacke but with whitish spots, which perish not so soone as those of wake-Robin, but endure together with the berries euen vntil winter: these berries also be not of a deepe red, but of a colour enclining to Saffron. The root is not vnlike to the Cuckow-pint, hauing the forme of a bulbe, full of strings, with diuers rude shapes of new plants, whereby it greatly encreaseth.

‡ The figure which our Authour heere gaue by the title of *Dracuntium minus*, was no other than of *Aron*, which is described in the first place of the next chapter: neither is the description of any other plant, than of that sort thereof which hath leaues spotted either with white or blacke spots, though our Authour say onely with white. I haue giuen you

Clusius his figure of *Arum Byzantinum*, in stead of that which our Author gaue. ‡

3 The root of water Dragon is not round like a bulbe, but very long, creeping, and ioynted, and of meane bignesse; out of the ioynts whereof arise the stalkes of the leaues, which are round, smooth, and spongie within, and there grow downwards certaine white and slender strings. The fruit springs forth at the top vpon a short stalke, together with one of the leaues, being at the beginning couered with little white threds, which are in stead of the floures: after that it groweth into a bunch or cluster, at the first Greene, and when it is ripe, red, lesser than that of Cuckow-pint, but not lesse biting: the leaues are broad, greenish, glib, and smooth, in fashion like those of Iuy, yet lesser than those of Cuckow-pint; and that thing whereunto the clustered fruit growes is also lesser, and in that part which is towards the fruit (that is to say the vpper part) is white.

4 The great Dragon of *Matthiolus* his description is a stranger not onely in England, but elsewhere for any thing that we can learne: my selfe haue diligently enquired of most strangers skilfull in plants, that haue resorted vnto me for conference sake, but no man can giue me any certaintie thereof; and therefore I thinke it amisse to giue you his figure or any description, for that I take it for a feigned picture.

¶ The Place.

The greater and the lesser Dragons are planted in gardens. The water Dragons grow in watery and marish places, for the most part in fenny and standing waters.

¶ The Time.

The berries of these plants are ripe in Autumne.

¶ The Names.

The Dragon is called in Greeke *Δρακύνιον*: in Latine, *Dracunculus*. The greater is named *Serpentaria maior*: of some, *Bisaria*, and *Colubrina*: *Cordus* calleth it *Dracunculus Polyphyllus*, and *Luph Crispum*: in high-Dutch, *Schlangenkraut*: in low-Dutch, *Speerwoxtele*: in French, *Serpentaire*: in Italian, *Dragontea*: in Spanish, *Taragontia*: in English, Dragons, and Dragon-wort. *Apuleius* calleth Dragon *Dracontea*, and setteth downe many strange names thereof, which whether they agree with the greater or the lesser, or both of them, he doth not expound; as *Pythionion*, *Anchomanes*, *Sauchromaton*, *Therion*, *Schaenos*, *Dorcadion*, *Typhonion*, *Therionphonon*, and *Eminion*. *Athenaus* sheweth, that Dragon is called *Aronia*, because it is like to *Aron*.

¶ The Temperature.

Dragon, as *Galen* saith, hath a certaine likenesse with *Aron* or wake-Robin, both in leaues, and also in root, yet more biting and more bitter than it, and therefore hotter, and of thinner parts: it is also

also something binding, which by reason that it is adjoined with the two former qualities, that is to say, biting and bitter, is made in like manner a singular medicine of very great efficacy.

¶ The Vertues.

The root of Dragons doth cleanse and scoure all the entrailes, making thinne, especially thicke and tough humours; and it is a singular remedy for vlcers that are hard to be cured, named in Greeke *καυηδον*. A

It scoureth and clenfeth mightely, aswell such things as haue need of scouring, as also white and blacke morpew, being tempered with vineger. B

The leaues also by reason that they are of like qualitie are good for vlcers and greene wounds: and the lesse dry they are, the fitter they be to heale; for the dryer ones are of a more sharpe or biting quality than is conuenient for wounds.

The fruit is of greater operation than either the leaues or the root: and therefore it is thought to be of force to consume and take away cankers and proud flesh growing in the nostrils, called in Greeke *Polypus*: also the juice doth cleanse away webs and spots in the eies. C

Furthermore, *Dioscorides* writeth, that it is reported that they who haue rubbed the leaues or root vpon their hands, are not bitten of the viper. D

Pliny saith, that serpents will not come neere vnto him that beareth Dragons about him, and these things are read concerning both the Dragons, in the two chapters of *Dioscorides*. E

Galen also hath made mention of Dragon in his booke of the faculties of nourishments, where he saith, that the root of Dragon being twice or thrice sod, to the end it may lose all his acrimony or sharpenesse, is sometimes giuen as Aron, or wake-Robin is, when it is needfull to expell the more forceable thicke and clammy humours that are troublesome to the chest and lungs.

And *Dioscorides* writeth, that the root of the lesser Dragon being both sodde and rost with honie, or taken of it selfe in meate, causeth the humours which sticke fast in the chest to be easily voided. G

The juice of the garden Dragons, as saith *Dioscorides*, being dropped into the eies, doth cleanse them, and greatly amend the dimnesse of the sight. H

The distilled water hath vertue against the pestilence or any pestilentiall feuer or poison, being drunke bloud-warme with the best treacle or mithridate. I

The smell of the floures is hurtfull to women newly conceiued with child. K

CHAP. 304. Of Cockow pint, or wake-Robin.

¶ The Description.

Arum or Cockow pint hath great, large, smooth, shining, sharpe pointed leaues, bespotted here and there with blackish spots, mixed with some blewnesse: among which riseth vp a stalke nine inches long, bespeckled in many places with certaine purple spots. It beareth also a certaine long hose or hood, in proportion like the eare of an hare: in the middle of which hood commeth forth a pestle or clapper of a darke murrie or pale purple colour: which being past, there succeedeth in place thereof a bunch or cluster of berries in manner of a bunch of grapes, greene at the first, but after they be ripe of a yellowish red like corall, and full of pith, with some threddy additaments annexed thereto.

There is in *Aegypt* a kinde of *Arum* which also is to be seene in *Africa*, and in certaine places of *Lusitania*, about riuers and floods, which differeth from that which groweth in *England* and other parts of *Europe*. This plant is large and great, and the leaues thereof are greater than those of the water Lillie: the root is thicke and tuberous, and toward the lower end thicker and broader, and may be eaten. It is reported to be without floure and seed, but the increase that it hath is by the fibres which runne and spread from the roots. This plant hath also pestells and clusters, of berryes as the common Aron, but somewhat different, the leaues are not cut into the stalke, but joined before the setting thereto: the root also is very large. Those that desire to see more of this plant, and the question which some haue moued, whether this be the *Colocasia*, or *Faba Aegyptia* of the Antients? let them haue recourse to the first chapter of *Fabius Columna* his *Minus cognitarum stripium pars altera*, and there they shall finde satisfaction. ‡

1 *Arum vulgare.*
Cockow pint.

2 *Arum Egyptiacum.*
Egyptian Cockow pint.

¶ *The Place.*

Cockow pint groweth in woods neere vnto ditches vnder hedges, euery where in shadowie places.

¶ *The Time.*

The leaues appeare presently after winter: the pestell sheweth it selfe out of his huske or sheath in Iune, whilest the leaues are in withering: and when they are gone, the bunch or cluster of berries becommeth ripe, which is in Iuly and August.

¶ *The Names.*

There groweth in Ægypt a kinde of Aron or Cuckow pint which is found also in Africa, and likewise in certaine places of Portingale neere vnto riuers and streames, that differeth from those of our countries growing, which the people of Castile call *Manta de nuestra senora*: most would haue it to be called *Colocasia*, but *Dioscorides* saith that *Colocasia* is the root of *Faba Ægyptia*, or the Beane of Egypt. ‡ *Fabius Columna* (in the place formerly alledged) prooues this not to be the true *Colocasia*, and yet *Prosper Alpinus* since in his second booke *de plantis exoticis*, cap. 17. and 18. labours to proue the contrary: let the curious haue recourse to these, for it is too tedious for me in this place to insist vpon it, being so large a point of controuersie, which hath so much troubled all the late writers. ‡

The common Cuckow pint is called in Latine, *Arum*: in Greeke, *ἄρου*: in shops, *Iarus*, and *Barba-Aron*: of others, *Pes vituli*: of the Syrians, *Lupha*: of the men of Cyprus, *Colocasia*, as we finde among the bastard names. *Pliny* in his 24. booke, 16. chapter, doth witnesse, that there is great difference betweene *Aron* and *Dracontium*, although there hath been some controuersie about the same among the old writers, affirming them to be all one: in high Dutch it is called, *Paffen pint*: in Italian, *Gigora*: in Spanish, *Taro*: in low Dutch, *Calfsuoet*: in French, *Pied d'veau*: in English, Cuckow pint, and Cuckow pintle, wake-Robin, Priests pintle, Aron; Calfes foot, and Rampe; and of some Strachwoort.

¶ *The Temperature.*

The faculties of Cuckow pint doe differ according to the varietie of countries: for the root hereof, as *Galen* in his booke of the faculties of nourishments doth affirme, is sharper and more biting in some countries than in others, almost as much as Dragons, contrariwise in Cyren a city in Africke, it is generally in all places hot and dry, at the least in the first degree.

¶ *The*

¶ The Vertues.

If any man would haue thicke and tough humours which are gathered in the chest and lungs to be clenfed and voided out by coughing, then that Cuckowpint is best that biteth most.

It is eaten being sodden in two or three waters, and fresh put to, whereby it may lose his acrimonie; and being so eaten, they cut thicke humors meanelly, but Dragons is better for the same purpose.

Dioscorides sheweth, that the leaues also are preferred to be eaten, and that they must be eaten after they be dried and boyled; and writeth also, that the root hath a peculiar vertue against the gout, being laid on stamped with Cowes dung.

Beares after they haue lien in their dens forty dayes without any manner of sustenance, but what they get with licking and sucking their owne feet, do as soone as they come forth eate the herbe Cuckowpint, through the windie nature whereof the hungry gut is opened and made fit againe to receiue sustenance: for by abstaining from food so long a time, the gut is shrunke or drawne so close together, that in a manner it is quite shut vp, as Aristotle, *Ælianus*, *Plutarch*, *Pliny*, and others do write.

The most pure and white starch is made of the roots of Cuckowpint; but most hurtfull to the hands of the Laundresse that hath the handling of it; for it choppeth, blistereth, and maketh the hands rough and rugged, and withall smarting.

CHAP. 305. Of Friers Cowle, or hooded Cuckowpint.

1 *Arisarum latifolium.*

Broad leaued Friers Cowle.

2 *Arisarum angustifolium.*

Narrow leaued Friers Cowle.

¶ The Description.

1 Broad leaued Friers hood hath a leafe like luy, broad and sharpe pointed, but far lesse, approaching neere to the forme of those of Cuckowpint: the stalke thereof is small and slender: the huske or hose is little; the pestel small, and of a blacke purplish colour; the cluster when it is ripe is red; the kernels small; the root white, hauing the forme of Aron or Cuckowpint, but lesser, whereof doubtlesse it is a kinde.

Aaaa 2

2 The

2 The second Friers hood hath many leaues, long and narrow, smooth and glittering : The huske or hofe is narrow and long ; the pestell that commeth forth of it is slender, in forme like a great earth worme, of a blackish purple colour, as hath also the inside of the hofe, vpon which, hard to the ground, and sometimes a little within the ground, groweth a certaine bunch or cluster of berries, greene at the first, and afterwards red : the root is round and white like the others.

¶ The Place.

These plants are strangers in England, but common in Italy, and especially in Tuscan about Rome, and in Dalmatia, as *Aloisius Anguillara* witnesseth : notwithstanding I haue them in my Garden.

¶ The Time.

The floures and fruit of these come to perfection with those of Cuckowpint and Dragons.

¶ The Names.

Friers hood is called of *Dioscorides*, *Aetion* : in Latine, *Arisarum* : but *Pliny* calleth it *Aris*, or *Aris* ; for in his twenty fourth booke, cap. 16. he saith, That *Aris* which groweth in Egypt is like Aron or Cuckowpint : it may be called in English after the Latine name *Arisarum* ; but in my opinion it may be more fitly called Friers hood, or Friers cowle, to which the floures seeme to be like ; whereupon the Spaniards name it *Frailillos*, as *Daleschamps* noteth.

¶ The Temperature.

Friers-Cowle is like in power and facultie to the Cuckow-pint, yet is it more biting, as *Galen* saith.

¶ The Vertues.

A There is no great vse of these plants in physicke ; but it is reported that they stay running or eating sores or vlcers : and likewise that there is made of the roots certaine compositions called in Greeke *Collyria*, good against fistula's : and being put into the secret part of any liuing thing, it roteth the same, as *Dioscorides* writeth.

† That which was formerly figured and described in the third place, vnder the title of *Arisarum latifolium* *Matthioli*, was the same with that described by the name of *Dracontium maritimum*, in the precedent chapter, and therefore here omitted.

CHAP. 306. Of *Astrabacca*.

1 *Afarum*.
Afarabacca.

2 *Afarina Matthioli*.
Italian *Afarabacca*.

¶ The Description.

THe leaues of Asarabacca are smooth, of a deepe Greene colour, rounder, broader, and tenderer than those of Iuy, and not cornered at all, not vnlike to those of Sow-bread: the floures lie close to the roots, hid vnder the leaues, standing vpon slender foot-stalkes, of an ill fauoured purple colour, like to the floures and husks of Henbane, but lesse, wherein are contained small seeds, cornered, and somewhat rough: the roots are many, small and slender, growing aslope vnder the vpper crust of the earth, one folded within another, of an vnpleasant taste, but of a most sweet and pleasing smell, hauing withall a kinde of biting qualitie.

2 This strange kinde of Asarabacca, which *Matthiolus* hath set forth creeping on the ground, in manner of our common Astrabacca, hath leaues somewhat rounder and rougher, slightly indented about the edges, and set vpon long slender foot-stalkes: the floures grow hard vnto the ground like vnto those of Cammomill, but much lesse, of a mealy or dusty colour, and not without smell. The roots are long and slender, creeping vnder the vpper crust of the earth, of a sharpe taste, and bitter withall. † This *Asarina* of *Matthiolus*, *Clusius* (whose opinion I here follow) hath iudged to be the *Tussilago Alpina* 2. of his description; wherefore I giue you his figure in stead of that of our Author, which had the floures exprest, which this wants. †

¶ The Place.

It delighteth to grow in shadowie places, and is very common in most gardens.

¶ The Time.

The herbe is alwaies Greene; yet doth it in the Spring bring forth new leaues and floures.

¶ The Names.

It is called in Greeke *ἄσarov*, *Asarum*: in Latine, *Nardus rustica*: and of diuers, *Perpensa*: *Perpensa* is also *Baccharis* in *Pliny*, lib. 21. cap. 21. *Macer* saith, That *Asarum* is called *Vulago*, in these words:

Est Asaron Græcè, Vulgago dicta Latine.

This herbe, *Asaron* do the Grecians name;
Whereas the Latines *Vulago* clepe the same.

It is found also amongst the bastard names, that it was called of the great learned Philosophers *Αἷμα Μαρτιος*: that is, *Martis sanguis*, or the blood of Mars: and of the French men *Baccar*; and thereupon it seemeth that the word *Asarabacca* came, which the Apothecaries vse, and likewise the common people: but there is another *Baccharis* differing from *Asarum*; yet notwithstanding *Cræteus* doth also call *Baccharis*, *Asarum*.

This confusion of both the names hath been the cause, that most could not sufficiently expound themselves concerning *Asarum* and *Baccharis*; and that many things haue beene written amisse in many copies of *Dioscorides*, in the chapter of *Asarum*: for when it is set downe in the Greek copies a sweet smelling garden herbe, it belongeth not to the description of this *Asarum*, but to that of *Baccharis*: for *Asarum* (as *Pliny* saith) is so called, because it is not put into garlands: and so by that meanes it came to passe, that oftentimes the descriptions of the old Writers were found corrupted and confused: which thing, as it is in this place manifest, so oftentimes it cannot so easily be marked in other places. Furthermore, *Asarum* is called in French *Cabaret*: in high-Dutch, *Hazeltwurtz*: in low-Dutch, *Hansdozen*: in English, *Asarabacca*, *Fole-foot*, and *Hazel-wort*.

¶ The Temperature.

The leaues of Asarabacca are hot and dry, with a purging qualitie adioyned thereunto, yet not without a certaine kinde of astringion or binding. The roots are also hot and dry, yet more than the leaues; they are of thin and subtile parts: they procure vrine, bring downe the desired sicknes, and are like in facultie, as *Galen* saith, to the roots of *Acorus*, but yet more forceable; and the roots of *Acorus* are also of a thinne essence, heating, attenuating, drying, and prouoking vrine, as he affirmeth: which things are happily performed by taking the roots of Asarabacca, either by themselves, or mixed with other things.

¶ The Vertues.

The leaues draw forth by vomit, thicke phlegmaticke and cholericke humours, and withall A moue the belly; and in this they are more forceable and of greater effect than the roots themselves.

They are thought to keepe in hard swelling cankers that they encrease not, or come to exulceration, or creeping any farther, if they be outwardly applied vpon the same. B

The roots are good against the stoppings of the liuer, gall, and spleene, against wens and hard swellings, and agues of long continuance: but being taken in the greater quantitie, they purge flegme and choler not much lesse than the leaues (though *Galen* say no) by vomit especially, and also by siege. C

- D** One dram of the poudre of the roots giuen to drinke in ale or wine, grossely beaten, prouoketh vomit for the purposes aforesaid; but being beaten into fine poudre, and so giuen, it purgeth very little by vomit, but worketh most by procuring much vrine; therefore the grosser the poudre is, so much the better.
- E** But if the roots be infused or boyled, then must two, three, or foure drams be put to the infusion, and of the leaues eight or nine be sufficient: the iuyce of which stamped with some liquid thing, is to be giuen. The roots may be steeped in wine, but more effectually in whay or lioned water, as *Mesues* teacheth.
- F** The same is good for them that are tormented with the Sciatica or gout in the huckle bones, for those that haue the drop sic, and for such also as are vexed with a quartaine ague, who are cured and made whole by vomiting.

CHAP. 307. Of Sea Binde-weed.

1 *Soldanella marina.*
Sea Binde-weed.

2 *Soldanella Alpina maior.*
Mountaine Binde-weed.

¶ The Description.

1 *Soldanella* or Sea Binde-weed hath many small branches, somewhat red, trailing vpon the ground, beset with small and round leaues, not much vnlike *Asarabacca*, or the leaues of *Aristolochia*, but smaller; betwixt which leaues and the stalkes come forth floures formed like a bell, of a bright red incarnate colour, in euery respect answering the small Binde-weed, whereof it is a kinde, albeit I haue here placed the same, for the reasons rendred in my Proeme. The seed is blacke, and groweth in round huskes: the root is long and small, thrusting it selfe far abroad, and into the earth like the other Binde-weeds.

2 *Soldanella* or mountaine Binde-weed hath many round leaues spred vpon the ground, not much vnlike the former, but rounder, and more full of veines, greener, of a bitter taste like sea Binde-weed: among which commeth forth a small and tender stalke a handfull high, bearing at the top little floures like the small Bell-floure, of a sky colour. The root is small and threddy.

3 There

‡ 3 *Soldanella Alpina minor.*
Small Mountaine Bindweed.

‡ 3 There is of this kinde another hauing all the parts smaller, and the leaues redder and rounder: the floures also blew, and composed of one leafe diuided into fve parts, and succeeded by a longish cod, round and sharp pointed. ‡

¶ The Place.

The first grows plentifully by the Sea shore in most places of England, especially neere to Lee in Essex, at Mersey in the same countie, in most places of the Isle of Thanet, and Shepey, and in many places along the Northern coast.

The second groweth vpon the mountains of Germanie, and the Alpes; it groweth vpon the mountains of VVales, not far from Cowmers Meare in North-Wales.

¶ The Time.

These herbes do floure in Iune, and are gathered in August to be kept for medicine.

¶ The Names.

The first called *Soldanella* is of the Apothecaries and the Antients called *Marina Brassica*, that is to say, Sea Colewoort: but what reason

hath moued them so to doe I cannot conceiue, vnlesse it be penurie and scarfitie of names, and because they know not otherwise how to terme it: of this I am sure, that this plant and *Brassica* are no more like than things which are most vnlike; for *Brassica Marina* is the Sea Colewoort, which doth much resemble the garden Cabbage or Cole, both in shape and in nature, as I haue in his due place expressed. A great fault and ouersight therefore it hath been of the old writers and their successors which haue continued the custome of this error, not taking the paines to distinguish a Bindweed from a Colewoort. But to auoid controuersies, the truth is, as I haue before shewed, that this *Soldanella* is a Bindweed, and cannot be esteemed for a *Brassica*, that is a Colewoort. The later Herbarists call it *Soldana*, and *Soldanella*: in Dutch, *Zeewind*, that is to say, *Convolvulus Marinus*: of *Dioscorides* *πράσινη δαλματική*, (i) *Brassica Marina*: in English, Sea VVithwinde, Sea Bindweed, Sea-bels, Sea-coale, of some, Sea Fole-foot, and Scottish Scuruie-grasse.

The second is called *Soldanella montana*: in English, Mountaine Bindweed.

¶ The Nature.

Sea Bindweed is hot and drie in the second degree: the second is bitter and very astringent.

¶ The Vertues.

Soldanella purgeth downe mightily all kinde of watrish humours, and openeth the stoppings of the liuer, and is giuen with great profit against the dropsie: but it must be boiled with the broth of some fat meat or flesh, and the broth drunke, or else the herbe taken in pouder worketh the like effect.

Soldanella hurteth the stomack, and troubleth the weake and delicate bodies which doe receiue it in pouder, wherefore aduice must be taken to mix the said pouder with Annise seeds, Cinnamon, ginger, and sugar, which spices do correct his malignitie.

Practitioners about Aufspurge and Rauispurge (cities of Germanie) do greatly boast that they haue done wonders with this herbe *Soldanella montana*; saying, that the leaues taken and emplastréd vpon the nauell and somewhat lower, draw forth water from their bellies that are hydroptike, that is, troubled with water or the dropsie: this effect it worketh in other parts without heating.

It doth also wonderfully bring flesh in wounds, and healeth them.

Dioscorides witnesseth, that the whole herbe is an enemy to the stomacke, biting and extremely purging (both sodden, and taken with meat) and bringeth troublesome gripings thereunto, and doth oftentimes more hurt than good.

‡ My friend Mr. Goodyer hath told me, that in Hampshire at Chichester and thereabout they make vse of this for Scuruie-grasse, and that not without great error, as any that know the qualities may easily perceiue.

CHAP. 308. Of the Grasse of Parnassus.

† 1 *Gramen Parnassi.*
Grasse of Parnassus.† 2 *Gramen Parnassi flore duplici.*
Grasse of Parnassus with double floures.

¶ The Description.

1 **T**He Grasse of Parnassus hath small round leaues, very much differing from any kind of Grasse, much resembling the leaues of Iuie, or Asarabacca, but smaller, and not of so darke a colour: among these leaues spring vp small stalkes a foot high, bearing little white floures consisting of five round pointed leaues; which beeing false and past, there come vp round knops or heads, wherein is contained a reddish seed. The root is somewhat thicke, with many strings annexed thereto.

2 The second kinde of *Gramen Parnassi* doth answer the former in each respect, sauing that the leaues are somewhat larger, and the floures double, otherwise verie like.

¶ The Place.

The first groweth very plentifully in Lansdall and Crauen, in the North parts of England; at Doncaster, and in Thornton fields in the same countie: moreouer in the Moore neere to Linton, by Cambridge, at Hessel also in Suffolke, at a place named Drinkstone, in the meadow called Butchers mead. † M^r. *Goodyer* found it in the boggy ground below the red well of Wellingborough in Northampton shire: and M^r. *William Broad* obserued it to grow plentifully in the Castle fields of Berwicke vpon Tweed. †

The second is a stranger in England.

¶ The Time.

These herbes do floure in the end of Iuly, and their seed is ripe in the end of August.

¶ The Names.

Valerius Cordus hath among many that haue written of these herbes said something of them to good purpose, calling them by the name of *Hepatica alba* (whereof without controuersie they are kindes) in English, white Liuerwoort: although there is another plant called *Hepatica alba*, which for

for distinction sake I haue thought good to English, Noble white Liuerwoort.

The second may be called Noble white Liuerwoort with the double floure.

¶ The Nature.

The seed of Parnassus Grasse, or white Liuerwoort, is drie, and of subtile parts.

¶ The Vertues.

The decoction of the leaues of Parnassus Grasse drunken, doth drie and strengthen the feeble A
and moist stomacke, stoppeth the bellie, and taketh away the desire to vomite.

The same boiled in wine or water, and drunken, especially the seed thereof, prouoketh vrine, brea- B
keth the stone, and driueth it forth.

† The figure that was formerly in the first place of this Chapter was of *Vnifolium*, described before, cap. 90. p. 409. that which was in the second place belonged to the first description.

CHAP. 309. Of white Saxifrage, or Golden Saxifrage.

¶ The Description.

THe white Saxifrage hath round leaues spread vpon the ground, and somewhat jagged about the edges, not much vnlike the leaues of ground Iuie, but softer and smaller, and of a more faint yellowish Greene: among which riseth vp a round hairie stalke a cubit high, bearing at the top small white floures, almost like Stockgillo floures: the root is compact of a number of blacke strings, whereunto are fastened very many small reddish graines or round roots as bigge as pepper cornes, which are vsed in medicine, and are called *Semen Saxifraga alba*; that is, the seede of white Saxifrage, or Stone-breake, although (beside these foresaid round knobbes) it hath also small seed contained in little huskes, following his floure as other herbes haue.

1 *Saxifraga alba.*
White Saxifrage.

2 *Saxifraga aurea.*
Golden Saxifrage.

‡ 3 *Saxifraga alba petraea.*
White Rocke Saxifrage.

2 Golden Saxifrage hath round compassed leaues, bluntly indented about the borders like the former, among which rise vp stalkes a handfull high, at the top whereof grow two or three little leaues together: out of the middle of them spring small floures of a golden color, after which come little husks, wherein is contained the red seed, not vnlike the former: the roote is tender, creeping in the ground with long threds or haire.

‡ 3 *Pona* hath set forth this plant by the name of *Saxifraga alba petraea*, and therefore I haue placed it here; though I thinke I might more fitly haue ranked him with *Paronychia rutaceo folio* formerly described. It hath a small single root from which arise diuers fat longish leaues, somewhat hairy, and diuided into three parts: amongst those rises vp a round knottie stalke, roughish, and of a purplish colour, some halfe foot high, diuided into sundry branches, which carry white floures, consisting of five leaues apiece, with some yellowish threds in their middles: these falling, there remaines a cup containing a very small seed. It floures at the end of Iune in the shadowie places of the Alpes, whereas *Pona* first obserued it. ‡

¶ The Place.

The white Saxifrage groweth plentifully in sundrie places of England, and especially in a field on the left hand of the high way, as you goe from the place of execution called Saint

Thomas Waterings vnto Dedford by London. It groweth also in the great field by Islington called the Mantles: also in the greene places by the sea side at Lee in Essex, among the rushes, and in fundrie other places thereabout, and else where. ‡ It also growes in Saint Georges fields behinde Southwarke. ‡

The golden Saxifrage groweth in the moist and marish grounds about Bathe and Wels, also in the Moores by Boston and Wisbich in Lincolnshire: ‡ and Mr. George Bomles hath found it growing in diuers woods at Chiffelhurst in Kent: Mr. Goodyer also hath obserued it abundantly on the shadowie moist rockes by Mapledurham in Hampshire: and I haue found it in the like places in Yorkshire. ‡

¶ The Time.

The white Saxifrage floureth in May and Iune: the herbe with his floure are no more seen vntill the next year.

The golden Saxifrage floureth in March and Aprill.

¶ The Names.

The first is called in Latine *Saxifraga Alba*: in English, white Saxifrage, or white Stone-breake: The second is called Golden Saxifrage, or golden Stone-breake.

¶ The Nature.

The first of these, especially the root and seed thereof, is of a warme or hot complexion. Golden Saxifrage is of a cold nature, as the taste doth manifestly declare.

¶ The Vertues.

- A The root of white Saxifrage boiled in wine and drunken, prouoketh vrine, clenseth the kidneis and bladder, breaketh the stone, and driueth it forth, and is singular good against the strangurie, and all other griefes and imperfections in the reines.
- B The vertues of golden Saxifrage are yet vnto vs vnknowne, notwithstanding I am of this minde, that it is a singular wound herbe, equall with Sanicle.

CHAP. 310 Of Sow-bread.

¶ The Description.

THe first being the common kinde of Sowbread, called in shops *Panis porcinus*, and *Arthanita*, hath many Greene and round leaues like vnto A farabacca, sauing that the vpper part of the leaues are mixed here and there confusedly with white spots, and vnder the leaues next the ground of a purple colour: among which rise vp little stemmes like vnto the stalks of violets, bearing at the top small purple floures, which turne themselues backward (beeing full blowne) like a Turks cap, or Tulepan, of a small sent or saour, or none at all: which being past there succeed little round knops or heads which containe slender browne feedes: these knoppes

1 *Cyclamen orbiculato folio.*
Round Sowbread.

2 *Cyclamen folio Hederae.*
Iuie Sowbread.

3 *Cyclamen Vernum.* Spring Sowbread.

are wrapped after a few daies in the small stalkes, as thred about a bottome, where it remaineth so defended from the iniurie of Winter close vpon the ground, couered also with the Greene leaues aforesaid, by which meanes it is kept from the frost, euen from the time of his feeding, which is in September vntill Iune: at which time the leaues do fade away, the stalkes and seed remaining bare and naked, whereby it inioyeth the Sun (whereof it was long deprived) the sooner to bring them vnto maturitie: the root is round like a Turnep, blacke without and white within, with many small strings annexed thereto.

‡ 4 *Cyclamen Vernalium album*.

White floured Sowbread.

‡ 5 *An Cyclaminos altera, hederaceis folijs planta?*

3 The second kinde of Sowbread, hath broad leaues spread vpon the ground, sharpe pointed. somewhat indented about the edges, of a darke Greene colour, with some little lines or strakes of white on the vpper side, and of a darke reddish colour on that side next the ground: among which rise vp slender foot-stalks of two or three inches long: at the tops whereof stand such floures as the precedent, but of a sweeter smell, and more pleasant colour. The seed is also wrapped vp in the stalk for his further defence against the iniurie of winter. The root is somewhat greater, and of more vertue, as shall be declared.

3 There is a third kinde of Sowbread that hath round leaues without peaked corners, as the last before mentioned, yet somewhat snipt about the edges, and speckled with white about the brims of the leaues, and of a blackish colour in the middle: the floures are like to the rest, but of a deeper purple: the root also like, but smaller, and this commonly floures in the Spring.

‡ 4 This in leaues and roots is much like the last described, but the floures are smaller, snow white, and sweet smelling. There are diuers other varieties of these plants, which I thinke it not necessarie for me to insist vpon: wherefore I referre the curious to the Garden of floures set forth by Mr. John Parkinson, where they shall finde satisfaction. ‡

5 There is a plant which I haue set forth in this place that may very well be called into question, and his place also, considering that there hath been great contention about the same, and not fully determined on either part, which hath moued me to place him with those plants that most do resemble one another, both in shape and name: this plant hath Greene cornered leaues like to Iuie, long

long and small gaping floures like the small Snapdragon : more hath not been said of this plant, either of stalke or root, but is left vnto the consideration of the learned.

‡ The plant which our Author here would acquaint you with, is that which *Lobel* figures with this title which I here giue, and saith it was gathered amongst other plants on the hills of Italy, but in what part or place, or how growing he knew not; and he onely questions whether it may not be the *Cyclaminos altera* of *Dioscorides*, lib. 2. cap. 195. ‡

¶ The Place.

Sow-bread groweth plentifully about Artoies and Vermandois in France, and in the Forest of Arden, and in Brabant : but the second groweth plentifully in many places of Italie.

It is reported vnto mee by men of good credit, that *Cyclamen* or Sow-bread groweth vpon the mountaines of Wales; on the hills of Lincolnshire, and in Somersetshire by the house of a gentleman called Mr. *Hales*; vpon a Fox-borough also not far from Mr. *Bamfields*, neere to a towne called Hardington. The first two kinds do grow in my garden, where they prosper well. ‡ I cannot learne that this growes wilde in England. ‡

¶ The Time.

Sow-bread floureth in September when the plant is without leafe, which doth afterwards spring vp, continuing greene all the Winter, couering and keeping warme the seede vntill Midsommer next, at what time the seed is ripe as aforesaid. The third floureth in the spring; for which cause it was called *Cyclamen verum*: and so doth also the fourth.

¶ The Names.

Sow-bread is called in Greeke *μαρμαρις*: in Latine, *Tuber terra*, and *Terra rapum*: of *Marcellus*, *Orbicularis*: of *Apuleius*, *Palalia*, *Rapum Porcinum*, and *Terra malum*: in shops, *Cyclamen*, *Panis porcinus*, and *Arthanita*: in Italian, *Pan Porcino*: in Spanish, *Mazan de Puerto*: in High Dutch, *Schweinbröt*: in Low Dutch, *Wetckins broot*: in French, *Pain de Porceau*: in English, Sow-bread. *Pliny* calleth the colour of this floure in Latine, *Colossinus color*: in English, Murrey colour.

¶ The Nature.

Sow-bread is hot and drie in the third degree.

¶ The Vertues.

The root of Sow-bread dried into pouder and taken inwardly in the quantitie of a dram and a halfe, with mead or honied water, purgeth downward tough and grosse flegme, and other sharpe humours.

The same taken in wine as aforesaid, is very profitable against all poison, and the bitings of venomous beasts, and to be outwardly applied to the hurt place.

The pouder taken as aforesaid, cureth the iaudise and the stoppings of the liuer, taketh away the yellow colour of the bodie, if the patient after the taking hereof be caused to sweat.

The leaues stamped with honie, and the iuice put into the eies, cleereth the sight, taketh away all spots and webs, pearle or haw, and all impediments of the sight, and is put into that excellent ointment called *Vnguentum Arthanita*.

The root hanged about women in their extreame trauell with childe, causeth them to be deliuered incontinent, and taketh away much of their paine.

The leaues put into the place hath the like effect, as my wife hath prooued sundrie times vpon diuers women, by my aduise and commandement, with good successe.

The iuice of Sow-bread doth open the Hemorrhoids, and causeth them to flow beeing applied with wooll or flocks.

It is mixed with medicines that consume or waste away knots, the Kings euill, and other hard swellings: moreover it clenseth the head by the nostrils, it purgeth the belly being annointed therewith, and killeth the childe. It is a strong medicine to destroy the birth, being put vp as a pessarie.

It scoureth the skin, and taketh away Sun-burning, and all blemishes of the face, pilling of the haire, and marks also that remaine after the small pocks and mesels: and giuen in wine to drinke, it maketh a man drunke.

The decoction thereof serueth as a good and effectuell bath for members out of ioint, the gout, and kided heeles.

The root being made hollow and filled with oile, closed with a little wax, and roasted in the hot embers, maketh an excellent ointment for the griefes last rehearsed.

Being beaten and made vp into trochisches, or little flat cakes, it is reported to be a good amorous medicine to make one in loue if it be inwardly taken.

¶ The Danger.

It is not good for women with childe to touch or take this herbe, or to come neere vnto it, or stride over the same where it groweth; for the naturall attractive vertue therein contained is such, that without controuersie they that attempt it in maner abouesaid, shall be deliuered before their

Bbbb

time:

time: which danger and inconuenience to auoid, I haue (about the place where it groweth in my garden) fastened sticke in the ground, and some other sticke I haue fastened also crosse-waies ouer them, lest any woman should by lamentable experiment finde my words to bee true, by their stepping ouer the same.

‡ I iudge our Author something too womanish in this, that is, led more by vain opinion than by any reason or experience, to confirme this his assertion, which frequent experience shews to be vaine and friuolous, especially for the touching, striding ouer, or comming neere to this herbe. ‡

CHAP. 311. Of Birthwoorts.

¶ The Kindes.

Birthwoort, as *Dioscorides* writeth, is of three sorts, long, round, and winding: *Plinie* hath added a fourth kinde called *Pistolochia*, or little Birthwoort. The later writers haue ioined vnto them a fifth, named *Saracens* Birthwoort.

1 *Aristolochia longa*.
Long Birthwoort.

2 *Aristolochia rotunda*.
Round Birthwoort.

¶ The Description.

1 **L**ong Birthwoort hath many small long slender stalkes creeping vpon the ground, tangling one with another very intricately, beset with round leaues not much vnlike Sowbread or Iuie, but larger, of a light or ouerworne greene colour, and of a grieuous or lothsome smell and saour: among which come forth long hollow floures, not much vnlike the floures of Aron, but without any pestell or clapper in the same, of a dark purple colour: after which do follow small fruit like vnto little peares, containing triangled seeds of a blackish colour. The root is long, thicke, of the colour of box, of a strong saour and bitter taste.

2 The round Birthwoort in stalkes and leaues is like the first, but his leaues are rounder: the floures differ onely in this, that they be somewhat longer and narrower, and of a faint yellowish colour, but the small flap or point of the floure that turneth backe againe, is of a darke or blacke purple

ple colour. The fruit is formed like a peare, sharpe toward the top, more ribbed and fuller than the former: the root is round like vnto Sow-bread, in taste and saour like the former.

3 *Aristolochia clematitis*. Climing Birthwoort.

† 4 *Aristolochia Saracenicæ*.
Saracens Birthwoort.

† 5 *Pistolochia*.
Small Birthwoort.

3 Climing Birthwoort taketh hold of any thing that is next vnto it, with his long and clasping stalks, which be oftentimes branched, and windeth it selfe like Bindweed: the stalks of the leaues are longer, whose leaues be smooth, broad, sharpe pointed, as be those of the others: the floures likewise hollow, long, yellow, or of a blackish purple colour: the fruit differeth not from that of the others: but the roots be slender and very long, sometimes creeping on the top of the earth, and sometimes growing deeper, being of like colour with the former ones.

4 There is a fourth kinde of Birthwoort resembling the rest in leaues and branched stalkes, yet higher

higher, and longer than either the long or the round: the leaues thereof be greater than those of *Asarabacca*; the floures hollow, long, and in one side hanging ouer, of a yellowish colour: the fruit is long and round like a peare, in which the seeds lie seuered, of forme three square, of an ill fauored blackish colour: the root is somewhat long, oftentimes of a mean thicknesse, yellow like to the colour of Box, not inferior in bitternesse either to the long or to the round Birthwoort: and sometimes these are found to be small and slender, and that is when they were but lately digged vp and gathered: for by the little parcels of the roots which are left, the young plants bring forth at the beginning tender and branched roots.

5 Small Birthwoort is like to the long and round Birthwoort both in stalkes and leaues, yet is it lesser and tenderer: the leaues thereof are broad, and like those of Iuie: the floure is long, hollow in the vpper part, and on the outside blackish: the fruit something round like the fruit of round Birthwoort: in stead of roots there grow forth a multitude of slender strings.

‡ 6 *Pistolochia Cretica* siue *Virginiana*. Virginian Snake-root.

‡ 6 *Clusius* figures and describes another smal *Pistolochia* by the name of *Pistolochia Cretica*, to which I thought good to adde the Epithite *Virginia* also, for that the much admired Snake-weed of Virginia seems no otherwise to differ from it than an inhabitant of Candy from one of the Virginians, which none I thinke will say to differ in *specie*. I will first giue *Clusius* his description, and then expresse the little varietie that I haue obserued in the plants that were brought from Virginia, and grew here with vs: it sends forth many slender stalks a foot long, more or lesse, and these are cornered or indented, crested, branched, tough, and bending towards the ground, or spread thereon, and of a darke green colour: vpon which without order grow leaues, nervous, and like those of the last described, yet much sharper pointed, and after a sort resembling the shape of those of *Smilax aspera*, but lesse, and of a darke and lasting greene colour, fastened to longish stalkes: out of whose bosomes grow long and hollow crooked floures, in shape like those of the long Birthwoort, but of a darker red on the outside, but somewhat yellowish within: and these are also fastened to pretty long stalks; and they are succeeded by fruit, not vnlike, yet lesse than that of the long Birthwoort. This hath abundance of roots, like as the former, but much smaller, and more fibrous, and of a stronger smell. It floures in Iuly and August. Thus *Clusius* describes his, to which that Snake-weed that was brought from Virginia, and grew with M^r. *John Tradescant* at South-Lambeth, An. 1632. was agreeable in all points, but here and there one of the lower leaues were somewhat broader and rounder pointed than the rest: the floure was long, red, crooked, and a little hairie, and it did not open the top, or shew the inner side, which I iudge was by reason of the coldnesse and vnseasonablenesse of the later part of the Sommer when it floured: the stalks in the figure should haue been exprest more crooking or indenting, for they commonly grow so. How hard it is to iudge of plants by one particle or facultie may very well appeare by this herbe I now treat of: for some by the similitude the root had with *Asarum*, and a vomiting qualitie which they attributed to it (which certainly is no other than accidentall) would forthwith pronounce and maintaine it an *Asarum*: some also refer it to other things, as to Primroses, *Vincitoxicum*, &c. Others more warily named it *Serpentaria Virginiana*, and *Radix Virginiana*, names as it were offering themselves and easily to be fitted and imposed vpon sundry things, but yet too generall, and therefore not fit any more to be vsed, seeing the true and specifick denomination is found. ‡

¶ The Place.

Pliny sheweth, that the Birthwoorts grow in fat and champion places, the fieldes of Spaine are full

full of these three long and round Birthwoorts: they are also found in Italie and Narbone or Languedock, a countrey in France. *Petrus Bellonius* writeth, that he found branched Birthwoort vpon Ida, a mountaine in Candie: *Carolus Clusius* saith, that he found this same about Hispalis, and in many other places of Granado in Spain; among bushes and brambles: they grow all in my garden.

¶ The Time.

They floure in May, Iune, and Iuly.

¶ The Names.

Birthwoort is called in Greeke ἀριστολόχεια: in Latine likewise *Aristolochia*, because it is ἀριστα τὰς νόχας: that is to say, good for women newly brought a bed, or deliuered with childe: in English, Birthwort, Hartwoort, and of some, *Aristolochia*.

The first is called *Aristolochia longa*, or long Birthwoort, of the forme of his root, and likewise *Aristolochia mas*, or male Birthwoort: the second is thought to be *Fæmina* or female Birthwoort, & it is called *Rotunda Aristolochia*, or round Birthwoort: of diuers also *Terra malum*, the Apple of the earth: yet *Cyclaminus* is also called *Terra malum*, or the Apple of the earth.

¶ The Temperature.

All these Birthwoorts are of temperature hot and drie, and that in the third degree, hauing besides a power to cleanse.

¶ The Vertues.

Dioscorides writeth, that a dram weight of long Birthwoort drunke with wine and also applied, is A good against serpents and deadly things: and that being drunke with myrrhe and pepper, it expelleth whatsoeuer is left in the matrix after the childe is deliuered, the floures also & dead children: and that being put vp in a pessarie it performeth the same.

Round Birthwoort serueth for all these things, and also for the rest of the other poisons: it is B likewise auailable against the stuffing of the lungs, the hicket, the shakings or shiuering of agues, hardnesse of the milt or spleene, burstings, cramps, and couulsions, paines of the sides if it be drunk with water.

It plucketh out thornes, splinters, and shiuers, and being mixed in plaisters, or pulresses, it draws C forth scales or bones, remoueth rottenesse or corruption, mundifieth and scoureth foule and filthy vlcers, and filleth them vp with new flesh, if it be mixed with Ireos and honie.

Galen saith, that branched Birthwoort is of a more sweet and pleasant smell: and therefore is v- D sed in ointments, but it is weaker in operation than the former ones.

Birthwoort, as *Pliny* writeth, being drunk with water is a most excellent remedie for cramps and E convulsions, bruises, and for such as haue falne from high places.

It is good for them that are short-winded, and are troubled with the falling sicknesse. F

The round *Aristolochia* doth beautifie, cleanse, and fasten the teeth, if they be often fretted or rub- G bed with the powder thereof.

† The root of the Virginian *Pistolochia*, which is of a strong and aromaticke sent, is a singular & H much vsed Antidote against the bite of the Rattle-snake, or rather Adder or Viper, whose bite is very deadly, and therefore by the prouidence of the Creator he hath vpon his taile a skinny dry substance parted into cels which containe some loose, hard drie bodies that rattle in them (as if one should put little stones or pease into a stiffe and very dry bladder) that so he may by this noise giue warning of his approach, the better to be auoided; but if any be bitten, they know, nor stand in need of no better antidote, than this root, which they chew, and apply to the wound, & also swallow some of it downe, by which means they quickly ouercome the malignitie of this poisonous bite, which otherwise in a very short time would proue deadly. Many also commend the vse of this against the plague, small pox, meafels, and such like maligne and contagious diseases. †

CHAP. 312. Of Violets.

The Kindes.

T Here might be described many kinds of floures vnder this name of violets, if their differences should be more curiously looked into than is necessarie: for we might ioine hereunto the stock Gillofloures, the Wall floures, Dames Gillofloures, Marians violets, and likewise some of the bulb-bed floures, because some of them by *Theophrastus* are termed Violets. But this was not our charge, holding it sufficient to distinguish and diuide them as neere as may be in kindred and neighbourhood; addressing my selfe vnto the Violets called the blacke or purple violets, or March Violets of the Garden, which haue a great prerogatiue aboue others, not onely because the minde concei- ueth a certaine pleasure and recreation by smelling and handling of those most odoriferous flours, but also for that very many by these Violets receiue ornament and comely grace: for there bee made of them Galands for the head, Nose-gaies, and poesies, which are delightfull to looke on, and pleasant to smell to, speaking nothing of their appropriate vertues; yea Gardens themselves receiue by these the greatest ornament of all, chiefeft beautie and most gallant grace; and the re- creation

creation of the minde which is taken hereby, cannot be but very good and honest: for they admonish and stir vp a man to that which is comely and honest, for floures through their beautie, variety of colour, and exquisite forme, do bring to a liberall and gentle manly minde, the remembrance of honestie, comeliness, and all kindes of vertues. For it would be an vnseemely and filthie thing (as a certaine wise man saith) for him that doth looke vpon and handle faire and beautifull things, and who frequenteth and is conuersant in faire and beautifull places, to haue his minde not faire, but filthie and deformed.

¶ *The Description.*

1 **T**He blacke or purple Violet doth forthwith bring from the root many leaues, broad, sleightly indented in the edges, rounder than the leaues of Iuie: among the midst whereof spring vp fine slender stems, and vpon euerie one a beautifull floure sweetly smelling, of a blew darkish purple, consisting of five little leaues, the lowest whereof is the greatest, and after them doe appeare little hanging cups or knaps, which, when they be ripe, do open and diuide themselues into three parts. The seed is small, long, and somewhat round withall. The root consisteth of many threddie strings.

1 *Viola nigra sive purpurea.*

The purple Garden Violet.

2 *Viola flore albo.*

The white Garden Violet.

2 The white garden Violet hath many milke white floures, in forme and figure like the precedent: the colour of whose floures especially setteth forth the difference.

3 The double garden violet hath leaues, creeping branches, and roots like the garden single violet, differing in that, that this sort of Violet bringeth forth most beautifull sweet double floures, and the other single.

4 The white double Violet likewise agreeth with the other of his kinde, and only differeth in the colour. For as the last described bringeth double blew or purple floures: contrariwise this plant beareth double white floures, which maketh the difference.

5 The yellow Violet is by nature one of the wilde Violets, for it groweth seldome any where but vpon most high and craggie mountains, from whence it hath bin diuers times brought into the garden, but it can hardly be brought to culture, or grow in the garden without great industrie. And by the relation of a Gentleman often remembred, called M^r. Thomas Hesketh, who found it growing

3 *Viola martia purpurea multiplex.*
The double garden purple Violet.

5 *Viola martia lutea.*
Yellow Violets.

† 6 *Viola canina sylvestris.*
Dogs Violets, or wilde Violets.

growing vpon the hills in Lancashire, neere vnto a village called Latham; and though he brought them into his garden, yet they withered and pined. The whole plant is described to be like vnto the field Violet, and differeth from it, in that this plant bringeth forth yellow floures, yet like in forme and figure, but without smell.

6 The wilde field Violet with round leaues riseth forth of the ground from a fibrous root, with long slender branches, whereupon do grow round smooth leaues. The floures grow at the top of the stalkes, of a light blew colour: † and this growes commonly in Woods and such like places, and floures in Iuly and August. There is another varietie of this wilde Violet, which hath the leaues longer, narrower, and sharper pointed. And this was formerly figured and described in this place by our Author. †

7 There is found in Germanie about Norremberg and Strasborough, a kinde of Violet which is altogether a stranger in these parts. It hath (saith my Author) a thicke and tough root of a woody substance, from which riseth vp a stalke diuiding it selfe into diuers branches, of a woody substance; whereupon grow long iagged leaues like those of the Pansey. The floures grow at the top, compact of fise leaues apiece, of a watchet colour.

¶ The Place.

The Violet groweth in gardens almost euery where: the others which are strangers haue beene touched in their descriptions.

¶ The Time.

The floures for the most part appeare in March, at the farthest in Aprill.

¶ The Names.

The Violet is called in Greeke *ἰώ*: of *Theophrastus*, both *ἰώ μέλας*, and *ἰωδάς*: in Latine, *Nigra viola*, or blacke Violet, of the blackish purple colour of the floures. The Apothecaries keepe the Latine name *Viola*; but they call it *Herba Violaria*, and *Mater Violarum*: in high-Dutch, *Blan Uiel*: in low-Dutch, *Uioleten*: in French, *Violette de Mars*: in Italian, *Viola mammola*: in Spanish, *Violeta*: in English, Violet. *Nicander* in his *Geoponickes* beleeueth, (as *Hermolaus* sheweth) that the Grecians did call it *ἰώ*, because certaine Nymphs of Ionia gaue that floure first to *Iupiter*. Others say it was called *ἰώ*, because when *Iupiter* had turned the young Damosell *Io*, whom he tenderly loued, into a Cow, the earth brought forth this floure for her food: which being made for her sake, receiued the name from her; and thereupon it is thought that the Latines also called it *Viola*, as though they should say *Vitula*, by blotting out the letter *t*. *Seruius* reporteth, That for the same cause the Latines also name it *Vaccinium*, alledging the place of *Virgil* in his *Bucolicks*:

Alba ligustra cadunt, vaccinia nigra leguntur.

Notwithstanding *Virgil* in his tenth *Eclog* sheweth, that *Vaccinium* and *Viola* do differ.

Ei nigrae viola sunt, & vaccinia nigra.

† *Vitruvius* also in his seventh booke of Architecture or Building doth distinguish *Viola* from *Vaccinium*: for he sheweth that the colour called *Sile Atticum*, or the Azure of Athens, is made *ex Viola*; and the gallant purple, *ex Vaccinio*. The Dyers, saith he, when they would counterfeit *Sile*, or Azure of Athens, put the dried Violets into a fat, kettle, or caldron, and boyle them with water; afterwards when it is tempered they poure it into a linnen strainer, and wringing it with their hands, receiue into a mortar the liquor coloured with the Violets; and steeping earth of *Erethria* in it, and grinding the same, they make the Azure colour of Athens. After the same manner they temper *Vaccinium*, and putting milke vnto it, do make a gallant purple colour. But what *Vaccinia* are we will elswhere declare.

¶ The Temperature.

The floures and leaues of the Violets are cold and moist.

¶ The Vertues.

- A The floures are good for all inflammations, especially of the sides and lungs; they take away the hoarsenesse of the chest, the ruggednesse of the winde-pipe and iawes, allay the extream heate of the liuer, kidneyes, and bladder; mitigate the fierie heate of burning agues; temper the sharpnesse of choler, and take away thirst.
 - B There is an oyle made of Violets, which is likewise cold and moist. The same being anointed vpon the testicles, doth gently prouoke sleepe which is hindred by a hot and dry distemper: mixed or laboured together in a wooden dish with the yelke of an egge, it asswageth the pain of the fundament and hemorrhoides: it is likewise good to be put into cooling clisters, and into pulsethes that coole and ease paine.
 - C But let the oyle in which the Violets be steeped be either of vnripe oliues, called *Omphacinum*, or of sweet Almonds, as *Mesues* saith, and the Violets themselues must be fresh and moist: For being dry, and hauing lost their moisture, they doe not coole, but seeme to haue gotten a kinde of heate.
 - D The later Physitians do thinke it good to mix dry Violets with medicines that are to comfort and strengthen the heart.
 - E The leaues of Violets inwardly taken do coole, moisten, and make the belly soluble. Being outwardly applied, they mitigate all kinde of hot inflammations, both taken by themselues, and also applied with Barley floure dried at the fire, after it hath lien soking in the water. They are likewise laid vpon a hot stomacke, and on burning eyes, as *Galen* witnesseth. *Dioscorides* writeth, that they be moreouer applied to the fundament that is fallen out.
 - F They may helpe the fundament that is fallen out, not as a binder keeping back the fundament, but as a suppler and a mollifier. Besides, *Pliny* saith that Violets are as well vsed in garlands, as smelt vnto; and are good against surfeting, heauinesse of the head; and being dried in water and drunke, they remoue the Squinancie or inward swellings of the throat. They cure the falling sicknesse, especially in yong children, and the seed is good against the stinging of Scorpions.
- There is a syrrop made of Violets and Sugar, whereof three or foure ounces being taken at one time, soften the belly, and purge choler. The manner to make it is as followeth.

First make of clarified sugar by boyling a simple syrrop of a good consistence or meane thicknesse, whereunto put the floures cleane picked from all manner of filth, as also the white ends nipped

nipped away, a quantitie according to the quantitie of the syrrup, to your owne discretion, where-
in let them infuse or steepe foure and twenty houres, and set vpon a few warme embers; then strain
it, and put more Violets into the same syrrup: thus do three or foure times, the oftner the better;
then set them vpon a gentle fire to simmer, but not to boyle in any wise: so haue you it simply made
of a most perfect purple colour, and of the smell of the floures themselves. Some do adde thereto
a little of the iuyce of the floures in the boyling, which maketh it of better force and vertue. Like-
wise some do put a little quantitie of the iuyce of Lymons in the boyling, which doth greatly en-
crease the beauty thereof, but nothing at all the vertue.

There is likewise made of Violets and sugar certain plates called Sugar Violet, or Violet tables, I
or Plate, which is most pleasant and wholesome, especially it comforteth the heart and the other
inward parts.

The decoction of Violets is good against hot feuers, and the inflammation of the liuer and all K
other inward parts: the like propertie hath the iuyce, syrrup, or conserue of the same.

Syrrup of Violets is good against the inflammation of the lungs and brest, against the pleurisie L
and cough, against feuers and agues in yong children, especially if you put vnto an ounce of Syr-
rup eight or nine drops of oyle of Vitrioll, and mix it together, and giue it to the childe a spoone-
full at once.

The same giuen in manner aforesaid is of great efficacie in burning feuers and pestilent disea- M
ses, greatly cooling the inward parts: and it may seeme strange to some, that so sharpe a corrosiue
as oyle of Vitriol should be giuen into the body; yet being delayed and giuen as aforesaid, suck-
ing children may take it without any perill.

The same taken as aforesaid cureth all inflammations of the throat, mouth, uvula, squinancie, N
and the falling euill in children.

Sugar-Violet hath power to cease inflammations, roughnesse of the throat, and comforteth the O
heart, asswageth the paines of the head, and causeth sleepe.

The leaues of Violets are vsed in cooling plaisters, oyles, and comfortable cataplasmes or pul- P
tesses; and are of greater efficacie among other herbes, as Mercurie, Mallowes, and such like, in
clisters, for the purposes aforesaid.

CHAP. 313. Of Hearts-ease, or Pansies.

¶ The Description.

1 **T**He Hearts-ease or Paunsie hath many round leaues at the first comming vp; afterward
they grow somewhat longer, sleightly cut about the edges, trailing or creeping vpon
the ground. The stalkes are weake and tender, whereupon do grow floures in forme
and figure like the Violet, and for the most part of the same bignesse, of three sundry colours;
whereof it tooke the syname *Tricolor*, that is to say, purple, yellow, and white or blew: by reason
of the beauty and brauerie of which colours they are very pleasing to the eye; for smell they haue
little or none at all. The seed is contained in little knaps, of the bignesse of a Tare, which come
forth after the floures be fallen, and do open of themselves when the seed is ripe. The root is no-
thing else but as it were a bundle of threddy strings.

2 The vpright Paunsie bringeth forth long leaues deeply cut in the edges, sharpe pointed, of
a bleake or pale greene colour, set vpon slender vpright stalkes, cornered, ioyned, or kneed a foot
high or higher; whereupon do grow very faire floures of three colours, *viz.* of purple, blew, and
yellow, in shape like the common Hearts-ease, but greater and fairer: which colours are so excel-
lently and orderly placed, that they bring great delectation to the beholders, though they haue
little or no smell at all. For oftentimes it hapneth, that the vppermost floures are differing from
those that grow vpon the middle of the plant, and those varie from the lowermost, as Nature list
to dally with things of such beauty. The seed is like the precedent.

3 The wilde Paunsie differeth from that of the garden, in leaues, roots, and tender branches:
the floures of this wilde one are of a bleake and pale colour, far inferiour in beauty to that of the
garden, wherein consisteth the difference.

4 Stony Hearts-ease is a base and low plant: The leaues are rounder, and not so much cut a-
bout the edges as the others: The branches are weake and feeble, trailing vpon the ground: The
floures are likewise of three colours, that is to say, white, blew, and yellow, void of smell. The root
perisheth when it hath perfected his seed.

5 There is found in sundry places of England a wilde kinde hereof, bringing floures of a faint
yellow colour, without mixture of any other colour, yet hauing a deeper yellow spot in the lowest
leaf,

1 *Viola tricolor.*
Hearts-ease.

2 *Viola affurgens tricolor.*
Vpright Hearts-ease.

3 *Viola tricolor sylvestris.*
Wilde Paunfies.

4 *Viola tricolor petraea.*
Stony Hearts-ease.

leafe with foure or fiue blackifh purple lines, wherein it differeth from the other wilde kinde: and this hath beene taken of fome yong Herbarifts to be the yellow Violet.

¶ *The Place.*

The Hearts-eafe groweth in fields in many places, and in gardens alfo, and that oftentimes of it felfe: it is more gallant and beautifull than any of the wilde ones.

Matthiolus reporteth, that the vpright Paunfie is found on mount Baldus in Italy. *Lobel* faith that it groweth in Languedocke in France, and on the tops of fome hills in England; but as yet I haue not feene the fame.

Those with yellow floures haue been found by a village in Lancashire called Latham, foure miles from Kyrckham, by Mr. *Thomas Hesketh* before remembred.

¶ *The Time.*

They floure not onely in the Spring, but for the moft part all Sommer thorow, euen vntill Autumne.

¶ *The Names.*

Hearts-eafe is named in Latine *Viola tricolor*, or the three coloured Violet; and of diuers, *Iacea*; (yet there is another *Iacea* fynamed *Nigra*: in English, Knap-weed, Bull-weed, and Matfellow) of others, *Herba Trinitatis*, or herbe Trinitie, by reason of the triple colour of the floures: of fome others, *Herba Clauellata*: in French, *Pensees*: by which name they became knowne to the Brabanders and others of the Low-countries that are next adioyning. It feemeth to be *Viola flammea*, which *Theophrastus* calleth *φλογος*, which is alfo called *φλογος*: in English, Hearts-eafe, Paunfies, Liue in idlenesse, Cull me to you, and Three faces in a hood.

The vpright Paunfie is called not vnproperly *Viola affurgens*, or *Surrecta*, and withall *Tricolor*, that is to fay, straight or vpright Violet three coloured: of fome, *Viola arborefcens*, or Tree Violet, for that in the multitude of branches and manner of growing it reſembles a little tree.

¶ *The Temperature.*

It is of temperature obſcurely cold, but more euidently moiſt, of a tough and ſlimie iuyce, like that of the Mallow; for which cauſe it moiſtneſh and ſuppleth, but not ſo much as the Mallow doth.

¶ *The Vertues.*

It is good, as the later Phyſitions write, for ſuch as are ſicke of an ague, eſpecially children and infants, whoſe conuulſions and fits of the falling ſickneſſe it is thought to cure. A

It is commended againſt inflammations of the lungs and cheſt, and againſt ſcabs and itchings of the whole body, and healeth vlcers. B

The diſtilled water of the herbe or floures giuen to drinke for ten or more dayes together, three ounces in the morning, and the like quantitie at night, doth wonderfully eaſe the paines of the French diſeaſe, and cureth the ſame, if the Patient be cauſed to ſweat ſundry times, as *Coſtans* reporteth, in his booke *de natura vniuerſ. ſtirp.* C

CHAP. 314. Of Ground-Fuy, or Ale-hooſe.

¶ *The Deſcription.*

Ground Iuy is a low or baſe herbe; it creepeth and ſpreads vpon the ground hither and thither all about, with many ſtalkes of an vncertaine length, ſlender, and like thoſe of the Vine, ſomething cornered, and ſometimes reddiſh: whereupon grow leaues ſomething broad and round, wrinkled, hairy, nicked in the edges, for the moſt part two out of euerie ioynt: amongſt which come forth the floures gaping like little hoods, not vnlike to thoſe of Germander, of a purpliſh blew colour: the roots are very threddy: the whole plant is of a ſtrong ſmell and bitter taſte.

¶ 2 Vpon the rockie and mountainous places of Prouince and Daulphine growes this other kinde of Ale-hooſe, which hath leaues, ſtalkes, floures, and roots like in ſhape to thoſe of the former, but the floures and leaues are of a light purple colour, and alſo larger and longer. This by *Lobel* is called *Aſarina*, ſiue *Saxatilis hederæ*. †

¶ *The Place.*

It is found as well in tilled as in vntilled places, but moſt commonly in obſcure and darke places, vpon banks vnder hedges, and by the ſides of houſes.

¶ *The Time.*

It remaineth greene not onely in Sommer, but alſo in Winter at any time of the yeare: it flouriſheth from Aprill till Sommer be far ſpent.

¶ *The*

1 *Hedera terrestris*.
Ale-hoofe.

‡ 2 *Hedera saxatilis*.
Rocke Ale-hoofe.

¶ The Names.

It is commonly called *Hedera terrestris*: in Greeke, *χάμαίρις*: also *Corona terra*: in high-Dutch, *Gundelrebe*: in low-Dutch, *Onderhaue*: in French, *Lierre terrestre*: *Hedera humilis* of some, and *Chamaecissum*: in English, Ground-Iuy, Ale-hoofe, Gill go by ground, Tune-hoofe, and Cats-foot. ‡ Many question whether this be the *Chamaecissus* of the Antients: which controuersie *Donatus* hath largely handled, *Pempt. 3. lib. 3. cap. 4.* ‡

¶ The Temperature.

Ground-Iuy is hot and dry, and because it is bitter it scoureth, and remoueth stoppings out of the intrals.

¶ The Vertues.

- A Ground-Iuy is commended against the humming noyse and ringing sound of the eares, being put into them, and for them that are hard of hearing.
- B *Matthiolus* writeth, That the iuyce being tempered with Verdugrease, is good against fistulaes and hollow vlcers.
- C *Dioscorides* teacheth, That halfe a dram of the leaues being drunke in foure ounces and a halfe of faire water, for forty or fifty dayes together, is a remedie against the Sciatica, or ache in the huckle bone.
- D The same taken in like sort six or seuen dayes doth also cure the yellow jaundice. *Galen* hath attributed (as we haue said) all the vertue vnto the floures: Seeing the floures of Ground-Iuy (saith he) are very bitter, they remoue stoppings out of the liuer, and are giuen to them that are vexed with the Sciatica.
- E Ground-Iuy, Celandine, and Daiesies, of each a like quantitie, stamped and strained, and a little sugar and rose water put thereto, and dropped with a feather into the eyes, taketh away all manner of inflammation, spots, webs, itch, smarting, or any grieve whatsoever in the eyes, yea although the sight were nigh hand gone: it is proued to be the best medicine in the world.
- F The herbes stamped as aforesaid, and mixed with a little ale and honey, and strained, takes away the pinne and web, or any grieve out of the eyes of horse or cow, or any other beast, being squirted into the same with a syringe, or I might haue said the liquor injected into the eyes with a syringe. But I list not to be ouer eloquent among Gentlewomen, to whom especially my Works are most necessarie.
- G The women of our Northerne parts, especially about Wales and Cheshire, do tunne the herbe Ale-hoof into their Ale; but the reason thereof I know not: notwithstanding without all controuersie

uerſie it is moſt ſingular againſt the griefes aforeſaid : being tunned vp in ale and drunke, it alſo purgeth the head from rhumaticke humors flowing from the braine.

Hederaterreſtris boyled in water ſtayeth the termes; and boyled in mutton broth it helps weake I and aking backes.

They haue uſed to put it into ointments againſt burning with fire, gunpouder, and ſuch like. K

Hederaterreſtris being bound in a bundle, or chopt as herbes for the pot, and eaten or drunke as L thin broth ſtayeth the flux in women.

CHAP. 315. Of Iuy.

¶ The Kindes.

There be two kinds of Iuy, as *Theophrastus* witneſſeth, reckoned among the number of thoſe plants which haue need to be propped vp; for they ſtand not of themſelues, but are faſtned to ſtone walls, trees, and ſuch like, and yet notwithstanding both of a wooddy ſubſtance, and yet not to be placed among the trees, ſhrubs, or buſhes, becauſe of the affinitie they haue with climbing herbes; as alſo agreeing in forme and figure with many other plants that climbe, and are indeed ſimply to be reckoned among the herbes that clamber vp. But if any will cauill, or charge me with my promiſe made in the beginning of this hiftorie, where we made our diuiſion, namely, to place each plant as neere as may be in kindred and neighbourhood; this promiſe I haue fulfilled, if the curious eye can be content to reade without raſhneſſe thoſe plants following in order, and not onely this climbing Iuy that liſteth her ſelfe to the tops of trees, but alſo the other Iuy that creepeth vpon the ground.

Of the greater or the climbing Iuy there are alſo many ſorts; but eſpecially three, the white, the blacke, and that which is called *Hedera Helix*, or *Hedera ſterilis*.

¶ The Deſcription.

The greater Iuy climbeth on trees, old buildings, and walls: the ſtalkes thereof are wooddy, and now and then ſo great as it ſeemes to become a tree; from which it ſendeth a multitude of little boughes or branches euery way, whereby as it were with arms it creepeth and wandereth far about: it alſo bringeth forth continually fine little roots, by which it faſtneſh it ſelfe and cleaueth wonderfull hard vpon trees, and vpon the ſmoothest ſtone walls: the leaues are ſmooth, ſhining eſpecially on the vpper ſide, cornered with ſharpe pointed corners. The floures are very ſmall and moſſie; after which ſucceed bundles of black berries, euery one hauing a ſmall ſharpe pointall.

There is another ſort of great Iuy that bringeth forth white fruit, which ſome call *Acharnicam irriguam*; and alſo another leſſer, the which hath blacke berries. This *Pliny* calleth *Selinitium*.

We alſo finde mentioned another ſort hereof ſpred abroad, with a fruit of a yellow Saffron colour, called of diuers *Dionyſias*, as *Dioſcorides* writeth: others *Bacchica*, of which the Poets uſed to make garlands, as *Pliny* teſtifieth, lib. 16. cap. 34.

2 Barren Iuy is not much vnlike vnto the common Iuy aforeſaid, ſauing that his branches are both ſmaller and tenderer, not liſting or bearing it ſelfe vpward, but creeping along by the ground vnder moiſt and ſadowie ditch bankes. The leaues are moſt commonly three ſquare, cornered, of a blackiſh Greene colour, which at the end of Sommer become browniſh red vpon the lower ſide. The whole plant beareth neither floures nor fruit, but is altogether barren and fruitleſſe.

3 There is kept for nouelties ſake in diuers gardens a Virginian, by ſome (though vnſitly) termed a Vine, being indeed an Iuy. The ſtalkes of this grow to a great heighth, if they be planted nigh any thing that may ſuſtaine or beare them vp: and they take firſt hold by certaine ſmall tendrels, vpon what body ſoetier they grow, whether ſtone, boords, bricke, yea glaſſe, and that ſo firmly, that oftentimes they will bring pieces with them if you plucke them off. The leaues are large, conſiſting of foure, ſiue, or more particular leaues, each of them being long, and deeply notched about the edges, ſo that they ſomewhat reſemble the leaues of the Cheſnut tree: the floures grow cluſtering together after the manner of Iuy, but neuer with vs ſhew themſelues open, ſo that we cannot iuſtly ſay any thing of their colour, or the fruit that ſucceeds them. It puts forth his leaues in April, and the ſtalkes with the rudiments of the floures are to be ſeene in Auguſt. It may as I ſaid be ſitly called *Hedera Virginiana*.

¶ The Place.

Iuy groweth commonly about walls and trees; the white Iuy groweth in Greece, and the barren Iuy groweth vpon the ground in ditch bankes and ſadowie woods.

1. *Hedera corymbosa*.
Clymbing or berried Iuy.

2. *Hedera Helix*.
Barren or creeping Iuy.

¶ *The Time.*

Iuy flourisheth in Autumne: the berries are ripe after the Winter Solstice.

¶ *The Names.*

Iuy is called in Latine *Hedera*: in Greeke, *Κλάδος*, and *Κλάδος*: in high-Dutch, *Epheu*: in low-Dutch, *Ueyle*: in Spanish, *Yedra*: in French, *Lierre*.

The greater Iuy is called of *Theophrastus* *ἡ δασύφυλλος Κλάδος*: in Latine, *Hedera attollens*, or *Hedera assurgens*: *Gaza* interpreteth it *Hedera excelsa*. The later Herbarists would haue it to be *Hedera arborea*, or tree Iuy, because it groweth vpon trees, and *Hedera muralis*, which hangeth vpon walls.

Creeping or barren Iuy is called in Greeke *ἡ ἀνδροκλάδος Κλάδος*: in English, Ground-Iuy: yet doth it much differ from *Hedera terrestris*, or Ground-Iuy before described: of some it is called *Clauicula*, *Hedera Helix*, and *Hedera sterilis*; and is that herbe wherein the Bore delighteth, according to *Iohannes Khuenius*.

¶ *The Temperature.*

Iuy, as *Galen* saith, is compounded of contrarie faculties; for it hath a certaine binding earthy and cold substance, and also a substance somewhat biting, which euen the very taste doth shew to be hot. Neither is it without a third facultie, as being of a certaine warme waterie substance, and that is if it be Greene: for whilest it is in drying, this watery substance being earthy, cold, and binding consumeth away, and that which is hot and biting remaineth.

¶ *The Vertues.*

- A The leaues of Iuy fresh and Greene boyled in wine, do heale old vlcers, and perfectly cure those that haue a venomous and malicious quality ioyned with them; and are a remedy likewise against burnings and scaldings.
- B Moreouer, the leaues boyled with vinegar are good for such as haue bad spleens; but the floures or fruit are of more force, being very finely beaten and tempered with vinegar, especially so vsed they are commended against burnings.
- C The iuyce drawne or snift vp into the nose doth effectually purge the head, stayeth the running of the eares that hath bene of long continuance, and healeth old vlcers both in the eares and also in the nostrils: but if it be too sharpe, it is to be mixed with oyle of Roses, or fallad oyle.
- D The gum that is found vpon the trunke or body of the old stocke of Iuy, killeth nits and lice, and taketh away haire: it is of so hot a qualitie, as that it doth obscurely burne: it is as it were a certaine

certaine waterish liquor congealed of those gummie drops. Thus farre *Galen*.

The very same almost hath *Dioscorides*, but yet also somewhat more: for ouer and besides hee E
saith, that sue of the berries beaten small, and made hot in a Pomegranat rinde, with oyle of roses,
and dropped into the contrarie eare, doth ease the tooth-ache, and that the berries make the haire
blacke.

Iuy in our time is very seldome vsed, saue that the leaues are layd vpon little vlcers made in the F
thighes, legs, or other parts of the body, which are called Issues; for they draw humors and water-
rish substance to those parts, and keepe them from hot swellings or inflammations, that is to say,
the leaues newly gathered, and not as yet withered or dried.

Some likewise affirme that the berries are effectually to procure vrine; and are giuen vnto those G
that be troubled with the stone and diseases of the kidneyes.

The leaues laid in steepe in water for a day and a nights space, helpe sore and smarting water- H
rish eyes, if they be bathed and washed with the water wherein they haue beene infused.

CHAP. 316. Of rough Binde-weed.

1 *Smilax Peruviana, Salsa parilla.*
Rough Binde-weed of Peru.

2 *Smilax aspera.*
Common rough Binde-weed.

The Description.

1 Although we haue great plenty of the roots of this Binde-weed of Peru, which we vsu-
ally cally *Zarza*, or *Sarfa Parilla*, wherewith diuers griefes and maladies are cured, and
that these roots are very well knowne to all; yet such hath beene the carelesnesse and
small prouidence of such as haue trauelled into the Indies, that hitherto not any haue giuen vs in-
struction sufficient, either concerning the leaues, floures, or fruit: onely *Monardus* saith, that it
hath long roots deepe thrust into the ground: which is as much as if a great learned man should
tell the simple, that our common carrion Crow were of a blacke colour. For who is so blinde that
seeth the root it selfe, but can easily affirme the roots to be very long? Notwithstanding, there is
in the reports of such as say they haue seene the plant it selfe growing, some contradiction or con-
trarietie: some report that it is a kind of Bind-weed, and especially one of these rough Bindweeds: others,

3 *Smilax aspera* Lusitanica.
Rough Binde-weed of Portugall.

tained a blackish seed in shape like that of hempe. The root is long, somewhat hard, and parted into very many branches.

3 This rough Binde-weed, found for the most part in the barren mountaines of Portugal, differeth not from the precedent in stalkes and floures, but in the leaues and fruit; for the leaues are softer, and lesse prickly, and sometimes haue no prickles at all, and they are also oftentimes much narrower: the fruit or berry is not red but blacke when as it commeth to be ripe. The root hereof is one single root of a woody substance, with some fibres annexed thereto, wherein consisteth the difference.

¶ The Place.

Zarza parilla, or the prickly Binde-weed of America, groweth in Peru a prouince of America, in Virginia, and in diuers other places both in the East and West Indies.

The others grow in rough and vntilled places, about the hedges and borders of fields, on mountaines and vallies, in Italy, Languedock in France, Spaine, and Germany.

¶ The Time.

They floure and flourish in the Spring: their fruit is ripe in Autumne, or a little before.

¶ The Names.

It is named in Greeke *Σμύλας αειχμία*, *Gaza* (*Theophrastus* his Translator) names it *Hedera Cilicia*; as likewise *Pliny*, who lib. 24. cap. 10 writeth, that it is also syrnamed *Nicophoron*. Of the Heturians, *Hedera spinosa*, and *Rubus ceruinus*: of the Castilians in Spaine, as *Lacuna* saith, *Zarza parilla*, as though they should say *Rubus viticula*, or Bramble little Vine. *Parra*, as *Matthiolus* interpreteth it, doth signifie a Vine; and *Parilla*, a small or little Vine.

Diuers affirme that the root (brought out of Peru a prouince in America) which the later Herbarists do call *Zarza*, is the root of this Bindeweed. *Garcias Lopez Lusitanus* granteth it to be like thereunto, but yet he doth not affirme that it is the same. Plants are oftentimes found to be like one another, which notwithstanding are proued not to be the same by some little difference; the diuers constitution of the weather and of the soile making the difference.

Zarzaparilla of Peru is a strange plant, and is brought vnto vs from the Countries of the new world called America; and such things as are brought from thence, although they also seeme and are like to those that grow in Europe, notwithstanding they doe often differ in vertue and operation: for the diuersitie of the soile and of the weather doth not only breed an alteration in the form, but

others, as one Mr. *White* an excellent painter, who carried very many people into Virginia (or after some Noremberga) there to inhabit, at which time hee did see thereof great plenty, as he himselfe reported vnto me, with this bare description; It is (saith he) the root of a small shrubbie tree, or hedge tree, such as are those of our country called Haw-thorns, hauing leaues resembling those of Iuy, but the floures or fruit he remembreth not. † It is most certaine, that *Sarsa parilla* is the root of the Americane *Smilax aspera*, both by consent of most Writers, and by the relation of such as haue seene it growing there. †

2 The common rough Binde-weed hath many branches set full of little sharpe prickles, with certaine clasping tendrels, where-with it taketh hold vpon hedges, shrubs, and whatsoeuer standeth next vnto it, winding and clasping it selfe about from the bottom to the top; whereon are placed at euery ioint one leafe like that of Iuy, without corners, sharpe pointed, lesser and harder than those of smooth Binde-weed, oftentimes marked with little white spots, and garded or bordered about the edges with crooked prickles. The floures grow at the top of crooked stalks of a white colour, and sweet of smell. After commeth the fruit like those of the wilde Vine, greene at the first, and red when they be ripe, and of a biting taste; wherein is con-

but doth most of all preuaile in making the vertues and qualities greater or lesser. Such things as grow in hot places be of more force, and greater smell; and in cold, of lesser. Some things that are deadly and pernicious, being remoued wax milde, and are made wholesome: so in like manner, although *Zarzaparilla* of Peru be like to rough Binde-weed, or to Spanish *Zarzaparilla*, notwithstanding by reason of the temperature of the weather, and also through the nature of the soile, it is of a great deale more force than that which groweth either in Spaine or in Africke.

The roots of *Zarzaparilla* of Peru, which are brought alone without the plant, be long and slender, like to the lesser roots of common liquorice, very many oftentimes hanging from one head, in which roots the middle string is hardest. They haue little taste, and so small a smell that it is not to be perceiued. These are reported to grow in Honduras a prouince of Peru. They had their name of the likenesse of rough Binde-weed, which among the inhabitants it keepeth; signifying in Spanish, a rough or prickly vine, as *Garcias Lopez* witnesseth.

¶ The Temperature.

The roots are of temperature hot and dry, and of thin and subtile parts, insomuch as their decoction doth very easily procure sweat.

¶ The Vertues.

The roots are a remedie against long continuall paine of the ioynts and head, and against cold A diseases. They are good for all manner of infirmities wherein there is hope of cure by sweating, so that there be no ague ioynd.

The cure is perfected in few dayes, if the disease be not old or great; but if it be, it requireth a B longer time of cure. The roots here meant are as I take it those of *Zarzaparilla*, whereof this *Smilax aspera* or rough Binde-weed is holden for a kinde: notwithstanding this of Spain and the other parts of Europe, though it be counted lesse worth, yet is it commended of *Dioscorides* and *Pliny* against poysons. The leaues hereof, saith *Dioscorides*, are a counterpoyson against deadly medicines, whether they be drunke before or after.

† The second and fourth were both formerly of one plant, I meane the historie; for the figure in the fourth place should haue been in the third, and the figure in the third was the same wth the second, and should haue been in the fourth place.

CHAP. 317. Of smooth or gentle Binde-weed.

1 *Smilax lenis siue lenis maior.*

Great smooth Binde-weed.

2 *Smilax lenis minor.*

Small Binde-weed.

¶ The Description.

1 **I**t is a strange thing vnto me, that the name of *Smilax* should be so largely extended, as that it should be assigned to those plants that come nothing neere the nature, and scarcely vnto any part of the forme of *Smilax* indeed. But we will leaue controuersies to the further consideration of such as loue to dance in quag-mires, and come to this our common smooth *Smilax*, called and knowne by that name among vs, or rather more truly by the name of *Convolvulus maior*, or *Volubilis maior*: It beareth the long branches of a Vine, but tenderer, and for the length and great spreading thereof it is very fit to make shadows in arbors: the leaues are smooth like Iuie, but somewhat bigger, and being broken are full of milke: amongst which come forth great white and hollow floures like bells. The seed is three cornered, growing in small huskes couered with a thin skin. The root is small, white and long, like the great Dogs grasfe.

2 *Smilax tenuis minor* is much like vnto the former in stalkes, leaues, floures, seed, and roots, sauing that in all respects it is much smaller, and creepeth vpon the ground. The branches are small and smooth: the little leaues tender and soft: the floures like vnto little bells, of a purple colour: the seed three cornered like vnto the others.

3 *Convolvulus minimus spica-folius.*
Lauander leaved Binde-weed.

† 4 *Convolvulus argenteus Althea folio.*
Siluer leaved Binde-weed.

3 This Bindweed *Pena* saith he neuer saw but in the brinks of quicke-fets and Oliuets in Pro- uence, Sauoy, and Narbone; notwithstanding I found it growing in the corne fields about great Dunmow in Essex, in such abundance, that it doth much hurt vnto their corne. This kind of Bind- weed or *Volubilis* is like vnto the small Bindweed before mentioned, but it hath a finer floure, plai- red or folded in the compasse of the bell very orderly, especially before the Sun rise (for after it opens it selfe the welts are not so much perceiued) and it is of a darke purple colour: the seed is not vnlike the rest, cornered and flat, growing out of slender branches which stand vpright and thicke together, proceeding out of a woody white root. The leaues are long and narrow, resem- bling *Linaria* both in colour and hairinesse, in taste drying, and somewhat heating.

5 *Volubilis nigra.*
Blacke Bindweed.

† 4 The stalkes and branches of this are some cubite long, slender, weake and hairy, so that they lie vpon the ground, if they haue nothing to sustaine them: vpon these without any order grow leaues, shaped like those of luy, or the marsh Mallow, but lesse, and couered ouer with a siluer-like downe or hairinesse, and diuided somewhat deep on the edges, sometimes also curled, and otherwhiles onely snipt about. The floure growes vpon long stalkes like as in other plants of this kinde, and consists of one folding leafe, like as that of the last mentioned, and it is either of a whitish purple, or else absolute purple colour: The root is small and creeping. It growes in many places of Spaine, and there floures in March and Aprill. *Clusius* calls this *Convolvulus Althea folio*, and saith that the Portugals name it *Verdezilla*, and commend it as a thing most effectuell to heale wounds. Our Authour gaue the figure hereof (how fitly let the Reader iudge) by the name of *Papauer cornutum luteum minus*, making it a horned Poppy, as you may see in the former Edition, Pag. 294. †

† 5 This kinde of Bindweed hath a rough root full of threddie strings, from which rise vp immediatly diuers trailing branches, wherupon grow leaues like the common field Bindweed, or like those of Orach, of a black green colour, whereof it tooke his name: the floures are smal, and like those of Orach: the seed is black, three square, like, but lesse than that of Buck-wheat.

The whole plant is not onely a hurtfull weed, but of an euill smell also, and too frequently found amongst corne. *Dodoneus* calls this *Convolvulum nigrum*: and *Helxine Cissampelos*: *Tabernamontanus*, *Volubilis nigra*: and *Lobel*, *Helxine Cissampelos altera Atriplicis effigie*.

¶ The Place.

All these kindes of Bindweeds do grow very plentifully in most parts of England, † The third and fourth excepted. †

¶ The Time.

They do floure from May to the end of August.

¶ The Names.

The great Bindweed is called in Greeke *μύλαξ λεῖα*: in Latine, *Smilax Lewis*: of *Galen* and *Paulus Aegineta*, *μύλαξ λεῖα*: it is furnamed *Lewis* or smooth, because the stalkes and branches thereof haue no prickles at all. *Dolichus* called also *Smilax hortensis*, or Kidney beane, doth differ from this: and likewise *Smilax* the tree, which the Latines call *Taxus*: in English, the Yew tree. The later Herbarists do call this Bindweed *Volubilis maior*, *Campanella*, *Funis arborum*, *Convolvulus albus*, and *Smilax leuis maior*: in like manner *Pliny* in his 21. booke, 5. chapt. doth also name it *Convolvulus*. It is thought to be *Ligustrum*, not the shrub priuet, but that which *Martial* in his first booke of Epigrams speaketh of, writing against *Procillus*.

The small Bindweed is called *Convolvulus minor*, and *Smilax leuis minor*, *Volubilis minor*: in high Dutch, *Windkraut*: in Low Dutch, *Wrange*: in French, *Liseron*: in Italian, *Vilucchio*: in Spanish, *Campanilla Yerna*: in English, *Withwinde*, *Bindweed*, and *Hedge-bels*.

¶ The Nature.

These herbs are of an hot and dry temperature.

¶ The Vertues.

The leaues of blacke Bindweed called *Helxine Cissampelos*, stamped and strained, and the iuce A drunken, doth loose and open the bellie exceedingly.

The leaues pound and laid to the grieved place, dissolueth, wasteth, and consumeth hard lumps B and swellings, as *Galen* saith.

The

D The rest of the Bindweeds are not fit for medicine, but vnprofitable weeds, and hurtfull vnto each thing that groweth next vnto them.

† The description which our Author intended in the first place for *Volubilis nigra*, and took out of the 274. page of the *Adversaria*, but so confusedly and imperfectly, neither agreeing with that he intended, I have omitted as impertinent, and made his later, though also vnperfect description, somewhat more compleat and agreeable to the plant figured and intended.

CHAP. 318. Of Blew Bindweed.

¶ The Description.

Blew Bindweed bringeth forth long, tender, and winding branches, by which it climeth vpon things that stand neere vnto it, and foldeth it selfe about them with many turnings and windings, wrapping it selfe against the Sun, contrary to all other things whatsoever, that with their clasping tendrels do embrace things that stand neere vnto them; whereupon doe grow broad cornered leaues very like vnto those of Iuie, something rough and hairy, of an over-worne russet Greene colour: among which come forth most pleasant floures bell fashion, something cornered as are those of the common Bindweed, of a most shining azure colour tending to purple: which being past, there succeed round knobbed seed vessels, wherein is contained long blackish seed of the bignesse of a Tare, and like vnto those of the great hedge Bindweed. The root is thred-dy, and perisheth at the first approch of Winter.

1 *Convolvulus Ceruleus.*
Blew Binde-weed.

2 *Convolvulus ceruleus folio rotundo.*
Round leaued blew Bindweed.

2 There are also kept in our gardens two other blew floured Bindweeds. The one a large and great plant, the other a lesser. The great sends vp many large and long winding branches, like those of the last described, and a little hairie: the leaues are large and roundish, ending in a sharpe point: the floures are as large as those of the great Bindweed, and in shape like them, but blew of colour, with five broad purplish veines equally distant each from other: and these floures commonly grow three neere together vpon three seuerall stalks some inch long, fastened to another stalke

‡ 3 *Convolvulus caeruleus minor, folio oblongo.*
Small blew Bindweed.

stake some handfull long: the cup which holds the floures, and afterwards becomes the seed vessell, is rough and hairie: the seed is blacke, and of the bignesse of a Tare: the root is stringie, and lasts no longer than to the perfecting of the seed. I haue onely giuen the figure of the leafe and floure largely exprest, because for the root and manner of growing it resembles the last described.

3 This small blew Bindweed sendeth forth diuers long slender creeping hairie branches, lying flat vpon the ground, vnlesse there be something for it to rest vpon: the leaues be longish and hairy, and out of their bosomes (almost from the bottome to the tops of the stalks) come small foot-stalkes carrying beautifull floures of the bignesse and shape of the common smal Bindweed, but commonly of three colours; that is, white in the verie bottome, yellow in the middle, and a perfect azure at the top; and these twine themselves vp, open and shut in fve plaits like as most other floures of this kinde doe. The seed is contained in round knaps or heads, and is blacke and cornered: the root is small, and perishes euery yeare. *Bauhine* was the first that set this forth, and that by the name of *Convolvulus peregrinus caeruleus folio oblongo*. ‡

¶ The Place.

The seede of this rare plant was first brought from Syria and other remote places of the world, and is a stranger in these Northern parts; yet haue I brought vp and nourished it in my garden vnto flourishing, but the whole plant perished before it could perfect his seed.

¶ The Time.

The seed must be sowne as Melons and Cucumbers are, and at the same time: it floured with me at the end of August.

¶ The Names.

It is called *Campana Lazula*, and *Lazura*: of the later Herbarists *Campana Caerulea*, and also *Convolvulum Caeruleum*: it is thought to be the *Ligustrum nigrum*; of which *Columella* in his tenth booke hath made mention.

Fer calathis violam, & nigro permista ligustro
Balsamum cum Cassia neetens, &c.

In baskets bring thou Violets, and blew Bindweed withall,
But mixed with pleasant Baulme, and Cassia medicinall.

For if the greater smooth Withwinde, or Bindweed be *Ligustrum*, then may this be not vnproperly called *Ligustrum nigrum*: for a blew purple colour is oftentimes called blacke, as hath beene said in the blacke Violet. But there be some that would haue this Bindweed to be *Gratum Nil Auicenna*, of which he writeth in the 306. chapter; the which differeth from that *Nil* that is described in the 512. chapter. For this is *Isatis Gracorum*, or the Grecian Woad: but that is a strange plant, and is brought from India, as both *Auicenna* and *Serapio* doe testifie: *Auicenna* in this manner: what is *Gratum Nil*? It is *Cartamum Indum*: and *Serapio* thus; *Habal Nil*, is *Gratum Indicum*, in cap. 283. where the same is described in these words: [The plant thereof is like to the plant of *Leblab*, that is to say of *Convolvulus*, or Bindweed, taking hold of trees with his tender stalks: it hath both green branches and leaues, and there commeth out by euery leafe a purple floure, in fashion of the Bell-floures: and when the floure doth fall away, it yeeldeth a seed in small cods (I read little heads) in

in which are three graines, lesser than the seedes of Stauesaker] to which description this blew Bindweed is answerable.

There be also other sorts of Bindweeds, which be referred to *Nil Auicenna*, which no doubt may be kinds of *Nil*; for nothing gainsaith it why they should not be so. Therefore to conclude, this beautifull Bindweed, which we call *Convolvulus Caruleus*, is called of the Arabians *Nil*: of *Serapio*, *Hab al Nil*: about Alepo and Tripolis in Syria the inhabitants call it *Hasmisen*: the Italians, *Campana azurea*: of the beautifull azured floures, and also *Fior de notte*, because his beautie appeares most in the night.

¶ The Temperature.

Convolvulus Caruleus, or *Nil*, as *Auicen* saith, is hot and drie in the first degree: but *Serapio* maketh it to be hot and drie in the third degree.

¶ The Vertues.

A It purgeth and voideth forth raw, thicke, flegmaticke, and melancholicke humours: it driues out all kinde of wormes, but it troubleth the belly, and causeth a readinesse to vomit, as *Auicen* saith: it worketh slowly, as *Serapio* writeth: in whom more hereof may be found, but to little purpose, wherefore we thinke good to passe it ouer.

CHAP. 319. Of Scammonie, or purging Bindweed.

I *Scammonium Syriacum*
Syrian Scammonie.

† 2 *Scamonea Valentina*.
Scammonie of Valentia.

¶ The Description.

I Scammonie of Syria hath many stalks rising from one root, which are long, slender, and like the clasping tendrels of the vine, by which it climeth and taketh hold of such things as are next vnto it. The leaues bee broad, sharpe pointed like those of the smooth or hedge Bindweed: among which come forth very faire white floures tending to a bush colour, bell fashion. The root is long, thicke, and white within: out of which is gathered a iuice that beeing hardned

hardned, is greatly vsed in Physicke: for which consideration, there is not any plant growing vpon the earth, the knowledge whereof more concerneth a Physition, both for his shape and properties, than this Scammonie, which *Pena* calleth *Lactaria scansoriaque volvula*, that is, milkie and climbing Windweed, whereof it is a kinde; although for distinction sake I haue placed them as two seuerall kindes. And although this herbe be suspected, and halfe condemned of some learned men, yet there is not any other herbe to be found, whereof so small a quantitie will do so much good: neither could those which haue carped at it, and reprobued this herbe, finde any simple in respect of his vertues to be put in his roome: and hereof insueth great blame to all practitioners, who haue not endeououred to bee better acquainted with this herbe, chiefly to auoid the deceit of the craftie Drug-seller and Medicine-maker of this confected Scammonie, brought vs from farre places, rather to be called I feare infected Scammonie, or poisoned Scammonie, than confected. But to auoid the inconueniences hereof, by reason of the counterfeiting and ill mixing thereof: I haue therefore thought good to set downe what I haue taken out of the diligent, and no lesse learned obseruations of *Pena*, concerning this plant, Anno 1561, or 1562. *Vid. aduers. pag. 272.*

‡ 3 *Scammonium Mospeliense.*
French Scammonie.

Sequinus Martinellus an Apothecarie of Venice, being a most diligent searcher of Simples, that hemight haue the right Scammony of Antioch, trauelled into Syria, where from the citie of Aleppo hee sent an 100. weight of the iuice of Scammonie of Antioch, prepared and hardned into a lumpe, at the making whereof he was present himselfe. This man sent also of the seeds thereof, which in all points answered the cornered seed of *Volubilis*; which being sowne in the beginning of the Spring at Padua and Venice, grew vp to the form of a braue & goodly *Convolvulus*, in leaues, floures, and shew so like vnto our *Cissampelos*, that a man would haue taken it for the same without controuersie, saying that the root was great, and in bignesse equall to the great Brionie, as also in tenderesse. The outward bark of the root was of a dusky colour, and white within: the inner pith beeing taken forth seemeth in all mens iudgements to be the same and the best allowed *Turbith officinarum*: and yet it differeth from Turbith, in that, that it is more brittle, and will more easily bee broken, though the pith in Scammonie bee no lesse gummie and ful of milkie iuice, than Turbith. Further *Pena* reporteth, that afterward hee sent of this seed vnto Antwerpe, where it grew very brauely, the climbing strings and branches growing vp to the height of fise or six cubites, not differing from that which was sowne in Italie. Also *William Dries* of Antwerp, a most excellent Apothecary, did cut off the branches of his Antwerpian Scammonie from the root, and dried them, planted the seeds in his garden, and

conferred the superfluous branched roots with the Turbith of Alexandria, and could not find them to differ or disagree the one from the other in any point. But he that will know more concerning the making, difference, choice and vse of Scammony, let him reade *Pena* in his chapter of Scammonie, in the place formerly cited, where he shall finde many excellent secrets worthy the noting of those which would know how to vse such rare and excellent medicines.

2 Scammony of Valentia (whereof I haue plentie in my garden) is also a kinde of Bindweed, growing naturally by the sea side vpon the grauelly shore, by the mouth of the riuer Rhodanus, at the waters called *Aguas Marianas*, where the Apothecaries of Montpellier gather of it great plentie, who haue attempted to harden the milkie iuice thereof, to vse it in stead of Scammonie of Antioch. This plant bringeth forth many slender branches, which will climbe and very well run vpon a pole, as being supported therewith, and mounteth to the height of fise or six cubits, climbing & ramping like the first kinde of Scammonie. The leaues are greene, smooth, plaine, and sharpe pointed,

pointed, which being broken do yeeld abundance of milke: the floures are white, small, and starre-fashion: the roots white and many, shooting forth sundry other roots, whereby it mightily increaseth.

† 3 This strange kinde of Scammonie, which *Clusius* maketh rightly to be *Periploca species*, hath very many long branches ramping and taking hold of such things as do grow neerevnto them, of a darkish ashe colour: whereupon do grow leaues sharp pointed, crooked at the setting on of the stalke like those of the blacke Bryonie, and likewise of an ashe colour, set together by couples: from the bosome whereof thrust forth small tender foot-stalkes, whereon are placed small white floures starre-fashion: the seeds are contained in long coddies, and are wrapped vp in downe, like as those of Swallow-wort. Theroot is very long, slender, and creeping, like that of the small Bindweed, so that if it once take in any ground, it can hardly be destroyed.

¶ The Place.

It doth grow in hot regions, in a fat soile, as in Misia, Syria, and other like countries of Asia, it is likewise found in the Island of Candia, as *Bellonius* witnesseth; from whence I had some seeds, of which seed I receiued two plants that prospered exceeding well; the one whereof I bestowed vpon a learned Apothecarie of Colchester, which continueth to this day, bearing both floures and ripe seed. But an ignorant weeder of my garden plucked mine vp, and cast it away in my absence, in stead of a weede: by which mischance I am not able to write heereof so absolutely as I determined: it likewise groweth neere vnto the sea side about Tripolis in Syria, where the inhabitants doe call it *Mendhendi*.

¶ The Time.

It floured in my garden about S. James tide, as I remember, for when I went to Bristow Faire, I left it in floure; but at my returne it was destroyed as aforesaid.

¶ The Names.

The Greekes call it *scammonium*: the Latines, *Scammonium*, so naming not onely the plant it selfe, but also the hard and condensed iuice: of the Apothecaries, *Scammonia*; and when it is prepared, *Diagridium*: as though they should say, *degridior*: which signifieth a little teare: both the herbe and iuice are named *Scamony*: of *Rhasis*, *Coriziola*.

¶ The Temperature.

The iuice doth mightily purge by the stoole, and is the strongest purge whatsoeuer; for as *Oribasius* saith, it is in no part overcome by those things which stir and moue the body. It worketh the same not vehemently by any hot qualitie, but by some other hid and secret propertie of the whole substance; for there is no extremitie of heat perceiued in it by taste: for with what liquor or thing soeuer it is mixed, it giueth vnto it no bitternesse, biting, or other vnpleasant taste at all, and therefore it is not to be accounted among the extreme hot medicines, but among those that are moderately hot and drie.

¶ The Vertues.

- A It clenseth and draweth forth especially choler: also thinne and waterish humours, and oftentimes flegme, yet is it as *Paulus* teacheth more hurtfull to the stomacke than any other medicine.
- B *Mesues* thinketh that it is not onely troublesome and hurtfull to the stomacke, but also that it shaueth the guts, gnawing and fretting the intrails; openeth the ends of the veins, and through the essence of his whole substance, it is an enemy to the heart, and to the rest of the inward parts: if it be vsed immoderately and in time not conuenient, it causeth swounings, vomitings, and ouerturnings of the stomacke, scouring, the bloody flux and vlcers in the lower gut, which bring a continuall desire to the stoole.
- C These mischiefes are preuented if the Scammonie be boiled in a Quince and mixed with the slime or mucilage of *Pisillium*, called Fleawort, the pap or pulp of Prunes, or other things that haue a slimie iuice, with a little Masticke added, or some other easie binding thing.
- D *Plinie* affirmeth that the hurt thereof is taken away if Aloes be tempered with it: [Scammonie (saith he) ouerthroweth the stomack, purgeth choler, looseth the belly vnlesse two drams of Aloes be put vnto one scruple of it] which also *Oribasius* alloweth of in the first booke of his *Synopsis*, and the seuenth booke of his medicinall Collections.
- E The old Physitions were also wont to boile Scammonie in a Quince, and to giue the Quince to be eaten, hauing cast away the Scammonie: and this Quince so taken doth moue the belly without any hurt vnto the stomacke, as *Galen* in his first booke of the Faculties of Nourishments doth set downe, and likewise in his third booke of the Faculties of simple Medicines.
- F The Apothecaries do vse Scammonie prepared in a Quince, which as we haue said they name *Diagridium*, and do mix it in diuers compositions.

They

They keepe vsually in their shops two compositions, or electuaries, the one of *Psyllium* or Fleawort, set downe by *Mesue*: the other of Prunes fathered vpon *Nicolaus*, which were deuised for the tempering and correction of Scammony, and be commended for hot burning agues, and tertians, and for what diseases soeuer that proceed of choler.

Galen hath taken Masticke and *Bdellium* out of the pilles called *Cochia*, which also conteine in them a great and sufficient quantitie of Scammonie; as we may reade in his first booke of medicines according to the places affected, which also we meane to touch in the chapter of *Coloquintida*, where we intend to intreat at large concerning masticke, and other binding things, that are accustomed to be mixed for the correction of strong and violent purgers.

The quantitie of Scammony, or of *Diagridum* it selfe, as *Mesue* writeth, is from five graines to ten or twelue: it may be kept as the same Author sheweth, foure yeeres: *Pliny* iudgeth it to be after two yeeres little worth: it is to be vsed, saith he, when it is two yeeres old, and it is not good before, nor after. The mixing or otherwise the vse thereof, more than is set downe, I thinke it not expedient to set forth in the Physicall vertues of Scammony, vpon the receipt whereof many times death insueth: my reasons are diuers, for that the same is very dangerous, either if too great a quantitie thereof be taken, or if it be giuen without correction; or taken at the hands of some runnagate physicke-monger, quack saluer, old women-leaches, and such like abusers of Physicke, and deceiuers of people. The vse of Scammony I commit to the learned; vnto whome it especially and onely belongeth, who can very carefully and curiously vse the same.

The titles of the second and third were formerly transposed, and both the figures belonged to the second description, which was of the Scammonium *Monspetra* of the *Advers.* being the same with the *Scammonia Valentina* of *Clusius*.

CHAP. 320. Of Briony, or the white Vine.

¶ The Kindes.

There be two kindes of Bryony, the one white, the other blacke: of the white Bryony as followeth.

Bryonia alba.

White Bryonie.

¶ The Description.

White Bryony bringeth forth diuers long and slender stalkes with many clasping tendrels like the Vine, wherewith it catcheth hold of those things that are next vnto it. The leaues are broad, five cornered, and indented like those of the Vine; but rougher, more hairie, and whiter of colour. The floures be small and white, growing many together. The fruite consisteth in little clusters, the berries whereof are at the first greene, and red when they be ripe. The roote is very greate, long, and thicke, growing deepe in the earth, of a white yellowish colour, extreame bitter, and altogether of an vnpleasant taste. The Queenes chiefe Surgion Mr. *William Godorons*, a very curious and learned gentleman shewed me a roote hereof, that waied halfe an hundred weight, and of the bignesse of a child, of a yeere old.

¶ The Place.

Briony groweth almost euery where among pot-herbes, hedge-bushes, and such like places.

¶ The Time.

It floureth in May, and bringeth forth his grapes in Autumne.

¶ The Names.

Bryony is called in Greek, *αμνιλος λευκος* in Latine, *Vitis*

Vitis alba, or white Vine, and it is named, *αἰμῶνος*, because it is not onely like the Vine in leaues, but also for that it bringeth forth his fruite made vp after the likenesse of a little cluster, although the berries stand not close together: it is called of *Pliny*, *Bryonia*, and *Madon*: of the Arabians, *Alphesera*: of *Mattheus Sylvaticus*, *Viticella*: in the poore mans Treasure, *Rorastrum*: of *Apuleius*, *Apiastellum*, *vitis Taminia*, *Vitis alga*, and *Vitalba*: in high Dutch, *Suchwurtz*: in low Dutch, *Bzionte*: in English, Bryony, white Bryony, and tetter Berrie: in French, *Coulenree*: in Italian, *Zucca sylvestica*: in Spanish, *Nueza blanca*.

¶ *The Temperature.*

White Bryony is in all parts hot and dry, exceeding the third degree, especially of heate, with an exceeding great force of clensing and scouring, by reason whereof it purgeth and draweth forth, not onely cholericke and flegmaticke humours, but also warrie.

¶ *The Vertues.*

- A *Dioscorides* writeth that the first springs or sproutings being boiled and eaten, do purge by siege and vrine. *Galen* saith, that all men vse accustomedly to eate of it in the spring time, and that it is a nourishment wholesome, by reason of the binding qualitie that it hath; which is to be vnderstood of those of the wilde Vine, called in Latine, *Tamus*, and not of the sproutings of this plant; for the sproutings of the first springs of white Bryony are nothing binding at all, but do mightily purge the belly, and torment the stomacke.
- B *Dioscorides* also affirmeth, that the juice of the root being pressed out in the spring, and drunke with meade or honied water, purgeth flegme: and not onely the juice, but also the decoction of the root draweth forth flegme, choler, and waterish humours, and that very strongly, and it is withall oftentimes so troublesome to the stomacke, as it procureth vomite.
- C This kinde of strong purgation is good for those that haue the dropisie, the falling sicknesse, and the dizzinesse and swimming of the braine and head, which hath continued long, and is hardly to be remooued: yet notwithstanding it is not dayly to be giuen (as *Dioscorides* admonisheth) to them that haue the falling sicknesse, for it will be troublesome enough to take it now and then: and it is (as we haue said) an exceeding strong medicine, purging with violence, and very forceable for mans nature.
- D The root put vp in manner of a pessary bringeth forth the dead child and afterbirth: being boiled for a bath to sit in, it worketh the same effect.
- E It scoureth the skin, and taketh away wrinckles, freckles, sunne burning, blacke marks, spots, and scars of the face, being tempered with the meale of vetches or Tares, or of Fenugreeke: or boiled in oile till it be consumed; it taketh away blacke and blew spots which come of stripes: it is good against Whitlowes: being stamped with wine and applied it breaketh biles, and small apostumes, it draweth forth splinters and broken bones, if it be stamped and laid thereto.
- F The same is also fitly mixed with eating medicines, as *Dioscorides* writeth.
- G The fruit is good against scabs and the leprie, if it be applied and annointed on, as the same Author affirmeth.
- H *Galen* writeth, that it is profitable for Tanners to thicken their leather hides with.
- I Furthermore, an electuary made of the roots and hony or sugar, is singular good for them that are short winded, troubled with an old cough, paine in the sides, and for such as are hurt and bursten inwardly: for it dissolueth and scatereth abroad congealed and clotted blood.
- K The root stamped with salt is good to be laid vpon filthy vlcers and scabbed legs. The fruite is likewise good to the same intent if it be applied in manner aforesaid.
- L The root of Bryony and of wake-Robin stamped with some sulphur or brimstone, and made vp into a masse or lump and wrapped in a linnen clout, taketh away the morpew, freckles, and spots of the face, if it be rubbed with the same being dipped first in vineger.

CHAP. 321. Of blacke Brionie, or the wilde Vine.

¶ *The Description.*

THE black Bryony hath long flexible branches of a woodie substance, couered with a gaping or clouen barke growing very farre abroad, winding it selfe with his small tendrels about trees, hedges, and what else is next vnto it, like vnto the branches of the Vine. The leaues are like vnto those of Iuie or garden Nightshade, sharpe pointed, and of a shining greene colour: the floures are white, small, and mossie; which being past, there succeed little clusters of red berries

1 *Bryonia nigra.*
Blacke Bryonie.

Bryonia nigra florens non fructum ferens.

berries, somewhat bigger than those of the small Raisons, or Ribes, which wee call Currans, or small Raisins. The root is very great and thick, oftentimes as bigge as a mans legge, blackish without, and verie clammie or slimie within; which being but scraped with a knife, or any other thing fit for that purpose, it seemeth to be a matter fit to spread vpon cloth or leather in manner of a plaister or Seare-cloth: which being so spread and vsed, it serueth to lay vpon many infirmities, and vnto verie excellent purposes, as shall bee declared in the proper place.

2 The wilde Blacke Bryonie resemblerh the former, as well in slender Vinie stalkes as leaues; but clasping tendrels hath it none, neuerthelesse by reason of the infinite branches, and the tenderesse of the same, it taketh hold of those things that stand next vnto it, although easie to bee loosed, contrarie vnto the other of his kinde. The berries heereof are blacke of colour when they be ripe. The root also is black without, and within of a pale yellow colour like box. † This which is here described is the *Bryonia nigra* of *Dodonæus*; But *Bauhine* calleth it *Bryonia Alba*; and saith it differeth from the common white Bryonie, onely in that the root is of a yellowish boxe colour on the inside, and the fruit or berries are blacke when as they come to ripeness.

3 This is altogether like the first described in roots, branches, and leaues; onely the foot-stalks whereon the floures grow are about eight or nine inches long: the floures are something greater, hauing neither before or after their flourishing any berries or shew thereof; but the floures and foot-stalks do soone wither and fall away: this I haue heretofore, and now this Sommer, 1621, diligently obserued, because it hath not bene mentioned or obserued by any that I know. *John Goodyer.* †

¶ The Place.

The first of these plants doth grow in hedges and bushes almost euery where.

The second groweth in Hessa, Saxonic, Westphalia, Pomerland, and Misnia, where white Bryonie doth not grow, as *Valerius Cordus* hath written, who saith that it growes vnder Hasell-trees, neere vnto a citie of Germanie called Argentine, or Strawsborough.

¶ The Time.

They spring in March, bring forth their floures in May, and their ripe fruit in September.

¶ The Names.

Blacke Bryonie is called in Greeke *ἀμπέλος ἀγρία*: in Latine, *Bryonia nigra*: and *Vitis sylvestris*, or wilde Vine; notwithstanding it doth not a little differ from *Labrusca*, or *Vitis Vinefera sylvestris*, that is to say, from the wilde vine, which bringeth forth wine, which is likewise called *Ampelos agria*: Why both thes were called by one name, *Pliny* was the cause, who could not sufficiently expound them in his 23. booke, first chapter; but confounded them, and made them all one, in which error are also the Arabians.

This wilde Vine also is called in Latine, *Tamus*, and the fruit thereof *Vua Taminia*. *Pliny* nameth it also *Salicastrum*. *Ruellius* saith that in certaine shops it is called *Sigillum B. Mariae*; it is also called *Cyclaminus altera* but not properly: in English, Blacke Bryonie, wilde Vine, and our Ladies-seale.

¶ The Temperature.

The roots of the wild Vine are hot and drie in the third degree: the fruit is of like temperature, but yet nor so forceable: both of them scoure and waste away.

¶ The Vertues.

- A *Dioscorides* saith, that the roots do purge waterish humours, and are good for such as haue the dropsie; if they be boiled in wine, adding vnto the wine a little sea water, and bee drunke in three ounces of faire fresh water: he saith furthermore, that the fruit or berries doth take away the Sunburne and other blemishes of the skin.
- B The berries do not onely cleanse and remoue such kinde of spots, but do also very quickly waste and consume away blacke and blew marks that come of bruiſes and drie beatings, which thing also the roots performe being laid vpon them.
- C The young and tender sproutings are kept in pickle, and reſerued to be eaten with meat as *Dioscorides* teacheth. *Matthiolus* writeth that they are ſerued at mens tables also in our age in Tuscany: others report the like also to be done in Andaloſia, one of the kingdomes of Granado.
- D It is ſaid that ſwine ſeeke after the roots hereof, which they dig vp and eat with no leſſe delight than they do the roots of *Cyclaminus*, or *Paniſ porcinus*, whereupon it was called *Cyclaminus altera*, or Sow-bread; if this reaſon ſtand for good, then may we in like manner ioine hereunto many other roots, and likewise call them *Cyclaminus altera*, or Sow-bread: for ſwine do not ſeeke after the roots of this onely, digge them vp and greedily deuoure them, but the roots of diuers other plants also, of which none are of the kindes of Sow-bread. It would therefore be a point of raſhneſſe to affirm *Tamus* or our Ladies-ſeale to be a kinde of Sowbread, becauſe the roots thereof are pleaſant meat to ſwine.
- E The root ſpred vpon a piece of ſheepes leather, in manner of a plaister whileſt it is yet fresh and green, taketh away blacke or blew marks, all ſcars and deformitie of the ſkin, breaketh hard apoſtoms, draweth forth ſplinters and broken bones, diſſolueth congealed bloud; and being laid on and vſed vpon the hip or huckle bones, ſhoulders, armes, or any other part where there is great pain and ache, it taketh it away in ſhort ſpace, and worketh very effectually.

† The figure that was formerly in the ſecond place of this chapter did no waies agree with the diſcription, for it was of the *Vierna* or Trauellors ioy (hereafter to be mentioned; which *Tabernaemontanus*, (whoſe figures our Author made uſe of) calls *Vitis nigra ſeunda*).

CHAP. 322. Of Bryonie of Mexico.

¶ The Deſcription.

1 **T**hat plant which is now called *Mechoacan*, or Bryonie of Mexico, commeth verie neere the kinds of Bindweeds, in leaues and trailing branches, but in roots like the Brionies; for there ſhooteth from the root thereof many long ſlender tendrels, which do infinitely graſpe and claſpe about ſuch things as grow or ſtand next vnto them: whereupon grow great broad leaues ſharpe pointed, of a darke greene colour, in ſhape like thoſe of our Ladies-ſeale, ſomewhat rough and hairie, and a little biting the tongue: among the leaues come forth the floures (as *Nicolaus Monardus* writeth) not vnlike thoſe of the Orenge tree, but rather of the golden Apple of Ioue, conſiſting of ſiue ſmall leaues: out of the middeſt whereof commeth forth a little clapper or peſtell in manner of a round lumpe, as big as a Haſell nut; which being diuided with a thin ſkin, or membrane, that commeth through it, openeth into two parts, in each whereof are contained two ſeeds, as bigge as Peaſe, in colour blacke and ſhining. The root is thicke and long, verie like vnto the root of white Bryonie, whereof we make this a kinde, although in the taſte of the roots there is ſome difference: for the root of white Bryonie hath a bitter taſte, and this hath little or no taſte at all.

2 The Bryony, or *Mechoacan* of Peru groweth vp with many long trailing flexible branches, interlaced with diuers Vine tendrels, which take hold of ſuch things as are next or neere vnto them, euen in ſuch manner of claſping and climbing as doth the blacke Bryonie, or wine Vine, whereunto it is very like almoſt in each reſpect, ſauing that his moſſie floures do ſmell very ſweetly. The fruit as yet I haue not obſerued, by reaſon that the plant which doth grow in my garden did not perfeſt the ſame, by occaſion of the great rain and intemperate weather that hapned in *An. 1596*. but I am in good hope to ſee it in his perfection, & then we ſhall eaſily iudge whether it be that right *Mechoacan* that hath been brought from Mexico and other places of the Weſt Indies or no? The root by the figure ſhould ſeeme to anſwer that of the wilde Vine, but as yet thereof I cannot write certainly.

3 There is brought to vs and into uſe of late time the root of another plant, which ſeemes

1 *Mechoacan*.
Bryonie of Mexico.

2 *Mechoacan Peruviana*.
Bryonie of Peru.

haue much affinitiewith *Mechoacan*, and therefore *Bauhine* hath called it *Bryonia Mechoacan nigricans*, and thus deliuer the historie thereof. [It is a root like *Mechoacan*, but couered with a blackish barke, and reddish (or rather grayish) on the inside: and cut into slices, it was brought some yeares agoe out of India by the name of *Chelapa*, or *Gelapa*. It is called by those of Alexandria and Marfeilles *Talapium* or *Gelapum*: and of those of Marfeilles it is thought the blacke or male *Mechoacan*: The taste is not vngratefull, but gummy, and by reason of the much gumminesse, put to the fire it quickly flames: it in facultie exceeds the common *Mechoacan*; for by reason of the great gumminesse it more powerfully purgeth serous humours with a little griping, also it principally strengthens the liuer and stomacke; wherefore it is safely giuen in the weight of ʒj. and performs the operation without nauousnesse. It is vsually giuen in Succorie water, or some thin broth three houres before meat.] Thus much *Bauhine*, who saith it was first brought to these parts eleuen yeres before he set forth his *Prodromus*, so that was about 1611. It hath beene little vsed here till within this ten yeares. ‡

¶ The Place.

Some write that *Mechoacan* was first found in the Prouince of New Spaine, neere vnto the citie of Mexico or Mexican, whereof it tooke his name. It groweth likewise in a prouince of the West Indies called *Nicaragua* and *Quito*, where it is thought the best doth grow.

¶ The Names.

It beareth his name as is said, of the prouince in which it is found. Some take it to be *Bryonia species*, or to be a kinde of Bryonie: but seeing the root is nothing bitter, but rather without taste, it hath little agreement with Bryonie; for the root of Bryonie is verie bitter. Diuers name it *Rhabdum*, or white Rubarbe, but vnproperly, being nothing like. It commeth neere vnto Scammony, and if I might yeeld my censure, it seemeth to be *Scammonium quoddam Americanum*, or a certain Scammonie of America. Scammonie creepeth, as wee haue sayd, after the manner of Bindweed. The root is both white and thicke: the iuice hath but little taste, as also hath this of *Mechoacan*: it is called in English, *Mechoa* and *Mechocan*, and may bee called Indian Bryonie.

¶ *The Temperature.*

The root is of a meane temperature between hot and cold, but yet drie.

¶ *The Vertues.*

- A It purgeth by siege, especially flegme, and then waterish humours. It is giuen from one ful dram weight to two, and that with wine, or with some distilled water (according as the disease requireth) or els in flesh broth.
- B It is to be giuen with good effect to all, whose diseases proceed of flegme and cold humors. It is good against head-ache that hath continued long, old coughes, hardnesse of breathing, the colick, paine of the kidneies and ioints, the diseases of the reines and belly.

CHAP. 323. *Of the Manured Vine.*¶ *The Kindes.*

THE Vine may be accounted among those plants that haue need of staies and props, and cannot stand by themselues; it is held vp with poles and frames of wood, and by that meanes it spreadeth all about and climbeth aloft: it ioyneth it selfe vnto trees, or whatsoeuer standeth next vnto it.

Of Vines that bring forth wine, some be tame and husbanded, and others that be wilde: of tame Vines there are many that are greater, and likewise another sort that be lesser.

¶ *The Description.*

THE trunke or bodie of the Vine is great and thicke, very hard, couered with many barks, and those full of clifles or chinkes; from which grow forth branches, as it were armes, many waies spreading; out of which come forth iointed shoots and springs: and from the bosome of those ioints, leaues, and clasping tendrels; and likewise bunches or clusters filled full of grapes: the leaues be broad, something round, five cornered, and somewhat indented about the edges, amongst which come forth many clasping tendrels, that take hold of such props or staies as do stand next vnto it. The grapes do differ both in colour and greatnesse, and also in many other things, the which to distinguish seuerally were impossible, considering the infinite sorts or kinds, and also those which are transplanted from one region or climate to another, do likewise alter both from the forme and taste they had before, in consideration whereof it shall be sufficient to set forth the figure of the manured grape, and speake somewhat of the rest.

There is found in Græcia and the parts of Morea, as *Pantalarea*, *Zante*, *Cephalonia*, and *Petras* (whereof some are Islands, and the other of the continent) a certaine Vine that hath a trunke or bodie of a wooddie substance, with a scaly or rugged bark, of a grayish colour, whereupon do grow faire broad leaues, sleightly indented about the edges, not vnlike vnto those of the Marsh-mallow: from the bosome whereof come forth many small clasping tendrels, and also rough and pliant foot-stalkes, whereon do grow verie faire bunches of grapes, of a watchet blewish colour: from the which fruit commeth forth long tender laces or strings, such as is found among Sauorie; whereupon wee call that plant which hath it laced Sauorie, not vnlike that that groweth among, and vpon Flax, which we call Dodder, or *Podagra lini*, whereof is made a blacke wine, which is called Greeke wine, yet of the taste of Sacke. The laced fruit of this Vine may be fitly termed *Vua barbata*, Laced or bearded grapes.

The plant that beareth those small Raisins which are commonly called Corans or Currans, or rather Raisins of Corinth, is not that plant which among the vulgar people is taken for Currans, being a shrubbe or bush that bringeth forth small clusters of berries, differing as much as may bee from Corans, hauing no affinitie with the Vine or any kinde thereof. The Vine that beareth small Raisins or Corans hath a bodie or stocke as other Vines haue, branches and tendrels likewise. The leaues are larger than any of the others, snipt about the edges like the teeth of a saw: among which come forth clusters of grapes, in forme like the other, but smaller, of a blewish colour; which being ripe are gathered and laid vpon hurdles, carpets, mats, and such like, in the Sun to drie: then are they carried to some house and laied vpon heapes, as we lay apples and corne in a garner, vntill the merchants do buy them: then do they put them into large Buts or other wooden vessels, and tread them downe with their bare feet, which they call Stiuing, and so are they brought into these parts for our vse. ‡ And they are commonly termed in Latine, *Vua Corinthiaca*, and *Passula minores*. ‡

‡ There

Vitis Vinifera.
The manured Vine.

‡ There is also another which beareth exceeding faire grapes; whereof they make Raisins, whiter coloured, and much exceeding the bignesse of the common Raisin of the Sunne: yet that Grape whereof the Raisin of the Sun is made is a large one, and thought to be the *Vua Zibibi* of the Arabians; and it is that which *Tabernamontanus* figured vnder that name, who therein was followed by our Authour: but the figures being little to the purpose, I haue thought good to omit them. ‡

There is another kinde of Vine, which hath great leaues very broad, of an ouerworne colour; whereupon do grow great bunches of Grapes of a blewish colour: the pulpe or meate whereof sticketh or cleaueth so hard to the graines or little stones, that the one is not easily diuided from the other; resembling some starued or withered berrie that hath been blasted, whereof it was named *Duracina*.

There be some vines that bring forth grapes of a whitish or reddish yellow colour: others of a deepe red, both in the outward skinne, pulpe, and iuyce within.

There be others whose grapes are of a blew colour, or something red, yet is the iuyce like those of the former. These grapes do yeeld forth a white wine before they are put into the presse, and a reddish or paller Wine when they are trodden with the husks, and so left to macerate or ferment, with which if they remaine too long they yeeld forth a wine of a higher colour.

There be others which make a blacke and obscure red wine, whereof some bring bigger clusters, and consist of greater grapes; others of lesser: some grow more clustred and closer together, others looser: some haue but one stone, others more: some make a more austere or harsh wine; others a more sweet: of some the old wine is best; of diuers, the first yeares wine is most excellent: some bring forth fruit foure square, of which sorts or kindes we haue great plenty.

¶ The Place.

A fit soile for Vines, saith *Florentinus*, is euery blacke earth, which is not very close nor clammy, hauing some moisture; notwithstanding *Columella* saith that great regard is to be had what kinde or sort of Vine you would nourish, according to the nature of the countrey and soile.

A wise husbandman will commit to a fat and fruitfull soile a leane Vine, and of his own nature not too fruitfull: to a leane ground a fruitfull vine: to a close and compact earth a spreading vine, and that is full of matter to make branches of: to a loose and fruitfull soile a Vine of few branches. The same *Columella* saith, that the Vine delighteth not in dung, of what kinde soeuer it be; but fresh mould mixed with some shavings of horne is the best to be disposed about the roots, to cause fertilitie.

¶ The Time.

Columella saith, that the Vines must be pruned before the young branches bud forth. *Palladius* writeth, in Februarie: if they be pruned later they lose their nourishment with weeping.

¶ The Names.

The Vine is called in Greeke *ἄμπελος*: as much to say in Latine as, *Vitis Vinifera*, or the Vine which beareth wine; and *ἄμπελος καλλία*: that is, *Vitis mansuetas*, *sive cultiva*, Tame or manured Vine. And it is called *ἄμπελος*, that it may differ from both the Bryonies, the white and the blacke, and from *Tamus*, or our Ladies Seale, which be likewise named *ἄμπελος*. It is called *Vitis*, because *inuittatur ad uvas pariendas*. It is cherished to the intent to bring forth full clusters, as *Varro* saith.

Pliny maketh *Vua Zibibi*, *Alexandrina vitis*, or Vine of Alexandria, in his fourteenth booke, and third chapter, describing the same by those very words that *Theophrastus* doth. *Dioscorides* setteth it downe to be *altera species Vitis sylvestris*, or a second kinde of wilde Vine; but wee had rather retaine it among the tame Vines. We may name it in English, Raisin Vine. The fruits hereof are called ‡

called in shops by the name of *Passularum de Corintho* : in English, Currans, or small Raisins.

Sylvestris Vitis or wilde Vine is called in Greeke *Ἀμύνθος ἀγρία* : and in Latine *Labrusca*, as in *Virgils Ecloges* :

— *Adspice ut antrum*
Sylvestris raris sparsit labrusca racemis.

— See how the wilde Vine
Bedecks the caue with sparsed clusters fine.

To this wilde Vine doth belong those which *Pliny* in his sixteenth booke, chapter 27. reporteth to be called *Trifera*, or that bring three sundry fruits in one year, as *Infana* and mad bearing Vines, because in those some clusters are ripe and full growne, some in swelling, and others but flourishing.

The fruit of the Vine is called in Greeke *ἔρπυρα*, and *εὐρύλη* : in Latine, *Racemus*, and *Vua* : in English, a bunch or cluster of Grapes.

The cluster of Grapes that hath been withered or dried in the Sun is named in Greeke *σέφι* : in Latine, *Vua passa* : in shops, *Passula* : in English, Raisins of the Sun.

The berry or Grape it selfe is called in Latine *Acinus*, and also *Granum*, as *Democritus* saith, speaking of the berry.

The seeds or stones contained within the berries are called in Latine, *Vinacea*, and sometimes *Nuclei* : in shops, *Arilli*, as though they should say *Ariduli*, because they are dry, and yeeld no iuyce, notwithstanding *Vinacea* are also taken in *Columella* for the drosse or remnant of the Grapes after they be pressed.

The stalke, which is in the middle of the clusters, and vpon which the grapes do hang, is called of *Galen*, *ἔρπυρα* : of *Varro*, *Scapus uvuarum*.

¶ The Temperature and Vertues.

A The tender and clasping branches of the Vine and the leaues do coole, and mightily bind. They stay bleeding in any part of the body : they are good against the laske, the bloody flux, the heartburne, heate of the stomacke, or readinesse to vomit. It stayeth the lusting or longing of women with childe, though they be but outwardly applied, and also taken inwardly any manner of waies. They be moreouer a remedie for the inflammation of the mouth, and almonds of the throat, if they be gargled, or the mouth washed therewith.

B Of the same faculty be also the clusters gathered before they be ripe, and likewise the bunches of the wilde grape, which is accounted to be more effectually against all those infirmities.

C *Dioscorides* saith, That the liquor which falleth from the body and branches being cut, and that sometime is turned as it were into a gum (which driueth forth stones out of the kidnies and bladder, if the same be drunke in wine) healeth ring-wormes, scabs, and leproie, but the place is first to be rubbed with Nitre. Being often anointed or layd on it taketh away superfluous haire : but yet he saith that the same is best which issueth forth of the greene and smaller stickes, especially that liquor which falleth away whilest the branches are burning, which taketh away warts, if it be laid on them.

D The stones and other things remaining after the pressing are good against the bloody flux, the laske of long continuance, and for those that are much subiect to vomiting.

E The ashes made of the stickes and drosse that remaine after the pressing, being laid vpon the piles and hard swellings about the fundament, doe cure the same, being mixed with oile of Rue, or Herbe-grace and vinegar, as the same Author affirmeth, it helpeth to strengthen members out of ioynt, and such as are bitten with any venomous beast, and easeth the paine of the spleene or milt, being applied in manner of a plaister.

F The later age do vse to make a lie of the ashes of Vine sticks, in compositions of causticke and burning medicines, which serue in stead of an hot-iron : the one we call a potentiall cauterie, and the other actual.

¶ Of Grapes.

G OF Grapes, those that are eaten raw do trouble the belly, and fill the stomacke full of winde, especially such as are of a sowre and austere taste ; such kinds of grapes doe very much hinder the concoction of the stomacke ; and while they are disperfed through the liuer and veins they ingender cold and raw iuyce, which cannot easily be changed into good blood.

H Sweet grapes and such as are thorow ripe, are lesse hurtfull ; their iuyce is hotter, and is easilier disperfed. They also sooner passe thorow the belly, especially being moist, and most of all if the liquor with the pulpe be taken without the stones and skin, as *Galen* saith.

I The substance of the stones, although it be drier, and of a binding quality, doth descend thorow all

all the bowels, and is nothing changed : as also the skins, which are nothing at all altered in the body, or very little.

Those grapes which haue a strong taste of wine are in a meane betweene soure and sweet. A

Such grapes as haue little iuyce do nourish more, and those lesse that haue more iuyce : but these do sooner descend ; for the body receiueth more nourishment by the pulpe than by the iuyce ; by the iuyce the belly is made more soluble. B

Grapes haue the preheminance among the Autumne fruits, and nourish more than they all, but yet not so much as figs : and they haue in them little ill iuyce, especially when they be thorow ripe. C

Grapes may be kept the whole yeare, being ordered after that manner as *Ioachimvs Camerarius* reporteth. You shall take (saith he) the meale of mustard seed, and strew in the bottome of any earthen pot well leaded ; whereupon you shall lay the fairest bunches of the ripest grapes, the which you shall couer with more of the foresaid meale, and lay vpon that another sort of Grapes, so doing vntill the pot be full. Then shall you fill vp the pot to the brim with a kinde of sweete Wine called Must. The pot being very close couered shall be set into some Cellar or other cold place. The Grapes you may take forth at your pleasure, washing them with faire water from the powder. D

¶ Of Raisins.

OF Raisins most are sweet ; some haue an austere or harsh taste. Sweet Raisins are hotter ; austere colder : both of them do moderately binde, but the austere somewhat more, which doe more strengthen the stomacke. The sweet ones do neither slacken the stomacke, nor make the belly soluble, if they be taken with their stones, which are of a binding qualitie : otherwise the stones taken forth, they do make the belly loose and soluble. E

Raisins do yeeld good nourishment to the body, they haue in them no ill iuyce at all, but doe ingender somewhat a thicke iuyce, which notwithstanding doth nourish the more. F

There commeth of sweet and fat Raisins most plenty of nourishment : of which they are the best that haue a thin skin. G

There is in the sweet ones a temperate and smoothing qualitie, with a power to clense moderately. They are good for the chest, lungs, winde-pipe, kidneyes, bladder, and for the stomacke ; for they make smooth the roughnesse of the winde-pipe, and are good against hoarsenesse, shortnesse of breath, or difficultie of breathing : they serue to concoct the spittle, and to cause it to rise more easily in any disease whatsoever of the chest, sides, and lungs, and do mitigate the paine of the kidneyes and bladder, which hath ioyned with it heate and sharpenesse of vrine : they dull and allay the malice of sharpe and biting humors that hurt the mouth of the stomacke. H

Moreover, Raisins are good for the liuer, as *Galen* writeth in his seuenth booke of medicines, according to the places affected : for they be of force to concoct raw humors, and to restrain their malignitie, and they themselues do hardly putrifie : besides, they are properly and of their owne substance familiar to the intrals, and cure any distemperature, and nourish much ; wherein they are chiefly to be commended, for Raisins nourish, strengthen, resist putrification, and if there be any distemperature by reason of moisture or coldnesse, they helpe without any hurt, as the said *Galen* affirmeth. I

The old Physitians haue taught vs to take forth the stones, as we may see in diuers compositions of the antient writers ; as in that composition which is called in *Galen*, *Arteriaca Mithridatis*, which hath the seeds of the Raisins taken forth : for seeing that Raisins containe in them a thicke substance, they cannot easily passe through the veines, but are apt to breed obstructions and stoppings of the intrals : which things happen the rather by reason of the seeds ; for they so much the harder passe through the body, and do quicklier and more easily cause obstructions, in that they are more astringent or binding. Wherefore the seeds are to be taken out, for so shall the iuyce of the Raisins more easily passe, and the sooner be distributed through the intrals. K

Dioscorides reporteth, That Raisins chewed with pepper draw flegme and water out of the head. L

Of Raisins is made a pulstesse good for the gout, rottings about the ioynts, gangrens, and mortified vlcers : being stamped with the herbe All-heale it quickly takes away the nailes that are loose in the fingers or toes, being laid thereon.

¶ Of Must.

MUST, called in Latine *Mustum*, that is to say, the liquor newly issuing out of the grapes when they be trodden or pressed, doth fill the stomacke and intrals with winde ; it is hardly digested ; it is of a thicke iuyce, and if it do not speedily passe through the body it becommeth more hurtfull. M

huitfull. It hath onely this one good thing in it (as *Galen* saith) that it maketh the body soluble.

- A** That which is sweetest and pressed out of ripe Grapes doth soonest passe through; but that which is made of soure and austere grapes is worst of all: it is more windy, it is hardly concocted, it ingendreth raw humors; and although it doth descend with a loosenesse of the belly, notwithstanding it oftentimes withall bringeth the collicke and paines of the stone: but if the belly be not mooued all things are the worse, and more troublesome; and it oftentimes brings an extreame laske, and the bloody flux.
- B** That first part of the wine that commeth forth of it selfe before the Grapes be hard pressed, is answerable to the Grape it selfe, and doth quickly descend; but that which issues forth afterward, hauing some part of the nature of the stones, stalks, and skins, is much worse.

¶ Of Cute.

- C** **O**F Cute that is made of Must, which the Latines call *Sapa*, and *Defrutum*, is that liquor which we call in English Cute, which is made of the sweetest Must, by boyling it to a certain thicknesse, or boyling it to a third part, as *Columella* writeth.
- D** *Pliny* affirmeth, That *Sapa* and *Defrutum* do differ in the manner of the boyling; and that *Sapa* is made when the new wine is boyled away till onely a third part remaineth: and *Defrutum* till halfe be boyled.
- E** *Siræum*, (saith he in his fourteenth booke, cap. 17.) which others call *Wine*, and we *Sapa*, a worke of wit, and not of nature, is made of new wine boyled to a third part; which being boiled to halfe we call *Defrutum*.
- F** *Palladius* ioyneth to these *Carænum*, which as he saith is made when a third part is boiled away, and two remaine.
- G** *Leontius* in his Geoponicks sheweth, that *Hepsema* must be made of eight parts of new wine, and an hundred of wine it selfe boyled to a third.
- H** *Galen* testifieth, that *Wine* is new wine very much boyled. The later Physitians do call *Hepsema* or *Sapa* boyled wine.
- I** Cute or boyled wine is hot, yet not so hot as wine, but it is thicker; yet not so easily distributed or carried through the body, and it slowly descendeth by vrine, but by the belly oftentimes sooner; for it moderately maketh the same soluble.
- K** It nourisheth more, and filleth the body quickly; yet doth it by reason of his thicknesse sticke in the stomacke for a time, and is not so fit for the liuer or for the spleene. Cute also doth digest raw humors that sticke in the chest and lungs, and raiseth them vp speedily. It is therefore good for the cough and shortnesse of breath.
- L** The Vintners of the Low-countries (I will not say of London) doe make of Cute and Wine mixed in a certain proportion, a compound and counterfeit wine, which they sell for Candy wine, commonly called Malmsey.
- M** *Pliny lib. 14. cap. 9.* saith, that Cute was first deuised for a bastard hony.

¶ Of Wine.

- N** **T**O speake of Wine, the iuyce of Grapes, which being newly pressed forth is called as we haue said *Mustum* or new wine: after the dregs and drosse are setled, and now it appeareth pure and cleere, it is called in Greeke *Wine*: in Latine *Vinum*: in English, Wine, and that not vnproperly. For certaine other iuyces, as of Apples, Pomegranats, Peares, Medlars, or Seruices, or such as otherwise made (for examples sake) of barley and Graine, be not at all simply called wines, but with the name of the thing added whereof they do consist. Hereupon is the wine which is pressed forth of the pomegranat berries named *Rhoites*, or wine of pomegranats: out of Quinces, *Cydones*, or wine of Quinces: out of Peares, *Apyites*, or Perry: and that which is compounded of barley is called *Zythum*, or Barley wine: in English, Ale or Beere.
- O** And other certaine wines haue borrowed surnames of the plants that haue beene steeped or infused in them; and yet all wines of the Vine, as Wormwood wine, Myrtle wine, and Hyssop wine, and these are all called artificiall wines.
- P** That is properly and simply called wine which is pressed out of the grapes of the vine, and is without any manner of mixture.
- Q** The kindes of wines are not of one nature, nor of one facultie or power, but of many differing one from another: for there is one difference thereof in taste, another in colour; the third is referred to the consistence or substance of the wine; the fourth consisteth in the vertue and strength thereof. *Galen* addeth that which is found in the smell, which belongs to the vertue and strength of the wine.

That

That may also be ioyned vnto them which respecteth the age: for by agewines become hotter A
and sharper, and doe withall change oftentimes the colour, the substance, and the smell: for some
wines are sweet of taste; others austere or something harsh; diuers of a rough taste, or altogether
harsh; and most of them sufficient sharpe: there be likewise wines of a middle sort, inclining to
one or other qualitie.

Wine is of colour either white or reddish, or of a blackish deepe red, which is called blacke, or B
of some middle colour betweene these.

Some wine is of substance altogether thin; other some thicke and fat; and many also of a mid- C
dle consistence.

One wine is of great strength, and another is weake, which is called a waterish wine: a ful wine D
is called in Latine *Vinosum*. There be also among these very many that be of a middle strength.

There is in all wines, be they neuer so weake, a certaine winie substance thin and hot. There be E
likewise waterie parts, and also diuers earthy: for wine is not simple, but (as *Galen* testifieth in his
fourth booke of the faculties of medicines) consisteth of parts that haue diuers faculties.

Of the sundry mixture and proportion of these substances one with another there rise diuers and F
sundry faculties of the wine.

That is the best and fullest wine in which the hot and winie parts do most of all abound: and G
the weakest is that wherein the waterie haue the preheminence.

The earthy substance abounding in the mixture causeth the wine to be austere or something H
harsh, as a crude or raw substance doth make it altogether harsh. The earthy substance being se-
uered falleth downe, and in continuance of time sinketh to the bottome, and becomes the dregs
or lees of the wine: yet it is not alwaies wholly seuered, but hath both the tast and other qualities
of this substance remaining in the wine.

All wines haue their heate, partly from the proper nature and inward or originall heate of the I
vine, and partly from the Sun: for there is a double heate which ripeneth not only the grapes, but
also all other fruits, as *Galen* testifieth; the one is proper and naturall to euery thing, the other is
borrowed of the Sun: which if it be perceiued in any thing, it is vndoubtedly best and especially
in the ripening of grapes.

For the heate which proceeds from the Sun concocteth the grapes and the iuyce of the grapes, K
and doth especially ripen them, stirring vp and increasing the inward and naturall heat of the wine,
which otherwise is so ouerwhelmed with abundance of raw and waterish parts, as it seemes to be
dulled and almost without life.

For vnlesse wine had in it a proper and originall heate, the grapes could not be so concocted by L
the force of the Sun, as that the wine should become hot; no lesse than many other things natu-
rally cold, which although they be ripened and made perfect by the heate of the Sun, do not for
all that lose their originall nature; as the fruits, iuyces, or seeds of Mandrake, Nightshade, Hem-
locke, Poppy, and of other such like, which though they be made ripe, and brought to full perfe-
ction, yet still retaine their owne cold qualitie.

Wherefore seeing that wine through the heate of the Sunne is for the most part brought to his M
proper heate, and that the heate and force is not all alike in all regions and places of the earth;
therefore by reason of the diuersitie of regions and places, the wines are made not a little to differ
in facultie.

The stronger and fuller wine groweth in hot countries and places that lie to the Sun; the rawer N
and weaker in cold regions and prouinces that lie open to the North.

The hotter the Sommer is the stronger is the wine; the lesse hot or the moister it is, the lesse ripe O
is the wine. Notwithstanding not onely the manner of the weather and of the Sunne maketh the
qualities of the wine to differ, but the natieue propertie of the soile also; for both the tast and other
qualities of the Wine are according to the manner of the Soile. And it is very well knowne,
that not only the colour of the wine, but the taste also dependeth vpon the diuersity of the grapes.

Wine (as *Galen* writeth) is hot in the second degree, and that which is very old in the third; but P
new wine is hot in the first degree: which things are especially to be vnderstood concerning the
meane betweene the strongest and the weakest; for the fullest and mightiest (being but *Horna*, that
is as I take it of one yeare old) are for the most part hot in the second degree. The weakest and
the most waterish wines, although they be old, do seldome exceed the second degree.

The driness is answerable to the heate in proportion, as *Galen* saith in his booke of Simples: but Q
in his bookes of the gouernment of health he sheweth, that wine doth not onely heate, but also
moisten our bodies, and that the same doth moisten and nourish such bodies as are extreme dry:
and both these opinions be true.

For the faculties of wine are of one sort as it is a medicine, and of another as it is a nourish- R
ment; which *Galen* in his booke of the faculties of nourishments doth plainly shew, affirming that
those qualities of the wine which *Hippocrates* writeth of in his booke of the manner of diet, be not
as

as a nourishment, but rather as of a medicine. For wine as it is a medicine doth dry, especially being outwardly applied; in which case, for that it doth not nourish the body at all, the drines doth more plainly appeare, and is more manifestly perceiued.

A Wine is a speciall good medicine for an vlcere, by reason of his heate and moderate drying; as *Galen* teacheth in his fourth booke of the method of healing.

B *Hippocrates* writeth, That vlcers, what manner of ones soeuer they are, must not be moistned vnlesse it be with wine: for that which is dry (as *Galen* addeth) commeth neerer to that which is whole, and the thing that is moist, to that which is not whole.

C It is manifest that Wine is in power or facultie dry, and not in act; for Wine actually is moist and liquid, and also cold: for the same cause it likewise quencheth thirst, which is an appetite or desire of cold and moist, and by this actuall moisture (that we may so terme it) it is if it be inwardly taken, not a medicine, but a nourishment; for it nourisheth, and through his moisture maketh plenty of blood; and by increasing the nourishment it moistneth the body, vnlesse peraduenture it be old and very strong: for it is made sharpe and biting by long lying, and such kinde of Wine doth not onely heate, but also consume and dry the body, for as much as it is not now a nourishment, but a medicine.

D That wine which is neither sharpe by long lying, nor made medicinable, doth nourish and moisten, seruing as it were to make plenty of nourishment and blood, by reason that through his actuall moisture it more moistneth by feeding, nourishing, and comforting, than it is able to dry by his power.

E Wine doth refresh the inward and naturall heate, comforteth the stomacke, causeth it to haue an appetite to meate, moueth concoction, and conueyeth the nourishment through all parts of the body, increaseth strength, inlargeth the body, maketh flegme thinne, bringeth forth by vrine cholericke and waterie humors, procureth sweating, ingendreth pure blood, maketh the body wel coloured, and turneth an ill colour into a better.

F It is good for such as are in a consumption by reason of some disease, and that haue need to haue their bodies nourished and refreshed (alwaies prouided they haue no feuer,) as *Galen* saith in his seventh booke of the Method of curing. It restoreth strength most of all other things, and that speedily: It maketh a man merry and ioyfull: It putteth away feare, care, troubles of minde, and sorrow: It moueth pleasure and lust of the body, and bringeth sleepe gently.

G And these things proceed of the moderate vse of wine: for immoderate drinking of wine doth altogether bring the contrarie. They that are drunke are distraughted in minde, become foolish, and oppressed with a drowse sleepinesse, and be afterward taken with the Apoplexy, the gout, or altogether with other most grievous diseases; the braine, liuer, lungs, or some other of the intrals being corrupted with too often and ouermuch drinking of wine.

H Moreouer, wine is a remedy against taking of Hemlocke or green Coriander, the iuyce of black Poppy, Wolfs-bane, and Leopards-bane, Tode-stooles, and other cold poysons, and also against the biting of serpents, and stings of venomous beasts, that hurt and kill by cooling.

I Wine also is a remedie against the ouer-fulnesse and stretching out of the sides, windy swellings, the Greene sicknesse, the dropie, and generally all cold infirmities of the stomack, liuer, milt, and also of the matrix.

K But Wine which is of colour and substance like water, through shining bright, pure, of a thin substance, which is called white, is of all wines the weakest; and if the same should be tempered with water it would beare very little: and hereupon *Hippocrates* calleth it *aryphos*, that is to say, bearing little water to delay it withall.

L This troubleth the head and hurteth the sinewes lesse than others do, and is not vnpleasant to the stomacke: it is easily and quickly disperfed thorow all parts of the body: it is giuen with far lesse danger than any other wine to those that haue the Ague (except some inflammation or hot swelling be suspected) and oftentimes with good successe to such as haue intermitting feuers; for as *Galen*, lib. 8. of his Method saith, it helpeth concoction, digesteth humors that be halfe raw, procureth vrine and sweat, and is good for those that cannot sleepe, and that be full of care and sorrow, and for such as are ouerwearyed.

M Blacke wine, that is to say wine of a deepe red colour, is thicke, and hardly disperfed, and doth not easily passe through the bladder: it quickly taketh hold of the braine, and makes a man drunk: it is harder of digestion: it remaineth longer in the body; it easily stoppeth the liuer and spleene; for the most part it bindes, notwithstanding it nourisheth more, and is more fit to ingender blood: it filleth the body with flesh sooner than others do.

N That which is of a light crimson red colour is for the most part more delightfull to the taste, fitter for the stomacke; it is sooner and easier disperfed: it troubleth the head lesse, it remains not so long vnder the short ribs, and easilier descendeth to the bladder than blacke wine doth: it doth also

also make the belly costive, if so be that it be not ripe. For such crude and rough wines do oftentimes molest weake stomackes, and are troublesome to the belly.

Reddish yellow wine seemeth to be in a meane betweene a thin and thicke substance: otherwise it is of all vines the hottest; and suffereth most water to be mixed with it, as *Hippocrates* writeth.

The old vine of this kinde, being of a thin substance and good smell, is a singular medicine for all those that are much subject to swooning, although the cause thereof proceed of choler that hurteth the mouth of the stomacke, as *Galen* testifieth in the 12. booke of his method.

Sweete wine the lesse hot it is, the lesse doth it trouble the head, and offend the minde; and it better passeth through the belly, making it oftentimes soluble: but it doth not so easily passe or descend by vrine.

Againe, the thicker it is of substance, the harder and slower it passeth through: it is good for the lungs, and for those that haue the cough. It ripeneth raw humours that sticke in the chest, and causeth them to be easilier spit vp; but it is not so good for the liuer, whereunto it bringeth no small hurt when either it is inflamed, or schirrous, or when it is stopped. It is also an enemy to the spleene, it sticketh vnder the short ribs, and is hurtfull to those that are full of choler. For this kind of wine, especially the thicker it is, is in them very speedily turned into choler: and in others when it is well concocted, it increaseth plenty of nourishment.

Austere wine, or that which is somewhat harsh in tast, nourisheth not much; and if so be that it be thin and white, it is apt to prouoke vrine, it lesse troubleth the head, it is not quickly digested, for which cause it is the more to be shunned, as *Galen* saith in his 12. booke of his method.

That wine which is altogether harsh or rough in tast, the lesse ripe it is, the neerer it cometh to the qualities of Veriuiue made of sower grapes, being evidently binding. It strengtheneth a weake stomacke; it is good against the vnkindely lusting or longing of women with child; it staueth the laske, but it sticketh in the bowels: breedeth stoppings in the liuer and milt; it slowly descendeth by vrine, and something troubleth the head.

Old wine which is also made sharpe by reason of age, is not onely troublesome to the braine, but also hurteth the sinewes: it is an enemy to the entrailes, and maketh the body leane.

New wine, and wine of the first yeere, doth easily make the body to swell, and ingendreth winde, it causeth troublesome dreames, especially that which is not thoroughly refined, or thicke, or very sweet: for such do sooner sticke in the intrailes than others do. Other wines that are in a meane in colour, substance, taste, or age, as they do decline in vertues and goodnesse from the extreames; so also they be free from their faults and discommodities. They come neere in faculties to those wines whereunto they be next, either in colour, taste, or substance, or else in smell or in age.

Wine is fittest for those that be of nature cold and dry; and also for old men, as *Galen* sheweth in his fifth booke of the gouernment of health: for it heateth all the members of their bodies, and purgeth away the watery part of the bloud, if their be any.

The best wines are those that be of a fat substance: for those both increase bloud, and nourish the body; both which commodities they bring to old men, especially at such time as they haue no ferous humour in their veines, and haue need of much nourishment. It happeneth that oftentimes there doth abound in their bodies a waterish excrement, and then stand they in most need of all of such wines as do prouoke vrine.

As wine is best for old men, so it is worst for children: by reason that being drunke, it both moisteneth and dryeth ouermuch, and also filleth the head with vapours, in those who are of a moist and hot complexion, or whose bodies are in a meane betweene the extreames, whom *Galen* in his booke of the gouernment of health doth persuaide, that they should not so much as taste of wine for a very long time: for neither is it good for them to haue their heads filled, nor to be made moist and hot, more than is sufficient, because they are already of such a heate and moisture, as if you should but little increase either qualitie, they would forthwith fall into the extreme.

And seeing that euery excesse is to be shunned, it is expedient most of all to shun this, by which not onely the body, but also the minde receiveth hurt.

Wherefore we thinke, that wine is not fit for men that be already of full age, vnlesse it be moderately taken, because it carrieth them headlong into fury and lust, and troubleth and dulleth the reasonable part of the minde.

¶ Of the delaying, or tempering of Wine.

IT was an ancient custome, and of long continuance in old time, for wines to be mixed with water, as it is plaine and euident not onely by *Hippocrates*, but also by other old mens writings. Wine first began to be mixed with water for health and wholesomenesse sake: for as *Hippocrates* writeth in his booke of ancient Physicke, being simply and of it selfe much drunke, it maketh

keth a man in some fortweake and feeble: which thing *Ouid*, seemeth also to allow of writing thus:

*Vt Venus eneruat vires, sic copia vini
Et tentat gressus, debilitatque pedes.*

As Venerie the vigour spends, so store of wine
Makes man to stagger, makes his strength decline.

- A Moreouer, wine is the sweeter, hauing water poured into it, as *Athenaeus* saith. *Homer* likewise commendeth that wine which is well and fitly allaiied. *Philocorus* writeth (as *Athenaeus* reporteth) that *Amphietyon* king of Athens was the first that allaiied wine, as hauing learned the same of *Dionysius*: wherefore he saith, that those who in that manner drunke it remained in health, that before had their bodies feebled and ouerweakened with pure and vnmixed wine.
- B The maner of mingling or tempering of wine was diuers: for sometimes to one part of wine, there were added two, and sometimes three or foure of water; or two parts of wine three of water: of a lesse delay was that which consisted of equall parts of wine and water.
- C The old Comedians did thinke that this lesser mixture was sufficient to make men mad, among whom was *Mnesitheus*, whose words be extant in *Athenaeus*.
- D *Hippocrates* in the seuenth booke of his Aphorismes saith, that this manner of tempering of wine and water by equall parts bringeth as it were a light pleasant drunkenesse, and that it is a kinde of remedy against disquietnesse, yawnings, and shiuerings; and this mingling belongeth to the strongest wines.
- E Such kinde of wines they might be which in times past the Scythians were reported of the old writers to drinke, who for this cause do call vnmixed wine the Scythians drinke. And they that drinke simple wine say, that they will *Scythizare*, or do as the Scythians do, as we may reade in the tenth booke of *Athenaeus*.
- F The Scythians, as *Hippocrates* and diuers other of the old writers affirme, be people of Germany beyond the flood Danubius, which is also called Ister: Rhene is a riuer of Scythia: and *Cyrus* hauing passed ouer Ister is reported to haue come into the borders of the Scythians.
- G And in this our age all the people of Germany do drinke vnmixed wine, which groweth in their owne countrey, and likewise other people of the North parts, who make no scruple at all to drinke of the strongest wines without any mixture.

¶ Of the liquor which is distilled out of wine, commonly called, *Aqua vitæ*.

- H There is drawne out of Wine a liquor, which in Latine is commonly called *Aqua vitæ*, or water of life, and also *Aqua ardens*, or burning water, which as distilled waters are drawne out of herbes and other things, is after the same manner distilled out of strong wine, that is to say, by certaine instruments made for this purpose, which are commonly called Limbeckes.
- I This kinde of liquor is in colour and substance like vnto waters distilled out of herbes, and also resembleth cleere simple water in colour, but in facultie it farre differeth.
- K It beareth the syname of life, because that it serueth to preserue and prolong the life of man.
- L It is called *Ardens*, burning, for that it is easily turned into a burning flame: for seeing it is not any other thing than the thinnest and strongest part of the wine, it being put to the flame of fire, is quickly burned.
- M This liquor is very hot, and of most subtile and thin parts, hot and dry in the later end of the third degree, especially the purest spirits thereof: for the purer it is, the hotter it is, the dryer, and of thinner parts: which is made more pure by often distilling.
- N This water distilled out of wine is good for all those that are made cold either by a long disease, or through age, as for old and impotent men: for it cherisheth and increaseth naturall heate; vpholdeth strength, repaireth and augmenteth the same: it prolongeth life, quickeneth all the senses, and doth not only preserue the memory, but also recouereth it when it is lost: it sharpeneth the sight.
- It is fit for those that are taken with the Catalepie (which is a disease in the braine proceeding of drineffe and cold) and are subject to dead sleepes, if there be no feuer joined; it serueth for the weakenesse, trembling, and beating of the hart; it strengtheneth and heateth a feeble stomacke; it consumeth winde both in the stomacke, sides, and bowels; it maketh good concoction of meate, and is a singular remedy against cold poisons.
- P It hath such force and power, in strengthening of the hart, and stirreth vp the instruments of the senses,

senses, that it is most effectuall, not onely inwardly taken to the quantitie of a little spoonefull, but also outwardly applied: that is to say, set to the nostrils, or laid vpon the temples of the head, and to the wrests of the armes; and also to foment and bath sundry hurts and griefes.

Being held in the mouth it helpeth the tooth-ache: it is also good against cold cramps and convulsions, being chafed and rubbed therewith.

Some are bold to giue it in quartaines before the fit, especially after the height or prim of the disease.

This water is to be giuen in wine with great iudgement and discretion; for seeing it is extreme hot, and of most subtrill parts, and nothing else but the very spirit of the wine, it most speedily peirceth through, and doth easily assault and hurt the braine.

Therefore it may be giuen to such as haue the apoplexie and falling sicknesse, the megrim, the headach of long continuance, the Vertigo, or giddinesse proceeding through a cold cause: yet can it not be alwaies safely giuen; for vnlesse the matter the efficient cause of the disease be small, and the sicke man of temperature very cold, it cannot be ministred without danger: for that it spreadeth and disperferth the humours, it filleth or stuffeth the head, and maketh the sicke man worse: and if the humours be hot, as bloud is, it doth not a little increase inflammations also.

This water is hurtfull to all that be of nature and complexion hot, and most of all to cholericke men: it is also offensive to the liuer, and likewise vnprofitable for the kidnies, being often and plentifully taken.

If I should take in hand to write of euery mixture, of each infusion, of the sundry colours, and euery other circumstance that the vulgar people doe giue vnto this water, and their diuers vse, I should spend much time but to small purpose.

¶ Of Argall, Tartar, or wine Lees.

The Lees of wine which is become hard like a crust, and sticketh to the sides of the vessell, and wine casks, being dried, hard, sound, and well compact, and which way be beaten into powder, is called in shops *Tartarum*: in English, Argall, and Tartar.

These Lees are vsed for many things; the siluer-Smiths polish their siluer herewith: the Diers vse it: and it is profitable in medicine.

It doth greatly dry and wast away, as *Paulus Aegineta* saith: it hath withall a binding facultie, proceeding from the kinde of wine, of which it commeth.

The same serueth for moist diseases of the body: it is good for them that haue the greene sicknesses and the dropsie, especially that kinde that lieth in the flesh, called in Latine, *Leucophlagmatica*: being taken euery day fasting halfe a penny weight or a full penny weight (which is a dram and nine graines after the Romanes computation) doth not onely dry vp the waterish excrements, and voideth them by vrine, but it preuaileth much to cleanse the belly by siege.

It would worke more effectuall, if it were mixed either with hot spices, or with other things that breake winde, or else with diurecticks, which are medicines that prouoke vrine; likewise to be mixed with gentle purgers, as the sicke mans case shall require.

The same of it selfe, or tempered with oile of Myrtles, is a remedy against soft swellings, as *Dioscorides* teacheth: it staieth the laske, and vomiting, being applied outwardly vpon the region of the stomacke in a pultis; and if it be laid to the bottome of the belly and secret parts, it stoppeth the whites, wasteth away hot swellings of the kernels in the flankes, and other places, which be not yet exulcerated: it asswageth great breasts, and dryeth vp the milke, if it be annointed on with vineger.

These Lees are oftentimes burnt: if it become all white it is a signe of right and perfect burning, for till then it must be burned: being so burnt, the Grecians terme it, *opleras*, as *Aegineta* saith: the Apothecaries call it, *Tartarumustum*, and *Tartarum calcinatum*: that is to say, burnt or calcined Tartar.

It hath a very great causticke or burning qualitie: it clenseth and thoroughly heateth, bindeth, eateth, and very much drieth, as *Dioscorides* doth write: being mixed with Rosin, it maketh rough and ill nailes to fall away: *Paulus* saith, that it is mixed with causticks or burning medicines to increase their burning qualitie: it must be vsed whilest it is new made, because it quickly vanissheth: for the Lees of wine burned, do soone relent or wax moist, and are speedily resolued into liquor: therefore he that would vse it dry, must haue it put in a glasse, or glassed vessell well stopped, and set in a hot and dry place. It melteth and is turned into liquor if it be hanged in a linnen bag in some place in a celler vnder the ground.

The Apothecaries call this liquor that droppeth away from it, oile of Tartar. It retaineth a causticke and burning quality, and also a very dry facultie: it very soon taketh away lepric, scabs, tetter, and other filth and deformitie of the skin and face: with an equall quantitie of Rose water

added,

added, and as much Ceruse as is sufficient for a liniment, wherewith the blemished or spotted parts must be anointed ouer night.

The brievesumme of that hath been said of the Vine.

- A** The iuyce of the greene leaues, branches, and tendrels of the Vine drunken, is good for those that vomit and spit blood, for the bloody flux, and for women with childe that vomite ouer-much. The kernell within the grapes boyled in water and drunke hath the same effect.
- B** Wine moderately drunke profiteth much, and maketh good digestion, but it hurteth and distempereth them that drinke it seldome.
- C** White wine is good to be drunke before meate; it preserueth the body, and pierceth quickly into the bladder: but vpon a full stomacke it rather maketh oppilations or stoppings, because it doth swiftly driue downe meate before Nature hath of her selfe digested it.
- D** Claret wine doth greatly nourish and warme the body, and is wholesome with meate, especially vnto phlegmaticke people; but very vnwholesome for yong children, as *Galen* saith, because it heateth aboue nature, and hurteth the head.
- E** Red wine stops the belly, corrupteth the blood, breedeth the stone, is hurtfull to old people, and good or profitable to few, saue to such as are troubled with the laske, bloody flux, or any other loosenesse of the body.
- F** Sacke or Spanish wine hath beene vsed of a long time to be drunke after meate, to cause the meate the better to digest; but common experience hath found it to be more beneficiall to the stomacke to be drunke before meate.
- G** Likewise Malmsey, Muscadell, Bastard, and such like sweet wines haue been vsed before meat, to comfort the cold and weake stomacke, especially being taken fasting: but experience teacheth, that Sacke drunke in stead thereof is much better, and warmeth more effectually.
- H** Almighty God for the comfort of mankind ordained Wine; but decreed withall, That it should be moderatly taken, for so it is wholsome and comfortable: but when measure is turned into excesse, it becommeth vnwholesome, and a poyson most venomous, relaxing the sinewes, bringing with it the palsey and falling sicknesse: to those of a middle age it bringeth hot feuers, frensie, and lecherie; it consumeth the liuer and other of the inward parts: besides, how little credence is to be giuen to drunkards it is euident; for though they be mighty men, yet it maketh them monsters, and worse than brute beasts. Finally in a word to conclude; this excessiue drinking of Wine dishonoreth Noblemen, beggereth the poore, and more haue beene destroyed by surfeiting therewith, than by the sword.

CHAP. 324. Of Hops.

The Kindes.

THere be two sorts of Hops: one the manured or the Garden Hop, the other wilde or of the hedge.

The Description.

THe Hop doth liue and flourish by embracing and taking hold of poles, pearches, and other things vpon which it climeth. It bringeth forth very long stalkes, rough, and hairie; also rugged leaues broad like those of the Vine, or rather of Bryonie, but yet blacker, and with fewer dented diuisions: the floures hang downe by clusters from the tops of the branches, puffed vp, set as it were with scales like little canes, or scaled Pineapples, of a whitish colour tending to yellownesse, strong of smell: the roots are slender, and diuersly folded one within another.

The wilde Hop differeth not from the manured Hop in forme or fashion, but is altogether lesser, as well in the clusters of floures, as also in the franke shoots, and doth not bring forth such store of floures, wherein especially consisteth the difference.

The Place.

The Hop ioyeth in a fat and fruitfull ground: it prospereth the better by manuring; also it groweth among briars and thornes about the borders of fields, I meane the wilde kinde.

The

Lupus salictarius.

Hops.

The Time.

The floures of hops are gathered in August and September, and reserved to be used in beere: in the Spring time come forth new shoots or buds; in the Winter onely the roots remaine alive.

The Names.

It is called in shops and in all other places *Lupulus*: of some, *Lupus salictarius*, or *Lupulus salictarius*: in high-Dutch, *Hopsen*: in low-Dutch, *Hoppe*: in Spanish, *Hombrezillos*: in French, *Houblon*: in English, Hops.

Pliny, lib. 21. cap. 15. maketh mention of Hops among the prickly plants.

The Temperature.

The floures of the hop are hot and dry in the second degree: they fill and stuffe the head, and hurt the same with their strong smell. Of the same temperature also are the leaues themselves, which doe likewise open and cleanse.

The Vertues.

The buds or first sprouts which come forth in the Spring are used to be eaten in sallads; yet are they, as Pliny saith, more toothsome than nourishing, for they yeeld but very small nourishment: notwithstanding they be good for the intrals, both in opening and procuring of vrine, and likewise in keeping the body soluble.

The leaues and little tender stalkes, and also the floures themselves remove stoppings out of the liuer and spleene, purge by vrine, helpe the spleene,

and be profitable against long lingering Agues, scabs, and such like filth of the skin, if they be boyled in whay.

The iuyce is of more force, and doth not onely remove obstructions out of the intrals, but it is also thought to auoid choler and flegme by the stoole. It is written, that the same dropped into the eares taketh away the stench and corruption thereof.

The floures are used to season Beere or Ale with, and too many do cause bitternesse thereof, and are ill for the head.

The floures make bread light, and the lumpe to be sooner and easilier leauened, if the meale be tempered with liquor wherein they haue been boyled.

The decoction of hops drunke openeth the stoppings of the liuer, the spleene, and kidneyes, and purgeth the blood from all corrupt humors, causing the same to come forth with the vrine.

The iuyce of Hops openeth the belly, and driueth forth yellow and cholericke humours, and purgeth the blood from all filthinesse.

The manifold vertues of Hops do manifestly argue the wholsomenesse of beere aboue ale; for the hops rather make it a physicall drinke to keepe the body in health, than an ordinary drinke for the quenching of our thirst.

CHAP. 325.

Of Travellers-Joy.

The Description.

The plant which Label setteth forth vnder the title of *Viorna*, Dodonæus makes *Vitis alba*, but not properly; whose long woody and viny branches extend themselves very far, and into infinite numbers, decking with his clasping tendrels and white starre-like floures (being very sweet) all the bushes, hedges, and shrubs that are neere vnto it. It sends forth many branched stalkes, thicke, tough, full of shoots and clasping tendrels, wherewith it folderh it selfe vpon the hedges, and taketh hold and climeth vpon euery thing that standeth neere vnto it.

it. The leaues are fastned for the most part by fines vpon one rib or stem, two on either side, and one in the midst or point standing alone, which leaues are broad like those of Iuy, but not cornered at all: among which come forth clusters of white floures, and after them great tufts of flat seeds, each seed hauing a fine white plume like a feather fastned to it, which maketh in the winter a goodly shew, covering the hedges white all ouer with his feather-like tops. The root is long, tough, and thicke, with many strings fastned thereto.

2 *Clusius* hath set forth a kind of *Clematis*, calling it *Clematis Batia*, hauing a maruellous long small branch full of ioynts, with many leaues indented about the edges like those of the peare tree, but stiffer and smaller, comming from euery ioynt, from whence also at each ioynt proceed two small clasping tendrels, as also the small foot-stalkes whereon the seeds do stand, growing in great tufted plumes or feathers, like vnto the precedent, whereof it is a kinde. The floures are not expressed in the figure, nor scene by the Author, and therefore what hath been said shall suffice.

1 *Viorna*.
The Trauellers Ioy.

2 *Clematis Batia*.
The Spanish Trauellers Ioy.

¶ *The Place.*

The Trauellers Ioy is found in the borders of fields among thornes and briars, almost in euerie hedge as you go from Grauesend to Canturbury in Kent; in many places of Essex, and in most of these Southerly parts about London, but not in the North of England that I can heare of.

The second is a stranger in these parts: yet haue I found it in the Isle of Wight, and in a wood by Waltham abbey.

¶ *The Time.*

The floures come forth in Iuly: the beauty thereof appeares in Nouember and December.

¶ *The Names.*

The first is called commonly *Viorna*, *quasi vias ornans*, of decking and adorning waies and hedges, where people traue; and thereupon I haue named it the Trauellers Ioy: of *Fuchsius* it is called *Vitis nigra*: of *Dodonaeus*, *Vitalba*: of *Mathiolus*, *Clematis altera*: of *Cordus*, *Vitis alba*: of *Dioscorides*, *Vitis syluestris*: of *Theophrastus*, *Atragene*: in Dutch, *Linen*: in French, as *Ruellius* writeth, *Viorne*.

¶ *The Temperature and Vertues.*

These plants haue no vse in physicke as yet found out, but are esteemed onely for pleasure, by reason of the goodly shadow which they make with their thicke bushing and clyming, as also for the beauty of the floures, and the pleasant sent or savor of the same.

CHAP. 326. Of Ladies Bower, or Virgins Bower.

¶ The Description.

1 **T**hat which *Lobel* describeth by the name *Clematis peregrina*, hath very long and slender stalks like the Vine, which are jointed, of a darke colour; it climeth aloft, and taketh hold with his crooked clasps vpon euery thing that standeth neere vnto it: it hath many leaues diuided into diuers parts; among which come the floures that hang vpon slender foot-stalkes, something like to those of *Peruinckle*, consisting onely of foure leaues, of a blew colour, and sometimes purple, with certaine threds in the middle: the seeds be flat, plaine, and sharpe pointed. The roots are slender, and spreading all about.

2 *Clematis peregrina Carulea, sive rubra.*
Blew or red floured Ladies-bower.

3 *Clematis Cerulea flore pleno.*
Double floured Virgins-bower.

2 The second differeth not from the other, in leaues, stalkes, branches nor seed. The onely difference consisteth in that, that this plant bringeth forth red floures, and the other blew.

3 There is preserved also in some Gardens another sort of this *Clematis*, which in rootes, leaues, branches, and manner of growing differs not from the former: but the floure is much different, being composed of abundance of longish narrow leaues, growing thicke together, with foure broader or larger leaues lying vnder, or bearing them vp, and these leaues are of a darke blewish purple colour. *Clusius* calls this *Clematis altera flore pleno*.

¶ The Place.

These plants delight to grow in Sunnie places: they prosper better in a fruitfull soile than in barren. They grow in my garden, where they flourish exceedingly.

¶ The Time.

They floure in Iuly and August, and perfect their seed in September.

¶ The Names.

Ladies Bower is called in Greeke *κλυματις*: in Latine, *Ambuxum*: in English you may call it Ladies

dies bower, which I take from his aptnesse in making of Arbors, Bowers, and shadie couertures in gardens.

¶ The Temperature and Vertues.

The facultie and the vse of these in Physicke is not yet knowne.

CHAP. 327. Of purging Peruinckle.

¶ The Description.

AMong these plants which are called *Clematides* these be also to be numbred, as hauing certaine affinitie, because of the spreading, branching, and semblance of the Vine; and this is called *Flammula vrens*, by reason of his fierie and burning heate, because that being laid vpon the skin, it burneth the place, and maketh an eschar, euen as our common caustick or corrasive medicines do. The leaues hereof answer both in colour and smoothnesse, *Vinca*, *Peruinca*, or *Peruinckle*, growing vpon long clambring tender branches, like the other kindes of climbing plants. The floures are very white, star-fashion, and of an exceeding sweet smell, much like vnto the smell of Hawthorne floures, but more pleasant, and lesse offensiue to the head: hauing in the middle of the floures certaine small chiues or threds. The root is tender, and disperseth it selfe far vnder the ground.

1 *Clematis vrens*.
Virgins Bower.

2 *Flammula Iouis surrecta*.
Vpright Virgins Bower.

2 Vpright Clamberer or Virgins Bower is also a kinde of *Clematis*, hauing long tough roots not vnlike to those of Licorice; from which riseth vp a straight vpright stalke, of the height of three or foure cubits, set about with winged leaues, composed of diuers small leaues, set vpon a middle rib, as are those of the ashe tree, or Valerian, but fewer in number: at the top of the stalks come forth small white floures, very like the precedent, but not of so pleasant a sweet smell; after which come the seeds, flat and sharpe pointed.

3 There

3 There is another *Clematis* of the kinde of the white *Clematis* or burning *Clematis*, which I have recovered from seed, that hath been sent me from a curious and learned citizen of Strawsborough, which is like vnto the others in each respect, sauing that, that the floures heereof are very double, wherein consisteth the especiall difference.

4 Amongst the kindes of climbing or clambering plants, *Carolus Clusius*, and likewise *Lobel* haue numbred these two, which approach neere vnto them in leaues and floures, but are far different in clasping tendrels, or climbing otherwise, beeing low and base plants in respect of the others of their kinde. The first hath for his roots a bundle of tough tangling threddes, in number infinite, and thicke thrust together; from which rise vp many small stalkes, of a brownish colour, foure square, and of a wooddie substance: whereupon doe grow long leaues, of a biting taste, set together by couples, in shape like those of *Asclepias*, or silken Swallow-woort. The floures grow at the toppe of the stalkes, of a faire blew or skie colour, consisting of foure parts in manner of a crosse, hauing in the middle a bunched pointell, like vnto the head of field Poppiewhen it is young, of a whitish yellow colour, hauing little or no smell at all. The floures beeing past, then commeth the seed, such as is to be seen in the other kindes of *Clematis*. The whole plant dieth at the approach of Winter, and recouereth it selfe againe from the root, which indureth, whereby it greatly increaseth.

4 *Clematis Pannonica.*

Bush Bower.

5 *Clematis maior Pannonica.*

Great Bush Bower.

5 The great Bush Bower differeth not from the former last described, but in greatnesse: which name of greatnesse setteth forth the difference.

6 Of these there is another, whose bending crested stalkes are some three cubites high, which send forth sundry small branches, set with leaues growing together by threes vpon short foot-stalkes, and they are like myrtle leaues, but bigger, more wrinkled, darke coloured, and snipt about the edges: the floure resembles a crosse, with foure sharpe pointed rough leaues of a whitish blew colour, which containe diuers small loose little leaues in their middles. The root is long and lasting. It growes vpon the rocky places of mount Baldus in Italy, where *Pona* found it, and he calls it *Clematis cruciata Alpina*.

6. *Clematis cruciata Alpina*.
Virgins Bower of the Alps.

¶ The Place.

These plants do not grow wilde in England, that I can as yet learne, notwithstanding I haue them all in my garden, where they flourish exceedingly.

¶ The Time.

These plants do floure from August to the end of September.

¶ The Names.

There is not much more found of their names than is expressed in their seuerall titles, notwithstanding there hath beene somewhat said, as I thinke, by hearesay, but nothing of certaintie: wherefore let that which is set downe suffice. We may in English call the first, Biting Clematis, or white Clematis, Biting Peruinkle or purging Peruinkle, Ladies Bower, and Virgins Bower.

¶ The Temperature.

The leafe hereof is biting, and doth mightily blister, being, as *Galen* saith, of a causticke or burning qualitie: it is hot in the beginning of the fourth degree.

¶ The Vertues.

Dioscorides writeth, that the leaues being applied do heale the scurfe and leproy, and that the seed beaten, and the poudre drunke with faire water or with mead, purgeth flegme and choler by the stoole.

CHAP. 328. Of Wood-binde, or Hony-suckle.

The Kindes.

There be diuers sorts of Wood-bindes, some of them shrubs with winding stalks, that wrappe themselves vnto such things as are neere about them. Likewise there be other sorts or kinds found out by the later Herbarists, that clime not at all, but stand vpright, the which shall bee set forth among the shrubbie plants. And first of the common Woodbinde.

¶ The Description.

1 **W**oodbinde or Honisuckle climeth vp aloft, hauing long slender wooddie stalkes, parted into diuers branches: about which stand by certaine distances smooth leaues, set together by couples one right against another; of a light greene colour aboue, vnderneath of a whitish greene. The floures shew themselves in the topps of the branches many in number, long, white, sweet of smell, hollow within; in one part standing more out, with certaine threddes growing out of the middle. The fruit is like to little bunches of grapes, red when they be ripe, wherein is contained small hard seed. The root is wooddie, and not without strings.

2 This strange kind of Woodbind hath leaues, stalks, and roots like vnto the common Woodbinde or Honisuckle, sauing that neere vnto the place where the floures come forth, the stalkes doe grow through the leaues, like vnto the herbe *Thorow-wax*, called *Perfoliata*, which leaues do resemble little saucers; out of which broad round leaues proceed faire, beautifull, and well smelling floures, shining with a whitish purple colour, and somewhat dast with yellow, by little and little stretched out like the nose of an Elephant, garnished within with small yellow chiues or threddes: and when the floures are in their flourishing, the leaues and floures do resemble saucers filled with the

the floures of Woodbinde : many times it falleth out, that there is to be found three or foure saucers one aboue another, filled with floures, as the first, which hath caused it to be called double Honysuckle, or Woodbinde.

1 *Periclymenum.*

Woodbinde, or Honisuckles.

2 *Periclymenum perfoliatum.*

Italian Woodbinde.

¶ *The Place.*

The VWoodbinde groweth in woods and hedges, and vpon shrubbes and bushes, oftentimes winding it selfe so straight and hard about, that it leaueth his print vpon those things so wrapped.

The double Honisuckle groweth now in my garden, and many others likewise in great plenty, although not long since, very rare and hard to be found, except in the garden of some diligent Herbarists.

¶ *The Time.*

The leaues come forth betimes in the spring : the floures bud forth in May and Iune : the fruit is ripe in Autumne.

¶ *The Names.*

It is called in Greeke *Periclymenum* : in Latine, *Volucrum maius* : of Scribonius Largus, *Syluamater* : in shops, *Caprifolium*, and *Marrifylua* : of some, *Lilium inter spinas* : in Italian, *vincibosco* : in High Dutch, *Geytbladt* : in Low Dutch, *Cheytenbladt*, and *Hammekens Cruut* : in French, *Cheurefeuille* : in Spanish, *Madreselua* : in English, VWoodbinde, Honisuckle, and Caprifoly.

¶ *The Temperature.*

There hath an errour in times past growne amongst a few, and now almost past recoverie to be called againe, being growne an errour vniuersall, which errour is, how the decoction of the leaues of Honisuckles, or the distilled water of the floures, are rashly giuen for the inflammations of the mouth and throte, as though they were binding and cooling. But contrariwise Honisuckle is neither cold nor binding ; but hot, and attenuating or making thinne. For as Galen saith, both the fruit of VWoodbinde, and also the leaues, do so much attenuate and heat, as if somewhat too much of them be drunke, they will cause the vrine to be as red as bloud, yet do they at the first onely prouoke vrine.

¶ *The*

¶ The Vertues.

- A *Dioscorides* writeth that the ripe seed gathered and dried in the shadow, and drunke vnto the quantitie of one dram weight, fortie daies together, doth waste and consume away the hardnesse of the spleene, remoueth wearisomnesse, helpeth the shortnesse and difficultie of breathing, cureth the hicket, procureth bloudie vrine after the sixt day, and causeth women to haue speedie trauell in childe bearing.
- B The leaues be of the same force: which being drunk thirty daies together, are reported to make men barren, and destroy their naturall seed.
- C The floures steeped in oile and set in the Sun, is good to annoint the bodie that is benumbed, and growne verie cold.
- D The distilled water of the floures are giuen to be drunke with good successe against the pissing of blood.
- E A syrrup made of the floures is good to be drunke against the diseases of the lungs and spleene that is stopped, being drunke with a little wine.
- F Notwithstanding the words of *Galen* (or rather of *Dodonaus*) it is certainly found by experience, that the water of Honisuckles is good against the forenesse of the throte and uyula: and with the same leaues boiled, or the leaues and floures distilled, are made diuers good medicines against cankers, and sore mouths, as well in children as elder people, and likewise for vlcérations and scaldings in the priuie parts of man or woman; if there be added to the decoction hereof some allome or Verdigreace, if the sore require greater clensing outwardly, provided alwaies that there be no Verdigreace put into the water that must be iniected into the secret parts.

CHAP. 329. Of *Jasmine*, or *Gelsimine*.1 *Jasminum album*.
VVhite Gelsimine.2 *Jasminum Candiflorum maius*.
Great white Gelsimine.

¶ The Description.

Iasmine, or Gelsimine, is of the number of those plants which haue need to be supported or propped vp, and yet notwithstanding of it selfe claspeth not or windeth his stalkes about

3 *Jasminum luteum*.
Yellow Iasmine.

bout such things as stand neere vnto it, but onely leaneth and lyeth vpon those things that are prepared to sustaine it about arbors and banquetting houses in gardens, by which it is held vp. The stalks therof are long, round, branched, ioined or kneed, and of a green colour, hauing within a white spongeous pith. The leaues stand vpon a middle ribbe, set together by couples like those of the ashe tree, but much smaller, of a deepe Greene colour. The floures grow at the vppermost part of the branches, standing in a smal tuft, far set one from another, sweet in smel, of colour white. The seed is flat and broad like those of Lupines, which seldome come to ripenesse. The root is tough and threddie.

2 *Label* reporteth that he saw in a garden at Bruxels, belonging to a reuerend perton called *M^r. Iohn Boifot*, a kinde of Gessmine, very much differing from our Iasmine, which he nourished in an earthen pot: it grew not aboue, saith he, to the height of a cubit, diuided into diuers branches, wherupon did grow leaues like those of the common white Iasmine, but blacker and rounder. The floures to the shew were most beautiful, in shape like those of the common Iasmine, but foure times bigger, gaping wide open, white on the vpper side, and of a bright red on the vnder side.

3 There is a kind hereof with yellow floures: but some doe describe for the yellow Iasmine, the shrubbie Trefoile, called of some *Trifolium fruticans*: and of others, *Polemonium*. But this yel-

low Iasmine is one, and that is another plant, differing from the kindes of Iasmine, as shall be declared in his proper place. The yellow Iasmine differeth not from the common white Gessmine, in leaues, stalks, nor fashion of the floures: the onely difference is, that this plant bringeth forth yellow floures, and the other white.

4 There is likewise another sort that differeth not from the former in any respect, but in the colour of the floure, for this plant hath floures of a blew colour, and the others not so, wherein consisteth the difference.

¶ *The Place.*

Gessmine is fostered in gardens, and is vsed for arbors, and to couer banquetting houses in gardens: it groweth not wilde in England that I can vnderstand of, though *M^r. Lyte* be of another opinion: the white Iasmine is common in most places of England: the rest are strangers, and not seene in these parts as yet.

¶ *The Time.*

They bring forth their pleasant floures in Iuly and August.

¶ *The Names.*

Among the Arabians *Serapio* was the first that named Gessmine, *Zambach*: it is called *Iasminum*, and *Ieseminum*, and also *Gesseminum*: in English, Iasmine, Gessmine, and Iesse.

There is in *Dioscorides* a composition of oile of Iasmine, which he saith is made in Persia of the white floures of Violets, which Violets seeme to be none other than the floures of this Gessmine: for *Dioscorides* oftentimes hath reckoned faire and elegant floures amongst the Violets, so that it must not seeme strange that he calleth the floures of Gessmine Violets, especially seeing that the plant it selfe was vnkowne vnto him, as it is euident.

¶ *The Temperature.*

Gessmine, and especially the floures thereof be hot in the beginning of the second degree, as *Serapio* reporteth out of *Mesue*.

¶ *The Vertues.*

The oile which is made of the floures hereof, wasteth away raw humors, and is good against cold rheumes, but in those that are of a hot constitution it causeth head-ache, and the ouermuch smell thereof maketh the nose to bleed, as the same Author affirmeth. It is vsed (as *Dioscorides* writeth,

and after him *Actius*) of the Persians in their banquets for pleasure sake: it is good to be annointed after bathes, in those bodies that haue need to be suppled and warmed, but by reason of smell it is not much vsed.

The leaues boiled in wine vntill they be soft, and made vp to the forme of a pultis, and applied, dissolue cold swellings, wens, hard lumps, and such like outgoings.

CHAP. 330. Of Peruinkle.

¶ The Description.

1 Peruinkle hath slender and long branches trailing vpon the ground, taking hold here and there as it runneth; small like to rushes, with naked or bare spaces betweene ioint and ioint. The leaues are smooth, not vnlike to the Bay leafe, but lesser. The floures grow hard by the leaues, spreading wide open, composed of fve small blew leaues.

We haue in our London gardens a kinde hereof bearing white floures, which maketh it to differ from the former.

1 *Vinca Peruinca minor.*
Peruinkle.

2 *Clematis Daphnoides, sive Peruinca maior.*
Great Peruinkle.

There is another with purple floures, doubling it selfe somewhat in the middle, with smaller leaues, wherein is the difference.

2 There is another sort, greater than any of the rest, which is called of some *Clematis Daphnoides*, of the similitude the leaues haue with those of the Bay. The leaues and floures are like those of the precedent, but altogether greater, wherein consisteth the difference.

¶ The Place.

They grow in most of our London gardens; they loue a moist and shadowie place: the branches remaine alwaies Greene.

¶ The Time.

The floures of them do flourish in March, Aprill, and May, and oftentimes later.

¶ The

¶ The Names.

Peruinkle is called in Greeke *μαριόλιν* : because it bringeth forth stalkes, which creepe like those of the Vine, and *Daphnoideis* by reason that the leaues are like those of the Bay, as aforesaid. Pliny calleth it *Vinca Peruinca*, and *Chamedaphne* : notwithstanding there is another *Chamedaphne*, of which in his place. The same Author likewise calleth it *Centunculus* : in High Dutch, *Ingrun* : in Low Dutch, *Wincdoorte*, *maegden cruyt* : in French, *Pucelage*, *Vauche* & *Peruauche* : in Italian, *Pro-uena* : in Spanish, *Perninqua* : in shoppes, *Clematis peruinca* : in English, Peruinkle, Peruinkle, and Periwinkle.

¶ The Temperature.

Peruinkle is something hot, but within the second degree, something drie and astringent.

¶ The Vertues.

The leaues boiled in wine and drunken, stop the laske and bloudie flix.

An handfull of the leaues stamped, and the iuice giuen to drinke in red wine, stoppeth the laske and bloudy flix, spitting of bloud, which neuer faileth in any bodie, either man or woman : it likewise stoppeth the inordinate course of the monethly sicknesse.

CHAP. 331. Of Capers.

¶ The Kindes.

There be two sorts of Capers especially, one with broad leaues sharpe pointed : the other with rounder leaues. The Brabanders haue also another sort, called *Capparis fabago*, or Bean Capers.

1 *Capparis folio acuto*.

Sharpe leasfed Capers.

2 *Capparis rotundiore folio*.

Round leasfed Capers.

¶ The Description.

The Caper is a prickly shrub, the shoots or branches whereof be full of sharpe prickly thornes, trailing vpon the ground if they bee not supported or propped vp: whereupon

Ffff 2

doe

doe grow leaues like those of the Quince tree, but rounder : amongst the which come forth long slender foot-stalkes, whereon do grow round knoppes, which doe open or spread abroad into faire floures, after which commeth in place long fruit, like to an oliue, and of the same colour, wherein is contained flat rough seeds, of a duskie colour. The root is wooddie, and couered with a thick bark or rinde, which is much vsed in Physicke.

2 The second kinde of Caper is likewise a prickly plant, much like the bramble bush, hauing many slender branches set full of sharpe prickles. The whole plant traileth vpon the place where it groweth, beset with round blackish leaues disorderly placed, in shape like those of *Astrabacca*, but greater, approching to the forme of Fole-foot : among which commeth forth a small and tender naked twig, charged at the end with a small knap or bud, which openeth it selfe to a small star-like floure, of a pleasant sweet smell, in place whereof comes a small fruit, long and round like the Cornell berrie, of a browne colour. The root is long and wooddie, and couered with a thicke barke or rinde, which is likewise vsed in medicine.

¶ *The Place.*

The Caper groweth in Italy, Spaine, and other hot Regions without manuring, in a leane soyle, in rough places amongst rubbish, and vpon old walls, as *Dioscorides* reporteth.

Theophrastus writeth, that it is by nature wild, and refuseth to be husbanded, yet in these our daies diuers vse to cherish the same, and to set it in dry and stony places : my selfe at the impression hereof, planted some seeds in the bricke walls of my garden, which as yet do spring and grow green, the successe I expect.

¶ *The Time.*

The Caper floureth in Sommer, euen vntill Autumne. The knoppes of the floures before they open are those Capers or sauce that wee eat, which are gathered and preferued in pickle or Salt.

¶ *The Names.*

It is called in Greeke *καπάρια* : and in Latine also *Capparis* : but properly *Cynobatos*, or *Canirubus* : which is also taken for the wilde Rose ; it is generally called Cappers in most languages : in English, Cappers, Caper, and Capers.

¶ *The Temperature.*

Capers, or the floures not yet fully growne, be of temperature hot, and of thinne parts ; if they be eaten greene, they yeeld very little nourishment, and much lesse if they be salted. And therefore they be rather a sauce and medicine, than a meat.

¶ *The Vertues.*

- A They stir vp an appetiteto meat ; they be good for a moist stomach, and stay the watering thereof, and clenseth away the flegme that cleaueth vnto it. They open the stoppings of the liuer and milt, with meat ; they are good to be taken of those that haue a quartaine Ague, and ill spleenes. They are eaten boiled (the salt first washed off) with oile and vineger, as other fallads be, and sometimes are boiled with meat.
- B The rinde or barke of the roor consisteth of diuers faculties, it heateth, clenseth, purgeth, cutteth and digesteth, hauing withall a certaine binding qualitie.
- C This barke is of a singular remedie for hard spleenes, being outwardly applied, and also inwardly taken, and the same boiled in vineger or oxymel, or being beaten and mixed with other simples : for after this manner it expelleth thicke and grosse humours, and conueieth away the same mixed with bloud, by vrine, and also by siege, whereby the milt or spleene is helped, and the paine of the huckle bones taken away : moreouer it bringeth downe the desired sicknesse, purgeth and draweth flegme out of the head, as *Galen* writeth.
- D The same barke (as *Dioscorides* teacheth) doth clense old filthie sores, and scoureth away the thicke lips and crusts about the edges, and being chewed it taketh away the tooth-ache.
- E Being stamped with vineger, it scoureth away tetters or Ring-wormes, hard swellings, and cures the Kings-euill.
- F The barke of the roots of Capers is good against the hardnesse and stopping of the spleene, and profiteth much if it be giuen in drinke to such as haue the Sciatica, the Palsie, and those that are bursten or bruised by falling from some high place : it doth mightily prouoke vrine, insomuch that if it be vsed ouermuch, or giuen in too great a quantity, it procureth bloud to come with the vrine.

CHAP.

CHAP. 332.

Of Beane Capers.

Capparis fabago.
Beane Capers.

¶ The Description.

THis plant which the Germanes call *Fabago*, and *Dodonæus* fauoring of Dutch, calleth it in his last Edition *Capparis Fabago*, and properly: *Lobel* calleth it *Capparis Leguminosa*: between which there is no great difference, who labour to refer this plant vnto the kindes of Capers, which is but a low and base herbe, and not a shrubbie bush, as are the true Capers. It bringeth forth smooth stalks tender and branched, whereupon doe grow long thicke leaues, lesser than those of the true Capers, and not vnlike to the leaues of Purslane, comming out of the branches by couples, of a light Greene colour. The floures before they be opened are like to those of the precedent, but when they be come to maturitie and full ripenesse they waxe white, with some yellow chiues in the midst: which being past, there appeare long cods, wherein is contained small flat seed. The root is tender, branching hither and thither.

¶ The Place.

It groweth of it selfe in corne fields of the low Countreies, from whence I haue receiued seeds for my garden, where they flourish.

¶ The Time.

It floureth when the Caper doth.

¶ The Names.

It is called in Latine of the later Herbarists *Capparis fabago*: of most, *Capparis Leguminosa*: it is thought to be that herbe which *Anicen* describeth in his 28. chapter, by the name of *Ardifrigi*: wee may content our selues that *Capparis fabago* retaineth that name still, and seeke for none other, vnlesse it be for an English name, by which it may be called after the Latine, Beane Caper.

¶ The Temperature and Vertues.

Touching the faculties thereof we haue nothing left in writing worth the remembrance.

CHAP. 333.

Of Swallow-wort.

¶ The Description.

SWallow-wort with white floures hath diuers vpright branches of a brownish colour, of the height of two cubits, beset with leaues not vnlike to those of *Dulcamara* or wooddie Night-shade, somewhat long, broad, sharpe-pointed, of a blackish Greene colour, and strong fauour: among which come forth very many small white floures star-fashion, hanging vpon little slender foot-stalkes: after which come in place thereof long sharpe pointed cods, stuffed full of a most perfect white cotton resembling filke, as well in shew as handling, (our London Gentlewomen haue named it *Silken Cissie*) among which is wrapped soft brownish seed. The roots are very many, white, threddie, and of a strong fauour.

2 The second kinde is oftentimes found with stalkes much longer, climbing vpon props or such things as stand neere vnto it, attaining to the height of fise or six cubites, wrapping it selfe vpon them with many and sundry foldings: the floures hereof are blacke: the leaues, cods, and roots be like those of the former.

1 *Asclepias flore albo.*
White Swallow-woort.

2 *Asclepias flore nigro.*
Blacke Swallow-woort.

¶ *The Place.*

Both these kindes do grow in my garden, but not wilde in England, yet haue I heard it reported that it groweth in the fields about Northampron, but as yet I am not certaine of it.

¶ *The Time.*

They floure about Iune, in Autumne the downe hangeth out of the cods, and the seed falleth to the ground.

¶ *The Names.*

It is called of the later Herbarists *Vincetoxicum*: of Ruellius, *Hederalis*: in High Dutch, *Swalwe wortele*, that is to say in Latine *Hirundinaria*: in English, Swallow-woort: of our Gentlewomen it is called Silken Cissie; *Æsculapius* (who is said to be the first inuenter of Physicke, whom therefore the Greekes and Gentiles honored as a God) called it after his owne name *Asclepias*, or *Æsculapius* herbe, for that he was the first that wrote thereof, and now it is called in shoppes *Hirundinaria*.

¶ *The Temperature.*

The roots of Swallow-woort are hot and dry; they are thought to be good against poison.

¶ *The Vertues.*

- A *Dioscorides* writeth, that the roots of *Asclepias* or Swallow-woort boiled in wine, and the decoction drunke, are a remedie against the gripings of the belly, the stingings of Serpents, and against deadly poison, being one of the especiallest herbes against the same.
- B The leaues boiled and applied in forme of a pultis, cure the euill sores of the paps or dugs, and matrix, that are hard to be cured.

CHAP. 334. Of Indian Swallow-woort.

¶ *The Description.*

Here groweth in that part of Virginia, or Norembega, where our English men dwelled (intending there to erect a certaine Colonie) a kinde of *Asclepias*, or Swallow-woort, which the

the Sauages call *Wisack* : there riseth vp from a single crooked root one vpright stalke a foot high, slender, and of a greenish colour : whereupon do grow faire broad leaues sharpe pointed, with many ribs or nerues running through the same like those of Ribwort or Plantaine, set together by couples at certaine distances. The floures come forth at the top of the stalks, which as yet are not obserued, by reason the man that brought the seeds and plants hereof did not regard them. After which, there come in place two cods (seldome more) sharpe pointed like those of our Swallow-wort, but greater, stuffed full of a most pure silke of a shining white colour : among which silke appeareth a small long tongue (which is the seed) resembling the tongue of a bird, or that of the herbe called Adders tongue. The cods are not only full of silke, but euerie nerue or sinew where-with the leaues be ribbed are likewise most pure silke ; and also the pilling of the stemmes, euen as flax is torne from his stalks. This considered, behold the iustice of God, that as he hath shut vp those people and nations in infidelity and nakednesse ; so hath he not as yet given them vnderstanding to couer their nakednesse, nor matter wherewith to doe the same ; notwithstanding the earth is couered ouer with this silke, which dayly they tread vnder their feet, which were sufficient to apparell many kingdomes, if they were carefully manured and cherished.

Wisack, sine Vincetoxicum Indianum.
Indian Swallow-wort.

‡ *Apocynum Syriacum Clusij.*

‡ This Plant, which is kept in some gardens by the name of Virginia Silke Grasse, I take to be the same, or very like the *Beidelsar* of *Alpinus* ; and the *Apocynum Syriacum* of *Clusius* : at Padua they call it *Esula Indica*, by reason of the hot milky iuyce. *Bauhinus* hath very vnfitly named it *Lappathum Aegyptiacum lactescens siliqua Asclepiadis*. But he is to be pardoned ; for *Iohannes Carolus Rosenberghus*, cap. 16. p. 46. of his *Animad. & Exerc. Medica*, or *Rosa nobilis iatrica*, hath taken vpon him the credit and inuention of this absurd denomination : I may call it absurd, for that neither any way in shape or qualitie it resembles or participates any thing with a *Docke*. I haue giuen you the figure of our Author with his title, and that of *Clusius* with his : in the former the cods are only well exprest ; in the later the leaues and floures reasonably well, but that they are too few in number, and set too far asunder. Vpon the sight of the growing and flourishing plant I tooke this description : The root is long and creeping ; the stalkes two or three cubits high, square, hollow, a finger thicke, and of a light Greene colour, sending out towards the top some few branches : vpon this at

certaine

certaine spaces grow by couples leaues some halfe foot long, and three inches broad, darke Greene on their vpper sides, more whitish below, and full of large and eminent veines: at the top of the stalke and branches it carries most commonly an hundred or more floures, growing vpon foot-stalkes some inch long, all close thrust together after the manner of the Hyacinth of Peru at the first flourishing: each floure is thus composed; first it hath five small Greene leaues bending backe, which serue for the cup: then hath it other five leaues foure times larger than the former, which bend backe and couer them; and these are Greene on the vnder side, and of a pale colour with some rednesse aboue: then are there five little graines (as I may so terme them) of a pleasant red colour, and on their outside like cornes of Millet, but hollow on their insides, with a little thred or chiue comming forth of each of them: these five ingirt a small head like a button, greenish vnderneath, and whitish aboue. I haue giuen you the figure of one floure by the side of our Authors figure. The leaues and stalkes of this plant are very full of a milky iuyce. ‡

¶ The Place.

It groweth, as before is rehearsed, in the countries of Norembega, now called Virginia by the honourable Knight Sir *Walter Raleigh*, who hath bestowed great summes of money in the disco-uerie thereof; where are dwelling at this present English men.

¶ The Time.

It springeth vp, floureth, and flourisheth both Winter and Sommer, as do many or most of the plants of that countrey. ‡ It dies downe with vs euery Winter and comes vp in the Spring, and floures in August, but neuer bringeth forth the cods with vs, by reason of the coldnesse of our Climate. ‡

¶ The Names.

The silke is vsed of the people of Pomeioc and other of the prouinces adioyning, being parts of Virginia, to couer the secret parts of maidens that neuer tasted man; as in other places they vse a white kinde of mosse Wifanck: we haue thought *Asclepias Virginiana*, or *Vincetoxicum Indianum* fit and proper names for it: in English, Virginia Swallow-wort, or the Silke-wort of Norembega.

¶ The Nature and Vertues.

- A** We finde nothing by report, or otherwise of our owne knowledge, of his physicall vertues, but onely report of the aboundance of most pure silke wherewith the whole plant is possessed.
- B** ‡ The leaues beaten either crude, or boyled in water, and applied as a pultesse, are good against swellings and paines proceeding of a cold cause.
- C** The milky iuyce, which is very hot, purges violently; and outwardly applied is good against tetters, to fetch haire off skins, if they be steeped in it, and the like. *Alpinus.* ‡

CHAP. 335.

Of the Bombaste or Cotton-Plant.

¶ The Description.

THe Cotton bush is a low and base Plant, hauing small stalkes of a cubit high, and sometimes higher; diuided from the lowest part to the top into sundry small branches, whereupon are set confusedly or without order a few broad leaues, cut for the most part into three sections, and sometimes more, as Nature list to bestow, somewhat indented about the edges, not vnlike to the leafe of the Vine, or rather the Veruaine Mallow, but lesser, softer, and of a grayish colour: among which come forth the floures, standing vpon slender foot-stalkes, the brimmes or edges whereof are of a yellow colour, the middle part purple: after which appeareth the fruit, round, and of the bignesse of a Tennise ball, wherein is thrust together a great quantitie of fine white Cotton wooll; among which is wrapped vp blacke seed of the bignesse of peasen, in shape like the trettles ordung of a cony. The fruit being come to maturitie or ripenesse, the huske or cod opens it selfe into foure parts or diuisions, and casteth forth his wooll and seed vpon the ground, if it be not gathered in his time and season. The root is small and single, with few threds annexed thereto, and of a wooddy substance, as is all the rest of the plant.

¶ The Place.

It groweth in India, in Arabia, Egypt, and in certaine Islands of the Mediterranean sea, as Cyprus, Candy, Malta, Sicilia, and in other prouinces of the continent adiacent. It groweth about Tripolis and Aleppo in Syria, from whence the Factor of a worshipfull merchant in London, Master *Nicholas Lete* before remembred, did send vnto his said master diuers pounds weight of the seed; whereof some were committed to the earth at the impression hereof, the successe we leaue to the

Gossipium, sine Xylon.

The Cotton bush.

the Lord. Notwithstanding my selfe 3 yeares past did sow of the seed, which did grow verie frankly, but perished before it came to perfection, by reason of the cold frosts that ouertooke it in the time of flourishing.

¶ *The Time.*

Cotton seed is sown in plowed fields in the Spring of the yeare, and reaped and cut down in haruest, euen as corne with vs; and the ground must be tilled and sown new againe the next yeare, and vsed in such sort as we do the tillage for corne and grain: for it is a plant of one yere, and perisheth when it hath perfected his fruit, as many other plants do.

¶ *The Names.*

Cotton is called in Greeke *ελας*, and *ροσμιον*: in Latine, *Xylum*, and *Gossipium* after the Greeke: in shops, *Larugo*, *Bombax*, and *Cotum*: in Italian, *Bombagia*: in Spanish, *Algodon*: in high-Dutch, *Baumwool*: in English and French, Cotton, Bombaste and Bombace.

Theophrastus hath made mention hereof in his fourth booke, cap. 9. but without a name; and he saith it is a tree in *Tylus* which beares wool. Neither is it any maruell if he took an vnknown shrub or plant, and that groweth in Countries farre off, for a tree: seeing also in this age (in which very many things come to be better knownethan in times past) the cotton or wooll hereof is called of the Germanes (as wee haue said) *Baumwooll*, that is, Wooll of a tree,

whereas indeed it is rather an herbe or small shrub, and not to be numbred among trees.

Of this *Theophrastus* writeth thus; It is reported that the same Island (*viz.* *Tylus*) doth bring forth many trees that beare wooll, which haue leaues like those of the Vine, &c.

Pliny writing of the same, lib. 19. cap. 1. saith thus: The vpper part of Egypt toward Arabia bringeth forth a shrub which is called *Gossipion*, or *Xylon*, and therefore the linnen that is made of it is called *Xylina*. It is (saith he) the plant that beareth that wooll wherewith the garments are made which the Priests of Egypt do weare.

¶ *The Temperature.*

The seed of Cotton (according to the opinion of *Serapio*) is hot and moist: the wooll it selfe is hot and dry.

¶ *The Vertues.*

The seed of Cotton is good against the cough, and for them that are shortwinded: it also stirreth vp the lust of the body by increasing naturall seed, wherefore it surpasseth. A

The oyle pressed out of the seed taketh away freckles, spots, and other blemishes of the skin. B

The ashes of the wooll burned stancheth the bleeding of wounds, vsed in restrictiue medicines, as Bole Armonicke, and is more restrictiue than Bole it selfe. C

To speake of the commodities of the wooll of this plant were superfluous, common experience and the dayly vse and benefit we receiue by it shew them. So that it were impertinent to our historie to speake of the making of Fustian, Bombasies, and many other things that are made of the wooll thereof. D

CHAP. 336. Of Dogs-bane.

¶ *The Kindes.*

There be two Kindes of Dogs-banes: the one a clymbing or clambering plant; the other an vpright shrub.

¶ *The*

¶ The Description.

Dogs-bane riseth vp like vnto a small hedge bush, vpright and straight, vntill it haue attained to a certaine heighth; then doth it claspe and clime with his tender branches as do the Bindeweeds, taking hold vpon props or poles, or whatsoeuer standeth next vnto it: whereupon do grow faire broad leaues, sharpe pointed like those of the Bay tree, of a deepe Greene colour. The floures come forth at the top of the stalkes, consisting of fve small white leaues: which being past, there succeed long cods, set vpon a slender foot-stalke by couples, ioyning themselues together at the extreme point, and likewise at the stalke, making of two pieces knit together one entire cod; which cod is full of such downy matter and seed as that of *Asclepias*, but more in quantity by reason the cods are greater; which being dry and ripe, the silken cotton hangeth forth, and by little and little sheddeth, vntill the whole be fallen vpon the ground. The whole plant yeeldeth that yellow stinking milky iuyce that the other doth, and sometimes it is of a white colour, according to the climate where it groweth; for the more cold the country is, the whiter is the iuyce; and the more hot, the yellower. The root is long and single, with some threds annexed thereto.

1 *Periplocarepens angustifolia.*
Climing Dogs-bane.

2 *Periplocalatifolia.*
Broad leaved Dogs-bane.

There is another Dogs-bane that hath long and slender stalkes like those of the Vine; but of a browne reddish colour, wherewith it windeth it selfe about such things as stand neere vnto it, in manner of a Bindweed: whereupon are set leaues not vnlike to those of the Iuy, but not so much cornered, of a darke Greene colour, and of a ranke smell being bruised betweene the fingers, yeelding forth a stinking yellow milky iuyce when it is so broken: amongst which come forth little white floures, standing scatteringly vpon little huskes: after the floures come long cods, very like vnto *Asclepias* or Swallow-wort, but greater, stuffed with the like soft downy silke; among which downe is wrapped vp flat blacke seed. The roots are many and threddy, creeping all about within the ground, budding forth new shoots in sundry places, whereby it greatly increaseth.

¶ The Place.

They grow naturally in Syria, and also in Italy, as *Matthiolus* reporteth: my louing friend *Iohn Robin* Herbarist in Paris did send me plants of both the kinds for my garden, where they floure and flourish; but whether they grow in France, or that he procured them from some other region, as yet I haue no certaine knowledge.

¶ The

¶ The Time.

They begin to bud forth their leaues in the beginning of May, and shew their floures in September.

¶ The Names.

Dogs-bane is called by the learned of our age *Periploca*: it is euident that they are to be referred to the *Apocynum* of *Dioscorides*. The former of the two hath been likewise called *κυνόβατον*, and *Brusica Canina*, or Dogs-Cole: notwithstanding there is another Dogs Cole, which is a kind of wilde Mercurie. We may call the first Creeping Dogs-bane; and the other, Vpright or Syrian Dogs-bane.

¶ The Temperature.

These plants are of the nature of that pestilent or poysonous herbe *Thora*, which being eaten of Dogs or any other liuing creature doth certainly kill them, except there be in readinesse an Antidote or preseruatiue against poyson, and giuen, which by probabilitie is the herbe described in the former chapter, called *Vincetoxicum*; euen as *Anthora* is the Antidote and remedy against the poyson of *Thora*; and *Herba Paris* against *Pardalianches*.

¶ The Vertues.

Dogs-bane is a deadly and dangerous plant, especially to foure footed beasts; for as *Dioscorides* writeth, the leaues hereof being mixed with bread and giuen, killeth dogs, wolues, Foxes, and leopards, the vse of their legs and huckle-bones being presently taken from them, and death it selfe followeth incontinent, and therefore not to be vsed in medicine.

CHAP. 337. Of Solomons Seale.

1 *Polygonatum*.

Solomons Seale.

2 *Polygonatum minus*.

Small Solomons Seale.

¶ The Description.

The first kinde of Solomons Seale hath long round stalkes, set for the most part with long leaues somewhat furrowed and ribbed, not much vnlike Plantaine, but narrower, which for the most part stand all vpon one side of the stalk, and hath smal white floures resembling the

the floures of Lilly conuall : on the other side when the floures be vaded there come forth round berries, which at the first are Greene, and of a blacke colour tending to blewnesse, and when they be ripe be of the bignesse of luy berries, of a very sweet and pleasant taste. The root is white and thicke, full of knobs or ioynts, which in some places resemble the marke of a seale, whereof I think it tooke the name *Sigillum Solomonis*; and is sweet at the first, but afterward of a bitter taste, with some sharpenesse.

2 The second kinde of *Polygonatum* doth not much vary from the former, sauing in the leaues, which be narrower, and grow round about the stalke like a spur, in fashion like vnto Woodroose or red Madder: among the leaues come forth floures like the former, but of a greener white colour: which being past, there succeed berries like the former, but of a reddish colour: which being past, there succeed berries like the former, but of a reddish colour: the roots are thick and knobby like the former, with some fibres annexed thereto.

3 *Polygonatum latifolium* 2. *Clusij*.

Sweet smelling Solomons Seale.

4 *Polygonatum ramosum*.

Branched Solomons Seale.

3 The third kinde of Solomons Seale, which *Carolus Clusius* found in the woody mountaines of Leitenberg, aboue Manderstorf, and in many other mountaines beyond the riuer Danubius, especially among the stones, hee sent to London to Mr. Garth a worshipfull Gentleman, and one that greatly delighteth in strange plants, who very louingly imparted the same vnto me. This plant hath stalkes very like vnto the common Solomons Seale, a foot high, beset with leaues vpon one side of the stalke like the first and common kinde, but larger, and more approaching to the bignesse of the broad leaved Plantaine, the taste whereof is not very pleasant: from the bosome of which leaues come forth small well smelling greenish white floures not much vnlike the first: which being past, there follow seeds or berries that are at the first green, but afterward blacke, containing within the same berries a small seed as big as a Vetch, and as hard as a stone. The roots are like vnto the other of his kinde, yet not so thicke as the first.

4 The fourth kind according to my account, but the third of *Clusius* (which he found also in the mountaines aforesaid) groweth a foot high, but seldome a cubit, differing from all the others of his kinde; for his stalkes diuide themselves into sundry other branches, which are garnished with goodly leaues, larger and sharper pointed than any of the rest, which do embrace the stalks about after the manner of *Perfoliata* or Thorow-wax, yet very like vnto the kindes of Solomons Seale in shew,

shew, saue that they are somewhat hoarie vnderneath the leaues, which at the first are sweete in taste, but somewhat acride or biting towards the later end. From the backe part of the leaues shoot forth small long tender and crooked stems, bearing at the end little gaping white floures not much vnlike *Lilium conuallium*, sauouring like Hawthorne floures, spotted on the inner side with blacke spots: which being past, there come forth three cornered berries like the narrow leaved Solomons seale, Greene at the first, and red when they be ripe, containing many white hard graines. The roots differ from all the other kindes, and are like vnto the crambling roots of *Thalictrum*, which the grauer hath omitted in the picture.

§ *Polygonatum angustifolium ramosum.*
Narrow leaued Solomons seale.

¶ This rare sort of Solomons Seale rises vp from his tuberous or knobby root, with a straight vpright stalke ioyned at certaine distances, leauing betweene each ioynt a bare and naked stalke, smooth, and of a greenish colour tending to yellownes; from the which ioyns thrust forth diuers smal branches, with foure narrow leaues set about like a star or the herbe Woodroose: vpon which tender branches are set about the stalkes by certaine spaces long narrow leaues inclosing the same round about: among which leaues come forth small whitish floures of little regard. The fruit is small, and of a red colour, full of pulpe or meate; among which is contained a hard stony seed like that of the first Solomons seale.

¶ There is kept in our gardens, and said to be brought from some part of America another *Polygonatum*, which sends vp a stalk some foot and more high, and it hath leaues long, neruous, and very Greene and shining, growing one by another without any order vpon the stalke, which is somewhat crested, crooked, and very Greene: bearing at the very top thereof, aboue the highest leafe, vpon little foot-stalks, some eight or nine little white floures, consisting of six leaues apiece, which are succeeded by berries, as in the former. This floures in May, and is vulgarly named *Polygonatum Virginianum*, or Virginian Solomons seale. ‡

¶ The Place.

The first sort of Solomons seale growes naturally wilde in Somerset-shire, vpon the North side of a place called Mendip, in the parish of Shepton Mallet: also in Kent by a village called Crayford, vpon Rough or Row hill: also in Odiam parke in Hampshire; in Bradfords wood, neere to a town in Wiltshire foure miles from Bathe; in a wood neere to a village called Horsley, fve miles from Gilford in Surrey, and in diuers other places.

That sort of Solomons seale with broad leaues groweth in certaine woods in Yorkshire called Clapdale woods, three miles from a village named Settle.

¶ The Time.

They spring vp in March, and shew their floures in May: the fruit is ripe in September.

¶ The Names.

Solomons seale is called in Greeke *μαριον*: in Latine likewise *Polygonatum*, of many, Knees, for so the Greeke word doth import: in shops, *Sigillum Salomonis*, and *Scala celi*: in English likewise *Scala celi*, Solomons seale, and White-wort, or white root: in high-Dutch, *Weisswurtz*: in French, *Seau de Solomon*: of the Hettrurians, *Fraxinella*, and *Fraxinella*.

¶ The Temperature.

The roots of Solomons seale, as Galen saith, haue both a mixt facultie and qualitie also: For they haue (saith he) a certaine kinde of astringion or binding, and biting withall, and likewise a certaine loathsome bitternesse, as the same Author affirmeth: which is not to be found in those that do grow in our climate.

¶ The Vertues.

- A *Dioscorides* writeth, That the roots are excellent good for to seale or close vp greene wounds, being stamped and laid thereon; whereupon it was called *Sigillum Salomonis*, of the singular vertue that it hath in sealing or healing vp wounds, broken bones, and such like. Some haue thought it tooke the name *Sigillum* of the markes vpon the roots: but the first reason seemes to me more probable.
- B The root of Solomons seale stamped while it is fresh and greene, and applied, taketh away in one night, or two at the most, any bruiſe, blacke or blew spots gotten by falls or womens wilfulnesse, in stumbling vpon their hasty husbands fists, or such like.
- C *Galen* saith, that neither herbe nor root hereof is to be giuen inwardly: but note what experience hath found out, and of late dayes, especially among the vulgar sort of people in Hampshire, which *Galen*, *Dioscorides*, or any other that haue written of plants haue not so much as dreamed of; which is, That if any of what sex or age soeuer chance to haue any bones broken, in what part of their bodies soeuer; their refuge is to stampe the roots hereof, and giue it vnto the patient in ale to drinke: which sodoreth and glues together the bones in very short space, and very strangely, yea although the bones be but slenderly and vnhandſomely placed and wrapped vp. Moreouer, the said people do giue it in like manner vnto their cattell, if they chance to haue any bones broken, with good successe; which they do also stampe and apply outwardly in manner of a pulstesse, as well vnto themselves as their cattell.
- D The root stamped and applied in manner of a pulstesse, and layd vpon members that haue been out of ioynt, and newly restored to their places, driueth away the paine, and knitteth the ioynt very firmly, and taketh away the inflammation, if there chance to be any.
- E The same stamped, and the iuyce giuen to drinke with ale or white wine, as aforesaid, or the decoction thereof made in wine, helps any inward bruiſe, disperſeth the congealed and clotted blood in very short space.
- F That which might be written of this herbe as touching the knitting of bones, and that truely, would seeme vnto some incredible; but common experience teacheth, that in the world there is not to be found another herbe comparable to it for the purposes aforesaid: and therefore in brieſe, if it be for bruiſes inward the roots must be stamped, some ale or wine put thereto, strained, and giuen to drinke.
- G It must be giuen in the same manner to knit broken bones, against bruiſes, black or blew marks gotten by stripes, falls, or such like; against inflammation, tumors or swellings that happen vnto members whose bones are broken, or members out of ioynt, after restauration: the roots are to be stamped small, and applied pulstesse or plaisterwise, wherewith many great works haue bene performed beyond credit.
- H *Matthiolus* teacheth, That a water is drawne out of the roots, wherewith the women of Italy vse to scoure their faces from sunne-burning, freckles, morpew, or any such deformities of the skinne.

† That which our Author formerly figured and described in the fifth place of this chapter, by the name of *Toliganatum acutum Clusi*, was that described by him in the fourth place; but the figure was not so well exprest.

CHAP. 338. Of Knee-holme, or Butchers broome.

¶ The Description.

Knee-holme is a low woody plant, hauing diuers small branches, or rather stems, rising immediately from the ground, of the height of a foot; whereupon are set many leaues like vnto those of the Box tree, or rather of the Myrtle, but sharpe and pricking at the point. The fruit groweth vpon the middle rib of the leafe, greene at the first, and red as Corall when it is ripe, like those of *Asparagus*, but bigger. The roots are white, branched, of a meane thicknesse, and full of tough sprouting shoots thrusting forth in other places, whereby it greatly encreaseth.

¶ The Place.

It groweth plentifully in most places in England in rough and barren grounds, especially vpon Hampsted heath foure miles from London: in diuers places of Kent, Essex, and Barkshire, almost in euery copse and low wood.

¶ The Time.

The young and tender sprouts come forth at the first of the Spring, which are eaten in some places

places, as the yong tender stalkes of Asparagus and such like herbes. The berries are ripe in August.

Ruscus, sine Bruscus.

Knee-holme, or Butchers broome.

¶ The Names.

It is called in Greeke *ῥυσκίον*, as though they should say *Acuta Myrtus*, or pricking Myrtle; and *Myrtus sylvestris*, or wild Myrtle: in Latine, *Ruscum*, or *Ruscus*: in shops, *Bruscus*: of diuers, *Scopa regia*, as testifieth *Marcellus Empericus* an old Writer: in high-Dutch, *Wuesdoorn*: in low-Dutch, *Stekende palm*: in Italian, *Rusco*, and *Pontogopi*: in Spanish, *Gilbarbeyra*: in English, Knee-holme, Knee-huluer, Butchers broome, and Petigree.

There be some (saith *Pliny*, lib. 25. cap. 13.) that call it *Oxymyr sine*.

Serapio, cap. 288. supposeth that *Myrtus Agria*, or wilde Myrtle, is the same that *Cubeba* are: he alledgeth a reason, because *Galen* hath not described *Myrtus Agria*, or Knee-holme; neither *Dioscorides Cubeba*. Which as it is a reason of no account, so is it also without truth: for *Galen* doth nowhere make mention of *Cubeba*; and be it that he had, it should not therefore follow that Knee-holme is *Cubeba*. *Galen* speaketh of *Carpesium*, which *Anicen* in his 137 chapter maketh to be *Cubeba*: and that *Carpesium* doth much differ from Kneeholme, those things do evidently declare which *Galen* hath left written hereof in his first book of of Counterpoysons. *Carpesium* (saith hee) is an herbe like in kinde to that which is called *Phu*, or Setwall, but of greater force, and more

aromaticall or spicie. This groweth very plentifully in Sida a city of Pamphilia. Also he saith further, that some of the stickes of *Carpesium* are like to those of Cinnamon: there be two kinds thereof, one which is named *Laërtium*; and another that is called *Ponticum*. They both take their names of the mountaines on which they grow: but *Ponticum* is the better, which is put into medicines in which the herbe *Phu* ought to be put. For *Carpesium*, as I haue said, is like vnto *Phu*, or Setwall, yet is it stronger, and yeeldeth a certaine aromaticall qualitie both in taste and smell. Thus far *Galen*. By which it plainly appeareth, that Knee-holme is not *Carpesium*, that is to say, *Anicenna* his *Cubeba*, as shall be further declared in the chapter of *Cubeba*.

Herein *Serapio* was likewise deceiued, who suspected it to be such a like thing; saying, There be certaine fruits or graines called *Cubeba*, not sticks: yet do they neither agree with Knee-holme, neither yet were they knowne vnto *Galen*.

Isaac in the second booke of his Practise doth number it among the graines: and likewise *Hali-abbas* in the second booke of his Practise also, num. 162. The later Grecians, among whom is *Nicolaus Myrepsus*, call them *Cubeba*.

¶ The Temperature.

The roots of Knee-holme, which be chiefly vsed, are of temperature hot, and meanly dry, with a thinnesse of essence.

¶ The Vertues.

The decoction of the roots of Knee-holme made in wine and drunken, prouoketh vrine, breaketh the stone, driueth forth grauell and sand, and easeth those that make their water with great paine.

Dioscorides writeth the same things of the leaues and berries, which moreover (saith hee) bring downe the desired sicknesse, helpe the head-ache and the yellow jaundice.ouer and besides, the roots do serue to raise vp gently tough and grosse flegm which sticketh in the lungs and chest, and do concoct the same.

CHAP. 339. Of Horse-tongue or Double-tongue.

¶ The Description.

HOrse-tongue sendeth forth round stalkes of a span long; wherupon are set long broad and sharpe pointed leaues, but not pricking as are those of Knee-holme, not vnlike to the leaues of the Bay tree, but lesser; greater than those of Knee-holme: out of the middle rib whereof commeth forth another leafe, sharpe pointed also, but small, and of the bignesse of the leafe of Knee-holme, resembling a little tongue. From the bosome of which two leaues commeth forth a berry of the bignesse of a pease, of colour red when it is ripe, which is sometimes in a manner all hid vnder the leafe. The root is white, long, and tough, and of a sweet and pleasant smell.

1 Hippoglossum mas.
The male Horse-tongue.

2 Hippoglossum femina.
The female Horse-tongue.

2 The female Horse-tongue differeth not from the precedent but in stature and colour of the fruit: it riseth vp (saith my Author) foure or fve handfulls high: the berries come forth of the middle part of the greater leafe, and the setting on of the lesser, of a feint yellowish red colour, wherein consisteth the difference. ‡ This is all one with the former. ‡

3 There is likewise another sort of Double-tongue set forth by *Matthiolus*, which seemes vnto some not to differ from the first described or best known Horse tongue, being in truth the self same plant without any difference: notwithstanding I haue set forth the figure, that it may appeare to be the same, or very little different, and that not to be distinguished: but *Matthiolus* may not escape without reprehension, who knowing the vntue translation of *Ruellius*, would set forth so false a picture in his Commentaries.

‡ Our Author here, as in many other places, mistakes himselfe; for *Matthiolus* did not set forth that figure that our Author giues in this place, for *Hippoglossum*, but by the title of *Laurus Alexandrina altera*: and it thus differs from the common Horse-tongue; it hath shorter and rounder leaues, yet sharpe pointed, and the berries are not couered with little leaues as in the other, neither haue they any apparant stalkes at all, but grow close to the leaues, as you may see them exprest in the figure. ‡

¶ The

3 *Hippoglossum Matthioli.*
Italian Horse-tongue.

¶ The Place.

They are found on the Alps of Liguria, and on the mountaines of Austria. *Belonius* writeth, that they do grow very plentifully about the hill *Athos*.

The first of the Horse-tongues growes in my garden very plentifully.

¶ The Time.

That which groweth in my garden floured in the beginning of May: the fruit is ripe in the fall of the lease.

¶ The Names.

Horse-tongue is called in Greek *ἵππος γλῶσσα*: of the later Herbarists, *Bonifacia*, *Vularia*, *Eislingua*, *Lingua Pagana*, and *Victoriola*. The same is also named *δακτύλιος*, of *Ida* a mountaine of *Troy*, which is called *Alexanders Troy*: of some, *Laurus Alexandrina*, or the Bay of *Alexandria*, and *Laurus Idaea*.

This *Hippoglossum Bonifacia* is called in high-Dutch, *Zapflinkraut*: in low-Dutch, *Tonghenblad*: in Spanish, *Lengua de Cavallo*: in English, Horse-tongue, Tongne-blade, Double-tongue, and Laurel of Alexandria.

¶ The Temperature.

Horse-tongue is evidently hot in the second degree, and dry in the first.

¶ The Vertues.

The roots of Double-tongue boiled in wine, and the decoction drunke, helpeth the strangurie, prouoketh vrine, easeth women that haue hard trauell in childe-bearing. It expelleth the secondine or after-birth. The root beaten to powder, whereof six drams giuen in sweet wine, doth helpe the diseases aforesaid: it bringeth downe the termes, as *Dioscorides* teacheth. The like writeth *Pliny* also: adding further, That it causeth women to haue speedy deliuerance, especially if halfe an ounce of the powder of the root be giuen to drink in a draught of sweet wine.

Baptista Sardus doth notably commend this herb for the diseases of the mother, by giuing, saith he, a little spoonfull of the powder either of the herbe, the fruit, or of the root, to her that is troubled with the mother, she is thereby forthwith recouered. He also writeth, that the same is a singular good medicine for those that be bursten, if a spoonfull of the powder of the root be drunke in the broth of flesh certaine dayes together.

CHAP. 340. Of Cucumbers.

¶ The Kindes.

There be diuers sorts of Cucumber; some greater, others lesser; some of the Garden, some wilde; some of one fashion, and some of another, as shall be declared in the following chapters.

¶ The Description.

The Cucumber creepes alongst vpon the ground all about, with long rough branches; whereupon do grow broad rough leaues vneuen about the edges: from the bosome whereof come forth crooked clasping tendrels like those of the Vine. The floures shoot forth betweene the stalkes and the leaues, set vpon tender foot-stalks composed of fine small yellow leaues: which being past, the fruit succeedeth, long, cornered, rough, and set with certaine bumpes or risings, greene at the first, and yellow when they be ripe, wherein is contained a firme and sollid pulpe or substance transparent or thorow-shining, which together with the seed is eaten a little before they be fully ripe. The seeds be white, long, and flat.

Gggg 3

2 There

1 *Cucumis vulgaris.*
Common Cucumber.

2 *Cucumis Anguina.*
Adders Cucumber.

3 *Cucumis ex Hispanica semine natus.*
Spanish Cucumber.

2 There be also certaine long cucumbers, which were first made (as is said) by art and manuring, which Nature afterwards did preferue: for at the first, when as the fruit is very little, it is put into some hollow cane, or other thing made of purpose, in which the cucumber groweth very long, by reason of that narrow hollownesse, which being filled vp, the cucumber encreaseth in length. The seeds of this kinde of cucumber being sowne bringeth forth not such as were before, but such as art hath framed; which of their own growth are found long, and oftentimes very crookedly turned: and thereupon they haue beene called *Anguini*, or long Cucumbers.

3 The peare fashioned Cucumber hath many trailing branches lying flat vpon the ground, rough and prickly; whereon doe stand at each ioynt one rough leafe, sharpe pointed, and of an ouerworn green colour; among which come forth clasping rendrels, and also slender foot-stalks, whereon do grow yellow starre-like floures. The fruit succeeds, shaped like a peare, as big as a great Warden. The root is threddy.

4 There hath bin not long since sent out of Spain some seeds of a rare & beautiful cucumber, into Strausburg a city in Germany, which there brought forth long trailing branches, rough & hairy, set with very large rough leaues sharp pointed, fashioned like vnto the leaues of the

the great Bur-docke, but more cut in or diuided : amongst which come forth faire yellow floures growing nakedly vpon their tender foot-stalks : the which beeing past, the fruit commeth in place, of a foot in length, Greene on the side toward the ground, yellow to the Sun ward, straked with many spots and lines of diuers colours. The pulpe or meat is hard and fast like that of our Pompion.

¶ *The Place.*

These kindes of Cucumbers are planted in gardens in most countries of the world.

¶ *The Time.*

According to my promise heretofore made, I haue thought it good and conuenient in this place to set downe not onely the time of sowing and setting of Cucumbers, Muske-melons, Citruls, Pompions, Gourds, and such like, but also how to set or sow all manner and kindes of other colde seeds, as also whatsoeuer strange seeds are brought vnto vs from the Indies, or other hot Regions: *videl.*

First of all in the middest of Aprill or somewhat sooner (if the weather be any thing temperate) you shall cause to be made a bed or banke of hot and new horse dung taken forth of the stable (and not from the dunghill) of an ell in breadth, and the like in depth or thicknesse, of what length you please, according to the quantitie of your seed: the which bank you shall couer with hoops or poles, that you may the more conueniently couer the whole bed or banke with Mats, old painted cloth, straw or such like, to keepe it from the iniurie of the cold frostie nights, and not hurt the things planted in the bed : then shall you couer the bed all ouer with the most fertilest earth finely sifted, halfe a foot thick, wherein you shall set or sow your seeds : that being done, cast your straw or other couerture ouer the same, and so let it rest without looking vpon it, or taking away of your couering for the space of seuen or eight daies at the most, for commonly in that space they will thrust themselves vp nakedly forth of the ground: then must you cast vpon them in the hottest time of the day some water that hath stood in the house or in the Sun a day before, because the water so cast vpon them newly taken forth of a well or pumpe, will so chill and coole them being brought and nourished vp in such a hot place, that presently in one day you haue lost all your labour ; I mean not onely your seed, but your banke also ; for in this space the great heat of the dung is lost and spent, keeping in memorie that euery night they must be couered and opened when the day is warmed with the Sun beames : this must be done from time to time vntill that the plants haue foure or six leaues a piece, and that the danger of the cold nights is past : then must they be replanted verie curiously, with the earth sticking to the plant, as neere as may be vnto the most fruitfull place, and where the Sun hath most force in the garden; provided that vpon the remouing of them you must couer them with some Docke leaues or wispes of straw, propped vp with forked stickes, as well to keepe them from the cold of the night, as also the heat of the Sun : for they cannot whilest they be young and newly planted, indure neither ouermuch cold nor ouermuch heat, vntill they are wel rooted in their new place or dwelling.

Oftentimes it falleth out that some seeds are more franker and forwarder than the rest, which commonly do rise vp very nakedly with long necks not vnlike to the stalke of a small mushrome, of a night old. This naked stalke must you couer with the like fine earth eten to the Greene leaues, hauing regard to place your banke so that it may be defended from the North-windes.

Obserue these instructions diligently, and then you shall not haue cause to complaine that your seeds were not good, nor of the intemperancie of the climat (by reason wherof you can get no fruit) although it were in the furthest parts of the North of Scotland.

¶ *The Names.*

The Cucumber is named generally *Cucumis* : in shops, *Cucumer* : and is taken for that which the Grecians call *σικκος* : in Latine, *Cucumis satiuus*, or garden Cucumber: in High Dutch, *Cucumen*: in Italian, *Concomero* : in Spanish, *Cogombro* : in French, *Concombre*. in Low Dutch, *Concommeren* : in English, Cowcumbers and Cucumbers.

¶ *The Temperature and Vertues.*

All the Cucumbers are of temperature cold and moist in the second degree. They putrifie soon A in the stomacke, and yeeld vnto the body a cold and moist nourishment, and that very little, and the same not good.

Those Cucumbers must be chosen which are green and not yet ripe: for when they are ripe and B yellow they be vnfit to be eaten.

The seed is cold, but nothing so much as the fruit. It openeth and clenseth, prouoketh vrine, o. C peneth the stoppings of the liuer, helpeth the chest and lungs that are inflamed, and being stamped and outwardly applied in stead of a clenser, it maketh the skin smooth and faire.

Cucumber (saith my Author) taken in meats, is good for the stomack and other parts troubled D with heat. It yeeldeth not any nourishment that is good, insomuch as the vnmeasurable vse thereof filleth the veines with naughty cold humours.

The seed stamped and made into milke like as they do with Almonds, or strained with milke or E sweet

sweet wine and drunke, looseth the belly gently, and is excellent against the exulceration of the bladder.

F The fruit cut in pieces or chopped as herbes to the pot and boiled in a small pipkin with a piece of mutton, being made into potage with Ore-meale, even as herb potage are made, whereof a messe eaten to break-fast, as much to dinner, and the like to supper; taken in this manner for the space of three weekes together without intermission, doth perfectly cure all manner of sawce-flegme and copper faces, red and shining fierie noses (as red as red Roses) with pimples, pumptes, rubies, and such like precious faces.

G Provided alwaies that during the time of curing you do vse to wash or bathe the face with this liquor following.

H Take a pinte of strong white wine vinegar, powder of the roots of Ireos or Orrice three dragmes, seared or bolted into most fine dust, Brimstone in fine powder halfe an ounce, Camphire two dragmes, stamped with two blanched Almondes, foure Oke Apples cut thorow the middle, and the iuice of foure Limons: put them all together in a strong double glasse, shake them together very strongly, setting the same in the Sunne for the space of ten daies: with which let the face be washed and bathed daily, suffering it to drie of it selfe without wiping it away. This doth not on-ly helpe fire faces, but also taketh away lentils, spots, morpew, Sun-burne, and all other deformities of the face.

† That which formerly was in the second place by the name of *Cusumia Turcica*, was the same with the fifth of the former Edition (now the fourth) and is there-fore omitted.

CHAP. 341. Of Wilde Cucumber.

Cucumis Asininus.

Wilde Cucumber.

¶ The Description.

THe wilde Cucumber hath many fat hairie branches, very rough and full of iuice, creeping or trailing vpon the ground, whereupon are set very rough leaues, hairy, sharp pointed, & of an ouerborne grayish Greene colour: from the bosome of which come forth long tender foot-stalkes: on the ends whereof doe grow small floures composed of five small leaues of a pale yellow colour: after which commeth forth the fruit, of the bignes of the smallest pullets egge, but somewhat longer, verie rough and hairy on the outside, and of the colour and substance of the stalkes, wherein is contained very much water and smal hard blackish seeds also, of the big- nesse of tares; which being come to maturitie and ripenesse, it casteth or squirteth forth his water with the seeds, either of it owne accord, or being touched with the most tender or delicate hand neuer so gently, and oftentimes striketh so hard against those that touch it (especially if it chance to hit against the face) that the place smarteth long after: whereupon of some it hath been called *Noli me tangere*, Touch me not. The root is thicke, white and long lasting.

¶ The Place.

It is found in most of the hot countries among rubbish, grauell, & other vntilled places: it is planted in gardens in the Low-countries, and being once planted, saith *Dodonaus*, it easily commeth vp againe many yeares after (which is true:) and yet saith he further, that it doth not spring againe of the root, but of the seeds spirted or cast about: which may likewise be true where he hath obserued it, but in my garden it is otherwise, for as I said before, the root is long lasting, and continueth from yeare to yeare.

¶ The

¶ The Time.

It springeth vp in May, it floureth and is ripe in Autumne, and is to be gathered at the same time, to make that excellent composition called *Elaterium*.

¶ The Names.

It is called in Greeke *οἶνος ἀγρός* : in Latine, *Agrestis*, and *Erraticus Cucumis* : in shoppes, *Cucumer aspinus* : in Italian, *Cocomero saluatico* : in Spanish, *Cogumbrillo amargo* : in English, wilde Cucum-ber, spirting Cucumbers, and touch me not: in French, *Concombres sauvages*.

¶ The Temperature.

The leaues of wilde Cucumbers, roots and their rindes as they are bitter in taste, so they be like- wise hot and clensing. The iuice is hot in the second degree, as *Galen* witnesseth, and of thin parts. It clenseth and wasteth away.

¶ The Vertues.

The iuice called *Elaterium* doth purge forth choler, flegme, and waterie humours, and that with A force, and not onely by siege, but sometimes also by vomit.

The quantity that is to be taken at one time is from five grains to ten, according to the strength B of the patient.

The iuice dried or hardened, and the quantitie of halfe a scruple taken, driueth forth by siege C grosse flegme, cholericke humours, and preuaileth mightily against the dropsie, and shortnesse of breath.

The same drawne vp into the nostrils mixed with a little milk, taketh away the rednesse of the D eies.

The iuice of the root doth also purge flegme, cholericke and waterish humours, and is good for E the dropsie: but not of such force as *Elaterium*, which is made of the iuice of the fruit: the making whereof I commend to the learned and curious Apothecaries: among which number M^r. *William Wright* in Bucklers Burie my louing friend hath taken more paines in curious composing of it, and hath more exactly performed the same than any other whatsoeuer that I haue had knowledge of.

CHAP. 342. Of Citrull Cucumbers.

1 *Citrullus officinarum*.
Citrull Cucumber.

2 *Citrullus minor*.
Small Citrull.

¶ The

¶ The Description.

1 **T**He Citrull Cucumber hath many long, flexible, and tender stalkes trailing vpon the ground, branched like vnto the Vine, set with certaine great leaues deeply cut, and very much iagged: among which come forth long clasping tendrels, and also tender footstalkes, on the ends whereof do grow floures of a gold yellow colour: the fruit is somewhat round, straked or ribbed with certaine deepe furrowes alongst the same, of a green colour aboue, and vnderneath on that side that lyeth vpon the ground something white: the outward skin whereof is very smooth; the meat within is indifferent hard, more like to that of the Pompion than of the Cucumber or Muske melon: the pulpe wherein the seed lieth, is spungie, and of a slimie substance: the seed is long, flat, and greater than those of the Cucumbers: the shell or outward barke is blackish, sometimes of an ouerworne reddish colour. The fruit of the Citrull doth not so easily rot or putrifie as doth the Melon, which being gathered in a faire dry day may be kept a long time, especially being couered in a heape of wheat, as *Matthiolus* saith; but according to my practise you may keepe them much longer and better in a heape of dry sand.

2 The second kinde of Citrull differeth not from the former, sauing that it is altogether lesfer, and the leaues are not so deeply cut or iagged, wherein consisteth the difference.

¶ The Place and Time.

The Citrull prospereth best in hot Regions, as in Sicilia, Apulia, Calabria, and Syria, about Alepo and Tripolis. We haue many times sown the seeds, and diligently obserued the order prescribed in planting of Cucumbers.

¶ The Names.

The later Herbarists do call it *Anguria*: in shoppes, *Citrullus*, and *Cucumis Citrullus*: in English, Citruls, and Cucumber Citruls, and the seed is knowne by the name of *Semen Citrulli*: or Citrull seed. But if *Cucumis Citrullus*, be so called of the yellow colour of the Citron, then is the common Cucumber properly *Cucumis Citrullus*: which is knowne vnto all to be contrarie.

¶ The Temperature and Vertues.

A The meat or pulpe of Cucumer Citrull which is next vnto the bark is eaten raw, but more commonly boiled: it yeeldeth to the bodie little nourishment, and the same cold: it ingendreth a waterish bloud, mitigateth the extremity of heat of the inner parts, and tempereth the sharpnesse and feruent heat of choler: being raw and held in the mouth, it takes away the roughnesse of the tongue in Agues, and quencheth thirst.

B The seeds are of the like facultie with those of Cucumbers.

CHAP. 343. Of the wilde Citrull called Colocynthis.

¶ The Description.

1 **C**oloquintida hath beene taken of many to be a kinde of the wild Gourd, it lieth along creeping on the ground as doe the Cucumbers and Melons, comming neereft of all to that which in those daies of some Herbarists is called Citrull Cucumber: it bringeth forth vpon his long branches smal crooked tendrels like the Vine, and also very great broad leaues deeply cut or iagged: among which come forth small floures of a pale yellow colour, then cometh the fruit round as a bowle, couered with a thin rinde, of a yellow colour when it is ripe, which when it is pilled or pared off, the white pulpe or spungie substance appeareth full of seedes, of a white or else an ouerworne browne colour, the fruit so pared or pilled, is dried for medicine, the which is most extreame bitter, and likewise the seede, and the whole plant it selfe in all his parts.

2 The second kinde of Coloquintida hath likewise many long branches and clasping tendrels, wherewith it taketh hold of such things as are neere vnto it. It bringeth forth the like leaues, but not so much iagged. The floures are small and yellow: the fruit is fashioned like a peare, and the other sort round, wherein the especiall difference consisteth.

¶ The Place.

Coloquintida is sowne and cometh to perfection in hot regions, but seldome or neuer in these Northerly and cold countries.

¶ The

1 *Colocynthis.*

The wilde Citrull or Coloquintida.

2 *Colocynthis pyriformis.*

Peare fashioned Coloquintida.

¶ The Time.

It is sowne in the Spring, and bringeth his fruit to perfection in August.

It hath bene diuers times deliuered vnto me for a truth, that they doe grow in the sands of the Mediterranean sea shore, or verie neere vnto it, wilde, for euery man to gather that list, especially on the coast of Barbarie, as also without the mouth of the Streights neere to *Santa Cruz* and other places adiacent, from whence diuers Surgions of London that haue trauelled thither for the curing of sicke and hurt men in the ship haue brought great quantities thereof at their returne.

¶ The Names.

It is vulgarly called *Coloquintida*: in Greeke *καλοκύνθισ*: the Latine translators for *Colocynthis* doe oftentimes set downe *Cucurbita sylvestris*: notwithstanding there is a *Cucurbita sylvestris* that differeth from *Colocynthis*, or *Coloquintida*: for *Cucurbita sylvestris* is called in Greeke *καλοκύνθα ἀγρία*: or wilde *Coloquintida*, whereof shall be set forth a peculiar chapter next after the *Cucurbita* or Gourd: in English it is called *Coloquintida*, or *Apple of Coloquintida*.

¶ The Temperature.

Coloquintida as it is in his whole nature and in all his parts bitter, so is it likewise hot and drie in the later end of the second degree, and therefore it purgeth, clenseth, openeth and performeth all those things that most bitter things do: but that the strong qualitie which it hath to purge by the stoole, is, as *Galen* saith, of more force than the rest of his operations.

¶ The Vertues.

Which operation of purging it worketh so violently, that it doth not onely draw forth flegme A and choler maruellous speedily, and in very great quantitie: but oftentimes fetcheth forth bloud and bloody excrements, by shauing the guts, and opening the ends of the meseraicall veines.

So that therefore the same is not to be vsed either rashly, or without some dangerous and extreme disease constraineth thereunto: neither yet at all, vnlesse some rough and clammy thing be mixed therewith, whereby the vehemencie thereof may be repressed, the hurtfull force dulled, and the same speedily passing through the belly, the guts be not fret or shaued. *M. sues* teacheth to mixe with it either *Mastich*, or gum *Tragacanth*. B

There be made of it *Trochises*, or little flat cakes, with *Mastich*, gum *Arabick*, *Tragacanth* and *Bellium*. C

Bdellium, of these, Mastich hath a manifest binding qualitie : but tough and clammy things are much better, which haue no astringent at all in them, or very little.

D For by such binding or astringent things, violent medicines being restrained and bridled, do afterward work their operation with more violence and trouble : but such as haue not binding things mixed with them do easilier worke, and with lesser paine, as be those pills which *Rhasis* in his ninth booke of *Almanzor* calleth *Illiacæ* : which are compounded of Coloquintida and Scamony, two of the strongest medicines that are ; and of a third called gum *Sagapene*, which through his clamminesse doth as it were daube the intrails and guts, and defend them from the harme that might haue come of either of them.

E The which composition, although it be wonderfull strong, and not to be vsed without very great necessitie vrge thereunto, doth notwithstanding easily purge, and without any great trouble, and with lesser torment than most of the mildest and gentlest medicins which haue Mastich and other things mixed with them that are astringent.

F And for this cause it is very like that *Galen* in his first booke of Medicines, according to the places affected, would not suffer Mastich and Bdellium to be in the pills, which are surnamed *Cochia* : the which notwithstanding his Schoolemaster *Quintus* was also wont before to adde vnto the same.

G But Coloquintida is not onely good for purgations, in which it is a remedie for the diffynesse or the turning sicknesse, the megrim, continuall head-ache, the Apoplexie, the falling sicknesse, the stuffing of the lungs, the gnawings and gripings of the guts and intrails, and other most dangerous diseases, but also it doth outwardly worke his operations, which are not altogether to be reiected.

H Common oile wherein the same is boiled, is good against the singing in the eares, and deafenes : the same killeth and driueth forth all manner of wormes of the belly, and doth oftentimes prouoke to the stoole, if the nauell and bottome of the belly be therewith annointed.

I Being boiled in vineger, and the teeth washed therewith, it is a remedie for the tooth-ache, as *Mesues* teacheth.

K The seed is very profitable to keepe and preferue dead bodies with ; especially if Aloes and Myrhe be mixed with it.

L The white pulpe or spongiouse pith taken in the weight of a scruple openeth the belly mightily, and purgeth grosse flegme, and cholericke humors.

M It hath the like force if it be boiled and laid to infuse in wine or ale, and giuen to drinke.

N Being taken after the same manner it profiteth the diseases before remembred, that is, the Apoplexie, falling sicknesse, giddinesse of the head, the collicke, loosenesse of sinewes, and places out of ioint, and all diseases proceeding of cold.

O For the same purposes it may be vsed in clisters,

P The same boiled in oile, and applied with cotton or wooll, taketh away the pain of the Hemorrhoides.

Q The decoction made in wine, and vsed as a fomentation or bathe, bringeth downe the desired sicknesse.

CHAP. 344. Of Muske-Melon, or Million.

The Kindes.

There be diuers sorts of Melons found at this day, differing very notably in shape and proportion, as also in taste, according to the climate and countrie where they grow : but of the Antients there was onely one and no more, which is that *Melopepo* called of *Galen*, *Cucumis*, or *Galen's* Cucumber : notwithstanding some haue comprehended the Muske-Melons vnder the Kindes of Citruls, wherein they haue greatly erred : for doubtlesse the Muske-Melon is a kinde of Cucumber, according to the best approued Authors.

The Description.

That which the later Herbarists do call Muske-Melons is like to the common Cucumber in stalks, lying flat vpon the ground, long, branched, and rough. The leaues be much alike, yet are they lesser, rounder, and not so cornered : the floures in like manner be yellow : the fruit is bigger, at the first somewhat hairy, something long, now and then somewhat round ; oftentimes greater, and many times lesser : the barke or rinde is of an ouerborne russet Greene colour,

1 *Melo.*

The Muske Melon.

2 *Melo Saccharinus.*

Sugar melon.

4 *Melo Hispanicus.*

Spanish Melons.

colour, ribbed and furrowed very deeply, having often chappes or chinkes, and a confused roughness: the pulpe or inner substance which is to be eaten, is of a faint yellow colour. The middle part whereof is full of a slimie moisture, among which is contained the seed, like unto those of the Cucumber, but lesser, and of a browner colour.

2 The sugar Melon hath long trailing stalkes lying vpon the ground, whereon are set small clasping tendrels like those of the Vine, and also leaues like vnto the common Cucumber, but of a greener colour: the fruite cometh forth among those leaues, standing vpon slender footstalkes, round as the fruite of *Coloquintida*, and of the same bignesse, of a most pleasant taste like Sugar, whereof it tooke the surname *Saccharatus*.

3 The Peare fashioned Melon hath many long vinie branches, whereupon doe grow cornered leaues like those of the Vine, and likewise great store of long tendrels, clasping and taking hold of each thing that it toucheth: the fruite groweth vpon slender footstalkes, fashioned like vnto a Peare, of the bignes of a great Quince.

4 The Spanish Melon bringeth forth long trailing

trailing branches, whereon are set broad leaues slightly indented about the edges, not diuided at all, as are all the rest of the Melons. The fruite groweth neere vnto the stalke, like vnto the common Pompion, very long, not crested or furrowed at all, but spotted with very many such markes as are on the backside of the Harts-tongue leafe. The pulpe or meate is not so pleasing in taste as the other.

¶ *The Place.*

They delight in hot regions, notwithstanding I haue seen at the Queenes house at Saint Iames very many of the first sort ripe, through the diligent and curious nourishing of them by a skilfull Gentleman the keeper of the said house, called M^r. *Fowle*, and in other places neere vnto the right Honorable the Lord of *Suffex* house, of Bermondsey by London, where from yeere to yeere there is very great plenty, especially if the weather be any thing temperate.

¶ *The Time.*

They are set or sowne in Aprill as I haue already shewne in the chapter of Cucumbers: their fruite is ripe in the end of August, and sometimes sooner.

¶ *The Names.*

The Muske Melon is called in Latine, *Melo*: in Italian, *Mellone*: in Spanish, *Melon*: in French, *Melons*: in High Dutch, *Melaun*: in low Dutch, *Meloenen*: in Greeke, *μύλον*, which doth signifie an apple; and therefore this kinde of Cucumber is more truly called *μυλοπίπων*, or *Melopepon*: by reason that *Pepo* hath the smell of an apple, whereto the smell of this fruit is like; hauing withall the smell as it were of Muske: which for that cause are also named *Melones Muschatellini*, or Muske Melons.

¶ *The Temperature.*

The meate of the Muske Melon, is very cold and moist.

¶ *The Vertues.*

A It is harder of digestion than is any of the rest of Cucumbers: and if it remaine long in the stomacke is putrieth, and is occasion of pestilent feuers: which thing also *Aëtius* witnesseth in the first booke of his *Terrabiles*, writing that the vse of *Cucumeres*, or Cucumbers, breedeth pestilent feuers; for he also taketh *Cucumis* to be that which is commonly called a Melon: which is vsually eaten of the Italians and Spaniards rather to repress the rage of lust, than for any other Physicall vertue.

B The seed is of like operation with that of the former Cucumber.

CHAP. 345. Of Melons, or Pompions.

¶ *The Kindes.*

T Here be found diuers kinds of Pompions which differ either in bignesse or forme: it shall be therefore sufficient to describe some one or two of them, and referre the rest vnto the view of the figures, which most liuely do expresse their differences; especially because this volume waxeth great, the description of no moment, and I hasten to an end.

¶ *The Description.*

1 The great Pompion bringeth forth thicke and rough prickly stalkes, which with their clasping tendrells take hold vpon such things as are neere vnto them, as poles, arbours, pales, and ledges, which vnlesse they were neere vnto them would creepe along vpon the ground; the leaues be wilde, and great, very rough, and cut with certaine deepe gasches, nicked also on the edges like a saw; the floures be very great like vnto a bell cup, of a yellow colour like go'd, hauing five corners standing out like teeth: the fruite is great, thicke, round, set with thicke ribbes, like edges sticking forth. The pulpe or meate whereof which is next vnder the rinde is white, and of a meane hardnesse: the pith or substance in the middle is spungie, and slimie: the seed is great, broad, flat, something white, much greater than that of the Cucumber, otherwise not differing at all in forme. The colour of the barke or rinde is oftentimes of an obscure greene, sometimes gray. The rinde of the greene Pompion is harder, and as it were of a woody substance: the rinde of the gray is softer and tenderer.

2 The second kinde of Melons or Pompions is like vnto the former in stalkes and leaues, and also in clasping tendrells: but the gasches of the leaues are not so deepe, and the stalkes be tenderer: the floures are in like manner yellow, gaping, and cornered at the top, as be those of the former; but the fruite is somewhat rounder; sometimes greater, and many times lesser: and oftentimes of

of a greene colour with an harder barke, now and then softer and whiter. The meat within is like the former: the seeds haue also the same forme, but they be somewhat lesfer.

1 *Pepo maximus oblongus.*
The great long Pompion.

2 *Pepo maximus rotundus.*
The great round Pompion.

3 Of this kinde there is also another Pompion like vnto the former in rough stalkes, and in gashed and nicked leaues: the floure is also great and yellow, like those of the others: the fruit is of a great bignesse, whose barke is full of little bunnies or hillie welts, as is the rinde of the Citron, which is in like manner yellow when it is ripe.

4 The fourth Pompion doth very much differ from the others in form: the stalks, leaues, and floures are like those of the rest: but the fruit is not long or round, but altogether broad, and in a manner flat like vnto a shield or buckler, thicker in the middle, thinner in the compasse, and curled or bumped in certaine places about the edges, like the rugged or vneuen barke of the Pomecitron; the which rinde is very soft, thin, and white: the meat within is meetely hard and dureable. The seed is greater than that of the common Cucumber, in forme and colour all one.

† *Macocks Virginiani, sive Pepo Virginianus.*
The Virginian Macocke, or Pompion.

† This hath rough cornered straked trailing branches proceeding from the root, eight or nine foot long, or longer, and those againe diuided into other branches of a blackish greene colour, trailing, spreading, or running alongst the earth, couering a great deale of ground, sending forth broad cornered rough leaues, on great grosse, long, rough, hairy foot-stalks, like and fully as big as the leaues of the common Pompion, with clasping tendrels and great broad shrieled yellow floures also like those of the common Pompion: the fruit succeedeth, growing alongst the stalkes, commonly not neere the root, but towards the vpper part or toppes of the branches, somewhat round, not extending in length, but flat like a bowle, but not so bigge as an ordinarie bowle, beeing seldome foure inches broad, and three inches long, of a blackish greene colour when it is ripe. The substance or eatable part is of a yellowish white colour, containing in the middest a great deale of pulpe or soft matter, wherein the seed lyeth in certaine rowes also, like the common Pompion, but smaller. The root is made of many whitish branches, creeping far abroad in the earth, and perish at the first approach of Winter.

3 *Pepo maximus compressus*. The great flat bottommed Pompion.

4 *Pepo maximus clypeatus*. The great buckler Pompion.

5 *Pepo Indicus minor rotundus*.
The small round Indian Pompion.

6 *Pepo Indicus angulosus*.
The cornered Indian Pompion.

Melones aquatici edules Virginiani.
The Virginian Water-Melon.

This Melon or Pompion is like and fully as bigge as the common Pompion, in spreading, running, creeping branches, leaues, floures, and clasping tendrels: the fruit is of a very blackish Greene colour, and extendeth it selfe in length neere foure inches long, and three inches broad, no bigger nor longer than a great apple, and grow alongst the branches forth of the bosomes of the leaues, not farre from the root euen to the toppes of the branches, containing a substance, pulpe, and flat seed, like the ordinary Pompion: the root is whitish, and disperfeth it selfe verie farre abroad in the earth, and perissheth about the beginning of VVinter. October the tenth, 1621. *John Goodyer.* ‡

¶ The Place.

All these Melons or Pompions be garden plants: they ioy best in a fruitfull soile, and are common in England; except the last described, which is as yet a stranger.

¶ The Time.

They are planted at the beginning of Aprill: they floure in August: the fruit is ripe in September.

¶ The Names.

The great Melon or Pompion is named in Greeke *μήλον*: in Latine likewise *Pepo*: The fruits of them all when they be ripe are called by a common name in Greeke, *μήλον*: in English, Millions or Pompion. Whereupon certaine Physitions, saith *Galen*, haue contended, that this fruit ought to be called *συκωμήλον*, that is to say in Latine, *Pepo Cucumeralis*, or Cucumber Pompion. *Pliny* in his ninth booke the fifth Chapter writeth, that *Cucumeres* when they exceed in greatnesse are named *Pepones*: it is called in High Dutch, *Pluker*: in Low Dutch, *Depoenen*: in French, *Pompons*.

¶ The Temperature and Vertues.

All the Melons are of a cold nature, with plenty of moisture: they haue a certaine clensing quality, by meanes whereof they prouoke vrine, and do more speedily passe through the bodie than do either the Gourd, Citrull, or Cucumber, as *Galen* hath written.

The pulpe of the Pompion is neuer eaten raw, but boiled. For so it doth more easily descend, making the belly soluble. The nourishment which commeth hereof is little, thin, moist and cold, (bad, saith *Galen*) and that especially when it is not well digested: by reason whereof it maketh a man apt and readie to fall into the disease called the Cholericke Passion, and of some the Felonie.

The seed clenseth more than the meat, it prouoketh vrine, and is good for those that are troubled with the stone of the kidnies.

The fruit boiled in milke and buttered, is not onely a good wholesome meat for mans body, but being so prepared, is also a most physicall medicine for such as haue an hot stomacke, and the inward parts inflamed.

The flesh or pulpe of the same sliced and fried in a pan with butter, is also a good and wholesome meat: but baked with apples in an ouen, it doth fill the body with flatuous or windie belchings, and is food vtterly vnwholesome for such as liue idly, but vnto robustious and rustick people nothing hurteth that filleth the belly.

CHAP. 346. Of Wilde Pompions.

¶ The Description.

AS there is a wilde sort of Cucumbers, of Melons, Citruls and Gourds, so likewise there be certaine wilde Pompions, that be so of their owne nature. These bring forth rough stalks, set with sharp thorny prickles. The leaues be likewise rough: the floures yellow as be those of the garden Melon, but euery part is lesser. The fruit is thicke, round, and sharp pointed, hauing a hard Greene rinde. The pulpe or meat whereof, and the middle pith, with the seed are like those of the garden Pompion, but very bitter in taste.

2 The second is like vnto the former, but it is altogether lesser, wherein consisteth the difference.

1 *Pepo maior syluestris.*
The great wilde Pompion.

2 *Pepo minor syluestris.*
The small wilde Pompion.

¶ *The Place.*

These Melons do grow wilde in Barbarie, Africa, and most parts of the East and West Indies. They grow not in these parts except they be sowne.

¶ *The Time.*

Their time of flourishing and flourishing answereth that of the garden Pompion.

¶ *The Names.*

Although the Antient Physitions haue made no mention of these plants, yet the thing it selfe doth shew, that there be such, and ought to be called in Greeke *πεπων syluestros*: in Latine, *Pepones syluestris*: in English, wilde Melons or Pompions.

¶ *The Temperature.*

Like as these wilde Melons be altogether of their owne nature very bitter, so be they also of temperature hot and drie, and that in the later end of the second degree. They haue likewise a clensing facultie, not inferior to the wilde Cucumbers.

¶ *The Vertues.*

A The wine, which when the pith and seed is taken forth, is powred into the rinde, and hath remained so long therein till such time as it becommeth bitter, doth purge the belly, and bringeth forth flegmaticke and cholerick humors. To be brieft, the iuice hereof is of the same operation that the wilde Cucumber is of; and being dried it may be vsed in stead of *Elaterium*, which is the dried iuice of the wilde Cucumber.

CHAP. 347. Of Gourds.

¶ *The Kindes.*

T Here be diuers sorts of Gourds, some wilde, and others tame of the garden; some bringing forth fruit like vnto a bottle; others long, bigger at the end, keeping no certaine forme or fashion; some greater, others lesser. † I will onely figure and describe two or three of the chiefeft, and so passe over the rest, because each one vpon the first sight of them knowes to what kinde to referre them. ‡

¶ *The*

¶ The Description.

1 **T**He Gourd bringeth forth very long stalkes as be those of the Vine, cornered and parted into diuers branches, which with his clasping tendrels taketh hold and clymeth vpon such things as stand neere vnto it: the leaues be very great, broad, and sharpe pointed, almost as great as those of the Clot-Burre, but softer, and somewhat couered as it were with a white freese, as be also the stalkes and branches, like those of the marish Mallow: the floures be white, and grow forth from the bosome of the leaues: in their places come vp the fruit, which are not all of one fashion, for oftentimes they haue the forme of flagons or bottles, with a great large belly and a small necke. The Gourd (saith *Pliny, lib. 19. cap. 5.*) groweth into any forme or fashion that you would haue it, either like vnto a wreathed Dragon, the leg of a man, or any other shape, according to the mould wherein it is put whilest it is young: being suffered to clime vpon any Arbour where the fruit may hang, it hath bene seene to be nine foot long, by reason of his great weight which hath stretched it out to the length. The rinde when it is ripe is verie hard, woody, and of a yellow colour: the meate or inward pulpe is white, the seed long, flat, pointed at the top, broad below, with two peakes standing out like hornes, white within, and sweet in taste.

2 The second differeth not from the precedent in stalkes, leaues, or floures: the fruit hereof is for the most part fashioned like a bottle or flagon, wherein especially consisteth the difference.

1 *Cucurbita anguina.*
Snakes Gourd.

2 *Cucurbita lagenaria.*
Bottle Gourds.

¶ The Place.

The Gourds are cherished in the gardens of these cold regions rather for pleasure than for profit: in the hot countries where they come to ripenesse there are sometimes eaten, but with small delight; especially they are kept for the rindes, wherein they put Turpentine, Oyle, Hony, and also serue them for pales to fetch water in, and many other the like vses.

¶ The Time.

They are planted in a bed of horse-dung in April, euen as we haue taught in the planting of cucumbers: they flourish in Iune and Iuly; the fruit is ripe in the end of August.

¶ The Names.

The Gourd is called in Greeke *Κυκλῶνδος ἡμερῶς*: in Latine, *Cucurbita edulis*, *Cucurbita sativa*: of *Pliny*, *Cucurbita*

Cucurbita Cameraria, because it climeth vp, and is a couering for arbours and walking places, and banqueting houses in gardens : he calleth the other which climeth not vp, but lyeth crawling on the ground, *Cucurbita plebeia* : in Italian, *Zucca* : in Spanish, *Calabazza* : in French, *Courge* : in high Dutch, *Kurbs* : in low-Dutch, *Cauwoorden* : in English, Gourds.

¶ *The Temperature.*

The meate or inner pulpe of the Gourd is of temperature cold and moist, and that in the second degree.

¶ *The Vertues.*

- A The iuyce being dropped into the eares with oyle of roses is good for the paine thereof proceeding of a hot cause.
- B The pulpe or meate mitigateth all hot swellings, if it be laid thereon in manner of a pultis, and being vsed in this manner it taketh away the head-ache and the inflammation of the eyes.
- C The same Author affirmeth, that a long Gourd or else a Cucumber being laid in the cradle or bed by the young infant whilst it is asleepe and sicke of an ague, it shall be very quickly made whole.
- D The pulpe also is eaten sodden, but because it hath in it a waterish and thinne iuyce, it yeeldeth small nourishment to the body, and the same cold and moist ; but it easily passeth thorow, especially being sodden, which by reason of the slipperinesse and moistnesse also of his substance mollifieth the belly.
- E But being baked in an ouen or fried in a pan it loseth the most part of his naturall moisture, and therefore it more slowly descendeth, and doth not mollifie the belly so soone.
- F The seed allayeth the sharpnesse of vrine, and bringeth downe the same.

CHAP. 348. Of the wilde Gourd.

1 *Cucurbita lagenaria sylvestris*.
Wilde Bottle Gourd.

2 *Cucurbita sylvestris fungiformis*.
Mushrome wilde Gourd.

¶ The Description

1 **T**here is besides the former ones a certaine wilde Gourd: this is like the garden Gourd in clymbing stalkes, clasping tendrels, and soft leaues, and as it were downy; all and euerie one of which things being farre lesse: this also clymbeth vpon Arbours and banquetting houses: the fruit doth represent the great bellied Gourd, and those that be like vnto bottles in forme, but in bignesse it is very farre inferiour; for it is small, and scarce so great as an ordinarie Quince, and may be held within the compasse of a mans hand: the outward rinde at the first is greene, afterwards it is as hard as wood, and of the colour thereof: the inner pulpe is moist, and very full of iuyce, in which lieth the seed. The whole is as bitter as Coloquintida, which hath made so many errors, one especially, in taking the fruit Coloquintida for the wilde Gourd.

2 The second wilde Gourd hath likewise many trailing branches and clasping tendrels, wherewith it taketh hold of such things as be neere vnto it: the leaues be broad, deeply cut into diuers sections, like those of the Vine, soft and very downy, whereby it is especially knowne to be one of the Gourds: the floures are very white, as are also those of the Gourds. The fruit succeedeth, growing to a round forme, flat on the top like the head of a Mushrome, whereof it tooke his surname.

¶ The Place.

They grow of themselves wilde in hot regions; they neuer come to perfection of ripenesse in these cold countries.

¶ The Time.

The time answereth those of the garden.

¶ The Names.

The wilde Gourd is called in Greeke *κολοκυνθία ἀγρία*: in Latine, *Cucurbita sylvestris*, or wilde Gourd. Pliny, lib. 20. cap. 3. affirmeth, that the wilde Gourd is named of the Grecians, *σιμπος*, which is hollow, an inch thicke, not growing but among stones, the iuyce whereof being taken is very good for the stomacke. But the wilde Gourd is not that which is so described, for it is aboute an inch thicke, neither is it hollow, but full of iuyce, and by reason of the extreme bitternesse offensive to the stomacke.

Some also there be that take this for Coloquintida, but they are far deceiued; for Colocynthis is the wilde Citrull Cucumber, whereof we haue treated in the chapter of Citruls.

¶ The Temperature.

The wilde Gourd is as hot and dry as Coloquintida, that is to say, in the second degree.

¶ The Vertues.

The wilde Gourd is extreme bitter, for which cause it openeth and scoureth the stopped passages of the body; it also purgeth downwards as do wilde Melons.

Moreover, the wine which hath continued all night in this Gourd likewise purgeth the belly mightily, and bringeth forth cholericke and flegmaticke humors.

CHAP. 349. Of Potato's.

Sisaronum Peruvianum, siue Batata Hispanorum.

Potatus, or Potato's.

¶ The Description.

THis Plant (which is called of some *Sisarum Peruvianum*, or *Skyrrrets of Peru*) is generally of vs called *Potatus*, or *Potatoes*. It hath long rough flexible branches trailing vpon the ground like vnto *Pompions*; whereupon are set Greene three cornered leaues, very like vnto those of the wilde *Cucumber*. There is not any that haue written of this planthaue said any thing of the floures: therefore I refer their description vnto those that shall hereafter haue further knowledge of the same. Yet haue I had in my garden diuers roots that haue flourished vnto the first approach of Winter, and haue growne vnto a great length of branches, but they brought not forth any floures at all; whether because the Winter caused them to perish before their time of flourishing, or that they be of nature barren of floures, I am not certaine. The roots are many, thicke, and knobbie, like vnto the roots of *Peonies*, or rather of the white *Asphodill*, ioyned together at the top into one head, in maner of the *Skyrrit*, which being diuided into diuers parts and planted, do make a great increase, especially if the greatest roots be cut into diuers goblots, and planted in good and fertile ground.

¶ The Place.

The *Potatoes* grow in *India*, *Barbarie*, *Spaine*, and other hot regions; of which I planted diuers roots (that I bought at the Exchange in *London*) in my garden, where they flourished vntil Winter, at which time they perished and rotted.

¶ The Time.

It flourisheth vnto the end of September: at the first approach of great frosts the leaues together with the roots and stalkes do perish.

¶ The Names.

Clusius calleth it *Battata*, *Camotes*, *Amotes*, and *Ignames*: in English, *Potatoes*, *Potatus*, and *Potades*.

¶ The Temperature.

The leaues of *Potatoes* are hot and dry, as may euidently appeare by the taste. The roots are of a temperate qualitie.

¶ The Vertues.

- A** The *Potato* roots are among the *Spaniards*, *Italians*, *Indians*, and many other nations common and ordinarie meate; which no doubt are of mighty and nourishing parts, and do strengthen and comfort nature; whose nutriment is as it were a meane betweene flesh and fruit, but somewhat windie; but being roasted in the embers they lose much of their windinesse, especially being eaten sopped in wine.
- B** Of these roots may be made conserues no lesse toothsome, wholesome, and dainty than of the flesh of *Quinces*: and likewise those comfortable and delicate meats called in shops *Morselli*, *Placentula*, and diuers other such like.
- C** These Roots may serue as a ground or foundation whereon the cunning Confectioner or Sugar-Baker may worke and frame many comfortable delicate Conserues, and restorative sweete meates.
- D** They are vsed to be eaten roasted in the ashes. Some when they be so roasted infuse them and sop them in Wine; and others to giue them the greater grace in eating, doe boyle them with prunes, and so eat them. And likewise others dresse them (being first roasted) with Oyle, Vineger, and salt, euerie man according to his owne taste and liking. Notwithstanding howsoeuer they be dressed, they comfort, nourish, and strengthen the body, procuring bodily lust, and that with greedinesse.

CHAP. 350. Of *Potatoes of Virginia*.

¶ The Description.

Virginia *Potato* hath many hollow flexible branches trailing vpon the ground, three square, vneuen, knotted or kneed in sundry places at certaine distances: from the which knots cometh forth one great leafe made of diuers leaues, some smaller, and others greater, set together vpon a fat middle rib by couples, of a swart Greene colour tending to rednesse; the whole leafe resembling those of the Winter-Cresses, but much larger; in taste at the first like grasse, but afterward sharpe and nipping the tongue. From the bosome of which leaues come forth long round

round slender foot-stalkes, whereon do grow very faire & pleasant floures, made of one entire whole leafe, which is folded or plaited in such strange sort, that it seemeth to be a floure made of fine dry small leaues, which cannot easily be perceiued except the same be pulled open. The whole floure is of a light purple colour, striped downe the middle of euery fold or welt with a light shew of yellowesse, as if purple and yellow were mixed together. In the middle of the floure thrusteth forth a thicke flat pointall yellow as gold; with a small sharpe Greene pricke or point in the midst thereof. The fruit succeedeth the floures, round as a ball, of the bignesse of a little Bulleffe or wilde plum, Greene at the first, and blacke when it is ripe; wherein is contained small white seed lesser than those of Mustard. The root is thicke, fat, and tuberous, not much differing either in shape, colour, or taste from the common Potatoes, sauing that the roots hereof are not so great nor long; some of them are as round as a ball, some ouall or egge-fashion; some longer, and others shorter: the which knobby roots are fastened vnto the stalkes with an infinite number of threddie strings.

Battata Virginiana, sive Virginianorum, & Pappus.
Virginian Potatoes.

¶ *The Place.*

It groweth naturally in America, where it was first discovered, as reports *C. Clusius*, since which time I haue receiued roots hereof from Virginia, otherwise called Norembega, which grow and prosper in my garden as in their owne native country.

¶ *The Time.*

The leaues thrust forth of the ground in the beginning of May: the floures bud forth in August. The fruit is ripe in September.

¶ *The Names.*

The Indians do call this plant *Pappus*, meaning the roots: by which name also the common Potatoes are called in those Indian countries. We haue the name proper vnto it mentioned in the title. Because it hath not onely the shape and proportion of Potatoes, but also the pleasant taste and vertues of the same, we may call it in English, Potatoes of America or Virginia.

† *Clusius* questions whether it be not the *Arachidna* of *Theophrastus*. *Bauhine* hath referred it to the Nightshades, and calleth it *Solanum tuberosum Esculentum*; and largely figures and describes it in his *Prodromus*, pag. 89. †

¶ *The*

¶ The Temperature and Vertues.

A The temperature and vertues be referred vnto the common Potatoes, being likewise a food, as also a meate for pleasure, equall in goodnesse and wholesomenesse vnto the same, being either roasted in the embers, or boyled and eaten with oyle, vineger, and pepper, or dressed any other way by the hand of some cunning in cookerie.

B ‡ *Bauhine* saith, That he heard that the vse of these tooths was forbidden in Bourgondy (where they call them Indian Artichokes) for that they were perswaded the too frequent vse of them caused the leprosie. ‡

CHAP. 351.

Of the Garden Mallow called *Hollihocke*.

¶ The Kindes.

There be diuers sorts or kinds of Mallows; some of the garden: there be also some of the Marish or sea shore; others of the field, and both wilde. And first of the Garden Mallow or *Hollihocke*.

1 *Malua hortensis*.
Single Garden *Hollihocke*.

2 *Malua rosea simplex peregrina*.
Tagged strange *Hollihocke*.

¶ The Description.

1 The tame or garden Mallow bringeth forth broad round leaues of a whitish Greene colour, rough, and greater than those of the wilde Mallow. The stalke is straight, of the height of foure or six cubits; whereon do grow vpon slender foot-stalks single floures not much vnlike to the wilde Mallow, but greater, consisting only of five leaues, sometimes white or red, now and then of a deepe purple colour, varying diuersly, as Nature list to play with it: in their places groweth vp a round knop like a little cake, compact or made vp of a multitude of flat feeds like little cheeses. The root is long, white, tough, easily bowed, and groweth deepe in the ground.

2 The

- 3 *Malua purpurea multiplex.*
Double purple Hollihocke.

2 The second being a strange kinde of Hollihocke hath likewise broad leaues, rough and hoarie, or of an ouerworne russet colour, cut into diuers sections euen to the middle ribbe, like those of Palma Christi. The floures are very single, but of a perfect red colour, wherein consisteth the greatest difference. ‡ And this may be called *Malua rosea simplex peregrina folio Ficus*. Iagged strange Hollihocke. ‡

3 The double Hollihocke with purple floures hath great broad leaues, confusedly indented about the edges, and likewise toothed like a saw. The stalke groweth to the height of foure or fise cubits. The floures are double, and of a bright purple colour.

4 The Garden Hollihocke with double floures of the colour of scarlet, groweth to the height of fise or six cubits; hauing many broad leaues cut about the edges. The stalke and root is like the precedent. ‡ This may be called *Multea hortensis rubra multiplex*, Double red Hollihockes, or Rose mallow. ‡

5 The tree mallow is likewise one of the Hollihockes; it bringeth forth a great stalke of the height of ten or twelue foot, growing to the forme of a small tree, whereon are placed diuers great broad leaues of a russet Greene colour, not vnlike to those of the great Clot Burre Docks, deeply indented about the edges. The floures are very great and double as the greatest Rose, or double Peiony, of a deep red colour tending to blacknesse. The roote is great, thicke, and of a

woody substance, as is the rest of the plant. ‡ This may be called *Malua hortensis atrorubente multiplice flore*. ‡

¶ The Place.

These Hollihockes are sowne in gardens, almost euery where, and are in vaine sought else where.

¶ The Time.

The second yeere after they are sowne they bring forth their floures in Iuly and August, when the seed is ripe the stalke withereth, the root remaineth and sendeth forth new stalkes, leaues and floures, many yeres after.

¶ The Names.

The Hollihocke is called in Greeke, *μαλβα*: of diuers, *Rosa ultramarina*, or outlandish Rose, and *Rosa hyemalis*, or winter Rose. And this is that Rose which *Pliny* in his 21. book, 4. chapter writes to haue the stalke of a mallow, and the leaues of a pot-herbe, which they cal *Moscenton*: in high Dutch, *Garten pappelen*: in low Dutch, *winter Roosen*: in French, *Rose d'outre mer*: in English, Hollihocke, and Hockes.

¶ The Temperature.

The Hollihocke is meetely hot, and also moist, but not so much as the wilde Mallow: it hath likewise a clammie substance, which is more manifest in the seed and root, than in any other part.

¶ The Vertues.

The decoction of the floures, especially those of the red, doth stop the ouermuch flowing of the monthly courses, if they be boiled in red wine.

The roots, leaues, and seeds serue for all those things for which the wilde Mallowses do, which are more commonly and familiarly vsed.

CHAP. 352. Of the wilde Mallowses.

¶ The Description.

- 1 The wilde Mallow hath broad leaues somewhat round and cornered, nickt about the edges, smooth, and Greene of colour: among which rise vp many slender tough stalkes,

liii

clad

clad with the like leaues, but smaller. The floures grow vpon little footstalkes of a reddish colour mixed with purple strakes, consisting of five leaues, fashioned like a bell: after which commeth vp a knap or round button, like vnto a flat cake, compact of many small seeds. The root is white, tough, and full of a slimie juice, as is all the rest of the plant.

2 The dwarfe wilde Mallow creepeth vpon the ground: the stalkes are slender and weake, yet tough and flexible. The leaues be rounder, and more hoary than the other. The floures are small and of a white colour.

3 The crispe or curled Mallow, called of the vulgar sort French Mallows, hath many small vpright stalkes, growing to the height of a cubit, and sometimes higher; whereon do grow broad leaues somewhat round and smooth, of a light Greene color, plaited or curled about the brims like a ruffe. The floures be small and white. The root perisheth when it hath perfected his seed.

1 *Malua sylvestris.*
The field Mallow.

2 *Malua sylvestris pumila.*
The wilde dwarfe Mallow.

4 The Vervaine Mallow hath many straight stalkes, whereon doe grow diuers leaues deeply cut and jagged euen to the middle rib, not vnlike to the leaues of Vervaine, whereof it tooke his name: among which come forth faire and pleasant floures like vnto those of the common Mallow in forme, but of a more bright red colour, mixed with stripes of purple, which setteth forth the beautie. The root is thicke, and continueth many yeeres. ‡ This is sometimes though more rarely found with white floures. ‡

‡ 5 This annuall Mallow, called by *Clusius*, *Malua trimestris*, is very like our common Mallow sending vp slender branched stalkes some three foot high; the bottome leaues are round, those on the stalkes more sharpe pointed, Greene aboue, and whiter vnderneath, the floures consist of five leaues of a light carnation colour, the seed is like that of the ordinary mallow, but smaller; and such also is the root which perisheth euery yeere as soon as the seed is ripe: it is sowne in some gardens, and growes wilde in Spaine. ‡

¶ The Place.

The two first mallows grow in vntoiled places among pot-herbes, by high waies, and the borders of fields.

The French mallow is an excellent pot-herbe, for the which cause it is sowne in gardens, and is not to be found wilde that I know of.

The

3 *Malva crispa*.
The French curled Mallow.

4 *Malva verbenaca*.
Veruaine Mallow.

5 *Malva aestiva Hispanica*.
The Spanish Mallow.

The Veruaine Mallow groweth not euerie where: it growes on the ditch sides on the left hand of the place of execution by London, called Tyborn: also in a field neere vnto a village fourteene miles from London called Bushey, on the backe-side of a Gentlemans house named Mr. Robert Wylbraham: likewise amongst the bushes and hedges as you go from London to a bathing place called the Old Foord; and in the bushes as you go to Hackny a village by London, in the closes next the town, and in diuers other places, as at Bassingburne in Hartfordshire, three miles from Roiston.

Mr. Goodyer found the Veruain Mallow with white floures growing plentifully in a close neere Maple-durham in Hampshire, called Aldercrofts.

¶ The Time.

Thesewilde Mallows do floure from Iune till Sommer be well spent: in the meane time their seed also waxeth ripe.

¶ The Names.

The wilde Mallow is called in Latine *Malva sylvestris*: in Greeke, *μαλὴ ἀγρία*, or *χρυσά*: and as though they should say a mitigator of paine: of some, *οφριακα*: in high-Dutch, *Wappelin*: in Low-Dutch, *Maluwe*, and *Keeskens crust*: in English, Mallow.

The Vervaine Mallow is called of *Dioscorides*, *Alcea*: in Greeke, ἀλκία: of some, *Herba Hungarica*, and *Herba Simeonis*, or Simons Mallow: in English, Vervaine Mallow, and iagged Mallow.

The name of this herbe *Malua* seemeth to come from the Hebrewes, who call it in their tongue מלוא *Malluach*, of the saltnesse, because the Mallow groweth in saltish and old ruinous places, as in dung-hills and such like, which in most abundant manner yeeldeth forth Salt-peter and such like matter: for מלח *Melach* signifieth salt, as the Learned know. I am perswaded that the Latine word *Malua* commeth from the Chaldee name *Mallucha*, the guttural letter, *Ch*, being left out for good sounds sake: so that it were better in this word *Malua* to readen as a vowel, than as a consonant: which words are vttered by the learned Doctor *Rabbi David Kimhi*, and seeme to carrie a great shew of truth: in English it is called Mallow; which name commeth as neere as may be to the Hebrew word.

¶ The Temperature.

The wilde Mallows haue a certaine moderate and middle heate, and moistnesse withall: the iuyce thereof is slimie, clammy, or gluing, the which are to be preferred before the garden Mallow or Hollihocke, as *Diphilus Siphinus* in *Athenaeus* doth rightly thinke, who plainly sheweth, that the wilde Mallow is better than that of the garden: although some do prefer the Hollihocke, whereunto we may not consent, neither yet yeeld vnto *Galen*, who is partly of that minde, yet standeth he doubtfull: for the wilde Mallow without controuersie is fitter to be eaten, and more pleasant than those of the garden, except the French Mallow, which is generally holden the wholsomest, and amongst the pot-herbes not the least commended by *Hesiod*: of whose opinion was *Horace*, writing in his second Ode of his *Epodon*,

— & graui
Malua salubres corpori.

The Mallow (saith *Galen*) doth nourish moderately, ingendreth grosse blood, keepeth the bodie soluble, and looseth the belly that is bound. It easily descendeth, not onely because it is moist, but also by reason it is slimy.

¶ The Vertues.

- A The leaues of Mallows are good against the stinging of Scorpions, Bees, Wasps, and such like: and if a man be first anointed with the leaues stamped with a little oyle, he shal not be stung at all, *Dioscorides* saith.
- B The decoction of Mallows with their roots drunken are good against all venome and poyson, if it be incontinently taken after the poyson, so that it be vomited vp againe.
- C The leaues of Mallows boyled till they be soft and applied, do mollifie tumors and hard swellings of the mother, if they do withall sit ouer the fume thereof, and bathe themselues therewith.
- D The decoction vsed in clisters is good against the roughnesse and fretting of the guts, bladder, and fundament.
- E The roots of the Vervaine Mallow do heale the bloody flux and inward burstings, being drunke with wine and water, as *Dioscorides* and *Paulus Aegineta* testifie.

CHAP. 353. Of Marsh Mallow.

¶ The Description.

1 **M**Arsh Mallow is also a certaine kinde of wilde Mallow: it hath broad leaues, small toward the point, soft, white, and freed or cottoned, and sleightly nicked about the edges: the stalkes be round and straight, three or foure foot high, of a whitish gray colour; whereon do grow floures like vnto those of the wilde Mallows, yet not red as they are, but commonly white, or of a very light purple colour out of the white: the knop or round button wherein the seeds lie is like that of the first wilde Mallow. The root is thicke, tough, white within, and containeth in it a clammy and slimy iuyce.

† 2 This strange kinde of Mallow is holden amongst the best writers to be a kinde of marsh Mallow: some excellent Herbarists haue set it downe for *Sida Theophrasti*, wherto it doth not fully answer: it hath stalks two cubits high, wheron are set without order many broad leaues hoarie and whitish, not vnlike those of the other marsh Mallow: the floures consist of five leaues, and are larger than those of the marsh Mallow, and of a purple colour tending to rednesse: after which there come round bladders of a pale colour, in shape like the fruit or seeds of round *Aristochia*, or Birthwort; wherein is contained round blacke seed. The root is thicke and tough, much like that of the common Mallow.

1 *Althæa liliiflora*.
Marsh Mallow.

2 *Althæa palustris*.
Water Mallow.

3 *Althæa arborescens*.
Tree Mallow.

4 *Althæa frutex* Clusj.
Shrubbed Mallow.

‡ 5 *Alcea fruticosa cannabina.*
Hempe-leaved Mallow.

or twelve foot : whereupon are set very many leaues deeply cut euen to the middle rib, like vnto the leaues of hempe : the floures and seeds are like vnto the common mallow : the root is exceeding great, thicke, and of a woody substance. ‡ *Clusius* calls this *Alcea fruticosa cannabino folio* : and it is with good reason thought to be the *Cannabis sylvestris* described by *Dioscorides*, lib. 3. cap. 166. ‡

¶ The Place.

The common marsh mallow groweth very plentifully in the marshes both on the Kentish and Essex shore alongst the riuer of Thames, about Woolwyth, Erith, Greenhyth, Grauesend, Tilburie, Lee, Colchester, Harwich, and in most salt marshes about London : being planted in gardens it prospereth well, and continueth long.

The second groweth in the moist and fenny places of Ferrara, betweene Padua in Italy, and the riuer Eridanus.

The others are strangers likewise in England : notwithstanding at the impression hereof I haue sown some seeds of them in my garden, expecting the successe.

¶ The Time.

They floure and flourish in Iuly and August : the root springeth forth afresh euery yeare in the beginning of March, which are then to be gathered, or in September.

¶ The Names.

The common marsh mallow is called in Greeke *Αλθαία*, and *Ιβίσκος* : the Latines retaine the names *Althea* and *Ibiscus* : in shops, *Bismalua*, and *Maluaniscus* ; as though they should say *Malua Ibiscus* : in high-Dutch, *Ibisch* : in low-Dutch, *witte Maluwe*, and *witten Hemst* : in Italian and Spanish, *Maluanisco* : in French, *Guimaulue* : in English, marsh mallow, moorish mallow, and white mallow.

The rest of the mallowes retaine the names expressed in their seuerall titles.

¶ The Temperature.

Marsh mallow is moderately hot, but drier than the other mallowes : the roots and seeds hereof are more dry, and of thinner parts, as *Galen* writeth ; and likewise of a digesting, softning, or mollifying nature.

¶ The

¶ *The Vertues.*

The leaues of Marsh Mallow are of the power to digest, mitigate paine, and to concoct. A

They be with good effect mixed with fomentations and pultesses against paines of the sides, of the stone, and of the bladder, in a bath also they serue to take away any manner of paine. B

The decoction of the leaues drunke doth the same, which doth not only assuage paine which proceedeth of the stone, but also is very good to cause the same to descend more easily, and to passe forth. C

The roots and seeds are profitable for the same purpose: moreover the decoction of the roots helpeth the bloody flux, yet not by any binding qualitie, but by mitigating the gripings and frettings thereof: for they doe not binde at all, although *Galen* otherwise thought, but they cure the bloody flux, by hauing things added vnto them, as the roots of Bistort, Tormentill, the floures and rindes of Pomegranates and such like. D

The mucilage or slimie iuice of the roots, is mixed very effectually with all oils, ointments, and plaisters that slacken and mitigate paine. E

The roots boiled in wine, and the decoction giuen to drinke, expell the stone and grauell, helpe the bloody flux, sciatica, crampes, and convulsions. F

The roots of Marsh Mallows, the leaues of common Mallows, and the leaues of Violets, boiled in water vntill they be verie soft, and that little water that is left drained away, stamped in a stone mortar, adding thereto a certaine quantitie of Fenugreeke, and Linefeed in powder; the root of the blacke Bryonie, and some good quantitie of Barrowes grease, stamped altogether to the forme of a pultis, and applied very warme, mollifie and soften Apostumes and hard swellings, swellings in the ioints, and sores of the mother: it consumeth all cold tumors, blastings, and windie outgrowings; it cureth the rifts of the fundament; it comforteth, defendeth, and preserueth dangerous greene wounds from any manner of accidents that may happen thereto, it helpeth digestion in them, and bringeth old vlcers to maturation. G

The seeds dried and beaten into powder and giuen to drinke, stoppeth the bloody flux and laske, and all other issues of blood. H

CHAP. 354. *Of the yellow Lillie.*

Althæa Lutea.
Yellow Mallow.

¶ *The Description.*

The yellow Mallow riseth vp with a round stalke, something hard or wooddie, three or foure cubits high, couered with broad leaues something round, but sharpe pointed, white, soft, set with very fine haire like to the leaues of gourds, hanging vpon long tender foot stalks: from the bosome of which leaues come forth yellow floures, not vnlike to those of the common Mallow in forme: the knops or seed vessels are blacke, crooked, or wrinckled, made vp of many small cods, in which is black seed: the root is small, and dieth when it hath perfected his seed.

¶ *The Place.*

The seed hereof is brought vnto vs from Spaine and Italy: we doe yearely sow it in our gardens, the which seldom or neuer doth bring his seed to ripenesse: by reason whereof, we are to seeke for seeds against the next yeare.

¶ *The Time.*

It is sowne in the midst of Aprill, it brings forth his floures in September.

¶ *The Names.*

Some thinke this to be *Abutilon*: whereupon that agreeth which *Anicen* writeth, that it is like to the Gourd, that is to say in leafe, and to be named *Abutilon*, and *Arbutilon* diuers take

take it to be that *Althæa* or Marsh Mallow, vnto which *Theophrastus* in his ninth booke of the Historie of Plants doth attribute *Florem* *μῆλον*, or a yellow floure: for the floure of the common Marsh Mallow is not yellow, but white; yet may *Theophrastus* his copie, which in diuers places is faultie, and hath many emptie and vnwritten places, be also faultie in this place; therefore it is hard to say, that this is *Theophrastus* marsh Mallow, especially seeing that *Theophrastus* seemeth also to attribute vnto the root of Marsh Mallow so much slime, as that water may bee thickened therewith, which the roots of common Marsh Mallow can very well doe: but the root of *Abutilon* or yellow Mallow not at all: it may be called in English, yellow Mallow, and *Anicen* his Mallow.

¶ The Temperature.

The temperature of this Mallow is referred vnto the Tree-mallow.

¶ The Vertues.

A *Anicen* saith, that *Abutilon* or yellow Mallow, is held to be good for greenewounds, and doth presently glew together, and perfectly cure the same.

B The seed drunke in wine preuaileth mightily against the stone.

C *Bernardus Paludanus* of Anchusen reporteth, that the Turks do drinke the seed to prouoke sleepe and rest.

CHAP. 355. Of Venice Mallow, or Good-night at Noone.

1 *Alcea Peregrina.*
Venice Mallow.

2 *Sabdarifa.*
Thornie Mallow.

¶ The Description.

† The Venice mallow riseth vp with long, round, feeble stalkes, whereon are set vpon long slender foot-stalkes, broad iagged leaues, deeply cut euen to the middle rib: amongst which come forth very pleasant and beautifull floures, in shape like those of the common mallow, something

‡ 3 *Alcea Egyptia*.
The Egyptian Codded Mallow.

something white about the edges, but in the middle of a fine purple: in the midst of this floure standeth forth a knap or pestel, as yellow as gold: it openeth it selfe about eight of the clocke, and shutteth vp againe at noone, about twelue a clock when it hath receiued the beams of the Sun, for two or three houres, whereon it should seeme to reioice to look, and for whose departure, being then vpon the point of declension, it seemes to grieue, and so shuts vp the floures that were open, and neuer opens them againe; whereupon it might more properly be called *Malua horaria*, or the Mallow of an houre: and this *Columella* seemeth to call *Moloché*, in this verse;

—*Et Moloché, Prono sequitur quæ vertice solem.*

The seed is contained in thicke rough bladders, whereupon *Dodonæus* calleth it *Alcea Vesicaria*: within these bladders or seed vessels are contained blacke seed, not vnlike to those of *Nigella Romana*. The root is small and tender, & perisheth when the seed is ripe, and must be increased by new and yearely sowing of the seed, carefully reserued.

2 Thorn Mallow riseth vp with one vpright stalk of two cubits high, diuiding it selfe into diuers branches, whereupon are placed leaues deeply cut to the middle rib, and likewise snipt about the edges like a saw, in taste like Sorrel the floures for the most part thrust forth of the

trunke or body of the small stalke, compact of five small leaues, of a yellowish colour, the middle part whereof is of a purple tending to rednesse: the husk or cod wherein the floure doth stand is set or armed with sharpe thornes: the root is small, single, and most impatient of our cold clymate, in somuch that when I had with great industrie nourished vp some plants from the seed, and kept them vnto the midst of May, notwithstanding one cold night chancing among many, hath destroyed them all.

‡ 3 This also is a stranger cut leaved Mallow, which *Clusius* hath set forth by the name of *Alcea Egyptia*: and *Prosper Alpinus* by the title of *Bammia*: the stalke is round, straight, green, some cubit and halfe high: vpon which without order grow leaues at the bottome of the stalk, like those of Mallow, cornered and snipt about the edges; but from the middle of the stalke to the top they are cut in with five deep gashes like as the leaues of the last described: the floures grow forth by the sides of the stalke, in forme and colour like those of the last mentioned, to wit, with five yellowish leaues: after these follow long thicke five cornered hairy and sharpe pointed seed vessels, containing a seed like *Orobis*, couered with a little downinesse: this growes in Egypt, where they eat the fruit thereof as we do Pease and Beanes: *Alpinus* attribut es diuers vertues to this plant, agreeable to those of the common Marsh-mallow. ‡

¶ The Place.

The seeds hereof haue been brought out of Spaine and other hot countries. The first prospereth well in my garden from yeare to yeare.

¶ The Time.

They are to be sowne in the most fertill ground and sunnie places of the garden, in the beginning of May, or in the end of Aprill.

¶ The Names.

Their names haue beene sufficiently touched in their seuerall descriptions. The first may be called in English, Venice-mallow, Good-night at noone, or the Mallow flourishing but an houre; of *Marthiolus* it is called *Hypecoon*, or Rue Poppie, but vnproperly.

¶ The Temperature and Vertues.

There is a certaine clammy iuice in the leaues of the Venice Mallow, whereupon it is thought A

to come neere vnto the temperature of the common Mallow, and to be of a mollifying facultie: but his vse in Physicke is not yet knowne, and therefore can there be no certaintie affirmed.

CHAP. 356. Of Cranes-bill.

¶ The Kindes.

There be many Kindes of Cranes-bill, whereof two were known to *Dioscorides*, one with the knobby root, the other with the Mallow leafe.

Geranium Columbinum.

Doues foot, or Cranes-bill.

¶ The Description.

Doues-foot hath many hairy stalks, trailing or leaning toward the ground, of a brownish color, somewhat kneed or iointed, whereupon do grow rough leaues of an ouerworne green colour, round, cut about the edges, and like vnto those of the common Mallow: amongst which come forth the floures of a bright purple color: after which is the seed, set together like the head and bil of a bird, whereupon it was called Cranes-bill, or Storks-bill, as are also all the other of his kinde. The root is slender, with some fibres annexed thereto.

¶ 2 There is another kinde of this with larger stalkes and leaues, also the leaues are more deeply cut in and diuided, and the floures are either of the same colour as those of the common kinde, or else somewhat more whitish. This may be called *Geranium columbinum maius dissectis foliis*, Great Doues foot.

¶ 3 To this kinde may also fitly be referred the *Geranium Saxatile* of *Thalium*: the root is smal and threddy, the leaues are smoother, redder, more bluntly cut about the edges, and transparent than those of the first described, yet round, and otherwise like them: the floures are small and red, and the bills like those of the former. Master *Goodyer* found it growing plentifully on the bankes by the highway leading from *Gilford* towards *London*, neere vnto the Townes end. ¶

¶ The Place.

It is found neere to common high waies, desert places, vntilled grounds, and specially vpon mud walls almost euery where.

¶ The Time.

It springeth vp in March and Aprill: floureth in May, and bringeth his seede to ripenesse in Iune.

¶ The Names.

It is commonly called in Latine, *Pes Columbinus*: in High Dutch, *Scarter kraut*: in Low Dutch, *Duyuen boet*: in French, *Pied de Pigeon*: hereupon it may be called *Geranium Columbinum*. in English, Doues-foot, and Pigeons-foot: of *Dioscorides*, *Geranium alterum*. of some, *Pulmonia*, and *Gruina*.

¶ The Temperature.

Doues foot is cold and somewhat drie, with some astringion or binding, hauing power to soder or ioine together.

¶ The Vertues.

A It seemeth, saith my Author, to be good for greene and bleeding wounds, and asswageth inflammations or hot swellings.

The herbe and roots dried, beaten into most fine powder, and giuen halfe a spoonfull fasting, and the like quantitie to bedwards in red wine, or old claret, for the space of one and twentie daies together, cureth miraculously ruptures or burstings, as my selfe haue often prooued, whereby I haue gotten crownes and credit: if the ruptures be in aged persons, it shall be needfull to adde thereto the powder of red snailles (those without shels) dried in an ouen, in number nine, which fortifieth the herbs in such sort, that it neuer faileth, although the rupture be great and of long continuance: it likewise profiteth much those that are wounded into the body, and the decoction of the herbe made in wine, preuaileth mightily in healing inward wounds, as my selfe haue likewise proued.

CHAP. 357. Of Herbe Robert.

Geranium Robertianum.

Herbe Robert.

¶ The Description.

Herbe Robert bringeth forth slender weake and brittle stalks, somewhat hairie, and of a reddish colour, as are oftentimes the leaues also, which are iagged and deeply cut, like vnto those of Cheruile, of a most loathsome stinking smell. The floures are of a most bright purple colour; which being past, there follow certaine smal heads, with sharpe beaks or bills like those of birds: the root is small and threddie,

¶ The Place.

Herbe Robert groweth vpon old walls, as well those made of bricke and stone, as those of mud or earth: it groweth likewise among rubbish, in the bodies of trees that are cut downe, and in moist and shadowie ditch banks.

¶ The Time.

It floureth from Aprill till Sommer be almost spent: the herbe is green in winter also, and is hardly hurt with cold.

¶ The Names.

It is called in high Dutch, *Ruprechts kraut*: in low Dutch, *Robrechts kruit*: and thereupon it is named in Latine, *Ruberta*, and *Roberti herba*: *Ruellius* calleth it *Robertiana*; and we, *Robertianum*: of *Tabernamontanus*, *Rupertianum*: in English, Herbe Robert. Hee that conferreth this Cranes bill with *Dioscorides* his third *Sideritis* shall plainly perceiue, that they are both one,

and that this is most apparently *Sideritis* 3. *Dioscoridis*; for *Dioscorides* setteth downe three *Sideritis*, one with the leafe of Horehound; the next with the leafe of Featne; and the third groweth in walls and Vineyards: the natiue soile of Herbe Robert agree thereunto, and likewise the leaues, being like vnto Cheruile, and not vnlike to those of Corianders, according to *Dioscorides* description.

¶ The Temperature.

Herbe Robert is of temperature somewhat cold: and yet both scouring and somewhat binding, participating of mixt faculties.

¶ The Vertues.

It is good for wounds and vlcers of the dugs & secret parts; it is thought to stanch bloud, which thing *Dioscorides* doth attribute to his third *Sideritis*: the vertue of this, saith he, is applied to heale vp bloody wounds.

CHAP. 358. Of knobbed Cranes-bill.

Geranium tuberosum.
Knobbie Cranes-bill.

¶ The Description.

THIS kinde of Cranes-bill hath many flexible branches, weake and tender, fat, and full of moisture, wheron are placed very great leaues cut into diuers small sections or diuisions, resembling the leaues of the tuberous *Anemone*, or Wind-floure, but somewhat greater, of an ouerworn greenish colour: among which come forth long foot-stalks, whereon do grow faire floures, of a bright purple colour, and like vnto the smallest brier Rose in forme: which being past, there succeed such heads and beaks as the rest of the Cranes-bill haue: the root is thick, bumped or knobbed, which we call tuberous.

¶ The Place.

This kinde of Cranes-bill is a stranger in England, notwithstanding I haue it growing in my garden.

¶ The Time.

The time answereth the rest of the Cranes-bills.

¶ The Names.

Cranes bill is called in Greeke *ῥοστρου*: in Latine, *Gruinalis*, commonly *Rostrum Gruis*, or *Rostrum Ciconia*: of the likenesse of a Cranes-bill, or storkes-bill: of some, *Acus moscata*: but that name doth rather belong to another of this kind: it is also called *Acus Pastoris*: in Italian, *Rostru di grua*: in French, *Bec de Grue*: in Spanish, *Pico di Ciquena*, *pico del gron*: in High Dutch *Storckenschuabel*: in Low Dutch, *Dileuergs beck*: in English, *Storks-bill*, *Cranes-bill*, *Hérons-bill*, and *Pincke-needle*: this is also called for distinction sake, *Geranium tuberosum*, and *Geranium bulbosum*: it is likewise *Geranium primum Dioscoridis* or *Dioscorides* his first Cranes-bill.

¶ The Temperature.

The roots of this Cranes-bill haue a little kinde of heat in them.

¶ The Vertues.

- A *Dioscorides* saith that the roots may be eaten, and that a dram weight of them drunk in wine doth waste and consume away the windiness of the Matrix.
- B Also *Pliny* affirmeth, that the root hereof is singular good for such as after weaknesse craue to be restored to their former strength.
- C The same Author affirmeth that the weight of a dram of it drunke in wine three times in a day, is excellent good against the Ptsicke, or consumption of the lungs.

CHAP. 359. Of Musked Cranes-bill.

¶ The Description.

MUSKED Cranes-bill hath many weake and feeble branches trailing vpon the ground, whereon doe grow long leaues, made of many smaller leaues, set vpon a middle rib, snipt or cut about the edges, of a pleasant sweete smell, not vnlike to that of Muske: among which come forth the floures set vpon tender foote-stalkes, of a red colour, compact of five small leaues apiece: after which appeare small heads and pointed beakes or bills like the other kindes of Cranes bills: the root is small and threddy.

¶ The

Geranium moschatum.
Musked Cranes bill.

¶ The Place.

It is planted in Gardens for the sweet smell that the whole plant is possessed with, ‡ but if you rub the leaues and then smell to them, you shall finde them to haue a sent quite contrary to the former. ‡

¶ The Time.

It floureth and flourisheth all the sommer long.

¶ The Names.

It is called *Myrrhida Plinij* *Rostrum Ciconie*, *Arcus moschata*, in shops, and *Acus pastoris*, and likewise *Geranium moschatum*: in English, Musked Storkes bill, and Cranes bill, *Muschatum*, and of the vulgar sort *Muschata*, and also Pick-needle.

¶ The Temperature.

This Cranes bill hath not any of his faculties found out or knowne: yet it seemeth to be colde and a little dry, with some astringion or binding.

¶ The Vertues.

The vertues are referred vnto those of Doves foot, and are thought of *Dioscorides* to be good for greene and bloody wounds, and hot swellings that are newly begun.

CHAP. 360. Of Crow-foot Cranes-bill, or *Gratia Dei*.

¶ The Description.

1 Crowfoot Cranes bill hath many long and tender branches tending to rednesse, set with great leaues deeply cut or jagged, in forme like those of the fiede Crow foot, whereof it tooke his name; the floures are pretty large, and grow at the top of the stalkes vpon tender footstalkes, of a perfect blew colour: which being past, there succeed such heads, beakes, and bils as the other Cranes bils.

I haue in my garden another sort of this Cranes bill, bringing forth very faire white floures, which maketh it to differ from the precedent; in other respects there is no difference at all.

2 This which is the *Geranium 2. Batrachiodon minus* of *Clusius* hath large stalkes and leaues, and those very much diuided or cut in; the stalkes also are diuided into sundry branches, which vpon long footstalkes carry floures like in shape, but lesse than those of the formerly described, and not blew, but of a reddish purple colour, hauing ten threds and a pointall comming forth of the middle of the floure; the beakes or bils which are the seed stand vpright, and hang not downe their points as most others do. The root is large and liues many yeares.

3 The stalkes of this are stiffe, greene, and hairy, diuided at their tops into sundry branches which end in long footstalkes, vpon which grow floures commonly by couples, and they consist of fise leaues apiece, and these of a darke red colour. The leaues are large, soft, and hairy, diuided into six or seuen parts, and snipt about the edges; the roots are large and lasting. It is kept with vs in gardens, and floures in May. *Clusius* calls it *Geranium 1. pullo flore*.

4 This also hath stalkes and leaues much like those of the last described, but somewhat lesse: the floures are as large as those of the last described, but of a more light red, and they are contained in thicker and shorter cups, and succeeded by shorter seeds or bils, and are commonly of a sweet muske-like smell: The root is very long, red, and lasting. It floures in the middest of May, and is called

Kkkk

† 1 *Geranium Batrachioides.*
Crow-foot Cranes-bill.

2 *Geranium Batrachioides alterum.*
Small Crow-foot Cranes-bill.

† 3 *Geranium Batrachioides pullo flore.*
Duskie Cranes-bill.

† 4 *Geranium Batrachioides longius radicans.*
Long rooted Cranes-bill.

called by Gesner, *Geranium montanum*: by Dodonæus, *Geranium batrachoides alterum*: and by Lobell, *Geranium batrachoides longius radicans*. †

¶ The Place.

These Cranes bills are wilde of their owne nature, and grow in barren places, and in vallies rather than in mountaines; both of them do grow in my garden.

¶ The Time.

They floure, flourish, and grow greene most part of the Summer.

¶ The Names.

It is called in Greeke, *batrachoides*, and *Geranium batrachoides*, which name it taketh from the likeness of Crowfoot: of some it is called *Ranunculus caruleus*, or blew Crowfoot: *Fuchsius* calleth it *Gottes gnad*, that is in Latine, *Gratia Dei*: in English also Gratia dei, blew Cranes bill, or Cranes bill with the blew floures, or blew Crowfoot Cranes bill.

¶ The Temperature.

The Temperature is referred to the other Cranes bills.

¶ The Vertues.

None of these plants are now in vse in Physicke; yet *Fuchsius* saith, that Cranes bill with the blew floure is an excellent thing to heale wounds.

CHAP. 361. Of Candy Cranes bill.

1 *Geranium Creticum*.
Candy Cranes bill.

2 *Geranium Malacoides*.
Bastard Candy Cranes bill.

¶ The Description.

1 The Cranes bill of Candie hath many long tender stalks, soft, and full of iuice: diuiding it selfe into diuers branches, whereon are set great broad leaues, cut, or jagged in diuers sections

sections or cuts: among which come forth flowers composed of five leaues apiece, of a blck with or watchet colour, in the middle part whereof come forth a few chives, and a small pointell of a purplish colour: the head and beake is like to the rest of the Cranes bills, but greater: the root dieth when it hath perfected his seed.

2 This Cranes-bill, being a bastard kinde of the former, hath long slender branches growing to the height of two or three cubits, set about with very great leaues, not vnlike to those of Hollihocks, but somewhat lesser, of an ouerworne Greene colour: among which rise vp little scot-stalks, on the ends whereof do grow small floures, lesser than those of the precedent, and of a murrey colour: the head and seeds are like also, but much lesser: the roots doe likewise die at the first approach of Winter.

¶ The Place.

These are strangers in England, except in the gardens of some Herbarists: they grow in my garden very plentifully.

¶ The Time.

The time answereth the rest of the Cranes-bills, yet doth that of Candie floure for the most part with me in May.

¶ The Names.

There is not more to be said of the names than hath been remembred in their seuerall titles: they may be called in English, Cranes-bills, or Storkes-bills.

¶ The Temperature.

Their temperature answereth that of Doves-foot.

¶ The Vertues.

A Their faculties in working are equall to those of Doves-foot, and vsed for the same purposes, (& rightly) specially being vsed in wound drinks, for the which it doth far excel any of the Cranes bills, and is equall with any other herbe whatsoever for the same purpose.

CHAP. 362. Of diuers wilde Cranes-bills.

¶ The Kindes.

There be diuers sorts or Kindes of Cranes-bills which haue not been remembred of the antient, nor much spoken of by the later writers, all which I meane to comprehend vnder this chapter, making as it were of them a Chapter of wilde Cranes-bills, although some of them haue place in our London gardens, and that worthily, especially for the beautie of the floures: their names shall be expressed in their seuerall titles, their natures and faculties are referred to the other Cranes-bills, or if you please to a further consideration.

¶ The Description.

1 Spotted Cranes-bill, or Storkes-bill, the which *Lobel* describeth in the title thus, *Geranium Fuscum flore liuido purpurante, & medio Candicante*, whose leaues are like vnto Crow-foot (being a kinde doubtlesse of Cranes bill, called *Gratia Dei*) of an ouerworne dustie colour, and of a strong saueur, yet not altogether vnpleasant: the stalkes are drie and brittle, at the tops whereof doe grow pleasant floures of a darke purple colour, the middle part of them tending to whitnesse: from the stile or pointel thereof, commeth forth a tuft of small purple hairy threds. The root is thick and very brittle, lifting it selfe forth of the ground, insomuch that many of the said roots lie aboue the ground naked without earth, euen as the roots of Floure-de-luces doe.

2 Of these wilde ones I haue another sort in my garden, which *Clusius* in his Pannonicke obseruations hath called *Geranium Hematoides*, or sanguine Cranes bill: and *Lobel*, *Geranium Gruinum*, or *Gruinale*: it hath many flexible branches creeping vpon the ground: the leaues are much like vnto Doves foot in forme, but cut euen to the middle rib: the floures are like those of the small wilde mallow, and of the same bignesse, of a perfect bright red colour, which if they be suffered to grow

1 *Geranium maculatum* *sive fuscum*.
Spotted Cranes bill.

2 *Geranium sanguinarium*.
Bloudy Cranes bill.

3 *Geranium Cicutæ folio inodorum*.
Vnsauorie fælde Cranes-bill.

5 *Geranium Violaceum*.
Violet Storkes-bill.

grow and stand vntill the next day, will be a murry colour; and if they stand vnto the third day, they will turne into a deep purple tending to blewneffe, their changing is such, that you shall finde at one time vpon one branch floures like in forme, but of diuers colours. The root is thicke, and of a wooddie substance.

3 This wilde kinde of musked Cranes bill, being altogether without fauour or smell, is called *Myrrhida inodorum*, or *Geranium arvense inodorum*, which hath many leaues spred flat vpon the ground, euery leafe made of diuers smaller leaues, and those cut or iagged about the edges, of no smel at all: amongst which rise vp slender branches, whereon doe grow small floures of a light purple colour: the root is long and fibrous.

4 This is also one of the wilde kinds of Cranes-bills, agreeing with the last described in each respect, except the floures, for as the other hath purple floures, so this plant bringeth forth white floures, other difference there is none at all.

5 The Cranes-bill with violet coloured floures, hath a thicke wooddie root, with some few strings annexed thereto: from which rise immediatly forth of the ground diuers stiffe stalks, which diuide themselues into other small branches, whereupon are set confusedly broad leaues, made of three leaues apiece, and those iagged or cut about the edges: the floures grow at the top of the branches of a perfect Violet colour, whereof it tooke his name: after which come such beakes or bills as the other of his kinde.

† The figure that was put vnto this Description is the same with *Geranium Robertianum*, and therefore I thought it not much amisse to put it here againe. †

6 I haue likewise another sort that was sent me from *Robinus* of Paris, whose figure was neuer set forth, neither described of any: it bringeth from a thicke tough root, with many branches of a brownish colour: wherupon do grow leaues not vnlike to those of *Gratia Dei*, but not so deeply cut, somewhat cornered, and of a shining greene colour: the floures grow at the top of the tender branches, composed of fixe small leaues, of a bright scarlet colour.

¶ The Place.

The third and fourth of these Cranes-bills growe of themselues about old VValls, and about the borders of fields, VVoods and copses; and most of the rest wee haue growing in our gardens.

¶ The Time.

Their time of flourishing and seeding answereth the rest of the Cranes bills.

¶ The Names.

Their seuerall titles shall serue for their names, referring what might haue been said more to a further consideration.

¶ The Nature and Vertues.

A There hath not as yet any thing beene found either of their temperature or faculties, but may be referred vnto the other of their kinde.

† CHAP. 363. Of certaine other Cranes-bills.

¶ The Description.

† 1 **T**His which *Clusius* receiued from Doctour *Thomas Pennie* of London, and sets forth by the same title as you finde it here exprest, hath a root consisting of sundry long and small bulbes, and which is fibrous towards the top: the stalke is a cubit high, ioyned, and red neere vnto the roote, and about the ioints: out of each of these iointes come two leaues which are fastened vnto somewhat long foot-stalkes, and diuided into fve parts, which also are snipt about the edges: out of each of which ioints by the setting on the foot-stalkes

‡ 1 *Geranium bulbosum* Pennai.
Pennies bulbous Cranes bill.

‡ 2 *Geranium nodosum*, Plateau.
Knotty Cranes bill.

‡ 3 *Geranium argenteum* Alpinum.
Silver leaved Mountaine Cranes bill.

foot-stalkes come forth five little sharpe pointed leaues : the floures grow by couples vpon the tops of the stalkes, and are of a reddish purple colour. It growes wilde in Denmark; whence Dr. Turner brought it, and bestowed it vpon Dr. Penny before mentioned.

2 This hath stalks some foot high, ioiuted, and of a purplish colour: vpon which grow leaues diuided into three parts; but those below are cut into five, and both the one and the other are snipt about the edges: the floures are composed of five reddish purple leaues of a pretty largenesse, with a reddish pointall in the middle; and falling, the seed follows, as in other plants of this kind: the root is knotty, and ioynted, with some fibres: it floures in May, and so continueth a great part of the Sommer after. *Clusius* calls this *Geranium 5. nodosum*, Plateau. This sometimes is found to carry tuberous excrescences vpon the stalkes, toward the later end of Sommer; whence Plateau distinguished it from the other, but afterwards found it to be the same: and *Clusius* also figures and describeth this later varietie by the name of *Geranium 6. tuberiferum* Plateau.

3 The root of this is some two handfulls long,

long, blacke without, and white within, and towards the top diuided into sundry parts; whence put forth leaues couered ouer with a fine siluer downe; and they are diuided into five parts, each of which againe is diuided into three others, and they are fastned to long slender and round foot-stalkes: the floures grow vpon foot-stalkes shorter than those of the leaues; the floures in colour and shape are like those of the Veuaine Mallow, but much lesse; and after it is vaded there followes a short bill, as in the other plants of this kinde. It floures in Iuly, and growes vpon the Alps, where *Pona* found it, and first set it forth by the name of *Geranium Alpinum longius radicum*.

4 The stalkes of this pretty Cranes bill are some foot or better high, whereon grow leaues parted into five or six parts like those of the *Geranium fuscum*, but of a lighter Greene colour: the floures are large, composed of five thin and soone fading leaues of a whitish colour, all ouer intermixt with fine veines of a reddish colour, which adde a great deale of beauty to the floure: for these veines are very small, and curiously dispersed ouer the leaues of the floure. It floures in Iune, and is preserued in diuers of our gardens; some call it *Geran. Romanum striatum*: in the *Hortus Eftensis* it is set forth by the name of *Geranium Anglicum variegatum*. *Bauhine* calls it *Geranium batrachiodes flore variegato*. We may call it Variegated or striped Cranes bill.

5 There is of late brought into this kingdome, and to our knowledge, by the industry of Mr. *Iohn Tradescant*, another more rare and no lesse beautifull than any of the former; and he had it by the name of *Geranium Indicum noctu odoratum*: this hath not as yet beene written of by any that I know; therefore I will giue you the description thereof, but cannot as yet giue you the figure, because I omitted the taking thereof the last yeare, and it is not as yet come to his perfection. The leaues are larger, being almost a foot long, composed of sundry little leaues of an vnequal bignes, set vpon a thicke and stiffe middle rib; and these leaues are much diuided and cut in, so that the whole leafe somewhat resembles that of *Tanacetum inodorum*: and they are thicke, Greene, and somewhat hairy: the stalke is thicke, and some cubit high; at the top of each branch, vpon foot-stalkes some inch long grow some eleuen or twelue floures, and each of these floures consisteth of five round pointed leaues of a yellowish colour, with a large blacke purple spot in the middle of each leafe, as if it were painted, which giues the floure a great deale of beauty, and it also hath a good smell. I did see it in floure about the end of Iuly, 1632. being the first time that it floured with the owner thereof. We may fitly call it Sweet Indian Storks bill, or painted Storks bill: and in Latine, *Geranium Indicum odoratum flore maculato*. †

CHAP. 364. Of Sanicle.

Sanicula, sine Diapensia. Sanicle.

¶ The Description.

Sanicle hath leaues of a blackish Greene colour, smooth and shining, somewhat round, diuided into five parts like those of the Vine, or rather those of the maple: among which rise vp slender stalkes of a browne colour, on the tops whereof stand white mossie floures: in their places come vp round seed, rough, cleauing to mens garments as they passe by, in manner of little burs: the root is blacke, and full of threddie strings.

¶ The Place.

It groweth in shadowie woods and copses almost euerie where: it ioeyeth in a fat and fruitfull moist soile.

¶ The Time.

It floureth in May and Iune: the seed is ripe in August: the leaues of the herbe are Greene all the yeare, and are not hurt with the cold of Winter.

¶ The Names.

It is commonly called *Sanicula*; of diuers, *Diapensia*: in high and low Dutch, *Sanikel*: in French, *Sanicle*: in English, *Sanickle*, or *Sanikel*: it is so called, *a sanandis vulneribus*, or of healing of wounds, as *Ruellius* saith: there be also other

other Sanicles, so named of most Herbarists, as that which is described by the name of *Dentaria*, or Coral-wort, and likewise *Auricula ursi*, or Beares eare, which is a kind of Cowslip; and likewise another set forth by the name of *Sanicula guttata*, whereof we haue entreated among the kindes of Beares eares.

¶ *The Temperature.*

Sanicle as it is in taste bitter, with a certaine binding qualitie; so besides that it clenseth, and by the binding faculty strengthneth, it is hot and dry, and that in the second degree, and after some Authors, hot in the third degree, and astringent.

¶ *The Vertues.*

The iuyce being inwardly taken is good to heale wounds.

The decoction of it also made in wine or water is giuen against spitting of blood, and the bloudie flux: also foule and filthy vlcers be cured by being bathed therewith. The herbe boyled in water, and applied in manner of a pulstesse, doth dissolue and waste away cold swellings: it is vsed in potions which are called *Vulnerarie* potions, or wound drinkes, which maketh whole and sound all inward wounds and outward hurts: it also helpeth the vlcérations of the kidnies, ruptures, or burstings.

CHAP. 365. Of Ladies Mantle, or great Sanicle.

Alchimilla.

Lyons foot, or Ladies mantle.

¶ *The Description.*

Ladies mantle hath many round leaues, with five or six corners finely indented about the edges, which before they be opened are plaited and folded together, not vnlike to the leaues of Mallowes, but whiter, and more curled: among which rise vp tender stalks set with the like leaues but much lesser: on the tops whereof grow small mossie floures clustering thicke together, of a yellowish Greene colour. The seed is small and yellow, inclosed in Greene husks. The root is thicke, and full of threddy strings.

¶ *The Place.*

It groweth of it selfe wilde in diuers places, as in the towne pastures of Andouer, and in many other places in Barkshire and Hampshire, in their pastures and copses, or low woods, and also vpon the banke of a mote that incloseth a house in Bureshey called Bourn hall, fourteen miles from London; and in the high-way from thence to Watford, a small mile distant from it.

¶ *The Time.*

It floureth in May and Iune: it flourisheth in Winter as well as in Sommer.

¶ *The Names.*

It is called of the later Herbarists *Alchimilla*, and of most, *Stellaria*, *Pes Leonis*, *Pata Leonis*, and *Sanicula maior*: in high-Dutch, *Synnauw*, and *Onser Frauen mantel*: in French, *Pied de Lion*:

in English, Ladies mantle, great Sanicle, Lyons foot, Lyons paw; and of some, Padelyon.

¶ *The Temperature.*

Ladies mantle is like in temperature to little Sanicle, yet is it more drying and more binding.

¶ *The Vertues.*

It is applied to wounds after the same manner that the smaller Sanicle is, being of like efficacy: it stoppeth bleeding, and also the ouermuch flowing of the natural sicknesse: it keeps downe maidens paps or duggs, and when they be too great or flaggie it maketh them lesse or harder.

CHAP. 366. Of Neese-wort Sanicle.

Elleborine Alpina.
Neesewort Sanicle.

¶ The Description.

When I made mention of *Helleborus albus*, I did also set downe my censure concerning *Elleborine*, or *Epipactis*: but this *Elleborine* of the Alpes I put in this place, because it approacheth neerer vnto Sanicle and *Ranunculus*, as participating of both: it groweth in the mountaines and highest parts of the Alpish hills, and is a stranger as yet in our English gardens. The root is compact of many small twisted strings like black Hellebor: from thence arise small tender stalkes, smooth, and easie to bend; in whose tops grow leaues with five diuisions, somewhat nickt about the edges like vnto Sanicle: the floures consist of six leaues somewhat shining, in taste sharp, yet not vnpleasant. This is the plant which *Pena* found in the Forrest of Esens, not farre from Iupiters mount, and sets forth by the name of *Alpina Elleborine Sanicula* & *Ellebori nigri facie*.

¶ The Nature and Vertues.

I haue not as yet found any thing of his nature or vertues.

CHAP. 367. Of Crow-feet.

¶ The Kindes.

There be diuers sorts or kinds of these pernicious herbes comprehended vnder the name of *Ranunculus*, or Crowfoot, whereof most are very dangerous to be taken into the body, and therefore they require a very exquisite moderation, with a most exact and due manner of tempering, not any of them are to be taken alone by themselves, because they are of most violent force, and therefore haue the greater need of correction.

The knowledge of these plants is as necessarie to the Physitian as of other herbes, to the end they may shun the same, as *Scribonius Largus* saith, and not take them ignorantly: or also, if necessitie at any time require, that they may vse them, and that with some deliberation and speciall choice, and with their proper correctiues. For these dangerous Simples are likewise many times of themselves beneficiall, and oftentimes profitable: for some of them are not so dangerous, but that they may in some sort, and oftentimes in fit and due season profit and do good, if temperature and moderation be vsed: of which there be foure kinds, as *Dioscorides* writeth; one with broad leaues, another that is downy, the third very small, and the fourth with a white floure: the later herbarists haue obserued also many moe: all these may be brought into two principall kinds, so that one be a garden or tame one, and the other wilde; and of these some are common, and others rare, or forreigne. Moreouer, there is a difference both in the roots and in the leaues; for one hath a bumped or knobby root, another a long leafe as *Speare-wort*: and first of the wilde or field Crow-feet, referring the Reader vnto the end of the stocke and kindred of the same, for the temperature and vertues.

1 *Ranunculus pratensis, etiamque hortensis.*
Common Crow-foot.

2 *Ranunculus surrectis cauliculis.*
Right Crow-foot.

James Spensby

3 *Ranunculus aruorum.*
Crowfoot of the fallowed field.

4 *Ranunculus Alpinus albus.*
White mountaine Crow-foot.

¶ The Description.

1 **T**He common Crow-foot hath leaues diuided into many parts, commonly three, sometimes five, cut here and there in the edges, of a deepe greene colour, in which stand diuers white spots: the stalkes be round, something hairie, some of them bow downe toward the ground, and put forth many little roots, whereby it taketh hold of the ground as it traileth along: some of them stand vpright, a foot high or higher; on the tops whereof grow small floures with five leaues apiece, of a yellow glittering colour like gold: in the middle part of these floures stand certaine small threds of like colour: which being past, the seeds follow, made vp in a rough ball: the roots are white and threddy.

2 The second kinde of Crow-foot is like vnto the precedent, sauing that his leaues are fatter, thicker, and greener, and his small twiggy stalkes stand vpright, otherwise it is like: of which kind it chanced, that walking in the field next to the Theatre by London, in the company of a worshipfull merchant named Mr. *Nicolas Lete*, I found one of this kinde there with double floures, which before that time I had not seene.

¶ The Place.

They grow of themselues in pastures and medowes almost euery where.

¶ The Time.

They floure in May and many moneths after.

¶ The Names.

Crow-foot is called of *Lobel*, *Ranunculus pratensis*: of *Dodonaeus*, *Ranunculus hortensis*, but vnproperly: of *Pliny*, *Polyanthemum*, which he saith diuers name *Batrachion*: in high-Dutch, **Schmalbluom**: in low Dutch, **Boter bloemen**: in English, King Kob, Gold cups, Gold knobs, Crowfoot, and Butter-floures.

¶ The Description.

3 The third kinde of Crow-foot, called in Latine *Ranunculus aruorum*, because it growes commonly in fallow fields where corne hath bene lately sowne, and may be called Corne Crow-foot, hath for the most part an vpright stalke of a foot high, which diuides it selfe into other branches: whereon do grow fat thicke leaues very much cut or iagged, resembling the leaues of Sampire, but nothing so greene, but rather of an ouerworne colour. The floures grow at the top of the branches, compact of five small leaues of a faint yellow colour: after which come in place clusters of rough and sharpe pointed seeds. The root is small and threddy.

4 The fourth Crow-foot, which is called *Ranunculus Alpinus*, because those that haue first written thereof haue not found it elsewhere but vpon the Alpish mountains (notwithstanding it groweth in England plentifully wilde, especially in a wood called Hampsted Wood, and is planted in gardens) hath diuers great fat branches two cubits high, set with large leaues like the common Crow-foot, but greater, of a deepe greene colour, much like to those of the yellow Aconite, called *Aconitum luteum Ponticum*. The floures consist of five white leaues, with small yellow chiues in the middle, smelling like the floures of May or Haw-thorne, but more pleasant. The roots are greater than any of the stocke of Crow-feet.

¶ The Place and Time.

Their place of growing is touched in their description: their time of flourishing and seeding answereth the other of their kindes.

¶ The Names.

The white Crow-foot of the Alps and French mountaines is the fourth of *Dioscorides* his description; for he describeth his fourth to haue a white floure: more hath not bin said touching the names, yet *Tabern.* calls it *Batrachium album*: in English, white Crow-foot.

¶ The Description.

5 Among the wilde Crow-feet there is one that is synnamed *Illyricus*, which brings forth slender stalks, round, and of a meane length: whereupon doe grow long narrow leaues cut into many long gashes, something white, and couered with a certaine downinesse: the floures be of a pale yellow colour: the root consisteth of many small bumpes as it were graines of corne, or little long bulbes growing close together like those of Pilewort. It is reported, that it was first brought out of Illyria into Italy, and from thence into the Low-Countries: notwithstanding we haue it growing very common in England. ‡ But only in gardens that I haue seene. ‡

6 The sixth kinde of Crow-foot, called *Ranunculus bulbosus*, or Onion rooted Crow-foot, and round rooted Crow-foot, hath a round knobby or onion-fashioned root, like vnto a small Turnep, and of the bignesse of a great Oliue: from the which rises vp many leaues spread vpon the ground, like those of the field Crow-foot, but smaller, and of an ouerworne greene colour: amongst which rise vp slender stalkes of the height of a foot: whereupon doe grow floures of a feint yellow colour. ‡ This growes wilde in most places, and floures at the beginning of May. ‡

¶ The

¶ The Place.

It is also reported to be found not only in Illyria and Sclauonia, but also in the Island Sardinia, standing in the Midland, or Mediteranian sea.

¶ The Names.

This Illyrian Crow foot is named in Greeke *σάρινον ἀγρον*, that is, *Apium sylvestre*, or wilde Smallage: also *Herba Sarda*: it may be, saith my Author, that kinde of Crowfoot called *Apium risus*, and *γελωτο-φω*; and this is thought to be that *Golotophillis*, of which *Pliny* maketh mention in his 24. booke, 17. chap. which being drunke, saith he, with wine and myrrh, causeth a man to see diuers strange sights, and not to cease laughing till he hath drunke Pine apple kernells with Pepper in wine of the Date tree, (I thinke he would haue said vntill he be dead) because the nature of laughing Crow-foot is thought to kill laughing, but without doubt the thing is cleane contrary; for it causeth such convulsions, cramps and wringings of the mouth and jawes, that it hath seemed to some that the parties haue dyed laughing, whereas in truth they haue died in great torment.

5 *Ranunculus Illyricus*.
Crowfoot of Illyria.

6 *Ranunculus bulbosus*.
Roundrooted Crowfoot.

¶ The Description.

7 The seventh kinde of Crowfoot, called *Auricomus* of the golden lockes wherewith the floure is thrummed, hath for his root a great bush of blackish hairy strings: from which shoote forth small jagged leaues, not much vnlike to Sanicle, but diuided onely into three parts, yet sometimes into five; among which rise vp branched stalkes of a foot high, whereon are placed the like leaues but smaller, set about the top of the stalkes, whereon do grow yellow floures, sweet smelling, of which it hath been called *Ranunculus dulcis*, *Tragi*, or *Tragus* his sweet Crowfoot. † It growes in meadowes and about the sides of woods, and floures in Aprill. †

† 8 Frogge Crowfoot, called of *Pena*, *Aconitum Batrachoides*: of *Dodoneus*, *Batrachion Apulei*, is that formerly described in the fourth place, whereto this is much alike, but that the stalkes and leaues are larger, as also the floures, which are white: the root is tough and threddy.

9 The ninth Crowfoote hath many grassie leaues, of a deepe Greene tending to blewnesse, somewhat long, narrow and smooth, very like vnto those of the small Bistort, or Snakeweed:

7 *Ranunculus auricomus*.
Golden-haired Crow-foot.

† 8 *Ranunculus Aconiti folio*.
Frog Crow-foot.

9 *Ranunculus gramineus* Lobelij.
Grassie Crow-foot.

10 *Ranunculus Autumnalis* Clusij.
Winter Crow-foot.

among which rise vp slender stalkes, bearing at the top small yellow floures like the other Crow-foot: the root is small and threddy. ‡ There is a variety of this hauing double floures; and I haue giuen you the figure thereof in stead of the single that was formerly in this place. ‡

10 The Autumne or Winter Crow-foot hath diuers broad leaues spred vpon the ground, snipt about the edges, of a bright shining Greene colour on the vpper side, and hoary vnderneath, full of ribs or sinewes as are those of Plantaine, of an vnpleasant taste at the first, afterward nipping the tongue: among which leaues rise vp sundry tender foot-stalkes, on the tops whereof stand yellow floures consisting of six small leaues apiece: after which succeed little knaps of seed like to a dry or withered straw-berry. The root is compact of a number of limber roots, rudely thrust together in manner of the Asphodill.

11 The Portugall Crow-foot hath many thicke clogged roots fastned vnto one head, very like those of the yellow Asphodill: from which rise vp three leaues, seldome more, broad, thicke, and puffed vp in diuers places, as if it were a thing that were blistered, by meanes whereof it is very vneuen. From the middle of which leaues riseth vp a naked stalke, thicke, fat, very tender, but yet fragile, or easie to breake: on the end whereof standeth a faire single yellow floure, hauing in the middle a naked rundle of a gold yellow tending to a Saffron colour.

11 *Ranunculus Lusitanicus Clusij.*
Portugall Crow-foot.

12 *Ranunculus globosus.*
Locker Gowllons, or Globe Crowfoot.

12 The Globe Crow-foot hath very many leaues deeply cut and iagged, of a bright Greene colour like those of the field Crow-foot: among which riseth vp a stalke, diuided toward the top into other branches, furnished with the like leaues of those next the ground, but smaller: on the tops of which branches grow very faire yellow floures, consisting of a few leaues folded or rolled vp together like a round ball or globe: whereupon it was called *Ranunculus globosus*, or the Globe Crow-foot, or Globe floure: which being past, there succeed round knaps, wherein is blackish seed. The root is small and threddy.

‡ 13 This hath large leaues like those of the last described, but rough and hairy: the stalk is some foot high: the floures are pretty large, composed of five white sharpe pointed leaues. It floures in Iuly, and growes in the Alps: it is the *Ranunculi montani* 2. species altera of *Clusius*.

14 This other hath leaues not vnlike those of the precedent, and such stalkes also; but the floures consist of 5 round leaues, purplish beneath; the edges of the vpper side are of a whitish purple, & the residue wholly white, with many yellow threds in the middle: it grows in the mountain

‡ 13 *Ranunculus hirsutus Alpinus flo. albo.* Rough white floured mountaine Crow-foot. ‡ 14 *Ranunculus montanus hirsutus purpureus.* Rough purple floured mountain Crowfoot.

Iura, against the city of Geneva, whereas it floures in Iune, and ripens the seed in August. *Clusius* had the figure and description hereof from Dr. Penny, and he calls it *Ranunculus montanus* 3. ‡

¶ The Place.

The twelfth kind of Crowfoot groweth in most places of York-shire and Lancashire, and other bordering shires of the North countrey, almost in euery meadow, but not found wilde in these Southerly or Westerly parts of England that I could euer vnderstand of.

¶ The Time.

It floureth in May and Iune: the seed is ripe in August.

¶ The Names.

The Globe floure is called generally *Ranunculus globosus*: of some, *Flos Trollius*, and *Ranunculus Alpinus*: in English, Globe Crow-foot, Troll floures, and Lockron gowlons.

CHAP. 368. Of Double yellow and white Batchelors Buttons.

¶ The Description.

THe great double Crow-foot or Batchelors button hath many iagged leaues of a deepe greene colour: among which rise vp stalkes, whereon do grow faire yellow floures exceeding double, of a shining yellow colour, oftentimes thrusting forth of the middest of the said floures one other smaller floure: the root is round, or fashioned like a Turnep; the form whereof hath caused it to be called of some S. Antonies Turnep, or Rape Crow-foot. The seed is wrapped in a cluster of rough knobs, as are most of the Crow-feet.

2 The double yellow Crow-foot hath leaues of a bright greene colour, with many weake branches trailing vpon the ground; whereon do grow very double yellow floures like vnto the precedent, but altogether lesser. The whole plant is likewise without any manifest difference, sauing that these floures do neuer bring forth any smaller floure out of the middle of the greater, as the other doth, and also hath no Turnep or knobby root at all, wherein consists the greatest difference.

3 The

† *Ranunculus maximus Anglicus.*
Double Crow-foot, or Batchelors buttons.

2 *Ranunculus dulcis multiplex.*
Double wilde Crow-foot.

3 *Ranunculus albus multiflorus.*
Double white Crow-foot.

3 The white double Crow-foot hath many great leaues deeply cut with great gashes, and those snipt about the edges. The stalks diuide themselves into diuers brittle branches, on the tops whereof do grow very double floures as white as snow, and of the bignesse of our yellow Batchelors button. The root is tough, limber, and disperfeth it selfe farre abroad, whereby it greatly increaseth.

¶ The Place.

The first and third are planted in gardens for the beauty of the floures, and likewise the second, which hath of late beene brought out of Lancashire vnto our London gardens, by a curious gentleman in the searching forth of Simples, M^r. Thomas Hesketh, who found it growing wilde in the towne fields of a smal village called Hesketh, not farre from Latham in Lancashire.

¶ The Time.

They floure from the beginning of May to the end of Iune.

¶ The Names.

Dioscorides hath made no mention hereof; but *Apuleius* hath separated the first of these from the others, intreating of it apart, and naming it by a peculiar name *Batrachion*; whereupon it is also called *Apuleij Batrachion*, or *Apuleius Crow-foot*.

It is commonly called *Rapum D. Anthonij*, or Saint Anthonies Rape: it may be called in English, Rape Crow-foot: it is called generally about London, Batchelors buttons, and double Crow-foot: in Dutch,

Dutch, *S. Anthony Rapkin*. ‡ These names and faculties properly belong to the *Ranunculus bulbosus*, described in the sixt place of the last chapter; and also to the first double one here described; for they vary little but in colour, and the singlenesse and doubleness of their floures. ‡

The third is called of *Lobel*, *Ranunculus niueus polyanthos*: of *Tabern.* *Ranunculus albus multiflorus*: in English, Double white Crow-foot, or Batchelors buttons.

¶ The Temperature.

These plants do bite as the other Crow-feet do.

¶ The Vertues.

A The chiefeft vertue is in the root, which being stamped with salt is good for those that haue a plague sore, if it be presently in the beginning tied to the thigh, in the middle between the groin or flanke and the knee: by meanes whereof the poyson and malignitie of the disease is drawn from the inward parts, by the emunctorie or clensing place of the flanke, into those outward parts of lesse account: for it exulcerateth and presently raiseth a blister, to what part of the body soeuer it is applied. And if it chance that the sore hapneth vnder the arme, then it is requisite to apply it to the arme a little about the elbow. My opinion is, that any of the Crow-feet will do the same: my reason is, because they all and euery of them do blister and cause paine, wheresoeuer they be applied, and paine doth draw vnto it selfe more paine; for the nature of paine is to resort vnto the weakest place, and where it may finde paine; and likewise the poyson and venomous qualitie of that disease is to resort vnto that painefull place.

B *Apuleius* saith further, That if it be hanged in a linnen cloath about the necke of him that is lunaticke, in the waine of the moone, when the signe shall be in the first degree of *Taurus* or *Scorpio*, that then he shall forthwith be cured. Moreouer, the herbe *Batrachion* stamped with vineger, root and all, is vsed for them that haue blacke skars or such like marks on their skins, it eats them out, and leaues a colour like that of the body.

† The figure that formerly was in the first place of this chapter was the double one mentioned in the second description of the foregoing chapter, where also you may finde a double floure exprest by the side of the figure.

CHAP. 369. Of Turkie or Asian Crow-feet.

1 *Ranunculus sanguineus multiplex*.
The double red Crow-foot.

‡ 2 *Ranunculus Asiaticus flo. pleno miniato*.
The double Asian skarlet Crow-foot.

† 3 *Ranunculus Asiaticus flore pleno prolifero.*
The double buttoned scarlet Asian Crow-foot.

4 *Ranunculus Tripolitanus.*
Crow-foot of Tripolie.

† 5 *Ranunculus grumosa radice ramosa.*
Branched red Asian Crow-foot.

† 6 *Ranunculus Asiaticus grumosa radice flo. albo.*
White flowered Asian Crow-foot.

‡ 7 *Ranunculus Asiaticus grumosa radice flore flavo vario.*
Asian Crow-foot with yellow striped floures.

¶ The Description.

1 The double red Crow-foot hath a few leaues rising immediatly forth of the ground, cut in the edges with deepe gashes, somewhat hollow, and of a bright shining green colour. The stalk riseth vp to the height of a foot, smooth and very brittle, diuiding it selfe into other branches, sometimes two, seldome three: whereon do grow leaues confusedly, set without order: the floures grow at the tops of the stalks, very double, and of great beauty, of a perfect scarlet colour, tending to rednesse. The root is compact of many long tough roots, like those of the yellow Asphodill.

‡ 2 Of this kinde there is also another, or other the same better exprest; for *Clusius* the author of these neuer see the former, but makes it onely to differ, in that the floures are of a sanguine colour, and those of this of a kinde of scarlet, or red lead colour.

3 This differs nothing from the former, but that it sends vp another floure somewhat lesser, out of the middle of the first floure, which happens by the strength of the root, and goodnesse of the soile where it is planted. ‡

4 The Crow-foot of Tripolis or the single red *Ranunculus* hath leaues at the first comming vp like vnto those of Groundswell: among which riseth vp a stalke of the height of halfe a cubit, somewhat hairy, wheron grow broad leaues deeply cut, euen to the middle rib, like those of the common Crow-foot, but greener: the floure groweth at the

top of the stalke, consisting of fise leaues, on the outside of a darke ouerworne red colour, on the inside of a red lead colour, bright and shining, in shape like the wilde corne Poppie: the knop or stile in the middle which containeth the seede is garnished or bedeckt with very many small purple thrummes tending to blacknesse: the root is as it were a roundell of little bulbes or graines like those of the small Celandine or Pilewoort.

‡ 5 There be diuers other Asian Crow-feet which *Clusius* hath set forth, and which grow in the most part in the gardens of our prime Florists, and they differ little in their roots, stalkes, or leaues, but chiefly in the floures; wherefore I will onely briefly note their differences, not thinking it pertinent to stand vpon whole descriptions, vnlesse they were more necessary: this first differs from the fourth in that the stalkes are diuided into sundry branches, which beare like, but lesse floures than those which stand vpon the main stalke: the colour of these differs not from that of the last described.

6 This is like the last described, but the floures are of a pure white colour, and sometimes haue a few streaks of red about their edges.

7 This in stalkes and manner of growing is like the precedent: the stalke seldome parting it selfe into branches; but on the top thereof it carries a faire floure consisting commonly of round topped leaues of a greenish yellow colour, with diuers red veines here and there dispersed and running alongst the leaues, with some purple thrums, and a head standing vp in the middle as in the former. ‡

¶ The Place.

The first groweth naturally in and about Constantinople, and in Asia on the further side of Bosphorus, from whence there hath been brought plants at diuers times, and by diuers persons, but they haue perished by reason of their long iourney, and want of skill of those bringers, that haue suffered them to lie in a box or such like so long, that when we haue receiued them they haue been as dry as ginger; notwithstanding *Clusius* saith he receiued a plant fresh and Greene, the which a domestical theefe stole forth of his garden. My Lord and Master the right Honorable the Lord Treasurer

furor had diuers plants sent him from thence which were drie before they came, as aforesaid. The other groweth in Aleppo and Tripolis in Syria naturally, from whence we haue receiued plants for our gardens, where they flourish as in their owne countrey.

¶ The Time.

They bring forth their pleasant floures in May and Iune, the seed is ripe in August.

¶ The Names.

The first is called *Ranunculus Constantinopolitanus*: Of Lobel, *Ranunculus sanguineus multiplex*, *Ranunculus Bizantinus*, five Asiaticus: in the Turkish tongue, *Torobolos*, *Catamer laile*: in English, the double red Ranunculus, or Crow-foot.

The fourth is called *Ranunculus Tripolitanus*, of the place from whence it was first brought into these parts: of the Turks, *Tarobolos Catamer*, without that addition *laile*: which is a proper word to all floures that are double.

¶ The Temperature and Vertues.

Their temperature and vertues are referred to the other Crow-feet, whereof they are thought to be kindes.

CHAP. 370. Of Speare-woort, or Bane-woort.

¶ The Description.

1 **S**peare-woort hath an hollow stalke full of knes or ioynts, whereon do grow long leaues, a little hairy, not vnlike those of the willow, of a shining green colour: the floures are very large, and grow at the tops of the stalks, consisting of five leaues of a faire yellow colour, verie like to the field gold cup, or wilde Crow-foot: after which come round knops or seed vessels, wherein is the seed: the root is contract of diuers bulbes or long clogs, mixed with an infinite number of hairy threds.

1 *Ranunculus flammeus maior.*
Great Speare-woort.

2 *Ranunculus flammeus minor.*
The lesser Speare-woort.

2 The

2 The common Spearewoort being that which we haue called the lesser, hath leaues, floures, and stalks like the precedent, but altogether lesser: the roote consisteth of an infinite number of threddie strings.

3 *Ranunculus flammens ferratus.*
Iagged Speare-woort.

4 *Ranunculus palustris rotundifolius.*
Marsh Crow-foot, or Speare-worts.

3 Iagged Speare-woort hath a thicke fat hollow stalke, diuiding it selfe into diuers branches, whereon are set somtimes by couples two long leaues, sharp pointed, & cut about the edges like the teeth of a saw. The floures grow at the top of the branches, of a yellow colour, in form like those of the field Crowfoot: the root consisteth of a number of hairy strings.

4 Marsh Crow-foot, or Speare-woort (whereof it is a kinde, taken of the best approued authors to be the true *Apium risus*, though diuers thinke that *Pulsatilla* is the same: of some it is called *Apium hemorrhoidarum*) riseth forth of the mud or waterish mire from a threddie root, to the height of a cubit, sometimes higher. The stalke diuideth it selfe into diuers branches, whereupon doe grow leaues deeply cut round about like those of Doues-foot, and not vnlike to the cut Mallow, but somewhat greater, and of a most bright shining green colour: the floures grow at the top of the branches, of a yellow colour, like vnto the other water Crow-feet.

¶ The Place.

They grow in moist and dankish places, in brinckes or water courses, and such like places almost euery where.

¶ The Time.

They floure in May when other Crow-feet do.

¶ The Names.

Speare-woort is called of the later Herbarists *Flammula*, and *Ranunculus Flammens*; of Cordus, *Ranunculus maritimus*, or broad leaued Crow-foot: of others, *Ranunculus longifolius*, or long leaved Crow-foot: in Low Dutch, *Egelcoolen*: in English, Speare-Crowfoot, Speare-woort, and Banewoort, because it is dangerous and deadly for sheep; and that if they feed of the same it inflameth their liuers, fretteth and blistereth their guts and intrails.

¶ The Temperature of all the Crowfeet.

Speare-woort is like to the other Crow-feet in facultie, it is hot in the mouth or biting, it exulcerateth

cerateth and raiseth blisters, and being taken inwardly it killeth remediless. Generally all the Crow-feet, as *Galen* saith, are of a very sharpe or biting qualitie, insomuch as they raise blisters with paine: and they are hot and drie in the fourth degree.

¶ *The Vertues of all the Crowfeet.*

The leaues or roots of Crowfeet stamped and applied vnto any part of the body, causeth the skin to swell and blister, and raiseth vp wheales, bladders, causeth scars, crusts, and ouglie vlcers: it is laid vpon cragged warts, corrupt nailes, and such like excrescences, to cause them to fall away.

The leaues stamped and applied vnto any pestilentiall or plague sore, or carbuncle, staie the spreading nature of the same, and causeth the venomous or pestilentiall matter to breath forth, by opening the parts and passages in the skin.

It preuaileth much to draw a plague sore from the inward parts, being of danger, vnto other remote places further from the heart, and other of the spirituall parts, as hath beene declared in the description.

Many doe vse to tie a little of the herbe stamped with salt vnto any of the fingers, against the pain of the teeth; which medicine seldome faileth, for it causeth greater paine in the finger than was in the tooth, by the meanes whereof, the greater paine taketh away the lesser.

Cunning beggars doe vse to stampe the leaues, and lay it vnto their legs and arms, which causeth such filthy vlcers as we daily see (among such wicked vagabonds) to moue the people the more to pittie.

The kinde of Crowfoot of Illyria, being taken to be *Apium risus* of some, yet others thinke *Aconitum Batrachoides* to be it. This plant spoileth the senses and vnderstanding, and draweth together the sinewes and muscles of the face in such strange manner, that those who beholding such as died by the taking hereof, haue supposed that they died laughing; so forceably hath it drawne and contracted the nerues and sinewes, that their faces haue been drawne awry, as though they laughed, whereas contrariwise they haue died with great torment.

† CHAP. 371. Of diuers other Crowfeet.

† 1 *Ranunculus Creticus latifolius.*
Broad leaued Candy Crowfoot.

† 2 *Ranunculus folio Plantaginis.*
Plantaine leaued Crowfoot.

The Description.

¶ 1 **T**He roots of this are somewhat like those of the Asian *Ranunculus*: the leaues are verie large & roundish, of a light green colour, cut about the edges, & here and there deeply diuided: the stalke is thicke, round, and stiffe, diuided into two or three branches; at the setting on of which grow longish leaues a little nickt about the end: the floures are of an indifferent bignesse, and consist of five longish round pointed leaues, standing a little each from other, so that the green points of the cups shew themselves between them: there are yellow threds in the middle of these floures, which commonly shew themselves in Februarie, or March. It is found only in some gardens, and *Clusius* onely hath set it forth by the name we here giue you.

2 This also that came from the Pyrenæan hills is made a Denizen in our gardens: it hath a stalke some foot high, set with neruous leaues, like those of Plantaine, but thinner, and of the colour of Woad, and they are something broad at their setting on, and end in a sharpe point: at the top of the stalke grow the floures, each consisting of five round slender pure white leaues, of a reasonable bignesse, with yellowish threds and a little head in the middle: the root is white and fibrous. It floures about the beginning of May. *Clusius* also set forth this by the title of *Ranunculus Pyrenæus albo flore*.

3 The same Author hath also giuen vs the knowledge of diuers other plants of this kinde, and this hee calls *Ranunculus montanus* 1. It hath many round leaues, here and there deeply cut in, and snipt about the edges, of a darke Greene colour, and shining, pretty thicke, and of a very hot raste: amongst which rises vp a slender, single, and short stalke, bearing a white floure made of five little leaues with a yellowish thrum in the middle: which falling, the seeds grow clustering together as in other plants of this kinde: the root is white and fibrous.

¶ 3 *Ranunculus montanus flo. minore.*

Mountain Crowfoot with the lesser floure.

¶ 4 *Ranunculus montanus flore maiore.*

Mountain Crowfoot with the bigger floure.

4 This also is nothing else but a varietie of the last described, and differs from it in that the floures are larger, and it is sometimes found with them double. Both these grow on the tops of the Alpes, and there they floure as soone as the snow is melted away, which is vsually in Iune: but brought into gardens they floure very early, to wit, in Aprill.

5 The leaues of this are cut or diuided into many parts, like those of Rue, but softer, & greener (whence *Clusius* names it *Ranunculus Ruta folio*) or not much vnlike those of Coriander (whereupon

‡ 5 *Ranunculus praecox rutaceo folio.*
Rue leaved Crowfoot.

‡ 6 *Ranunculus Praecox Thalictri folio.*
Columbine Crowfoot.

‡ 7 *Ranunculus parvus echinatus.*
Small rough headed Crowfoot.

Ponsa calls it *Ranunculus Coriandri folio*:) amongst
or rather before these comes up a stalk some hand
full high, bearing at the top thereof one floure of
a reasonable bignesse: on the outside before it be
thoroughly open of a pleasing red color, but white
within, composed of twelve or more leaues.

6 This hath a stalke some foot high, small and
reddish, whereon grow sundry leaues like those of
the greater *Thalictrum*, or those of Columbines,
but much lesse, and of a bitter taste: out of the bo-
somes of these leaues come the floures at each
space one, white, and consisting of five leaues a-
piece: which falling, there succeed two or three
little hornes containing a round reddish seed: the
root is fibrous, white, very bitter, and creepes here
and there, putting up new shoots. It growes in di-
uers woods of Austria, and floures in Aprill, and
the seed is ripe in May, or Iune. *Clusius* calls it *Ra-
nunculus praecox 2. Thalictri folio*. It is the *Aquile-
gia minor Dalechampi* in the *Hist. Lugd.*

7 This which (as *Clusius* saith) some call the
Ranunculus of *Apuleius*, hath also a fibrous root,
with small leaues diuided into three parts, & cut
about the edges, and they grow vpon short foot-
stalkes; the stalkes are some two handfulls high,
commonly leaning on the ground, and on them
grow such leaues as the former: and out of their
bosomes come little foot-stalks carrying floures
of a pale yellow color, made of five leaues apiece,
which

M m m m

which follow there succed five or six sharpe pointed rough cods, containing seed almost like that of the former. †

CHAP. 372. Of Wolfes-bane.

¶ The kindes.

There be diuers sorts of Wolfes-bane: whereof some bring forth flowers of a yellow colour; others of a blew, or tending to purple: among the yellow ones there are some greater, others lesser; some with broader leaues, and others with narrower.

1 *Thora Valdensis.*
Broad leaved VVolfes-bane.

2 *Thora montis Baldi, five Sabaudica.*
Mountaine VVolfes-bane.

¶ The Description.

1 The first kinde of *Aconite*, of some called *Thora*, others adde therto the place where it groweth in great abundance, which is the Alps, and call it *Thora Valdensium*. This plant tooke his name of the Greek word *ακονιτα*, signifying corruption, poison, or death, which are the certaine effects of this pernicious plant: for this they vse very much in poisons, and when they meane to infect their arrow heads, the more speedily and deadly to dispatch the wilde beasts, which greatly annoy those mountaines of the Alpes: to which purpose also it is brought into the Mart-townes neere vnto those places to be sold vnto the hunters, the iuice thereof beeing prepared by pressing forth, and so kept in hornes and hooves of beasts, for the most speedie poison of all the *Aconites*, for an arrow touched therewith, leaueth the wound vncureable (if it but onely fetch bloud where it entereth in) except that round about the wound the flesh bee speedily cut away in great quan-

argueth also that *Matthiolus* hath vnproperly called it *Pseudoaconitum*, that is, false or bastard Aconite, for without question there is no worse or more speedie venome in the world, nor no Aconite or toxicall plant comparable hereunto. And yet let vs consider the fatherly care and prouidence of God, who hath prouided a conquerour and triumpher ouer this plant so venomous, namely his *Antigonist*, *Antithora*, or to speake in shorter and fewer syllables, *Anthora*, which is the very antidote or remedie against this kinde of Aconite. The stalke of this plant is small and rushie, very smooth, two or three handfulls high: whereupon do grow two, three, or foure leaues, seldome more, which be something hard, round, smooth, of a light Greene colour tending to blewnesse, like the colour of the leaues of Woad, nicked in the edges. The floures grow at the top of the stalkes, of a yellow colour, lesser than those of the field Crowfoot, otherwise alike: in the place therof groweth a knop or round head, wherein is the seed: the root consisteth of nine or ten slender clogs, with some small fibers also, and they are fastened together with little strings vnto one head, like those of the white Asphodill.

2 Wolfes-bane of the mount Baldus hath one stalke, smooth and plaine, in the middle whereof come forth two leaues and no more, wherein it differeth from the other of the Valdens, hauing likewise three or foure sharpe pointed leaues, narrow and somewhat iagged at the place where the stalke diuideth it selfe into smaller branches: whereon do grow small yellow floures like the precedent, but much lesser.

¶ The Place.

These venomous plants doe grow on the Alpes, and the mountaines of Sauoy and Switzerland: the first grow plentifully in the countrey of the Valdens, who inhabite part of those mountaines towards Italie. The other is found on Baldus, a mountaine of Italy. They are strangers in England.

¶ The Time.

They floure in March and Aprill, their seed is ripe in Iune.

¶ The Names.

This kinde of Aconite or Wolfes-bane is called *Thora*, *Taura*, and *Tura*, it is surnamed *Valdensis*, that it may differ from *Napellus*, or Monkes hood, which is likewise named *Thora*.

Auicenna maketh mention of a certaine deadly herbe in his fourth booke, sixt Fen. called *Farsun*; it is hard to affirme this same to be *Thora Valdensis*.

† *Gesner* iudges this to be the *Aconitum pardalianches* of *Dioscorides*, and herein is followed by *Bauhine*. †

¶ The Temperature and Vertues.

The force of these Wolfes-banes, is most pernicious and poison some, and (as it is reported) A exceedeth the malice of *Napellus*, or any of the other Wolfes-banes, as we haue said.

They say that it is of such force, that if a man especially, and then next any foure footed beast B be wounded with an arrow or other instrument dipped in the iuice hereof, they die within halfe an houre after remedlesse.

† There were formerly foure figures in this chapter, with as many descriptions, though the plants figured and described were but two, to which number they are now reduced. The two former, which were by the names of *Thora Valdensis*, *mas* and *femina*, thus differed, the male had only two large round leaues, and the female foure. The other two being also of one plant are more deeply cut in vpon the top of the leaues, which are fewer and lesser than those of the former.

CHAP. 373. Of Winter Wolfes-bane.

¶ The Description.

THIS kinde of Aconite is called *Aconitum hyemale Belgarum*, of *Dodoneus*, *Aconitum luteum minus*. In English, VVolfes-bane, or smal yellow wolfes-bane, whose leaues come forth of the ground in the dead time of winter, many times bearing the snow vpon their heads of his leaues and floures; yea the colder the weather is, and the deeper that the snow is, the fairer and larger is the floure; and the warmer that the weather is, the lesser is the floure, and worse coloured: these leaues I say come forth of the ground immediatly from the root, with a naked, soft, and slender stem, deeply cut or iagged on the leaues, of an exceeding faire Greene colour, in the midst of which commeth forth a yellow floure, in shew or fashion like vnto the common field Crow-foot: after which follow sundry cods full of browne seeds like the other kindes of Aconites: the root is thicke, tuberous, and knottie, like to the kindes of *Anemone*.

Aconitum hyemale.

Winter Woolfes-bane.

¶ The Place.

It groweth vpon the mountaines of Germany: we haue great quantitie of it in our London gardens.

¶ The Time.

It floureth in Ianuarie, the seed is ripe in the end of March.

¶ The Names.

It is called *Aconitum hyemale*, or *Hibernum*, or winter Aconite: that it is a kinde of Aconite or Woolfs-bane, both the form of the leaues and cods, and also the dangerous faculties of the herbe it selfe do declare.

It is much like to *Aconitum Theophrasti*: which he describeth in his ninth booke, saying, it is a short herbe hauing no *στέφανος*, or superfluous thing growing on it, and is without branches as this plant is: the root, saith he, is like to *καρύον*, or to a nut, or els to *καρύον*, a dry fig, onely the leafe seemeth to make against it, which is nothing at all like to that of Succorie, which he compareth it vnto.

¶ The Temperature and Vertues.

This herbe is counted to be very dangerous and deadly, hot and drie in the fourth degree, as *Theoph.* in plaine words doth testifie concerning his owne Aconite; for which he saith that there was neuer found his Antidote or remedie: whereof *Athenaus* and

Theopompus write, that this plant is the most poisonous herb of all others, which moued *Ouid* to say *Qua quia nascuntur dura vivacia caute*: notwithstanding it is not without his peculiar vertues. *Ioachimus Camerarius* now liuing in Noremberg saith, the water dropped into the eies ceaseth the pain and burning: it is reported to preuaile mightily against the bitings of scorpions, and is of such force, that if the scorpion passe by where it groweth and touch the same, presently he becommeth dull, heauy, and sencelesse, and if the same scorpion by chance touch the white Hellebor, he is presently deliuered from his drowinesse.

CHAP. 374. Of Mithridate Woolfes-bane.

¶ The Description.

This plant called *Anthora*, being the antidote against the poison of *Thora*, Aconite or wolfs bane, hath slender hollow stalkes, very brittle, a cubit high, garnished with fine cut or iagged leaues, very like to *Nigella Romana*, or the common Larkes spur, called *Consolida Regalis*: at the top of the stalkes doe grow faire flowers, fashioned like a little helmer, of an ouerworne yellow colour; after which come small blackish cods, wherein is contained blacke shining feed like those of Onions: the root consisteth of diuers knobs or tuberous lumps, of the bignesse of a mans thumbe.

¶ The Place.

This plant which in Greeke we may terme *Ανθόρα*: groweth abundantly in the Alps, called *Rhetici*, in Sauoy, and in Liguria. The Ligurians of Turin, and those that dwell neere the lake Lemane, haue found this herbe to be a present remedy against the deadly poison of the herb *Thora* and the rest of the Aconites, provided that when it is brought into the garden there to be kept for Physicks vse, it must not be planted neere to any of the Aconites: for through his attractiue qualitie, it will draw

Anthora five Aconitum salutiferum.
Wholsome Wolfes-bane.

draw vnto it self the malignant and venomous poison of the Aconite, whereby it will become of the like qualitie, that is, to become poisonous likewise: but being kept far off, it retaineth his owne naturall qualitie still.

¶ *The Time.*

It floureth in August, the seed is ripe in the end of September.

¶ *The Names.*

The inhabitants of the lake of Geneva, & the Piemontoise do call it *Anthora*, and the common people *Anthoro*. *Auicenna* calleth a certaine herbe which is like to Monks hood, as a remedy against the poison thereof, by the name of *Napellus Moyses*, in the 500 chap. of his second booke, and in the 745. chap. he saith, that *Zedoaria* doth grow with *Napellus* or Monks hood, and that by reason of the neerenesse of the same, the force and strength thereof is dulled and made weaker, and that it is a treacle, that is, a counterpoison against the Viper, Monks hood, & all other poisons: and hereupon it followeth, that it is not only *Napellus Moyses*, but also *Zedoaria Auicenna*: notwithstanding the Apothecaries do sell another *Zedoaria* differing from *Anthora*, which is a root of a longer forme, which not without cause is thought to be *Auicens* and *Serapio's Zerumbeth*, or *Zurumbeth*.

It is called *Anthora*, as though they should say *Antithora*, because it is an enemy to *Thora*, and a counterpoison to the same. *Thora* and *Anthora*, or *Tura* and *Antura*, seeme to be new words, but yet they are vsed in *Marcellus Empericus*, an old writer, who teacheth a medicine to be made of *Tura* and *Antura*, against the pin and web in the eyes: in English, yellow Monks-hood, yellow Helmet floure, and Aconites Mithridate.

¶ *The Vertues.*

The root of *Anthora* is wonderfull bitter, it is an enemy to all poisons: it is good for purgations; for it voideth by the stoole both waterie and slimie humours, killeth and driueth forth all manner of wormes of the belly.

Hugo Solerius saith, that the roots of *Anthora* do largely purge, not onely by the stoole, but also by vomite: and that the measure thereof is taken to the quantitie of *Faselus* (which is commonly called a beane) in broth or wine, and is giuen to strong bodies.

Antonius Guainerius doth shew in his treatie of the plague, the second difference, the third chapter, that *Anthora* is of great force, yea and that against the plague: and the root is of like vertues, giuen with Dittanie, which I haue seene, saith he, by experience: and he further saith, it is an herbe that groweth hard by that herbe *Thora*, of which there is made a poison, wherewith they of Sauoy and those parts adiacent do enueneome their arrowes, the more speedily to kill the wilde Goats, and other wilde beasts of the Alpish mountaines. And this root *Anthora* is the *BeZoar* or counterpoison to that *Thora*, which is of so great a venome, as that it killeth all liuing creatures with his poisonous qualitie: and thus much *Guainerius*.

Simon Iannensis hath also made mention of *Anthora*, and *Arnoldus Villanovanus* in his treatie of D poisons: but their writings do declare that they did not well know *Anthora*.

CHAP. 375. Of yellow Wolfes-bane.

¶ *The Description.*

THE yellow kinde of Wolfes-bane called *Aconitum luteum Ponticum*, or according to *Dodonaeus* *Aconitum Lycoctonon luteum maius*: in English, yellow Wolfes-bane, whereof this our age hath found out sundry sorts not knowne to *Dioscorides*, although some of the sorts seeme to stand indifferent

Aconitum luteum Ponticum.
Yellow Woolfesbane.

the head. This calleth to my remembrance an history of a certaine Gentleman dwelling in Lincolneshire, called *Mahewe*, the true report whereof my very good friend Mr. *Nicholas Belfon*, sometimes fellow of Kings Colledge in Cambridge, hath deliuered vnto me: Mr. *Mahewe* dwelling in Boston, a student in Physicke, hauing occasion to ride through the Fennes of Lincolneshire, found a root that the hogs had turned vp, which seemed vnto him very strange and vnknowne, for that it was in the spring before the leaues were out, : this he tasted, and it so inflamed his mouth, tongue, and lips, that it caused them to swell very extreame, so that before he could get to the towne of Boston he could not speake, and no doubt had lost his life if that the Lord God had not blessed those good remedies which presently he procured and vsed. I haue here thought good to expresse this history, for two especiall causes; the first is, that some industrious and diligent obseruer of nature may be prouoked to seeke forth that venemous plant, or some of his kindes: for I am certainly perswaded that it is either the *Thora Valdensium*, or *Aconitum luteum*, whereof this gentleman tasted, which two plants haue not at any time been thought to grow naturally in England: the other cause is, for that I would warne others to beware by that gentlemans harme. ‡ I am of opinion that this root which Mr. *Mahewe* tasted was of the *Ranunculus flammew maior*, described in the first place of the 370. chapter aforegoing, for that growes plentifully in such places, and is of a very hot taste and hurtfull qualitie. ‡

¶ The Place.

The yellow Woolfesbane groweth in my garden, but not wilde in England, or in any other of these Northerly regions.

¶ The Time.

It floureth in the end of Iune, somewhat after the other Aconites.

¶ The Names.

This yellow Woolfes-bane is called of *Lobel*, *Aconitum luteum Ponticum*, or Ponticke Woolfes-bane. There is mention made in *Dioscorides* his copies of three Woolfes-banes, of which the hunters vse one, and Physitions the other two. *Marcellus Virgilius* holdeth opinion that the vse of this plant is vtterly to be refused in medicine.

¶ The Temperature and Vertues.

A The facultie of this Aconite, as also of the other Woolfes-banes, is deadly to man, and likewise to all other liuing creatures.

It is vsed among the hunters which seek after wolues, the iuyce whereof they put into raw flesh, which the wolues deuoure, and are killed.

CHAP. 376.

Of other Wolfes-banes and Monkes-hoods.

¶ The Description.

T His kinde of Wolfes-bane (called *Aconitum Lycoctonum*: and of *Dodonæus*, *Aconitum Lycoctonon flore Delphinij*, by reason of the shape and likenes that the floure hath with *Delphinium*, or Larkes-spur: and in English it is called blacke Wolfes-bane) hath many large leaues of a very deepe Greene or ouerworne colour, very deeply cut or iagged: among which riseth vp a stalke two cubits high; whereupon do grow floures fashioned like a hood, of a very ill fauoured blewish colour, and the thrums or threds within the hood are blacke: the seed is also blacke and three cornered, growing in small husks: the root is thicke and knobby.

† 1 *Aconitum lycoctonon flore Delphinij*.
Larks-heele Wolfes-bane.

† 2 *Aconitum lycoctonon caeruleum paruum*.
Small blew Wolfes-bane.

2 This kinde of Wolfes-bane, called *Lycoctonon caeruleum paruum, facie Napelli*: in English small Wolfes-bane, or round Wolfes-bane, hath many slender brittle stalkes two cubits high, beset with leaues very much iagged, and like vnto *Napellus*, called in English, Helmet-floure. The floures do grow at the top of the stalkes, of a blewish colour, fashioned also like a hood, but wider open than any of the rest: the cods and seed are like vnto the other: the root is round and small, fashioned like a Peare or small Rape or Turnep: which moued the Germanes to call the same **Rapen-bloemen**, which is in Latine, *Flos rapaceus*: in English, Rape-floure.

3 This kinde of Wolfes-bane, called *Napellus verus*, in English, Helmet-floure, or the great Monkes-hood, beareth very faire and goodly blew floures in shape like an helmet; which are so beautifull, that a man would thinke they were of some excellent vertue, but *non est semper sides habenda fronti*. This plant is vniuersally knowne in our London gardens and elsewhere; but naturally it

it groweth in the mountaines of Rhetia, and in sundry places of the Alps, where you shall find the grasse that groweth round it eaten vp with cattell, but no part of the herbe it selfe touched, except by certain flies, who in such abundant measure swarme about the same that they couer the whole plant: and (which is very strange) although these flies do with great delight feed hereupon, yet of them there is confected an Antidote or most auailable medicine against the deadly bite of the spider called *Tarantala*, or any other venomous beast whatsoeuer; yea, an excellent remedie not onely against the Aconites, but all other poysons whatsoeuer. The medicine of the foresaid flies is thus made: Take of the flies which haue fed themselves as is aboue mentioned, in number twentie, of *Aristolochia rotunda*, and bole Armoniack, of each a dram.

4 There is a kinde of Wolfes-bane which *Dodonaeus* reports he found in an old written Greeke booke in the Emperors Librarie at Vienna, vnder the the title of *Aconitum lycoctonum*, that answereth in all points vnto *Dioscorides* his description, except in the leaues. It hath leaues (saith hee) like vnto the Plane tree, but lesser, and more full of iags or diuisions; a slender stalke as Ferne, of a cubit high, bearing his seed in long cods: it hath blacke roots in shape like Creauises. Hereunto agreeth the Emperors picture in all things sauing in the leaues, which are not so large, nor so much diuided, but notched or toothed like the teeth of a saw.

3 *Napellus verus caeruleus.*
Blew Helmet-floure, or Monks-hood.

† 4 *Aconitum lycoctonum ex Cod. Casareo.*

† 5 Besides these mentioned by our Author there are sundry other plants belonging to this pernicious Tribe, whose historie I will briefly runne ouer: The first of these is that which *Clusius* hath set forth by the name of *Aconitum lycoctonum flo.* *Delphinij Silesiacum*: it hath stalks some two or three cubits high, smooth and hollow, of a greenish purple colour, and couered with a certaine mealiness: the leaues grow vpon long stalks, being rough, and fashioned like those of the yellow Wolfes bane, but of a blacker colour: the top of the stalke ends in a long spike of spurre-floures, which before they be open resemble locusts or little Lizards, with their long and crooking tailes; but opening they shew five leaues, two on the sides, two below, and one aboue, which ends in a crooked taile or home: all these leaues are wrinkled, and purple on their outsides, but smooth, and of an elegant blew within. After the floures are past succeed three square cods, as in other Aconites, wherein is contained an vnequall brownish wrinkled seed: the root is thicke, black, and tuberous. This growes naturally in some mountaines of Silesia, and floures in Iuly and August.

‡ 5 *Aconitum lycoct. hirsutum* flo. Delphinij.
Rough Larks-heele Wolfes-bane.

‡ 7 *Aconitum purpureum Neubergense*.
Purple Monks-hood of Newburg.

‡ 6 *Aconitum violaceum*.
Violet coloured Monks hood.

‡ 8 *Aconitum maximum Iudenbergense*.
Large flowered Monks-hood.

6 The leaues of this are somewhat like, yet lesse than those of our common Monks-hood, blackish on the vpper side and shining. The stalke is some cubit and halfe high, firme, full of pith, smooth, and shining; diuided towards the top into some branches carrying few floures, like in forme to those of the vulgar Monks-hood, of a most elegant and deepe violet colour: the seeds are like the former, and roots round, thicke, and short, with many fibres. It growes vpon the hills nigh Saltsburg, where it floures in Iuly: but brought into gardens it floures sooner than the rest of this kinde, to wit in May. *Clusius* calls this *Aconitum lycoctonum* 4. *Tauricum*.

7 This hath leaues broader than those of our ordinarie Monks-hood, yet like them: the stalke is round, straight, and firme, and of some three cubits height, and oft times toward the top diuided into many branches, which carry their floures spike-fashion, of a purple colour, absolutely like those of the common sort, but that the thrummie matter in the midst of the floures is of a duskier colour. The root and rest of the parts are like those of the common kinde: it growes naturally vpon the Styrian Alpes, whereas it floures somewhat after the common kinde, to wit, in Iuly. *Clusius* hath it by the name of *Aconitum lycoctonum* 5. *Neubergense*.

† 9 *Aconitum maximum nutante coma*.
Monkes-hood with the bending or
nodding head.

8 The leaues of this are also diuided into five parts, and snipt about the edges, and doe very much resemble those of the smal Wolfs-bane described in the second place, but that the leaues of that shine, when as these do not: the stalke is two cubits high, not very thicke, yet firme and straight, of a greenish purple colour; and at the top carries five or six floures, the largest of all the Monks-hoods, consisting of foure leaues, as in the rest of this kind, with a very large helmet ouer them, being sometimes an inch long, of an elegant blewish purple color: the seed-vessels, seeds, and roots are like the rest of this kinde. This growes on Iudenberg, the highest hill of all Stiria, and floures in August; in gardens about the end of Iuly. *Clusius* names it *Aconitum Lycoct.* 9. *Iudenbergense*.

9 This rises vp to the height of three cubits, with a slender round stalke which is diuided into sundry branches, and commonly hangs downe the head; whence *Clusius* calls it *Aconitum lycoctonum* 8. *coma nutante*. The floures are like those of the common Monks-hood, but of somewhat a lighter purple colour. The leaues are larger and long, and much more cut in or diuided than any of the rest. The roots, seeds, and other particles are not vnlike those of the rest of this kinde. †

¶ The Place.

Diuers of these Wolfs-banes grow in some gardens, except *Aconitum lycoctonum*, taken forth of the Emperors booke.

¶ The Time.

These plants do floure from May vnto the end of August.

¶ The Names.

The first is *Lycoctoni species*, or a kinde of Wolfs-bane, and is as hurtfull as any of the rest, and called of *Lobel*, *Aconitum flore Delphinij*, or Larke-spur Wolfs-bane. *Auicenna* speaketh hereof in his second booke, and afterwards in his fourth booke, Fen. 6. the first Treatise: hauing his reasons why and wherefore he hath separated this from *Canach adip*, that is to say, the Wolfs strangler, or the Wolfs-bane.

The later and barbarous Herbarists call the third Wolfs bane in Latine *Napellus*, of the figure and shape of the roots of *Napus*, or *Nauet*, or *Nauew* gentle: it is likewise *Aconiti lycoctoni species*, or a kinde of Wolfs-bane: also it may be called *Toxicum*; for *Toxicum* is a deadly medicine where-with the Hunters poyson their speares, darts, and arrowes, that bring present death: so named of arrowes which the Barbarians call *Toxumata*, and *Texa*. *Dioscorides* setting downe the symptomes

or

or accidents caused by *Toxicum*, together with the remedies, reckoneth vp almost the verie same that *Anicen* doth concerning *Napellus*: notwithstanding *Anicen* writes of *Napellus* and *Toxicum* feuerally; but not knowing what *Toxicum* is, as he himselfe confesseth: so that it is not to be maruelled, that hauing written of *Napellus*, he should afterward entreat againe of *Toxicum*.

¶ *The Nature and Vertues.*

All these plants are hot and dry in the fourth degree, and of a most venomous qualitie.

The force and facultie of Wolfes-bane is deadly to man and all kindes of beasts: the same was tried of late in Antwerpe, and is as yet fresh in memorie, by an euident experiment, but most lamentable; for when the leaues hereof were by certaine ignorant persons serued vp in fallads, all that did eate thereof were presently taken with most cruell symptomes, and so died.

The symptomes that follow those that do eate of these deadly herbes are these; their lips and tongues swell forthwith, their eyes hang out, their thighes are stiffe, and their wits are taken from them, as *Anicen* writeth in his fourth booke. The force of this poyson is such, that if the points of darts or arrowes be touched with the same, it bringeth deadly hurt to those that are wounded therewith.

Against so deadly a poyson *Anicen* reckoneth vp certaine remedies, which helpe after the poyson is vomited vp; and among these he maketh mention of the Mousse (as the copies euery where haue it) nourished and fed vp with *Napellus*, which is altogether anemie to the poysonsome nature thereof, and deliuereth him that hath taken it from all perill and danger.

*Antonius Guaneri*us of Pauia, a famous physition in his age, in his treaty of poysons is of opinion, that it is not a mouse that *Anicen* speakes of, but a fly: for he telleth of a certaine Philosopher that did very carefully and diligently make search after this Mousse, and neither could find at any time either Mousse, or the root of Wolfes-bane gnawne or bitten, as he had read; but in searching he found many flies feeding on the leaues, which the same Philosopher tooke, and made of them an Antidote or counterpoyson, which he found to be good and effectuell against other poysons, but especially the poyson of Wolfes-bane.

This composition consisteth of two ounces of *Terra lemnia*, as many of the berries of the Bay tree, and the likeweight of Mithridate, 24 of the flies that haue taken their repast vpon Wolfes-bane, of honey and oyle Oliue a sufficient quantitie.

The same opinion that *Guaneri*us is of, *Petrus Pena* and *Matthias de Lobel* doe also hold; who affirme, that there was neuer scene at any time any Mousse feeding thereon, but that there be Flies which resort vnto it by swarmes, and feed not onely vpon the floures, but on the herbe also.

¶ *The Danger.*

There hath bene little heretofore set downe concerning the vertues of the Aconites, but much might be said of the hurts that haue come hereby, as the wofull experience of the lamentable example at Antwerpe, yet fresh in memorie, doth declare, as we haue said.

† The figure that was in the first place formerly was of the *Aconitum luteum Porticum*; and that in the second place was of a *Napellus*.

CHAP. 377. Of blacke Hellebore.

¶ *The Description.*

1 The first kinde of blacke Hellebor *Dodonæus* setteth forth vnder this title *Veratrum nigrum*; and it may properly be called in English, blacke Hellebor, which is a name most fitly agreeing vnto the true and vndoubted blacke Hellebor, for the kindes and other sorts hereof which hereafter follow are false and bastard kindes thereof. This plant hath thicke and fat leaues of a deepe greene colour, the vpper part whereof is somewhat bluntly nicked or toothed, hauing sundry diuisions or cuts; in some leaues many, in others fewer, like vnto the female Peony, or *Smyrniū Creticum*. It beareth Rose fashioned floures vpon slender stems, growing immediately out of the ground an handfull high, somtimes very white, and oftentimes mixed with a little shew of purple: which being vaded, there succeed small huskes full of blacke seeds: the roots are many, with long blacke strings comming from one head.

2 The second kinde of blacke Hellebor, called of *Pena*, *Helleborastrum*; and of *Dodonæus*, *Veratrum secundum* (in English, bastard Hellebor) hath leaues much like the former, but narrower and blacker, each leafe being much iagged or toothed about the edges like a saw. The stalkes grow to the height of a foot or more, diuiding themselues into other branches toward the top; whereon do grow floures not much vnlike to the former in shew, saue that they are of a greenish herby colour. The roots are small and threddy, but not so blacke as the former.

3 The

1 *Helleborus niger verus*.
The true blacke Hellebor.

2 *Helleborastrum*.
Wilde blacke Hellebor.

3 *Helleboraster maximus*.
The great Ox-heele.

4 *Consiligo Ruellij, & Sesamoides magna Cordi*.
Setter-wort, or Beare-foot.

3 The third kinde of blacke Hellebor, called of *Pena*, *Helleboraster maximus*, with this addition, *flore & semine pragnans*, that is, full both of floures and seed, hath leaues somewhat like the former wilde Hellebor, saue that they be greater, more jagged, and deeply cut. The stalks grow vp to the height of two cubits, diuiding themselves at the top into sundry small branches, whereupon grow little round and bottle-like hollow Greene floures; after which come forth seeds which come to perfect maturitie and ripenesse. The root consisteth of many small blacke frings, inuolued or wrapped one within another very intricately.

4 The fourth kinde of blacke Hellebor (called of *Pena* and *Lobel*, according to the description of *Cordus* and *Euellius*, *Sesamoides magnum*, and *Consiligo*: in English, Ox-heele, or Setter-wort; which names are taken from his vertues in curing Oxen and such like cattell, as shall be shewed afterward in the names thereof) is so well knowne vnto the most sort of people by the name of Beare-foot, that I shall not haue cause to spend much time about the description. ‡ Indeed it was not much needfull for our Author to describe it, for it was the last thing he did; for both these two last are of one plant, both figures and descriptions; the former of these figures expressing it in floure, and the later in seed: but the former of our Author was with somewhat broader leaues, and the latter with narrower. ‡

¶ The Place.

These Hellebors grow vpon rough and craggy mountains: the last growes wilde in many woods and shadowie places in England: we haue them all in our London gardens.

¶ The Time.

The first floureth about Christmasse, if the Winter be milde and warme: the others later:

¶ The Names.

It is agreed among the later writers, that these plants are *Veratrum nigrum*: in English, blacke Hellebor: in Greeke, *κινναβος*: in Italian, *Elleboro nero*: in Spanish, *Verde gambre negro*: of diuers, *Melampodium*, because it was first found by *Melampus*, who was first thought to purge therewith *Prætus* his mad daughters, and to restore them to health. *Dioscorides* writeth, that this man was a shepherd: others, a Sooth-sayer. In high Dutch it is called *Christwurtz*, that is, Christs herbe, or Christmasse herbe: in low Dutche, *Weylich Kerst cruyt*, and that because it floureth about the birth of our Lord Iesus Christ.

The third kinde was called of *Fuchsius*, *Pseudohelleborus*, and *Veratrum nigrum adulterinum*, which is in English, false or bastard blacke Hellebor. Most name it *Consiligo*, because the husbandmen of our time do herewith cure their cattell, no otherwise than the old Farriers or horse-leeches were wont to do, that is, they cut a slit or hole in the dew-lap, as they terme it (which is an emptie skin vnder the throat of the beast) wherein they put a piece of the root of Setterwort or Beare-foot, suffering it there to remaine for certaine dayes together: which manner of curing they do call Setting of their cattell, and is a manner of rowelling, as the said Horse-leeches doe their horses with horse haire twisted, or such like, and as in Surgerie we do vse with filke, which in stead of the word *Seton*, a certaine Physitian called it by the name Rowell; a word very vnproperly spoken of a learned man, because there would be some difference betwixt men and beasts. This manner of setting of cattell helpeth the disease of the lungs, the cough, and wheezing. Moreover, in the time of pestilence or murraine, or any other diseases affecting cattell, they put the root into the place aforesaid, which draweth vnto it all the venomous matter, and voideth it forth at the wound. The which *Absyrtus* and *Hierocles* the Greeke Horse-leeches haue at large set downe. And it is called in English, Beare-foot, Setter-wort, and Setter-grasse.

The second is named in the German tongue, *Lowstkraut*, that is, *Pedicularis*, or Low sie grasse: for it is thought to destroy and kill lice, and not onely lice but sheepe and other cattell: and may be reckoned among the Beare-feet, as kindes thereof.

¶ The Temperature.

Blacke Hellebor, as *Galen* holdeth opinion, is hotter in taste than the white Hellebor: in like manner hot and dry in the third degree.

¶ The Vertues.

Black Hellebor purgeth downwards flegme, choler, and also melancholy especially, and all melancholy humors, yet not without trouble and difficultie: therefore it is not to be giuen but to robustious and strong bodies, as *Mesues* teacheth. A purgation of Hellebor is good for mad and furious men, for melancholy, dull, and heauy persons, for those that are troubled with the falling sicknes, for lepers, for them that are sicke of a quartane Ague, and briefly for all those that are troubled with blacke choler, and molested with melancholy.

The manner of giuing it (meaning the first blacke Hellebor) saith *Aetnarius* in his first booke, is B three scruples, little more or lesse.

It is giuen with wine of raisins or oxymel, but for pleasantnes sake some sweet and odoriferous C seeds

feeds must be put vnto it: but if you would haue it stronger, adde thereunto a grain or two of Scamonie. Thus much *Actuarius*.

D The first of these kindes is best, then the second; the rest are of lesse force.
E The roots take away the morpew and blacke spots in the skin, tetters, ring-wormes, leprogies, and scabs.

F The root sodden in pottage with flesh, openeth the bellies of such as haue the dropsie.

G The root of bastard Hellebor, called among our English women Beare-foot, steeped in wine and drunken, looseth the belly euen as the true blacke Hellebor, and is good against all the diseases whereunto blacke Hellebor serueth, and killeth wormes in children.

H It doth his operation with more force and might, if it be made into pouder, and a dram thereof be receiued in wine.

I The same boyled in water with Rue and Agrimony, cureth the jaundice, and purgeth yellow superfluities by siege.

K The leaues of bastard Hellebor dried in an ouen, after the bread is drawne out, and the pouder thereof taken in a figge or raisin, or strawed vpon a piece of bread spred with honey and eaten, killeth wormes in children exceedingly.

CHAP. 378. Of Dioscorides his blacke Hellebor.

Astrantia nigra, siue Veratrum nigrum Dioscoridis, Dod.

¶ The Description.

Blacke Master-wort, or *Dioscorides* his blacke Hellebor.

T His kinde of blacke Hellebor, set forth by *Lobel* vnder the name of *Astrantia nigra*, agreeeth very well in shapewith the true *Astrantia*, which is called *Imperatoria*: neuertheles by the consent of *Dioscorides* and other Authors, who haue expressed this plant for a kinde of *Veratrum nigrum*, or blacke Hellebor, it hath many blackish green leaues parted or cut into foure or fise deepe cuts, after the maner of the vine leafe very like vnto those of *Sanicle*, both in greenes of colour, and also in proportion. The stalke is euen, smooth, and plain: at the top wherof grow floures in little tufts or vmbels, set together like those of *Scabious*, of a whitish light greene colour, dashed ouer as it were with a little darke purple: after which come the seed like vnto *Carthamus* or bastard Saffron. The roots are many blackish threds knit to one head or master root.

¶ The Place.

Blacke Hellebor is found in the mountaine of Germany, and in other vntilled and rough places: it prospereth in gardens.

Dioscorides writeth, That blacke Hellebor groweth likewise in rough and dry places: and that is the best which is taken from such like places; as that (saith hee) which is brought out of Anticyra a city in Greece. It groweth in my garden.

¶ The Time.

This blacke Hellebor flowreth not in Winter, but in the Sommer moneths. The herb is green all the yeare thorow.

¶ The Names.

It is called of the later Herbarists, *Astrantia nigra*: of others, *Sanicula femina*: notwithstanding it differeth much from *Astrantia*, an herbe which is also named *Imperatoria*, or Master-wort. The vulgar people call it Pellitorie of Spaine, but vntruly: it may be called blacke Master-wort, yet doubtlesse a kinde of Hellebor, as the purging facultie doth shew: for it is certaine, that diuers experienced physitians can witnesse, that the roots hereof do purge melancholy and other humors, and

and that they themselves have perfectly cured mad melancholy people being purged herewith. And that it hath a purging qualitie, *Conradus Gesnerus* doth likewise testifie in a certaine Epistle written to *Adolphus Occo*, in which he sheweth, that *Astrantia nigra* is almost as strong as white Hellebor, and that he himselfe was the first that had experience of the purging facultie thereof by sieg: which things confirme that it is *Dioscorides* his blacke Hellebor.

Dioscorides hath also attributed to this plant all those names that are ascribed to the other black Hellebors. He saith further, that the seed thereof in Anticyra is called *Sesamoides*, the which is vsed to purge with, if so be that the Text be true, and not corrupted. But it seemeth not to be altogether perfect; for if *Sesamoides*, as *Pliny* saith, and the word it selfe doth shew, hath his name of the likenesse of *Sesamum*, the seed of this blacke Hellebor shall vnproperly be called *Sesamoides*; being not like that of *Sesamum*, but of *Cnicus* or bastard Saffron. By these proofes we may suspect, that these words are brought into *Dioscorides* from some other Author.

¶ The Temperature and Vertues.

The faculties of this plant we haue already written to be by triall found like to those of the other blacke Hellebor: notwithstanding those that are described in the former chapter are to be accounted of greater force.

† This whole Chapter (as most besides) was out of *Dodonæus*, who, *Rempt. 3. lib. 2. cap. 30.* labours to proue this plant to be the true blacke Hellebor of *Dioscorides*. There was also another description thrust by our Author into this chapter, being of the *Periscaria filiquosa* or *Noli me tangere* formerly described in the fourth place of the 114. Chap. pag. 446.

CHAP. 379. Of Herbe Christopher.

Christophoriana.
Herbe Christopher.

¶ The Description.

Although Herbe Christopher be none of the Binde-weeds, or of those plants that haue need of supporting or vnderpropping, wherewith it may clime or rampe, yet because it beareth grapes, or clusters of berries, it might haue been numbred among the *Ampelae*, or those that grow like Vines. It brings forth little tender stalkes a foot long, or not much longer; whereupon do grow sundry leaues set vpon a tender foot-stalke, which do make one leafe somewhat iagged or cut about the edges, of a light greene colour: the floures grow at the top of the stalks, in spokie tufts consisting of four little white leaues apiece: which being past, the fruit succeeds, round, somewhat long, and blacke when it is ripe, hauing vpon one side a streaked furrow or hollownesse growing neere together as doe the clusters of grapes. The root is thicke, blacke without, and yellow within like Box, with many trailing strings annexed therto, creeping far abroad in the earth, whereby it doth greatly increase, and lasteth long.

¶ The Place.

Herbe Christopher groweth in the North parts of England, neere vnto the house of the right worshipfull Sir *William Bowes*. I haue receiued plants thereof from *Robinus* of Paris, for my garden, where they flourish.

¶ The Time.

It floureth and flourisheth in May and Iune, and the fruit is ripe in the end of Sommer.

Nnnn

¶ The

¶ The Names.

It is called in our age *Christophoriana*, and *S. Christophori herba*: in English, Herbe Christopher: some there be that name it *Costus niger*: others had rather haue it *Aconitum bacciferum*: it hath no likenes at all nor affinitie with *Costus*, as the simplest may perceiue that do know both. But doubtlesse it is of the number of the Aconites, or Wolfes-banes, by reason of the deadly and pernicious qualitie that it hath, like vnto Wolfes-bane, or Leopards-bane.

¶ The Temperature.

The temperature of Herbe Christopher answereth those of the Aconites, as we haue said.

¶ The Vertues.

I finde little or nothing extant in the antient or later writers, of any one good propertie where-with any part of this plant is possessed: therefore I wish those that loue new medicines, to take heed that this be none of them, because it is thought to be of a venomous and deadly qualitie.

CHAP. 380. Of Peionie.

¶ The Kindes.

There be three Peionies, one male, and two females, described by the Antients: the later writers haue found out foure more; one of the female kinde, called *Pæonia pumila*, or dwarfe Peonie; and another called *Pæonia promiscua siue neutra*, Bastard, Mis-begotten, or neither of both, but as it were a plant participating of the male and female; one double Peonie with white floures, and a fourth kinde bearing single white floures.

1 *Pæonia mas.*

Male Peonie.

*Pæonia mas cum semine.*

Male Peonie in seed.

¶ The Description.

The first kinde of Peonie (being the male, called *Pæonia mas*: in English, Male Peiony) hath thicke red stalkes a cubit long: the leaues be great and large, consisting of diuers leaues growing or ioyned together vpon one slender stemme or rib, not much vnlike the leaues of the

the Wall-nut tree both in fashion and greatnesse : at the top of the stalkes grow faire large red floures very like roses, hauing also in the midst yellow threds or thrums like them in the rose called *Anthera* : which being vaded and fallen away, there come in place three or foure great cods or huskes, which do open when they are ripe ; the inner part of which cods is of a faire red colour, wherein is contained blacke shining and polished seeds as big as a pease, and betweene euery black seed is couched a red or crimson seed, which is barren and empty. The root is thicke, great, and tuberous, like vnto the common Peonie.

2 There is another kinde of Peonie, called of *Dodonæus*, *Peonia fœmina prior* : of *Label*, *Peonia fœmina* : in English, female Peonie, which is so well knowne vnto all that it needeth not any description.

3 The third kinde of Peonie (which *Pena* setteth forth vnder the name *Peonia fœmina polyanthos* : *Dodonæus*, *Peonia fœmina multiplex* : in English, Double Peonie) hath leaues, roots, and floures like the common female Peonie, saue that his leaues are not so much iagged, and are of a lighter Greene colour : the roots are thicker and more tuberous, and the floures much greater, exceeding double, of a very deep red colour, in fashion very like the great double rose of Prouince, but greater and more double.

2 *Peonia fœmina*.
Female Peonie.

3 *Peonia fœmina multiplex*.
Double red Peonie.

4 There is found another sort of the double Peonie, not differing from the precedent in stalks, leaues, or roots : this plant bringeth forth white floures, wherein consisteth the difference.

5 There is another kinde of Peonie (called of *Dodonæus*, *Peonia fœmina altera* : but of *Pena*, *Peonia promiscua*, *sive neutra* : in English, Maiden or Virgin Peiony) that is like to the common Peiony, sauing that his leaues and floures are much lesse, and the stalks shorter : it beareth red floures and seed also like the former.

6 We haue likewise in our London gardens another sort bearing floures of a pale whitish colour, very single, resembling the female wilde Peiony, in other respects like the double white Peiony, but lesser in all the parts thereof.

† 7 *Clusius* by seed sent him from Constantinople had two other varieties of single Peonies ; the one had the leaues red when they came out of the ground ; and the floure of this was of a deep red colour : the other had them of a whitish Greene, and the floures of this were somewhat larger, and of a lighter colour. In the leaues & other parts they resembled the common double Peiony. †

4 *Pæonia fœmina polyanthos flore albo.*
The double white Peionie.

6 *Pæonia fœmina pumila.*
Dwarfe female Peionie.

5 *Pæonia promiscua.*
Maiden Peionie.

7 *Pæonia Byzantina.*
Turkish Peionie.

¶ The Place.

All the sorts of Peonies do grow in our London gardens, except that double Peiony with white floures, which we do expect from the Low-countries of Flanders.

The male Peonie groweth wilde vpon a cony berry in Betfome, being in the parish of Southfleet in Kent, two miles from Grauei-end, and in the ground sometimes belonging to a farmer there called *Iohn Bradley*.

¶ I haue been told that our Author himselfe planted that Peonie there, and afterwards seemed to finde it there by accident: and I do beleuee it was so, because none before or since haue euer seen or heard of it growing wild since in any part of this Kingdome. ¶

¶ The Time.

They floure in May: the seed is ripe in Iuly.

¶ The Names.

The Peonie is called in Greeke *παonia*: in Latine also *Pæonia*, and *Dulcisfida*: in shops, *Pionia*: in high Dutch, *Peonien blumen*: in low Dutch, *Maast bloemen*: in French, *Pinoine*: in Spanish, *Rosa del monte*: in English, Peonie: it hath also many bastard names, as *Rosa fatuina*, *Herba Casta*: of some, *Lunaris*, or *Lunaria Pæonia*: because it cureth those that haue the falling sicknesse, whom some men call *Lunaticos*, or *Lunaticke*. It is called *Idæus Dactylus*: which agreeth with the female Peonie, the knobbie roots of which be like to *Dactyli Idæi*, and *Dactyli Idæi* are certaine precious stones of the forme of a mans finger, growing in the Island of Candie: it is called of diuers *Aglaophotis*, or brightly shining, taking his name of the shining and glittering graines, which are of the colour of scarlet.

There be found two *Aglaophotides*, described by *Ælianus* in his 14. booke; one of the sea, in the 24. Chapter: the other of the earth, in the 27. chapter. That of the sea is a kinde of *Fucus*, or sea mosse, which groweth vpon high rocks, of the bignesse of Tamarisk, with the head of Poppy, which opening in the Sommer Solstice doth yeeld in the night time a certain fierie, and as it were sparkling brightnesse or light.

That of the earth, saith he, which by another name is called *Cynospastus*, lieth hid in the day time among other herbes, and is not knowne at all, and in the night time it is easily seene: for it shineth like a star, and glittereth with a fierie brightnesse.

And this *Aglaophotis* of the earth, or *Cynospastus*, is *Pæonia*; for *Apuleius* saith, that the seedes or graines of Peonie shine in the night time like a candle, and that plenty of it is in the night season found out and gathered by the shepheards. *Theophrastus* and *Pliny* do shew that Peonie is gathered in the night, which *Ælianus* also affirmeth concerning *Aglaophotis*.

This *Aglaophotis* of the earth, or *Cynospastus*, is called of *Iosephus* the writer of the Iewes warre, in his seuenth booke, 25. chapter, *Baaras*, of the place wherein it is found, which thing is plaine to him that conferreth those things which *Ælianus* hath written of *Aglaophotis* of the earth, or *Cynospastus*, with those which *Iosephus* hath set downe of *Baaras*: for *Ælianus* saith, that *Cynospastus* is not plucked vp without danger, and that it is reported how he that first touched it, not knowing the nature thereof, perished. Therefore a string must be fastned to it in the night, and a hungrie dog tied thereto, who being allured by the smell of roasted flesh set towards him, may plucke it vp by the rootes. *Iosephus* also writeth, that *Baara* doth shine in the euening like the day star, and that they who come neere, and would plucke it vp, can hardly do it, except that either a womans vrine, or her menses be poured vpon it, and that so it may be pluckt vp at the length.

Moreouer, it is set downe by the said Author, as also by *Pliny* and *Theophrastus*, that of necessitie it must be gathered in the night, for if any man shall pluck off the fruit in the day time, being seene of the VVood-pecker, he is in danger to loose his eyes; and if he cut the root, it is a chance if his fundament fall not out. The like fabulous tale hath been set forth of Mandrake, the which I haue partly touched in the same chapter. But all these things be most vaine and frivolous: for the root of Peonie, as also the Mandrake, may be remoued at any time of the yeare, day or houre whatsoever.

But it is no maruell, that such kindes of trifles, and most superstitious and wicked ceremonies are found in the books of the most antient writers; for there were many things in their time verie vainly feined and cogged in for ostentation sake, as by the Egyptians and other counterfeit mates, as *Pliny* doth truly testifie: an imitator of whom in times past, was one *Andreas* a Physition, who, as *Galen* saith, conueied into the art of Physick, lies and subtrill delusions. For which cause *Galen* commanded his Schollers to refraine from the reading of him, and of all such like lying and deceitfull sycophants. It is reported that these herbes tooke the name of Peonie, or *Pein*, of that excellent Physition of the same name, who first found out and taught the knowledge of this herbe vnto posteritie.

¶ The Temperature.

The root of Peionie, as *Galen* saith, doth gently binde with a kinde of sweetnesse: and hath also ioined with it a certaine bitterish sharpnesse: it is in temperature not very hot, little more than meanly hot; but it is drie, and of subtile parts.

¶ The Vertues.

- A *Dioscorides* writeth, that the root of the Male Peionie being dried, is giuen to women that be not well clenfed after their deliuerie, being drunke in Mead or honied water to the quantitie of a bean; for it scowreth those plants, appeaseth the griping throwes and torments of the belly, and bringeth downe the desired sicknesse.
- B *Galen* addeth, that it is good for those that haue the yellow iauandise, and pain in the kidnies and bladder, it clenfeth the liuer and kidnies that are stopped.
- C It is found by sure and euident experience made by *Galen*, that the fresh root tied about the necks of children, is an effectuell remedie against the falling sicknesse, but vnto those that are growne vp in more yeares, the root thereof must also be ministred inwardly.
- D It is also giuen, saith *Pliny*, against the disease of the minde. The root of the male Peionie is preferred in this cure.
- E Ten or twelue of the red berries or seeds drunke in wine that is something harsh or sower, and red, do stay the inordinate flux, and are good for the stone, in the beginning.
- F The blacke graines (that is the seed) to the number of fifteene taken in wine or mead, helps the strangling and paines of the matrix or mother, and is a speciall remedie for those that are troubled in the night with the disease called *Ephialtes* or night Mare, which is as though a heauy burthen were laid vpon them, and they oppressed therewith, as if they were overcome by their enemies, or ouerprest with some great weight or burthen; and they are also good against melancholicke dreames.
- G Syrrup made of the floures of Peionie helpeth greatly the falling sicknesse: likewise the extraction of the roots doth the same.

CHAP. 381. Of toothed Violets or Corall woorts.

1 *Dentaria Bulbifera.*

Toothed Violet.

2 *Dentaria Coralloidea radice, sive Dent. Enneaphyllos.*

The Corall toothed Violet.

3 *Dentaria Heptaphyllos* Clusij.
The seven leaved toothed Violet.

4 *Dentaria Pentaphyllos* Clusij.
Five leaved toothed Violet.

5 *Dentaria Pentaphyllos altera*.
The other five leaved Corall-wort.

¶ The Description.

1 **T**he first kinde of *Dentaria* (called in Latine *Dentaria baccifera*: of *Dodonaeus*, *Dentaria prior*: in English, Dogs tooth violet), hath a tuberous and knobbie root, toothed, or as it were kneed like vnto the crags of Corall, of an vnpleasant sauer, and somewhat sharp in taste: from which spring forth certaine small and slender stalkes a foot high, which haue leaues verie much cut or iagged, like vnto those of Hempe, of the forme and fashion of Ashen leaues: at the top of the stalkes doe grow small white floures, in shape like *Viola matronales*, that is, Queenes Gillofloures, or rather like stocke-Gillofloures, of a white yellow colour, laid ouer with a light sprinkling of purple: among which come forth small knobs growing vpon the stalks among the leaues, such as are to be seen vpon the *Chimists Martagon*, which being ripe, do fall vpon the ground, whereof many other plants are ingendred.

2 The second kinde of Dogs-tooth violet bringeth forth small round stalks, firm and stiffe, a foot high, beset with leaues much broader, rounder, and greener than the former, bearing at the top many little floures consisting of foure small leaues, of a pale herbie colour; which being past, there succeed long and slender coddles somewhat

somewhat like the cods of Queenes Gillofloures, wherein is contained small blackish seed: the root is like the former, but not in euery respect much resembling Corall, yet white and tuberous notwithstanding.

3 The third kinde of Dogs-tooth Violet is called of *Clusius*, *Dentaria heptaphyllos*, that is, consisting of seuen leaues fastened vpon one rib, sinew, or small stem: of *Lobel* with this title, *Alabastrites altera*, or *Dentaria altera*: but *Cordus* calleth it *Coralloides altera*: in English, Corall violet; it hath stalkes, floures, and roots like vnto the first of his kinde, sauing that the floures are much fairer, and white of colour, and the roots haue a greater resemblance of Corall than the other.

4 The fourth kinde of Dogs-tooth violet, called in English Coddied violet (which *Clusius* setteth forth vnder the title *Dentaria Matthioli Pentaphyllos*, which *Pena* doth also expresse vnder the title of *Nemoralis alpina Herbariorum Alabastrites*; *Cordus* calleth it *Coralloides*, and may very well bee called in English Cinkfoile violet) hath leaues so like the greater Cinkfoile, that it is hard to know one from another; therefore it might very well haue been reckoned among the herbes called *Pentaphylla*, that is, fise leaued herbes. This plant groweth in the shadowie Forrest about Turin, and the mountain Sauena called Calcaris, and by the Rhene not far from Basill. The stalks grow to the height of a cubit, beset with a tuft of floures at the top like to that of the first, but of a deeper purple colour: which being vaded, there succeed long and flat cods like vnto Rocket, or the great Celandine, wherein is contained a small seed. All the whole plant is of a hot and bitter taste. The roots are like vnto Corall, of a pale whitish colour: the leaues are rough and harsh in handling, and of a deep greene colour.

† 5 *Clusius* giues vs another varietie of *Dentaria pentaphyllos*, whose roots are more vneuen and knobby than the last described: the stalke is some foot high: the leaues fise vpon a stalke, but not so rough, nor of so deep a greene as those of the former; yet the floures are of a deep purple colour, like those of the last described. †

¶ The Place.

They grow on diuers shadowie and darke hills. *Valerius Cordus* writeth, that they are found about the forest Hercinia, not far from Northusium, most plentifully, in a fat soile that hath quarries of stone in it. The first I haue in my garden.

¶ The Time.

They floure especially in Aprill and May: the seed commeth to perfection in the end of August.

¶ The Names.

The toothed Violet, or after some, Dogs-tooth violet, is commonly called *Dentaria*: of *Cordus*, *Coralloides*, of the root that is in forme like to Corall. *Matthiolus* placeth it inter *Solidagines* & *Symphyta*, among the Confoundes and Comfries. Wee had rather call them *Viola Dentaria*, of the likenesse the floures haue with Stocke-gillofloures. They may be called in English, Toothed Violets, or Corall-worts.

¶ The Temperature and Vertues.

A I haue read of few or no vertues contained in these herbes, sauing those which some women haue experienced to be in the first kinde thereof, and which *Matthiolus* ascribeth vnto *Pentaphylla dentaria* the fourth kinde, in the fourth booke of his Commentaries vpon *Dioscorides*, and in the chap. conterning *Symphytum*, where he saith that the root is vsed in drinckes which are made against *Enterocoele* and inward wounds, but especially those wounds and hurts which haue entred into the hollownesse of the brest.

CHAP. 382. Of Cinkefoile, or fise finger Grasse.

¶ The Description.

1 THE first kinde of Cinkfoile is so common and so vniuersally knowne, that I thinke it a needlesse trauell to stand about the description. † It hath many long slender stalks, lying spred vpon the ground, out whereof grow leaues made of fise longish snipt leaues fastened to one long foot-stalke: the floures also grow vpon the like foot-stalks, and are composed of fise yellow leaues. The root is pretty large, of a reddish colour, and round; but dried, it becomes square. †

2 The second kinde of Cinkfoile or Quinkefoile hath round and smal stalks of a cubit high; the leaues are large, and very much iagged about the edges, very like the common Cinkfoile: the floures grow at the top of the stalks, in fashion like the common kind, but much greater, and of a pale or bleake yellow or else whitish colour: the root is blacke without, and full of strings annexed thereto, and of a wooddie substance.

† 3 The

Quinquefolium vulgare.
Common Cinkfoile.

† 2 *Quinquefolium maius rectum.*
Great vpright Cinkfoile.

3 *Pentaphyllum purpureum.*
Purple Cinkfoile.

4 *Pentaphyllum rubrum palustre.*
Marsh Cinkfoile.

5 *Pentaphyllum petrosum*, *Heptaphyllum* Clusij.
Stone Cinkfoile.

† 6 *Pentaphyllum supinum* *Potentilla* facie.
Silverweed Cinkfoile.

7 *Quinquesfolium Tormentilla* facie.
Wall Cinkfoile.

8 *Pentaphyllum lacanum*.
Hoarie Cinkfoile.

† 3 The third kinde of Cinkefoile hath leaues like those of the last described, and his floures are of a purple colour; which being past, there succeedeth a round knop of seed like a Strawberry before it be ripe: the stalkes are creeping vpon the ground: the root is of a woody substance, full of blacke strings appendant thereto. ‡ This differs not from the last described, but in the colour of the floures. ‡

4 The fourth kinde of Cinkefoile is very like vnto the other, especially the great kinde: the stalkes are a cubit high, and of a reddish colour: the leaues consist of fve parts, somewhat snipt about the edges: the floures grow at the tops of the stalkes like vnto the other Cinkefoiles, sauing that they be of a darke red colour: the root is of a woody substance, with some fibres or threddy strings hanging thereat.

9 *Pentaphyllum incanum minus repens.*

Small hoary creeping Cinkefoile.

10 *Quinquesfolium sylvaticum majus flo. albo.*

Wood Cinkefoile, with white floures.

5 The fifth kinde of Cinkefoile groweth vpon the cold mountaines of Sauoy, and in the vallie of Austensie, and in Narbone in France, and (if my memory faile not) I haue seen the same growing vpon Beeston castle in Cheshire: the leaues hereof are few, and thinne set, consisting of fve parts like the other Cinkefoiles, oftentimes six or seuen set vpon one foot-stalke, not snipt about the edges as the other, but plaine and smooth; the leafe is of a shining white siluer colour, very soft and shining: the floures grow like starres, vpon slender stalkes by tufts and bunches, of a white colour, and sometimes purple, in fashion like the floures of *Alchimilla*, or Ladies mantle: the root is thicke and full of strings, and of a browne purple colour.

† 6 This plant, whose figure our Author formerly gaue for *Fragaria sterilis*, & in his description confounded with it, to auoid confusion, I thinke fit to giue you here amongst the Cinkefoiles, and in that place the *Fragaria sterilis*, as most agreeable thereto. This seemes to challenge kindred of three seuerall plants, that is, Cinkefoile, Tormentill, and Siluer-weed, for it hath the vpper leaues, the yellow floures, creeping branches, and root of Cinkefoile, but the lower leaues are of a darke greene, and grow many vpon one middle rib like those of Siluer-weed; the fruit is like an vnripe Strawberry. Lobel calls this *Pentaphyllum supinum Tormentilla facie*: and *Tabernamontanus*, *Quinquesfolium fragiferum repens*. ‡

7 The seuenth kinde of Cinkefoile, Pena that diligent searcher of Simples found in the Alpes of Rhetia, nere Clauena, and at the first sight supposed it to be a kinde of Tormentilla, or Pen-

taphyllum, saue that it had a more threddy root, rather like *Geranium*; it is of a darke colour outwardly, hauing some sweet smell, representing *Garyophyllata* in the sauer of his roots: in leaues and floures it resembles Cinkefoile and Tormentill, and in shape of his stalkes and roots *Auens* or *Garyophyllata*, participating of them all: notwithstanding it approacheth neereft vnto the Cinkefoiles, hauing stalkes a foot high, whereupon grow leaues diuided into fve parts, and jagged round about the edges like the teeth of a saw, hauing the pale yellow floures of *Pentaphyllum* or *Tormentilla*; within which are little mossie or downy threddes, of the colour of saffron, but lesser than the common *Auens*.

8 The eighth kinde of Cinkefoile (according to the opinion of diuers learned men, who haue had the view thereof, and haue iudged it to be the true *Leucas* of *Dioscorides*, agreeable to *Dioscorides* his description) is all hoary, whereupon it tooke the addition *Incanum*. The stalkes are thicke, woody, and somewhat red, wrinckled also, and of a browne colour; which rise vnequall from the root, spreading themselues into many branches, shadowing the place where it groweth, beset with thicke and notched leaues like *Scordium*, or water Germander, which according to the iudgment of the learned is thought to be of no lesse force against poison than *Pentaphyllum*, or *Tormentilla*, being of an astringent and drying quality. Hereupon it may be that some trying the force hereof, haue yeelded it vp for *Leucas Dioscoridis*. This rare plant I neuer found growing naturally, but in the hollownesse of the peakish mountaines, and dry grauelly vallies.

† 11 *Quinquefolium syluaticum minus flo. albo.*
Small white floured wood Cinkefoile.

† 12 *Quinquefolium minus flo. aureo.*
Small golden floured Cinkefoile.

† 9 This hath the like creeping purple branches as the last described: the leaues are narrower, more hairy and deeper cut in: the floures are also of a more golden colour, in other respects they are alike. †

† 10 The wood Cinkefoile hath many leaues spred vpon the ground, consisting of fve parts; among which rise vp other leaues, set vpon very tall foot-stalkes, and long in respect of those that did grow by the ground, and somewhat snipt about the ends, and not all alongst the edges. The floures grow vpon slender stalkes, consisting of fve white leaues. The root is thicke, with diuers fibres comming from it.

† 11 This also from such a root as the last described sends forth many slender branches not creeping, but standing vpright, and set with little hoary leaues, snipt onely at the ends, like as those

‡ 13 *Pentaphyllum fragiferum.*
Strawberry Cinkfoile.

those of the last described: the tops of the branches carry pretty white floures like those of the last described, whereof it seems to be a kinde, yet lesse in each respect.

12 This from a blacke and fibrous root sends forth creeping branches, set with leaues like the common Cinkfoile, but lesse, somewhat hoary and shining; the stalks are some handfull high, and on their tops carry large floures in respect of the smalnesse of the plant, and these of a faire golden colour, with saffron coloured threds in their middle; the feedes grow after the manner of other Cinkfoiles: this floures in Iune, and it is *Clusius* his *Quinquefolium 3. aureo flore.* ‡

13 There is one of the mountain Cinkfoiles that hath diuers slender brittle stalks, rising immediatly out of the ground; whereupon are set by equall distances certain iagged leaues, not vnlike to the smallest leaues of Auens: the floures are white and grow at the top, hauing in them threds yellow of colour, and like to the other Cinkfoiles, but altogether lesser. The root is thicke, tough, and of a wooddie substance. ‡ The feedes grow clustering together like little Strawberries, whence *Clusius* calls it *Quinquefolium fragiferum.* ‡

¶ The Place.

They grow in low and moist medowes, vpon banks and by high waies sides: the second is onely to be found in gardens.

The third groweth in the woods of Saue-
na and Narbon, but not in England. The
fourth groweth in a marsh ground adioining to the land called Bourne ponds, halfe a mile from
Colchester; from whence I brought some plants for my garden, where they flourish and prosper
well.

The fifth groweth vpon Becstone castle in Cheshire: the sixth vpon bricke and stonewals about
London, especially vpon the bricke wall in Liuer-lane.

The place of the seuenth and eight is set forth in their descriptions.

¶ The Time.

These plants do floure from the beginning of May to the end of Iune.

¶ The Names.

Cinkfoile is called in Greeke *πενταφυλλον*: in Latine, *Quinquefolium*: the Apothecaries vse the Greek
name *Pentaphyllum*: and sometime the Latine name. There be very many bastard names, wherewith I
will not trouble your eares: in High Dutch, *Junff fingerkraut*: in Low Dutch, *Vijf Winger
kruid*: in Italian, *Cinquesoglio*: in French, *Quinte feuille*: in Spanish, *Cinco en rama*: in English,
Cinkfoile, Fiue finger Grasse, Fiue leaued grasse, and Sinkfield.

¶ The Temperature.

The roots of Cinkfoile, especially of the first, do vehemently drie, and that in the third degree,
but without biting: for they haue very little apparant heat or sharpnesse.

¶ The Vertues.

The decoction of the roots of Cinkfoile drunke, cureth the bloody fluxe, and all other fluxes of A
the belly, and stancheth all excessiue bleeding.

The iuice of the roots while they be yong and tender, is giuen to be drunke against the diseases B
of the liuer and lungs, and all poison.

The same drunke in Mead or honied water, or wine wherein some pepper hath been mingled, cu- C
reth the tertian or quartaine feuers: and being drunken after the same manner for thirty daies toge-
ther, it helpeth the falling sicknesse.

The leaues vsed among herbes appropriate for the same purpose, cureth ruptures and burstings D
of the rim, and guts falling into the cods.

- E** The iuice of the leaues drunken doth cure the laundice, and comforteth the stomacke and liuer.
- F** The decoction of the roots held in the mouth doth mitigate the paine of the reeth, staieth putrefaction, and all putrified vlcers of the mouth, helpeth the inflammations of the almonds, throat, and the parts adioining, it staieth the laske, and helpeth the bloody flux.
- G** The root boiled in vineger is good against the shingles, appeaseth the rage of fretting sores, and cankerous vlcers.
- H** It is reported, that foure branches hereof cureth quartaine agues, three tertians, and one branch quotidian: which things are most vaine and friuolous, as likewise many other such like, which are not onely found in *Dioscorides*, but also in other Authors, which we willingly withstand.
- I** *Oriolpho Morolto* a learned Physitian, commended the leaues being boiled with water, and some *Lignum vite* added therto, against the falling sicknesse, if the patient be caused to sweat vpon the taking thereof. He likewise commendeth the extraction of the roots against the bloody flux.

† Our Author formerly in his description, title, and place of growing mentioned that plant which he figured, and is yet kept in the second place; and in the first place he figured the common Cinke-foile, and made mention of it, yet without description in the second. That which formerly was in the sixth place, by the name of *Pentaphyllum lupinum*, was the same with that in the fifth place.

CHAP. 383. Of Setfoile, or Tormentill.

Tormentilla.
Setfoile.

¶ The Description.

THis herbe Tormentill or Setfoile is one of the Cinkfoiles, it brings forth many stalks slender, weake, scarce able to lift it selfe vp, but rather lieth downe vpon the ground: the leaues be lesser than Cinkefoile, but more in number, sometimes five, but commonly seuen, whereupon it tooke his name Setfoile, which is seuen leaues, and those somewhat snipt about the edges: the floures grow on the toppes of slender stalkes, of a yellow colour, like those of the Cinkfoiles. The root is blacke without, reddish within, thicke, tuberous, or knobbie.

¶ The Place.

This plant loueth woods and shadowie places, and is likewise found in pastures lying open to the Sun, almost euery where.

¶ The Names.

It floureth from May, vnto the end of August.

¶ The Names.

It is called of the later Herbarists *Tormentilla*: some name it after the number of the leaues *Septifolium*, and *Septifolium*: in English, Setfoile and Tormentill: in high-Dutch, *Birkwurtz*: most take it to be *Chrysogonon*; whereof *Dioscorides* hath made a brieue description.

¶ The Temperature.

The root of Tormentill doth mightily dry, and that in the third degree, and is of thin parts: it hath in it very little heat, and is of a binding quality.

¶ The Vertues.

A Tormentill is not only of like vertue with Cinkefoile, but also of greater efficacie: it is much vsed against pestilent diseases: for it strongly resisteth putrefaction, and procureth sweate.

The

The leaues and roots boiled in wine, or the iuice thereof drunken prouoketh sweat, and by that means driueth out all venome from the heart, expelleth poison, and preserueth the bodie in time of pestilence from the infection thereof, and all other infectious diseases.

The roots dried made into powder and drunke in wine doth the same.

The same powder taken as aforesaid, or in the water of a Smiths forge, or rather the water where in hot Steele hath been often quenched of purpose, cureth the laske and bloody flux, yea although the patient haue adioined vnto his scouring a grieuous feuer.

It stoppeth the spitting of blood, pissing of blood, and all other issues of blood, as well in men as women.

The decoction of the leaues and rootes, or the iuice thereof drunke, is excellent good for all wounds, both outward and inward: it also openeth and healeth the stoppings of the liuer and lungs, and cureth the iaundice.

The root beaten into powder, tempered or kneaded with the white of an egge and eaten, staieth the desire to vomite, and is good against choler and melancholic.

CHAP. 384. Of wilde Tansie or Siluer-weed.

Argentina.

Siluerweed, or wilde Tansie.

¶ The Description.

Wilde Tansie creepeth along vpon the ground with fine slender stalkes and clasping tendrels: the leaues are long made vp of many small leaues, like vnto those of the garden Tansie, but lesser; on the vpper side Greene, and vnder very white. The floures be yellow, and stand vpon slender stems, as doe those of Cinkfoile,

¶ The Place.

It groweth in moist places neere vnto high waies and running brookes euery where.

¶ The Time.

It floureth in Iune and Iuly.

¶ The Names.

The later Herbarists do call it *Argentina*, of the siluer drops that are to be seene in the distilled water therof when it is put into a glasse, which you shall easily see rowling and tumbling vp and downe in the bottome; I iudge it rather so called of the fine shining Siluer coloured leaues. It is likewise called *Potentilla*: of diuers, *Agrimonia sylvestris*, *Anserina*, and *Tanacetum sylvestre*: in High Dutch, *Genserich*: in Low Dutch, *Santerick*: in French, *Argentine*: in English, *Wilde Tansie*, and *Siluerweed*.

¶ The Temperature.

It is of temperature moderately cold, and dry almost in the third degree, hauing withall a binding facultie.

¶ The Vertues.

Wilde Tansie boiled in wine and drunk, stoppeth the laske and bloody flux, and all other flux of blood in man or woman.

The same boiled in water and salt and drunke, dissolueth clotted and congealed blood in such as are hurt or bruised with falling from some high place.

The decoction hereof made in water, cureth the vicers and cankers of the mouth, if some honie and allom be added thereto in the boiling.

Wilde Tansie hath many other good vertues, especially against the stone, inward wounds, and wounds of the priuie or secret parts, and closeth vp all Greene and fresh wounds.

E The distilled water taketh away freckles, spots, pimples in the face and Sun-burning; but the herbe laid to infuse or steepe in white wine is far better: but the best of all is to steepe it in strong white wine vinegre, the face being often bathed or washed therewith.

CHAP. 385. *Of Auens, or Herbe Bennet.*

1 *Caryophyllata.*

Auens or herbe Bennet.

2 *Caryophyllata montana.*

Mountaine Auens.

¶ *The Description.*

THe common Auens hath leaues not vnlike to Agrimony, rough, blackish, and much clouen or deeply cut into diuers gashes: the stalke is round and hairy, a foot high, diuiding it selfe at the top into diuers branches, whereupon do grow yellow floures like those of Cinkefoile or wilde Tansie: which being past, there follow round rough reddish hairy heads or knops ful of seed, which being ripe wil hang vpon garments as the Burs doe. The root is thicke, reddish within, with certaine yellow strings fastened thereunto, smelling like vnto Cloues or like vnto the roots of Cyperus.

2 The Mountain Auens hath greater and thicker leaues than the precedent, rougher, and more hairie, not parted into three, but rather round, nicked on the edges: among which riseth vp slender stalkes, whereon doe grow little longish sharpe pointed leaues: on the toppes of each stalke doth grow

3 *Caryophyllata Alpina pentaphylla.*
Five leaved Auens.

4 *Caryophyllata montana purpurea.*
Red flowered mountaine Auens.

5 *Caryophyllata Alpina minima.*
Dwarfe mountaine Auens.

Botany hic: Lib. 2.

grow one floure greater than that of the former, which consisteth of five little leaues as yellow as gold: after which growes vp the seeds among long hairy threds. The root is long, growing aslope, somewhat thicke, with strings annexed thereto.

3 Five finger Auens hath many small leaues spread vpon the ground, diuided into five parts, somewhat snipt about the edges like Cinkefoile, whereof it tooke his name. Among which rise vp slender stalkes diuided at the top into diuers branches, whereon do grow small yellow floures like those of Cinkefoile: the root is composed of many tough strings of the smell of Cloues, which makes it a kind of Auens; otherwise doubtles it must of necessitie be one of the Cinkfoiles

† 4 This hath ioyned stringy roots some finger thick, from whence rise vp many large and hairy leaues, composed of diuers little leaues, with larger at the top, and these snipt about the edges like as the common Auens: amongst these leaues grow vp sundry stalkes some foot or better high, whereon grow floures hanging downe their heads, and the tops of the stalkes and cups of the floures are commonly of a purplish colour: the floures themselves are of a pretty red colour, and are of diuers shapes, and grow diuers wayes; which hath bene the reason that *Clusius* and others haue iudged them seuerall plants, as may be seene in *Clusius* his Workes, where he giues you the floures, which you here finde exprest, for a different kind. Now some of these floures, euen the greater part of them grow with five red round pointed leaues, which neuer lie faire open, but only stand straight out, the middle part being filled with a hairy matter and yellowish threds: other some consist of seuen, eight, nine, or more leaues; and some againe lie wholly open, with greene leaues growing close vnder the cup of the floure, as you may see them represented in the figure; and some few now and then may be found composed of a great many little leaues thick thrust together, making a very double floure. After the floures are false come such hairy heads as in other plants of this kinde, amongst which lies the seed. *Gesner* calls this *Geum rivale*: *Thalius*, *Caryophyllata maior purpurea*: *Camerarius*, *Caryophyllata aquatica*: *Clusius*, *Caryophyllata montana prima, & tertia*.

5 The root of this is also thicke, fibrous, and whitish; from which arise many leaues three fingers high, resembling those of Agrimonie, the little leaues standing directly opposite each against other, snipt about the edges, hairy, a little curld, and of a deepe greene colour: out of the midst of those, vpon a short stalk growes commonly on single floure of a gold-yellow colour, much like the mountaine Auens described in the second place. It floures at the beginning of Iuly, and groweth vpon the Alpes. *Pona* was the first that described it, and that by the name of *Caryophyllata Alpina omnium minima*. †

¶ The Place.

These kindes of Auens are found in high mountaines and thicke woods of the North parts of England: we haue them in our London gardens, where they flourish and encrease infinitely.

† The red floured mountaine Auens was found growing in Wales by my much honoured friend Mr. *Thomas Glynn*, who sent some plants thereof to our Herbarists, in whose gardens it thriue exceedingly. †

¶ The Time.

They floure from the beginning of May to the end of Iuly.

¶ The Names.

Auens is called *Caryophyllata*, so named of the smell of Cloues which is in the roots, and diuers call it *Sanamunda*, *Herba benedicta*, and *Nardus rustica*: in high-Dutch, *Benedicten wortz*: in French, *Galiot*: of the Wallons, *Gloria filia*: in English, Auens, and herbe Benet: it is thought to be *Geum Plinij*, which most do suspect, by reason he is so brieue. *Geum*, saith *Pliny*, lib. 26. cap. 7. hath little slender roots, blacke, and of a good smell.

The other kinde of Auens is called of the later Herbarists, *Caryophyllata montana*, Mountaine Auens: it might agree with the description of *Baccharis*, if the floures were purple tending to whitenesse; which as we haue said are yellow, and likewise differ in that, that the roots of Auens smell of Cloues, and those of *Baccharis* haue the smell of Cinnamon.

¶ The Temperature.

The roots and leaues of Auens are manifestly dry, and something hot, with a kinde of scouring qualitie.

¶ The Vertues.

- A The decoction of Auens made in wine is commended against cruditie or rawnesse of the stomacke, paine of the Collicke, and the biting of venomous beasts.
- B The same is likewise a remedie for stiches and grieve in the side, for stopping of the liuer; it concocteth raw humours, scoureth away such things as cleaue to the intrals, wasteth and dissolueth winde, especially being boyled with wine: but if it be boyled with pottage or broth it is of great efficacie, and of all other pot-herbes is chiefe, not onely in physcally broths, but commonly to be vsed in all.
- C The leaues and roots taken in this manner dissolue and consume clotted blood in any inward part

part of the body; and therefore they are mixed with potions which are drunk of those that are bruised, that are inwardly broken, or that have fallen from some high place.

The roots taken up in Autumne and dried, do keep garments from being eaten with moths, and make them to have an excellent good odour, and serue for all the physcally purposes that Cinkefoiles do.

CHAP. 386. Of Straw-berries.

The Kindes.

There be diuers sorts of Strawberries; one red, another white, a third sort Greene, and likewise a wilde Straw-berrie, which is altogether barren of fruit.

1 *Fragaria & Fraga.* Red Straw-berries.

2 *Fragaria & Fraga subalba.* White Straw-berries.

The Description.

The Straw-berrie hath leaues spred vpon the ground, somewhat snipt about the edges, three set together vpon one slender foot-stalke like the Trefoile, Greene on the vpper side, and on the nether side more white: among which rise vp slender stems, whereon do grow small floures, consisting of five little white leaues, the middle part somewhat yellow, after which commeth the fruit, not vnlike to the Mulberrie, or rather the Raspis, red of colour, hauing the taste of wine, the inner pulpe or substance whereof is moist and white, in which is contained little seeds: the root is threddy, of long continuance, sending forth many strings, which disperse themselves far abroad, whereby it greatly increaseth.

Of these there is also a second kinde, which is like to the former in stems, strings, leaues, and floures. The fruit is something greater, and of a whitish colour, wherein is the difference.

There is another sort, which brings forth leaues, floures, and strings like the other of his kinde. The fruit is green when it is ripe, tending to rednesse vpon that side that lieth to the Sun, cleauing faster

faster to the stemmes, and is of a sweeter taste, wherein onely consisteth the difference.

† 3 *Fragaria minime vesca, sine sterilis.*
Wilde or barren Straw-berry.

† There is also kept in our gardens (onely for varietie) another Straw-berry which in leaues and growing is like the common kinde; but the floure is greenish, and the fruit is harsh, rough, and prickly, being of a greenish colour, with some shew of rednesse. M^r. Iohn Tradescant hath told me that he was the first that tooke notice of this Straw-berry, and that in a womans garden at Plimouth, whose daughter had gathered and set the roots in her garden in stead of the common Straw-berry: but she finding the fruit not to answer her expectation, intended to throw it away: which labor he spared her, in taking it and bestowing it among the louers of such varieties, in whose gardens it is yet preferred. This may be called in Latine, *Fragaria fructu hispido*, The prickly Straw-berry. ‡

† 3 This wild Strawberry hath leaues like the other Straw-berry, but somewhat lesse, and softer, slightly indented about the edges, and of a light greencolour: among which rise vp slender stems bearing such floures as the common Straw-berries doe, but lesser, which doe wither away, leauing behinde a barren or chaffie head, in shape like a Straw-berry, but of no worth or value: the root is like the others.

¶ The Place.

Straw-berries do grow vpon hills and vallies, likewise in woods and other such places that be somewhat shadowie: they prosper well in Gardens, the first euery where, the other two more rare, and are not to be found saue only in gardens.

‡ The barren one growes in diuers places, as vpon Blacke heath, in Greenwich parke, &c. ‡

¶ The Time.

The leaues continue greene all the yeare: in the Spring they spred further with their strings, and floure afterward: the berries are ripe in Iune and Iuly. ‡ The barren one floures in April and May, but neuer carries any berries. ‡

¶ The Names.

The fruit or berries are called in Latine by *Virgil* and *Ouid*, *Fraga*: neither haue they any other name commonly knowne: they are called in high-Dutch *Erdbeeren*: in low-Dutch, *Certbeeren*: in French, *Fraises*: in English, Strawberries.

¶ The Temperature.

The leaues and roots do coole and dry, with an astringent or binding quality: but the berries be cold and moist.

¶ The Vertues.

- A The leaues boyled and applied in manner of a pultis taketh away the burning heate in wounds: the decoction thereof strengthneth the gummies, fastneth the teeth, and is good to be held in the mouth, both against the inflammation or burning heate thereof, and also of the almonds of the throat: they stay the ouermuch flowing of the bloody flux, and other issues of blood.
- B The berries quench thirst, and do allay the inflammation or heate of the stomack: the nourishment which they yeeld is little, thin, and waterish, and if they happen to putrifie in the stomack, their nourishment is naught.
- C The distilled water drunke with white Wine is good against the passion of the heart, reuiuing the spirits, and making the heart merry.
- D The distilled water is reported to scoure the face, to take away spots, and to make the face faire and smooth; and is likewise drunke with good successe against the stone in the kidnies.
- E The leaues are good to be put into Lotions or washing waters, for the mouth and the priuie parts.

The

The ripe Straw-berries quench thirst, coole heat of the stomach, and inflammation of the liuer, F
take away (if they be often vsed) the rednesse and heate of the face.

† That figure which formerly was in this place, and some part of the description were (as I haue formerly noted) of the *Pentstemon supinum* *Potentilla facie*, which you may finde described amongst the Cinktoles in the sixth place.

CHAP. 387. Of Angelica.

The Kindes.

There be diuers kinds of Angelica's; the garden Angelica, that of the water, and a third sort wilde growing vpon the land.

1 *Angelica sativa*. Garden Angelica.

2 *Angelica sylvestris*. Wilde Angelica.

The Description.

Concerning this plant Angelica there hath bin heretofore some contention and contro-
uerfie; *Cordus* calling it *Smyrniū*: some later writers, *Costus niger*: but to auoid ca-
uill, the controuersie is soone decided, sith it and no other doth assuredly retaine the
name *Angelica*. It hath great broad leaues, diuided againe into other leaues, which are indented or
snipt about much like to the vppermost leaues of *Sphondylium*, but lower, tenderer, greener, and of a
stronger fauor: among which leaues spring vp the stalkes, very great, thicke, and hollow, fixe or
seuen foot high, ioynted or kneed: from which ioynts proceed other armes or branches, at the top
whereof grow tufts of whitish floures like Fennell or Dill: the root is thicke, great, and oilous, out
of which issueth, if it be cut or broken, an oylie liquor: the whole plant, as well leaues, stalkes, as
roots, are of a reasonable pleasant saueur, not much vnlike *Petroleum*.

There is another kinde of true Angelica found in our English gardens (which I haue obserued)
being like vnto the former, sauing that the roots of this kinde are more fragrant, and of a more aro-
maticke saueur, and the leaues next the ground of a purplish red colour, and the whole plant lesser.

2 The

† 3 *Archangelica*.
Great wilde Angelica.

white colour, and tuft fashion: which being past, there succeed broad long and thicke seeds, longer and thicker than garden Angelica: the root is great, thicke, white, of little saour, with some strings appendant thereto.

† This of our Authors description seemes to agree with the *Archangelica* of Lobel, Dodonæus, and Clusius, wherefore I haue put their figure to it. †

¶ The Place.

The first is very common in our English gardens: in other places it growes wilde without planting; as in Norway, and in an Island of the North called Island, where it groweth very high. It is eaten of the inhabitants, the barke being pilled off, as we vnderstand by some that haue trauelled into Island, who were sometimes compelled to eate hereof for want of other food; and they report that it hath a good and pleasant taste to them that are hungry. It groweth likewise in diuers mountaines of Germanie, and especially of Bohemia.

¶ The Time.

They floure in Iuly and August, whose roots for the most part do perish after the seed is ripe: yet haue I with often cutting the plant kept it from seeding, by which meanes the root and plant haue continued sundry yeares together.

¶ The Names.

It is called of the later age *Angelica*: in high-Dutch, *Angelick*, *Brustwurtz*, or *des heilighen Geyst wurtzel*, that is, *Spiritus sancti radix*, the root of the holy Ghost, as witnesseth Leonhartus Fuchs: in low-Dutch, *Angelika*: in French, *Angelic*: in English also *Angelica*.

It seemeth to be a kind of *Laserpitium*; for if it be compared with those things which Theophrastus at large hath written concerning *Silphium* or *Laserpitium*, in his sixth booke of the historie of plants, it shall appeare to be answerable thereunto. But whether wild *Angelica* be that which Theophrastus calleth *Magydaris*, that is to say, another kinde of *Laserpitium*, we leaue to be examined and considered of by the learned Physitians of our London Colledge.

¶ The Temperature.

Angelica, especially that of the garden, is hot and dry in the third degree; therefore it openeth, attenuateth or maketh thin, digesteth, and procureth sweat.

¶ The

2 The wilde Angelica, which seldome growes in gardens, but is found to grow plentifully in water soken grounds and cold moist medowes, is like to that of the garden, saue that his leaues are not so deeply cut or iagged; they be also blacker and narrower: The stalkes are much slenderer and shorter, and the floures whiter: the root much smaller, and hath more threddy strings appendant thereunto, and is not so strong of saour by a great deale.

3 *Matthiolus* and *Gesner* haue made mention of another kinde of Angelica, but we are very slenderly instructed by their insufficient descriptions: notwithstanding for our better knowledge and more certain assurance I must needs record that which my friend M^r. *Bredwell* related to me concerning his sight thereof, who found this plant growing by the mote which compasseth the house of M^r. *Munke* of the parish of Iuer, two miles from Colbrook; and since that I haue seene the same in low fenny and marshy places of Essex, about Harwich. This plant hath leaues like vnto the garden Angelica, but smaller, and fewer in number, set vpon one rib a great stalke, grosse and thicke, whose ioynts and that small rib whereon the leafe growes are of a reddish colour, hauing many long branches comming forth of an husk or case, such as is in the common garden Parsnep: the floures doe grow at the top of the branches, and are of a

¶ The Vertues.

The roots of garden Angelica is a singular remedy against poison, and against the plague, and all infections taken by euill and corrupt aire; if you do but take a peece of the root and hold it in your mouth, or chew the same between your teeth, it doth most certainly driue away the pestilentiall aire, yea although that corrupt aire haue possessed the hart, yet it driueth it out again by vrine and sweat, as Rue and Treacle, and such like *Antipharacado*.

Angelica is an enemy to poisons: it cureth pestilent diseases if it by vsed in season: a dram weight of the pouder hereof is giuen with thin wine, or if the feuer be vehement, with the distilled water of *Carduus benedictus*, or of *Tormentill*, and with a little vineger, and by it selfe also, or with Treacle of Vipers added.

It openeth the liuer and spleene: draweth downe the termes, driueth out or expelleth the secondine.

The decoction of the root made in wine, is good against the cold shiuering of agues.

It is reported that the root is auailable against witchcraft and inchantments, if a man carry the same about them, as *Fuchsius* saith.

It attenuateth and maketh thin, grosse and tough flegme: the root being vsed greene, and while it is full of iuice, helpeth them that be asthmaticke, dissoluing and expectorating the stuffings therein by cutting off and clensing the parts affected, reducing the body to health againe; but when it is dry it worketh not so effectually.

It is a most singular medicine against surfeting and loathsomenesse to meate: it helpeth concoction in the stomacke, and is right beneficiall to the hart: it cureth the bitings of mad dogges, and all other venomous beasts.

The wilde kinds are not of such force in working, albe it they haue the same vertues attributed vnto them.

CHAP. 388. Of Masterworts and herbe Gerard.

1. *Imperatoria.*

Masterwoorts.

2. *Herba Gerardi.*

Herbe Gerard, or. Aish-weed.

¶ The Description.

1 *Imperatoria* or Masterwoort hath great broad leaues not much vnlike wilde Angelica, but smaller, and of a deeper greene colour, in fauor like Angelica, and euery leafe diuided into sundry other little leaues: the tender knotted stalkes are of a reddish colour, bearing at the top round spokie tufts with white floures: the seed is like the seed of Dill: the root is thicke, knotty and tuberous, of a good fauour, and hot or biting vpon the tongue, which hath moued the vnskilfull to call it Pellitory of Spaine, but very vnfitly and vtruely.

2 *Herba Gerardi*, which Pena doth also call *Imperatoria* and *Ostrutium*: the Germanes *Podagraria*, that is, Gout-woort: in English, herbe Gerard, or wilde Masterwoort, and in some places after *Lyte*, Aishweed, is very like the other in leaues, floures, and roots, sauing that they be smaller, growing vpon long stems: the roots tenderer, whiter, and not so thicke or tuberous. The whole plant is of a reasonable good fauour, but not so strong as Masterwoort.

¶ The Place.

Imperatoria groweth in darke woods and desarts; in my Garden and sundry others very plentifully.

Herbe Gerard groweth of it selfe in gardens without setting or sowing, and is so fruitfull in his increase, that where it hath once taken root, it will hardly be gotten out againe, spoiling and getting euery yeere more ground, to the annoying of better herbes.

¶ The Time.

They floure from the beginning of Iune to the beginning of August.

¶ The Names.

Imperatoria, or *Astrantia*, is called in English, Masterwoort, or bastard Pellitory of Spaine.

Herba Gerardi is called in English, Herb Gerard, Aishweed, and Goutwoort: in Latine also *Podagraria Germanica*.

¶ The Nature.

Imperatoria, especially the root, is hot and dry in the third degree. The wilde *Imperatoria*, or herbe Gerard, is almost of the same nature and quality, but not so strong.

¶ The Vertues.

A *Imperatoria* is not onely good against all poison, but also singular against all corrupt and naughty aire and infection of the pestilence, if it be drunken with wine.

B The roots and leaues stamped, dissolue and cure pestilentiall carbuncles and botches, and such other apostumations and swellings, being applied thereto.

C The root drunke in wine cureth the extreme and rigorous cold fits of agues, and is good against the drop sicke, and prouoketh sweate.

D The same taken in manner aforesaid, comforteth and strengthneth the stomack, helpeth digestion, restoreth appetite, and dissolueth all ventosities or windinesse of the stomacke and other parts.

E It greatly helpeth such as haue taken great squats, bruses, or falls from some high place, dissolving and scattering abroad congealed and clotted blood within the body: the root with his leaues stamped and laid vpon the members infected, cureth the bitings of mad dogs, and of all other venomous beasts.

F Herbe Gerard with his roots stamped, and laid vpon members that are troubled or vexed with the gout, swageth the paine, and taketh away the swellings and inflammation thereof, which occasioned the Germanes to giue it the name *Podagraria*, because of his vertues in curing the gout.

G It cureth also the Hemorrhoids, if the fundament be bathed with the decoction of the leaues and roots, and the soft and tender sodden herbes laid thereon very hot.

H False Pellitory of Spaine attenuateth or maketh thin, digesteth, prouoketh sweate and vrine, concocteth grosse and colde humors, wasteth away windinesse of the entrailes, stomacke and matrix: it is good against the collicke and stone.

I One dram of the root in powder giuen certaine daies together, is a remedy for them that haue the drop sicke, and also for those that are troubled with convulsions, cramps, and the falling sicknesse.

K Being giuen with wine before the fit come, it cureth the quartaine ague, and is a remedy against pestilent diseases.

L The same boiled in sharpe or sower wine, easeth the tooth-ach, if the mouth be washed therewith very hot.

M Being chewed it draweth forth water and flegme out of the mouth (which kinde of remedies in Latine are called *Apophlegmatismi*) and disburdeneth the braine of phlegmaticke humors, and are likewise vsed with good successe in apoplexies, drow sicke sleepes, and other like infirmities.

CHAP. 389.

Of Hercules Wound-wort, or All-heale.

¶ The Kindes.

Panax is of sundry kinds, as witnesseth *Theophrastus* in his ninth booke; one groweth in Syria, and likewise other three, that is to say, *Chironium*, *Heracleum*, and *Æsculapium*; or *Chiron's* All-heale, *Hercules* All-heale, and *Æsculapius* All-heale. Besides these there is one *Platyphyllon*, or broad leaved; so that in *Theophrastus* there are six kinds of *Panax*: but *Dioscorides* describeth only three, *Horacleum*, *Asclepium*, and *Chironium*: whereunto we haue added another sort, whose vertues wee found out by meanes of a husbandman, and for that cause haue named it *Panax Coloni*, or Clownes wort.

1 *Panax Heracleum*.
Hercules All-heale.

2 *Panax Heracleum mains*.
Hercules great Wound-wort.

¶ The Description.

1 **H**ercules All-heale or Wound-wort hath many broad leaues spread vpon the ground, very rough and hairy, of an ouerworne greene colour, and deeply cut into diuers sections like those of the Cow Parsenep, and not vnlike to the fig leaues: among the which riseth vp a very strong stalke couered ouer with a rough hairinesse, of the height of foure or fve cubits. Being wounded it yeeldeth forth a yellow gummie iuyce, as doth euery part of the plant, which is that precious gum called *Opopanax*: at the top of which stalks stand great tufts or vmbels of yellowish floures, set together in spoky rundles like those of Dill, which turn into seed of a straw colour, sharpe and hot in taste, and of a pleasing fauour: the root is very thicke, fat, and full of iuyce, and of a white colour.

2 The great Wound-wort, which the Venetians nourish in their gardens, hath great large leaues somewhat rough or hairie, consisting of diuers small leaues set together vpon a middle rib, which make one entire leafe ioyned together in one, whereof each collaterall or side leafe is long and

and sharpe pointed: among which riseth vp a knotty stalke three or foure cubits high, diuiding it selfe into diuers branches; on the tops whereof do grow spokie tufts or rundles like the precedent, but the floures are commonly white: the seed is flat and plaine: the root long, thicke, and white, which being broken or wounded, yeeldeth forth liquor like that of the former, of a hot and biting taste.

¶ *The Place.*

These plants grow in Syria; the first of them also in my garden: but what *Panax* of Syria is, *Theophrastus* doth not expresse. *Pliny* in his 2 booke, Chap. 26. saith, that the leaues are round, and of a great compasse: but it is suspected that these are drawne from the description of *Hercules Panax*.

Broad leaved *Panax* is thought to be the great *Centory*: for *Pliny* witnesseth, that *Panax* which *Chiron* found out is surnamed *Centaurium*, *Centorie*.

Matthiolus saith it growes of it selfe in the tops of the hills *Apennini*, in the *Cape Argentaria*, in the sea coasts of *Siena*, and it is cherished in the gardens of *Italy*: but he cannot affirme, That the liquor hereof is gathered in *Italy*; for the liquor *Opopanax* which is sold in *Venice* is brought, saith he, out of *Alexandria* a city in *Egypt*: it groweth also in *Syria*, *Boeetia*, and in *Phocide*, cities of *Arcadia*.

¶ *The Time.*

They floure and flourish from the first of May vnto the end of September.

¶ *The Names.*

That which is called *πάναξ* in Greeke, is likewise named *Panax* in Latine: and that *Panax Heracium* which *Dioscorides* setteth downe is called in Latine, *Panax Heraculum*, or *Herculeum*, or *Hercules Panax*: it may be called in English, *Hercules his Wound-wort* or *All-heale*, or *Opopanax wort*, of the Greeke name.

¶ *The Temperature.*

The barke of the root of *Hercules Wound-wort* is hot and dry, yet lesse than the iuyce, as *Galen* teacheth.

¶ *The Vertues.*

- A The seed beat to powder and drunke in *Wormwood wine* is good against poyson, the biting of mad dogs, and the stinging of all manner of venomous beasts.
- B The leafe or root stamped with honey, and brought to the forme of an Vnguent or Salue, cureth wounds and vlcers of great difficultie, and couereth bones that are bare or naked without flesh.

CHAP. 390. Of Clownes Wound-wort or All-heale.

¶ *The Description.*

Clownes All-heale, or the Husbandmans Wound-wort, hath long slender square stalks of the height of two cubits, furrowed or chamfered along the same as it were with small gutters, and somewhat rough or hairy: whereupon are set by couples one opposite to another, long rough leaues somewhat narrow, bluntly indented about the edges like the teeth of a saw, of the forme of the leaues of *Speare-mint*, and of an ouerworne greene colour: at the top of the stalkes grow the floures spike fashion, of a purple colour mixed with some few spots of white, in forme like to little hoods. The root consisteth of many small threddy strings, whereunto are annexed or tied diuers knobby or tuberous lumps, of a white colour tending to yellownesse: all the whole plant is of an vnpleasant sauour like *Stachys* or stinking *Hore-hound*. † The root in the Winter time and the beginning of the Spring is somewhat knobby tuberous, and ioynted, which after the stalkes grow vp become flaccide and hollow, and so the old ones decay, and then it putteth forth new ones. †

¶ *The Place.*

It groweth in moist medowes by the sides of ditches, and likewise in fertile fields that are somewhat moist, almost euery where; especially in *Kent* about *Southfleet*, neere to *Grauesend*, and likewise in the medowes by *Lambeth* neere *London*.

¶ *The Time.*

It floureth in *August*, and bringeth his seed to perfection in the end of *September*.

¶ *The Names.*

That which hath bin said in the description shall suffice touching the names, as well in Latine as English.

† This

Panax Coloni.
Clownes All-heale.

‡ This plant by *Gesner* was called *Stachys palustris*, and *Betonica fetida*, and thought to be of the kinde of *Herba Iudaea*, or *Sideritis*; to which indeed I should, and *Thalium* hath referred it, calling it *Sideritis* 1. *gravis odoris*: *Casalpinus* calls it *Tertiola*; and giues this reason, *quod Tertianus sanat*, because it cures Tertians. *Tabernamontan.* called it *Stachys aquatica*, whose figure with a description our Author in the former edition gaue, pag. 565. by the name of *Marrubium aquaticum acutum*; yet (as it seemeth) either not knowing, or forgetting what he had formerly done, he here againe setteth it forth as a new thing, vnder another title: but the former figure of *Tabern.* being in my iudgment the better, I haue here giuen you, with addition of the iointed tuberous roots as they are in Winter: yet by the Caruers fault they are not altogether so exquisitely exprest as I intended. ‡

¶ The Temperature.

This plant is hot in the second degree, and dry in the first.

¶ The Vertues.

The leaues hereof stamped with *Axungia* or A hogs grease, and applied vnto greene wounds in manner of a pulstesse, healeth them in short time, and in such absolute manner, that it is hard for any that haue not had the experience thereof to beleue: for being in Kent about a

Patient, it chanced that a poore man in mowing of Peason did cut his leg with a sithe, wherein he made a wound to the bones, and withall very large and wide, and also with great effusion of blood; the poore man crept vnto this herbe, which he bruised with his hands, and tied a great quantity of it vnto the wound with a piece of his shirt, which presently stanchd the bleeding, and ceased the paine, insomuch that the poore man presently went to his dayes worke againe, and so did from day to day, without resting one day vntill he was perfectly whole; which was accomplished in a few dayes, by this herbe stamped with a little hogs grease, and so laid vpon in manner of a pulstesse, which did as it were glew or soder the lips of the wound together, and heale it according to the first intention, as we terme it, that is, without drawing or bringing the wound to suppuration or matter; which was fully performed in seuen dayes, that would haue required forty dayes with balsam it selfe. I saw the wound, and offered to heale the same for charitie; which he refused, saying that I could not heale it so well as himselfe: a clownish answer I confesse, without any thanks for my good will; whereupon I haue named it *Clownes Wound-wort*, as aforesaid. Since which time my selfe haue cured many grieuous wounds, and some mortall, with the same herbe; one for example done vpon a Gentleman of *Graves Inne* in *Holborne*, M^r. *Edmund Cartwright*, who was thrust into the lungs, the wound entring in at the lower part of the *Thorax*, or the brest-blade, euen through that cartilaginous substance called *Mucronata Cartilago*, insomuch that from day to day through that cartilaginous substance called *Mucronata Cartilago*, insomuch that from day to day the frothing and puffing of the lungs did spew forth of the wound such excrements as it was possessed of, besides the Gentleman was most dangerously vexed with a double quotidian feuer; whom by Gods permission I perfectly cured in very short time, and with this *Clownes* experiment, and some of my foreknowne helpes, which were as followeth.

First I framed a slight vnguent hereof thus: I tooke foure handfulls of the herbe stamped, and put them into a pan, whereunto I added foure ounces of *Barrowes grease*, halfe a pinte of oyle Oliue, wax three ounces, which I boyled vnto the consumption of the iuyce (which is known when the stuffe doth not bubble at all) then did I straine it, putting it to the fire againe, adding thereto two ounces of *Turpentine*, the which I suffered to boyle a little, reseruing the same for my vse.

The which I warmed in a sawcer, dipping therein small soft tents, which I put into the wound, defending the parts adioyning with a plaister of *Calcitheos*, relented with oyle of roses: which manner of dressing and preserving I vsed euen vntill the wound was perfectly whole: notwithstanding once in a day I gaue him two spoonfulls of this decoction following.

I tooke a quart of good *Claret Wine*, wherein I boyled an handfull of the leaues of *Solidago* *Saraceni*.

Saracemica, and Saracens Confound, or foure ounces of honey, whereof I gaue him in the morning two spoonfulls to drinke in a small draught of wine tempered with a little Sugar.

E In like manner I cured a Shoo-makers seruant in Holburne, who intended to destroy himselfe for causes knowne vnto many now liuing : but I deemed it better to couer the fault, than to put the same in print, which might moue such a gracelesse fellow to attempt the like : his attempt was thus ; First, he gaue himselfe a most mortall wound in the throat, in such sort, that when I gaue him drinke it came forth at the wound, which likewise did blow out the candle : another deep and grievous wound in the brest with the said dagger, and also two others in *Abdomine* or the nether belly, so that the *Zirbus* or fat, commonly called the caule, issued forth, with the guts likewise : the which mortall wounds, by Gods permission, and the vertues of this herbe, I perfectly cured within twenty dayes : for the which the name of God be praised.

CHAP. 391. Of *Magydare*, or *Lasfer-wort*.

† *Laserpitium*.
Lasfer-wort.

¶ The Description.

IT seemeth that neither *Dioscorides* nor yet *Theophrastus* haue euer seene *Laserpitium*, *Sagapnum*, or any other of the gummiferous roots, but haue barely and nakedly set downe their iudgments vpon the same, either by heare-say, or by reading of other mens Workes. Now then seeing the old Writers be vnperfect herein, it behooueth vs in this case to search with more diligence the truth hereof ; and the rather, for that very few haue set forth the true description of that Plant which is called *Laserpitium*, that is indeed the true *Laserpitium*, from the roots whereof flow that sap or liquor called *Lasfer*. This plant, as *Pena* and *Lobel* themselues say, was found out not far from the Isles which *Dioscorides* calls *Stoëchades*, ouer against *Maffilia*, among sundry other rare plants. His stalke is great and thicke like *Ferula*, or *Fennell* gyant : The leaues are like vnto the common *Smallage*, and of an vnpleasant fauour. The floures grow at the top of the stalkes, tuft-fashion like *Ferula* or *Fennell* : which being past, there suc-

ceed broad and flat seeds like *Angelica*, of a good fauour, and of the colour of *Box*. The roots are many, comming from one head or chiefe root, and are couered over with a thicke and fat barke. These roots and stalkes being scarified or cut, there floweth out of them a strong liquor, which being dried is very medicinable, and is called *Lasfer*.

¶ The Place.

There be sundry sorts of *Lasfer*, flowing from the roots and stalkes of *Laserpitium*, the goodnesse or qualitie whereof varieth according to the countrey or clymate wherein the plant groweth. For the best groweth vpon the high mountaines of *Cyrene* and *Africa*, and is of a pleasant smell : in *Syria* also, *Media*, *Armenia*, and *Lybia* ; the liquor of which plant growing in these places is of a most strong and detestable fauour. *Lobel* reporteth, that *Iacobus Rainaudus* an Apothecarie of *Maffilia* was the first that made it knowne, or brought the plants thereof to *Montpellier* in France, vnto the learned *Rondeletius*, who right well beholding the same, concluded, that of all the kindes of *Ferula* that he had euer seene, there was not any so answerable vnto the true *Laserpitium* as this onely plant.

¶ The Time.

This Plant floureth in *Montpellier* about *Midsummer*.

¶ The

¶ The Names.

It is called in Latine *Laserpitium*: in English, *Laseroort*, and *Magydare*: the gum or liquor that issueth out of the same is called *Lasar*, but that which is gathered from those plants that doe grow in Media and Syria, is called *Asa fatida*.

¶ The Nature.

Laserpitium, especially the root, is hot and drie in the third degree: *Lasar* is also hot and drie in the third degree, but it exceedeth much the heate of the leaues, stalkes, and rootes of *Laserpitium*.

¶ The Vertues.

The root of *Laserpitium* well pounded, or stamped with oile, scattereth clotted bloud, taketh away blacke and blew markes that come of bruises or stripes, cureth and dissolueth the Kings-euill, and all hard swellings and botches, the places being annointed or plaistered therewith. A

The same root made into a plaister with the oile of Ireos and wax, doth both assuage and cure the Sciatica, or gout of the hip or huckle bone. B

The same holden in the mouth and chewed, doth assuage the tooth-ache; for they are such roots as draw from the braine a great quantite of humors. C

The liquor or gum of *Laserpitium*, especially the *Lasar* of Cyrene broken and dissolved in water and drunken, taketh away the hoarsenesse that commeth suddenly: and being supt vp with a reare egge, cureth the cough: and taken with some good broth or supping, is good against an old pleurisie. D

Lasar cureth the iaundies and drop sic, taken with dried figs: also being taken in the quantitie of a scruple, with a little pepper and Myrrhe, is very good against shrinking of sinewes, and members out of joint. E

The same taken with honie and vineger, or the syrrup of vineger, is very good against the falling sicknesse. F

It is good against the flux of the belly comming of the debilitie and weaknesse of the stomacke (called in Latine *Celiacus morbus*) if it be taken with raisons of the Sun. G

It driueth away the shakings and shüerings of agues, being drunke with wine, pepper, & white Frankincense. Also there is made an electuarie thereof called *Antidotus ex succo Cyrenaisco*, which is a singular medicine against feuer quartaines. H

It is excellent against the bitings of all venomous beasts, and venomous shot of darts or arrowes, not onely taken inwardly, but also applied outwardly vpon wounds. I

It bringeth to maturation, and breaketh all pestilentiall imposthumes, botches and carbuncles, being applied thereto with Rue, Salt-peter, and honie: after the same manner it taketh away corns after they haue been scarified with a knife. K

Being laied to with Copperas and Verdigrease, it taketh away all superfluous outgrowings of the flesh, the Polypus that happeneth in the nose, and all scurue manginesse. L

If it be applied with vineger, pepper and wine, it cureth the naughtie scurfe of the head, and falling off of the haire. M

The gum or liquor of *Laserpitium* which groweth in Armenia, Lybia, and sundry other places, is that stinking and lothsome gum called of the Arabian Physitions *Asa* and *Assa*, as also with vs in shoppes *Asa fatida*: but the *Laserpitium* growing in Cyrene is the best, and of a reasonable pleasant smell, and is called *Lasar* to distinguish and make difference betweene the two iuices, though *Asa fatida* be good for all purposes aforesaid, yet is it not so good as *Lasar* of Cyrene: it is good also to smell vnto, and to be applied vnto the nauels of women vexed with the choking, or rising of the mother. N

† That figure which formerly was in this place, was of the common Louage described in the following chapter.

CHAP. 392. Of common Louage.

¶ The Description.

Antient writers haue added vnto this common kinde of Louage, a second sort, yet knowing that the plant so supposed is the true *Siler montanum*, and not *Leuisticum*, though others haue also deemed it *Laserpitium*. These two suppositions are easily answered, sith they bee sundrie kindes of plants, though they be very neere in shape and faculties one vnto another. This plant being

† *Leuisticum vulgare.*
Common Louage.

peth digestion; wherefore the people of Genes in times past did vse it in their meates, as wee doe pepper, according to the testimonie of *Ant. Musa*.
C The distilled water of Louage cleareth the sight, and putteth away all spots, lentils, freckles, and rednesse of the face, if they be often washed therewith.

† The figure which was here was of the *Siler montanum*, or *Seseli Officinorum*.

being our common garden Louage, hath large and broad leaues, almost like to smallage. The stalks are round, hollow and knottie, 3. cubits high, hauing spoky tufts, or bushy rundles, and at the top of the stalks of a yellow colour, a round, flat, and browne seed, like the seede of Angelica: the root is long and thicke, and bringeth forth euery yeare new stems.

¶ The Place.

The right *Leuisticum* or Louage groweth in sundry gardens, and not wild (as far as I know) in England.

¶ The Time.

Louage floureth most commonly in Iuly and August.

¶ The Names.

It is called in Latine *Leuisticum*: and by some, *Ligusticum*: of other some, *Siler montanum*, but not truly: in High Dutch, *Libstockel*: in French, *Liuische*: in Low Dutch, *La-uetse*: in English, Louage.

¶ The Nature.

This plant is hot and drie in the third degree.

¶ The Vertues.

The roots of Louage are very good for all inward diseases, driving away ventosities or windinesse, especially of the stomacke.

The seed thereof warmeth the stomack, helpe

CHAP. 393. Of Cow Parsnep.

¶ The Description.

THIS plant *Sphondylium* groweth in all Countries, and is knowne by the name of wilde Parsnep or *Sphondylium*, whereunto it effectually answereth, both in his grieuous and ranke sauour, as also in the likenesse of the root, whereupon it was called *Sphondylium*; and of the Germanes, *Acanthus*, but vntruly: the leaues of this plant are long and large, not much vnlike the leaues of wilde Parsnep, or *Panax Heracleum*; deeply notched or cut about the edges like the teeth of a saw, and of an ouerworne greene colour. The floures grow in tufts or rundles, like vnto wilde Parsneps: the root is like to Henbane: this herbe in each part thereof hath an euill sauour, and differeth from the right *Acanthium*, not onely in faculties, but euen in all other things.

¶ The Place.

This plant groweth in fertile moist medowes, and feeding pastures, very commonly in all parts of England, or elsewhere, in such places as I haue trauelled.

¶ The Time.

Sphondylium floureth in Iune and Iuly.

¶ The Names.

It is called in Greek *Σφονδύλιον*: in Latine likewise *Sphondylium*: the in shops of High and Low Germanie

† *Sphondylium.*
Cow Parsnep.

† The figure formerly was of the *Pastinaca sylvestris*, or *Elaphoglossum* of *Tabernaemontani*, and the figure that should have been here was afterwards, under the title of *Hippocrepis*.

many *Branca vrsina*, who vnadvisedly in times past haue vsed it in clysters, instead of Brancke Vrsine, and thereupon haue named it **Bernclaw**: in English, Cow Parsnep, meadow Parsnep, and Madnep.

¶ *The Nature.*

Cow Parsnep is of a manifest warm complexion.

¶ *The Vertues.*

The leaues of this plant do consume and dissolue cold swellings if they be bruised and applied thereto. A

The people of Polonia and Lituania vse to make drinke with the decoction of this herbe, and leuen or some other thing made of meale, which is vsed in stead of beere and other ordinarie drinke. B

The seede of Cow parsnep drunken, scoureth out flegmaticke matter through the guts, it healeth the iaundice, the falling sicknesse, the strangling of the mother, and them that are short winded. C

Also if a man be falne into a dead sleepe, or a swoone, the fume of the seed will waken him againe. D

If a pihrenticke or melancholicke mans head bee annointed with oile wherein the leaues and roots haue beene sodden, it helpeth him very much, and such as be troubled with the head-ache and the lethargie, or sicknesse called the forgetfull euill. E

CHAP. 394. Of Herbe Frankincense.

¶ *The Description.*

1 **T**Here hath beene from the beginning diuers plants of sundry kindes, which men haue termed by this glorious name *Libanotis*, onely in respect of the excellent and fragrant smell which they haue yeelded vnto the senses of man, somewhat resembling Frankincense. The sent and smell *Dioscorides* doth ascribe to the root of this first kinde, which bringeth forth a long stalk with ioints like Fennell, whereon grow leaues almost like Cheruill or Hemlocks, sauing that they be greater, broader, and thicker: at the top of the stalkes grow spokie tassels bearing whitish floures, which do turne into sweet smelling seed, somewhat flat, and almost like the seed of *Angelica*. The root is blacke without, and white within, hairie aboue, at the parting of the root and stalke like vnto *Meum* or *Peucedanum*, and saureth like vnto *Rosine*, or Frankincense.

2 The second kinde of *Libanotis* hath also a straight stalke, full of knots and ioints: the leaues are like vnto Smallage: the floures grow in tassels like vnto the former, and bring forth great, long and vneuen seed, of a sharpe taste: the root is like the former, and so is the whole plant very like, but lesser.

3 The third kinde of *Libanotis* differeth somewhat from the others in forme and shape, yet it agreeth with them in smell, which in some sort is like Frankincense: the leaues are whiter, longer, and rougher than the leaues of Smallage: the stalks do grow to the height of two cubits, bearing at the top the spokie tufts of Dill, somewhat yellow: the root is like the former, but thicker, neither wanteth it hairie tassels at the top of the root; which the others also haue, before rehearsed.

1 *Libanotis Theophrasti maior.*
Great herbe Frankinsence.

2 *Libanotis Theophrasti minor.*
Small herbe Frankinsence.

3 *Libanotis Theophrasti nigra.*
Blacke herbe Frankinsence.

4 *Libanotis Galeni, Cachrys veriar.*
Rosemarie Frankincense.

4 I cannot finde among all the plants called *Libanotides*, any one more agreeable to the true and right *Libanotis* of *Dioscorides* than this herbe, which ariseth vp to the height of fve or six cubits with the cleere shining stalks of *Ferula*; diuiding it selfe from his knottie ioints into sundry arms or branches, set full of leaues like Fennell, but thicker and bigger, and fatter than the leaues of *Cotula fetida*, of a grayish Greene colour, bearing at the top of the stalks the tufts of *Ferula*, or rather of Carrots, full of yellow floures: which being past there succeedeth long flat seed like the seed of the Ash tree, smelling like Rosin, or Frankincense, which being chewed filleth the mouth with the tast of Frankincense, but sharper: all the rest of the plant is tender, and somewhat hot, but not vnpleasant: the plant is like vnto *Ferula*, and aboundeth with milke as *Ferula* doth, of a reasonable good sauour.

¶ The Place.

I haue the two last Kindes growing in my garden; the first and second grow vpon the high Deserts and mountaines of Germanie.

¶ The Time.

These herbes do floure in Iuly and August.

¶ The Names.

This herbe is called in Greeke *Λιβανotis*, because their roots do smell like incense, which is called in Greeke *λίβανος*; in Latine, *Rosmarinus*; the first may be Englished great Frankincense Rosemarie; the second small Frankincense Rosemarie; Mr. *Lite* calleth the third in English, blacke Hart-root, the fourth white Hart-root: the seed is called *Cachrys* or *Canchrys*.

¶ The Nature.

These herbes with their seeds and roots are hot and drie in the second degree, and are of a digesting, dissoluing, and mundifying qualitie.

¶ The Vertues.

The leaues of *Libanotis* pounded, stoppe the fluxe of the Hemorrhoides or piles, and supple the swellings and inflammations of the fundament called *Condilomata*, concoct the swellings of the throat called *Strum*, and ripen botches that will hardly bee brought to suppuration or to ripeness.

The iuice of the leaues and roots mixed with honie, and put into the eies, doth quicken the sight, and cleereth the dimnesse of the same.

The seed mingled with honie, doth scoure and cleanse rotten vlcers, and being applied vnto cold and hard swellings consumeth and wasteth them.

The leaues and roots boiled vntill they be soft, and mingled with the meale of Darnell and vinner, asswageth the paine of the gout, if they be applied thereto.

Moreouer being receiued in wine and pepper, it helpeth the iaundice, and prouoketh sweat, and being put into oile and vsed as an ointment, it cureth ruptures also.

It purgeth the disease called in Greeke *Λιπος*; in Latine, *Vitiligo*, or *Impetigo*, that is, the white spot-rines of the skin, chaps, or rifts in the palms of the hands and soles of the feet, and by your patience cousin german to the scab of Naples, transported or transferred into France, and prettily well sprinkled ouer our Northern coasts.

When the seed of *Libanotis* is put into receipts, you must vnderstand, that it is not meant of the seed of *Cachris*, because it doth with his sharpenesse exasperate or make rough the gullet; for it hath a very heating qualitie, and doth drie very vehemently, yea this seed being taken inwardly, or the herbe it selfe, causeth to purge vpward and downward very vehemently.

CHAP. 395. Of Corianders.

¶ The Description.

1 THE first or common kinde of Coriander is a very stinking herbe, smelling like the stinking worme called in Latine *Cimex*: it hath a round stalke full of branches, two foot long. The leaues are of a faint Greene colour, very much cut or iagged: the leaues that grow lowest, and spring first, are almost like the leaues of Cheruill or Parsley, but those which come forth afterward, and grow vpon the stalks, are more iagged, almost like the leaues of Fumitorie, though a great deale smaller, tenderer, and more iagged. The floures are white, and do grow in round tassels like vnto Dill. The seed is round, hollow within, and of a pleasant sent and sauour when it is drie. The root is hard, and of a wooddie substance, which dieth when the fruit is ripe, and soweth it selfe from

from yeare to yeare, whereby it mightily increaseth.

1 *Coriandrum*.
Coriander.

‡ 2 *Coriandrum alterum minus odorum*.
Bastard Coriander.

2 There is a second kinde of Coriander very like vnto the former, sauing that the bottome leaues and stalks are smaller: the fruit thereof is greater, and growing together by couples, it is not so pleasant of saour nor taste, being a wilde kinde thereof, vnfit either, for meat or medicine.

¶ The Place.

Coriander is sowne in fertile fields and gardens, and the first doth come of it selfe from time to time in my garden, though I neuer sowed the same but once.

¶ The Time.

They floure in Iune and Iuly, and deliuer their seed in the end of August.

¶ The Names.

The first is called in Latine *Coriandrum*: in English, Corianders. The second, *Coriandrum alterum*, wilde Corianders.

¶ The Temperature.

The greene and stinking leaues of Corianders are of complexion cold and dry, and very naught, vnwholesome and hurtfull to the body.

The drie and pleasant well saouring seede is warme, and very conuenient to fundrie purposes.

¶ The Vertues.

A Coriander seed prepared and couered with sugar, as comfits, taken after meat closeth vp the mouth of the stomacke, staieth vomiting, and helpeth digestion.

B The same parched or roasted, or dried in an ouen, and drunk with wine, killeth and bringeth forth wormes, stoppeth the laske, and bloody flux, and all other extraordinarie issues of bloud.

The manner how to prepare Coriander, both for meat and medicine.

C Take the seed well and sufficiently dried, whereupon poure some wine and vinegar, and so leaue them to infuse or steepe foure and twentie houres, then take them forth and drie them, and keepe them for your vse.

D The greene leaues of Coriander boiled with the crums of bread or barley meale, consumeth all hot

hot swellings and inflammations: and with Beane meale dissolueth the Kings euill, wens, and hard lumps.

The juice of the leaues mixed and laboured in a leaden mortar, with Ceruse, Litharge of silver, vinegar, and oile of Roses, cureth S. Anthonies fire, and taketh away all inflammations whatsoeuer.

The juice of the greene Coriander leaues, taken in the quantitie of foure dragmes, killeth and poisoneth the body.

The seeds of Coriander prepared with sugar, preuaile much against the gout, taken in some small quantitie before dinner vpon a fasting stomacke, and after dinner the like without drinking immediately after the same, or in three or foure houres. Also if the same be taken after supper it preuaileth the more, and hath more superiority ouer the disease.

Also if it be taken with meate fasting, it causeth good digestion, and shutteth vp the stomacke, keepeth away fumes from rising vp out of the same: it taketh away the sounding in the eares, drieth vp the rheume, and easeth the squinancy.

CHAP. 396. Of Parsley.

Apium hortense.
Garden Parsley.

The Description.

THe leaues of garden Parsley are of a beautiful greene, consisting of many little ones fastned together, diuided most commonly into three parts, and also snipt round about the edges: the stalke is aboue one cubit high, slender, something chamfered, on the top whereof stand spoked rundles, bringing forth very fine little floures, and afterwards small seeds somewhat of a fiery taste: the root is long and white, and good to be eaten.

There is another garden Parsley in taste and vertue like vnto the precedent: the onely difference is, that this plant bringeth forth leaues very admirably crisped or curled like fannes of curled feathers, whence it is called *Apium crispum*, *sive multifidum*, Curl'd Parsley.

There is also kept in some gardens another Parsley called *Apium sive Petroselinum Virginianum*, or Virginian Parsly; it hath leaues like the ordinary, but rounder, and of a yellowish greene colour, the stalkes are some three foot high, diuided into sundry branches whereon grow umbels of whitish floures: the seeds are like, but larger than those of the common Parsley, and when they are ripe they commonly sow themselves, and the old roots die, and the young ones beare seed the second yeere after there sowing.

The Place.

It is sowne in beds in gardens; it groweth both in hot and cold places, so that the ground be either by nature moist, or be oftentimes watered: for it prospereth in moist places, and is delighted with water, and therefore it naturally commeth vp neere to fountaines or springs: *Fuchsius* writeth that it is found growing of it selfe in diuers fenny grounds in Germany.

The Time.

It may be sowne betime, but it slowly commeth vp: it may oftentimes be cut and cropped: it bringeth forth his stalkes the second yeere: the seeds be ripe in Iuly or August.

The Names.

Every one of the Parsleyes is called in Greeke *ανησον*, but this is named, *ανησον κισσιν*, that is to say, *Apium hortense*: the Apothecaries and common Herbarists name it *Petroselinum*: in high Dutch,

Petersilgen: in low Dutch, **Trimen Peterselie**: in French, *du Persil*: in Spanish, *Perejil Inducro*, and *Salsa*: in Italian, *Petrosello*: in English, *Persele*, *Parfely*, common Parsley, and garden Parsley. Yet is it not the true and right *Petroselinum* which groweth among rocks and stones, whereupon it tooke his name, and whereof the best is in Macedonia: therefore they are deceived who thinke that garden Parsley doth not differ from stone Parsley, and that the onely difference is, for that Garden Parsley is of lesse force than the wilde; for wilde herbes are more strong in operation than those of the garden.

¶ *The Temperature.*

Garden Parsley is hot and dry, but the seed is more hot and dry, which is hot in the second degree, and dry almost in the third: the root is also of a moderate heate.

¶ *The Vertues.*

- A The leaues are pleasant in sauces and broth, in which besides that they giue a pleasant taste, they be also singular good to take away stoppings, and to prouoke vrine: which thing the roots likewise do notably performe if they be boiled in broth: they be also delightfull to the taste, and agreeable to the stomacke.
- B The seeds are more profitable for medicine; they make thinne, open, prouoke vrine, dissolve the stone, breake and waste away winde, are good for such as haue the dropsie, draw downe mensēs, bring away the birth, and after-birth: they be commended also against the cough, if they be mixed or boiled with medicines made for that purpose: lastly they resist poisons, and therefore are mixed with treacles.
- C The roots or the seeds of any of them boiled in ale and drunken, cast forth strong venome or poison, but the seed is the strongest part of the herbe.
- D They are also good to be put into clysters against the stone or torments of the guts.

CHAP. 367: Of water Parsley, or Smalage.

Eleselinum, siue Paludapium.

Smalage.

¶ *The Description.*

Smalage hath greene smooth and glittering leaues, cut into very many parcels, yet greater and broader than those of common Parsley: the stalkes be chamfered and diuided into branches, on the tops whereof stand little white floures; after which doe grow seeds something lesser than those of common Parsley: the roote is fastened with many strings.

¶ *The Place.*

This kinde of Parsley delighteth to grow in moist places, and is brought from thence into gardens. † It growes wilde abundantly vpon the bankes in the salt marshes of Kent and Essex. †

¶ *The Time.*

It flourishes when the garden Parsley doth, and the stalke likewise commeth vp the next yeere after it is sowne, and then also it bringeth forth seeds which are ripe in Iuly and August.

¶ *The Names.*

It is called in Greeke *Περσιν* of *Gaza*, *Paludapium*: in shops, *Apium*, absolutely without any addition: in Latine, *Palustre Apium*, and *Apium rusticum*: in high Dutch, *Epsich*: in low Dutch, *Eppe*, and of diuers *Joustroutomereck*: in Spanish and Italian, *Apio*: in French, *de Lache*: in English, Smalage, Marsh Parsley, or water Parsley.

¶ *The Temperature.*

This Parsley is like in temperature and vertues to that of the garden, but it is both hotter and drier,

drier, and of more force in most things: this is seldome eaten, neither is it counted good for sauce, but it is very profitable for medicine.

¶ The Vertues.

The juice thereof is good for many things, it clenseth, openeth, attenuateth or maketh thin; it remoueth obstructions, and prouoketh vrine, and therefore those syrups which haue this mixed with them, as that which is called *Syrupus Bizantinus*, open the stoppings of the liuer and spleene, and are a remedy for long lasting agues, whether they be tertians or quartains, and all other which proceed both of a cold cause and also of obstructions or stoppings, and are very good against the yellow jaundise. A

The same juice doth perfectly cure the malicious and venomous vlcers of the mouth, and of the almonds of the throat with the decoction of Barly and *Mel Rosarum*, or hony of Roses added, if the parts be washed therewith: it likewise helpeth all outward vlcers and foule wounds: with hony it is profitable also for cankers exulcerated, for although it cannot cure them, yet it doth keep them from putrifaction, and preserueth them from stinking: the seed is good for those things for which that of the Garden Parsley is: yet is not the vse thereof so safe, for it hurteth those that are troubled with the falling sicknesse, as by euident proofes it is very well knowne. B

Smallage, as *Pliny* writeth, hath a peculiar vertue against the biting of venomous spiders. C

The juice of Smallage mixed with hony and beane floure, doth make an excellent mundification for old vlcers and malignant sores, and staieth also the weeping of the cut or hurt sinewes in simple members, which are not very fatty or fleshy, and bringeth the same to perfect digestion. D

The leaues boiled in hogs grease, and made into the forme of a pultis, take away the paine of felons and whitlowes in the fingers, and ripen and heale them. E

CHAP. 398. Of Mountaine Parsley.

† *Oreoselinum.*

Mountaine Parsley.

¶ The Description.

THE stalke of mountaine Parsley, as *Dioscorides* writeth, is a span high, growing from a slender root; vpon which are branches and little heads like those of Hemlock, yet much slenderer: on which stalkes do grow the seed, which is long, of a sharpe or biting taste, slender, and of a strong smell, like vnto Cumin: but we can not find that this kinde of Mountaine Parsley is knowne in our age: the leaues of this we here giue are like those of common parsley, but greater and broader, consisting of many slender footstalkes fastened vnto them; the stalke is short, the floures on the spoked tufts be white; the seed small: the root is white, and of a meane length or bignesse, in taste somewhat biting and bitterish, and of a sweet smell.

¶ The Place.

† *Dioscorides* writeth, that mountaine Parsley groweth vpon rockes and mountaines. And *Dodonaeus* affirmeth that this herbe described growes on the hills which diuide Silesia from Moravia, called in times past the countrey of the Marcians: also it is said to be found on other mountaines and hills in the North parts of England.

¶ The Names.

The Grecians doe name it of the mountaines *oreoselinon*, which the Latines also for that cause doe call *Capium Montanum*, and *Montapium*: in English, mountaine Parsley: in Latine, *Apium*: but *Dioscorides* maketh *Petroselinum* or stone Parsley to differ from mountaine Parsley; for saith he, we

we must not be deceiued, taking mountaine Parsley to be that which groweth on rockes : for rocke Parsley is another plant, of some it is called, *Ueulgutta* : in Latine, *Multilona*, (in English, much good :) for it is so named because it is good, and profitable for many things : and this is not altogether vnproperly termed *Oreoselinum*, or mountaine Parsley ; for it groweth as we haue said on mountaines, and is not vnlike to stone Parsley : the seed is not like to that of Cumin, for if it were so: who would deny it to be *Oreoselinum*, or *Dioscorides*, his mountaine Parsley.

¶ The Temperature and Vertues.

A *Oreoselinum*, or mountaine Parsley is, as *Galen* saith, like in faculty vnto Smallage, but more effectually; *Dioscorides* writeth that the seed and root being drunke in wine prouoke vrine, bring downe the menses, and that they are mixed with counterpoisons, diurecticke medicines, and medicines that are hot.

B The root of *Veelgutta*, or much good, is also hot and dry, and that in the later end of the second degree, it maketh thin, it cutteth, openeth, prouoketh, breaketh the stone and expelleth it, openeth the stoppings of the liuer and spleene, and cureth the yellow jaundise: being chewed it helpeth the tooth-ach, and bringeth much water out of the mouth.

† This whole chapter was wholly taken from *Dodonæus* *Pempt. s. lib. 4. cap. 3.* wherefore I haue giuen his figure, which was agreeable to the history, for the figure our Author here gaue, was of the *Selinum montanum pumilum*, farre different from this, as I shall hereafter shew you in the ch. p. of *Pencedanum*.

CHAP. 399. Of stone Parsley of Macedonie.

† 1 *Petroselinum Macedonium*, *Fuchsij*.
Bastard stone Parsley.

† 2 *Petroselinum Macedonicum verum*.
The true Parsley of Macedonia.

¶ The Description.

OF stone Parsley very little is written of the old writers, *Dioscorides* onely saith that this hath seed like to that of *Ameos*, but of a more pleasant smell, sharpe, aromaticall, or spiced : touching the forme of the leaues, the colour of the floures, and fashion of the root

root he writeth nothing at all: and *Pliny* is more brieve; as for *Theophrastus* he doth not so much as name it, making mention onely of Parsley, Alexander, Smallage, and mountaine Parsley.

For stone Parsley *Leonhartus Fuchsius* hath set down a plant, hauing leaues not spred and cut after the manner of garden Parsley, but long, and snipped round about, made vp and fastened to a rib or stem in the midst, something like, but yet not altogether, to the first leaues of the lesser Saxifrage; the stalke is slender, and a cubit and a halfe high; the floures on the spokie tufts are white: the seed something blacke, like to that of Ameos, and garden Parsley, very sweet of smell, something sharpe or biting; the root is slender and full of strings.

Lebel also in stead of the right stone Parsley describeth another, which the Venetians call stone Parsley of Macedonia: this hath leaues like those of garden Parsley, or rather of the Venetian Saxifrage which is the blacke herbe Frankincense formerly described: the stalke is a cubit high, the spokie tufts something white; the seed small, quickly vading (as he saith) inferiour to that of garden Parsley in temperature and vertues; but whether this be the true and right stone Parsley, he addeth, he is ignorant.

¶ The Place.

It groweth on craggy rocks, and among stones: but the best in Macedonia, wherupon it beareth the surname *Macedonicum*, of Macedonia.

¶ The Time.

It floureth in the sommer moneths.

¶ The Names.

It is called in Greeke, *Στάννα*, of the stony places where it groweth: in Latine, *Petrapium*, and *Beyrosolium Macedonicum*: in English, stone Parsley: the Apothecaries know it not: they are farre deceiued that would haue the herbe which *Fuchsius* pictureth to be *Amomum*: for *Amomum* differeth from this, as it is very plaine by the description thereof in *Dioscorides*: but we hold this for the true stone Parsley, till such time as we may learne some other more like in leaues to the Parslies, and in seed, such as that of stone Parsley ought to be: and the very seed it selfe may cause vs to hold this opinion, being so agreeing to the description as no herbe more; for it is sharpe and biting, and of a sweeter smell than is that of Ameos, and of a more spiey sent; yet do not the leaues gaine say it, which though they haue not the perfect forme of other Parsleyes, yet notwithstanding are not altogether vnlike. ¶ The first of these is thought by *Anguillara*, *Turner*, *Gesner*, *Cordus*, and others, to be the *Sison* of *Dioscorides*, and *Tragus* calls it, *Amomum Germanicum*, and the seeds in shops retaine the name of *Sem. Amom.* The second is thought by *Columna* to be the second *Danum* of *Dioscorides*. ¶

¶ The Temperature.

The seed of stone Parsley which is most commonly vsed, is hot and dry, hauing withall a cutting quality.

¶ The Vertues.

It prouoketh vrine, and bringeth downe the floures: it is profitable against winde in the stomacke and collicke gut, and gripings in the belly: for it is, as *Galen* saith, *σπαστικός*, that is to say, a vntwister or consumer of winde: it is a remedy against paine in the sides, kidnies, and bladder, it is also mixed in counterpoisons: *Dioscorides*.

¶ The first figure that was formerly in this chapter should haue been in the second place, and that in the second place was of Alexander, and should haue been put in the following chapter.

¶ CHAP. 400. Of Corne Parsley, or Hone-wort.

¶ The Description.

THIS herbe commeth vp at the first from seed like Parsley, with two small long narrow leaues, the next that spring are two small round smooth leaues nickt about the edges, and so for two or three couples of leaues of the next growth there are such round leaues growing on a middle rib by couples, and one round one, also at the top, after as more leaues spring vp, so the fashion of them also change, that is to say, euery leafe hath about eight or nine small smooth greene leaues, growing on each side of a middle rib one opposite against another, and one growing by it selfe at the top, and are finely snipt or indented about the edges, in forme resembling those of *Sium odoratum* *Tragi*, but not so bigge, long, or at all brownish; amongst which rise vp many small round straked stalkes or branches, about two foot long, now and then aboue twenty from one root, sometimes growing vpright, sometimes creeping not farre from the ground, joynted or kneed, and

‡ *Selinum Sij folijs.*
Honewoort.

and diuiding themselves into very many branches, at euery joynt groweth one leate smaller than the former, which together with the lowermost perish, so that there is feldome one greene leafe to be seen on this herbe when the seed is ripe; the floures are white, and grow most commonly at the tops of the branches, sometimes at most of the joynts euen from the earth, in vneuen or vnderly umbells, euery floure hauing five exceeding small leaues, flat, and broad at the toppe, and in the middle very small cheiues with purple tops, the whole floure not much exceeding the bignesse of a small pins head, which being past there commeth vp in the place of euery floure two small gray crooked straked seeds, like Parsley seeds, but bigger, in taste hot and aromaticall. The root is small and whitish, with many threds not so big as Parsley roots. It beginneth to floure about the beginning of Iuly, & so continues floueing a long time; part of the seed is ripe in August, and some scarce in the beginning of October, mean while some falleth, wherby it renueth it selfe, and groweth with flourishing greene leaues all the winter.

I tooke the description of this herbe the yeere, 1620. but obserued it long before, not knowing any name for it: first I refered it to *Sium*, calling it, *Sium terrestre*, and *Sium segetum & agrorum*; afterwards vpon sight of *Selinum peregrinum primum Clusii*, which in

some respects resembleth this herbe, I named it *Selinum Sij folijs*; yet wanting an English name, at length about the yeere 1625. I saw Mistris *Vrsula Leigh* (then seruant to Mistris *Bilson* of Mapledurham in Hampshire, and now (5. *Marcij* 1632. wife to Master *William Mooring* Schoole-master of Petersfield, a Towne neere the said Mapledurham) gather it in the wheate erthes about Mapledurham aforesaid (where in such like grounds it still groweth, especially in clay grounds) who to'd me it was called Honewort, and that her Mother mistris *Charitie Leigh* late of Brading in the Isle of Wight deceased, taught her to vse it after the manner heere expressed, for a swelling which shee had in her left cheeke, which for many yeeres would once a yere at the least arise there, and swell with great heat, rednesse, and itching, vntil by the vse of this herbe it was perfectly cured, and rose no more nor swelled, being now (5. *Martij* 1632) about twenty yeeres since, only the scar remaineth to this day. This swelling her mother called by the name of a Hone, but asking whether such tumors were in the said Isle vsually called Hones she could not tell, by reason shee was brought from Brading aforesaid young, and not being aboue twelue yeeres old when shee vsed this medicine.

¶ The Vertues.

- A Take one handfull of the greene leaues of this Honewort, and stampe them, put to it about halfe a pinte or more of beere, straine it, and drinke it, and so continue to drinke the like quantity euery morning fasting till the swelling doth abate, which with or in her was performed in the space of two weekes at the most. August, 18. 1620. *John Goodyer*: ‡

CHAP. 401. Of *Alexander*.

¶ The Description.

THe leaues of *Alexander* are cut into many parcells like those of *Smallage*, but they be much greater and broader, smooth also, and of a deepe greene colour: the stalke is thicke, oftentimes a cubit high: the floures be white, and grow vpon spokie tufts: the seed is thicke, long,

long, blacke something bitter, and of an aromaticall or spicy smell: the root is thicke, blacke without, white within, like to a little Radish, and is good to be eaten. out of which being broken or cut, there issueth forth a juice that quickly waxeth thicke, hauing in it a sharpe bitternesse, like in taste vnto Myrrhe: which thing also *Theophrastus* hath noted, there issueth out of it, saith he, a juice like Myrrhe.

† *Hippofelinum*.
Alexanders.

¶ The Place.

Alexanders or great Parsley groweth in most places of England.

¶ The Time.

The seed waxeth ripe the second yeere, in the Moneth of August.

¶ The Names.

It is called in Greeke, of the greatnesse wherein, it excelleth the other Parsleyes *ἰσμοῖον*, or Horse Parsley; of *Γαζα*, *Equapium*: it is also named *Olus aiurum*, or the blacke pot-herbe; and of diuers Syluestre *Apium*, or wilde Parsley; of *Galen* and certaine others, *ἰσμοῖον*, by reason of the juice that issueth forth thereof, that is, as we haue said, like vnto Myrrhe, which is called in Greeke *ἰσμοῖον*: there is also another *Smyrnum* of mount Aman, of which we do write in the 404. chapter: the Apothecaries call it *Petroselinum Macedonicum*: others, *Petroselinum Alexandrinum*: the Germanes, *Grosz Epsich*: the Low-Country-men, *Peterselie van Macedonion*: in Spanish, *Perexil Macedonico*: the French, and Englishmen, *Alexandre*, *Alexanders*.

¶ The Temperature.

The seed & root of Alexanders, are no lesse hot and dry than are those of the Garden Parsley, they cleanse and make thinne, being hot and dry in the third degree.

¶ The Vertues.

Dioscorides saith, that the leaues and stalkes are boiled and eaten, and dressed alone by themselves, or with fishes: that they are preserved raw in pickle: that the root eaten both raw and sod, is good for the stomacke: the root hereof is also in our age serued to the table raw for a sallade herbe.

The seeds bring downe the floures, expell the secondine, breake and consume winde, prouoke vrine, and are good against the strangury: the decoction also of the root doth the same, especially if it be made with wine.

† The figure formerly here was of *Spondylium*, and that belonging to this place was put in the foregoing chapter.

CHAP. 402. Of wilde Parsley.

¶ The Description.

THIS is like to the kindes of Parsleyes in the sundry cuts of the leaues, and also in the bignesse; for they be broad and cut into diuers parcels: the stalkes are round, chamfered, set with certaine joints, hollow within, a cubit high or higher, two or three comming forth together out of one root, and in the nether part many times of a darke reddish colour. The floures be white, and grow vpon spokie tufts: the seed is round, flat, like that of Dill: the root is white within, and diuided into many branches and strings. This plant in what part soeuer it be cut or broken, yeeldeth forth a milky juice.

¶ The

† *Apium sylvestre sine Thysellium.*

Wilde Parsley.

¶ *The Place.*

It is found by ponds sides in moist and dankish places, in ditches also, hauing in them standing waters, and oftentimes by old stockes of Alder trees.

† I haue not as yet obserued this plant growing wilde with vs. †

¶ *The Time.*

It floureth and bringeth forth seed in Iune and Iuly.

¶ *The Nature.*

The shops of the Low countries haue mis-called it in times past by the name of *Meum*, and vsed it for the right Mew, or Spiknel wort. The Germanes name it *Olsenich*; *Valerius Cordus*, *Olsenichium*: diuers in the Low Countries call it *wilde Eppe*: that is to say in Latine, *Apium sylvestre*, or wilde Parsley: and some, *water Eppe*: that is, *Hydrosetinum*, or *Apium aquatile*, water Parsley: and oftentimes is it named, as we haue already written, *Eleoselinum*, and *Sium*. It may be more rightly termed in Latine, *Apium sylvestre*, and in English, wilde Parsley.

Dioscorides hath made mention of wilde Parsley in the chapter of *Daucus* or wilde Carrot: and *Theophrastus* in his seuenth booke, where he maketh the Parsleyes to differ both in leaues and stalkes, and sheweth that some

haue white stalkes, others purple, or else of sundry colours, and that there is also a certaine wilde Parsley; for he saith that those which haue the purple stalkes, and the stalkes of diuers colours, come neereest of all to the wilde Parsley. And therefore seeing that *Olsenichium*, or wilde Parsley, hath the lower part of the stalke of a purplish colour, and like in leaues to Parsley, which in times past we thought good rather to call *Apium sylvestre*, or wilde Parsley, than to erre with the Apothecaries, and to take it for Mew. And after when we now know that it was held to be *Thysellium Plinij*, and that we could alledge nothing to the contrary, we also setled our selues to be of their opinion; and the rather, because the faculties are agreeable. *Thysellium*, saith *Pliny*, lib. 25. chapter 11. is not vnlike to Parsley: the root hereof purgeth flegme out of the head; which thing also the root of *Olsenichium* doth effectually performe, as we will forthwith declare. The name also is agreeable, for it seemeth to be called *daucus*, because it extendeth it selfe, in Greeke, *δαυκος*, thorow ditches, or marish places.

¶ *The Temperature.*

The root hereof is hot and dry in the third degree.

¶ *The Vertues.*

A The root being chewed, bringeth by the mouth flegme out of the head, and is a remedy for the tooth-ach, and there is no doubt but that it also makes thin, cutteth and openeth, prouoketh vrine, and bringeth downe the floures, and doth likewise no lesse but more effectually performe those things that the rest of the Parsleyes do.

† The figure formerly put in this place was of the *Censilium sylvestre* of *Tabernaemontanus*, whose history I intend hereafter to giue you.

CHAP. 403. Of bastard Parsley.

¶ *The Description.*

T The first kinde of bastard Parsley is a rough hairy herbe, not much vnlike to Carrots: the leaues are like to those of Corianders, but parted into many small jagges: at the top of the branches do grow shadowie umbels, or spokie ruddles, consisting of many small white floures:

1 *Caucalis albis floribus.*
Bastard Parsley with white flowers.

2 *Caucalis Apij folijs flore rubro.*
Bastard Parsley with red flowers.

3 *Caucalis Peucedanij folio.*
Hogs Parsley

4 *Caucalis maior Clus.*
Great rough Parsley.

floures; the seed is long and rough, like the seed of Carrots, but greater: the root is straight and single, growing deepe into the ground, of a white colour, and in taste like the Parsnep.

2 There is another sort like vnto the former, sauing that the leaues thereof are broader, and the floures are of a reddish colour: there hath great controuersie risen about the true determination of *Caucalis*, because the Latine interpretation of *Dioscorides* is greatly suspected, containing in it selfe much superfluous matter, not pertinent to the history: but wee deeme that this plant is the true *Caucalis*, the notes set downe declare it so to be: the floures, saith he, are reddish: the seeds covered with a rough huske set about with prickles, which cleaue vnto garments that it toucheth, as doe Burs; which roughnesse being pilled off, the seed appeares like vnto hulled Otes, not vnpleasant in taste, all which do shew it to be the same.

3 There is likewise another sort that hath a long single root, thrummed about the vpper end with many thrummy threds of a browne colour: from which riseth vp diuers stalkes full of joynts or knees, covered with a sheath or skinnie filme, like vnto that of *Micum*: the leaues are finely cut or jagged, resembling the leaues of our English Saxifrage: the floures grow at the top of the stalkes in spoky rundles like Fennell: the seed is small like that of Parsley.

† 5 *Caucalis minor flosculis rubentibus.*
Hedge Parsley.

† 6 *Caucalis nodosa echinoto semine.*
Knotted Parsley.

† 4 *Clusius* vnder the name of *Caucalis maior* hath described and figured this, which hath many crested straight stalkes some two cubits high or more, which are diuided into sundry branches, and at each joynt send forth large & winged leaues somewhat like those of Angelica, but rougher, and of a darker Greene; at the tops of the branches grow umbels of whitish floures, being of somewhat a purplish or flesh colour vnderneath; and these are succeeded by broad seed almost like those of the Cow-Parsnep, but that they are rougher, and forked at the top, and prickly: the root is white, hard and woody. It floures in Iune, ripens the seed in Iuly and August, and then the root dyes, and the seed must be sowne in September, and so it will come vp and continue Greene all the winter.

5 Besides these formerly described there are two others growing wilde with vs: the first of these, which I haue thought good to call Hedge, or field Parsley, (because it growes about hedges, and in plowed fields very plentifully euery where) hath crested hollow stalkes growing vp to some cubit and halfe high, whereon stand winged leaues made of sundry little longish ones, set one against

against another, snipt about the edges, and ending in a long and sharpe pointed leafe: these leaues as also the stalkes are somewhat rough and harsh, and of a darke Greene color: the floures are small and reddish, and grow in little umbels, and are succeeded by longish little rough seed of somewhat a strong and aromaticke taste and smell. It is an annuall plant, and floures commonly in Iuly, and the seeds are ripe in August. *Cordus* and *Thalys* call it *Daucoides minus*; and *Bauhine*, *Caucalis semine aspeo flosculis subrubentibus*. There is a bigger and lesser variety or sort of this plant, for you shall find it growing to the height of two cubits, with leaues and all the vpper parts answerable, and you may againe obserue it not to exceed the height of halfe a foot.

6 This other, which *Bauhine* hath first set forth in writing by the name of *Caucalis nodosa echinata* *semine*, hath a white and long root, from which it sends vp sundry small crested and rough branches which commonly lie along vpon the ground, and they are commonly of an vnequall length, some a cubit long, other some scarce two handfulls: the leaues are small, rough, winged, and deeply jagged, and at the setting on of each leafe close to the stalkes vsually vpon very short foot-stalkes grow small little floures of colour white, or reddish, and made of fve little leaues apeece: after these follow the seed, round, small and rough, and they grow close to the stalkes. It floures in Iune and Iuly, and growes wilde in sundry places, as in the fields, and vpon the bankes about S. Iames, and Pickadilla. *Fabius Columna* iudges it to be the true *Scandix* of the Antients. †

There is likewise one of these found in Spaine, called *Caucalis Hispanica*, like the first: but it is an annuall plant, which perishes at the first approach of winter, the which I haue sowne in my garden, but it perished before the seed was perfected.

¶ The Place.

These plants do grow naturally vpon rockes and stony grounds: we haue the first and the third in our pastures in most places of England: that with red floures is a stranger in England.

† I haue not heard that the third growes wilde with vs, but the second was found growing in the corne fields on the hilles about Bathe, by Mr. Bowles. †

¶ The Time.

They floure and flourish from May to the end of August.

¶ The Names.

Bastard Parsley is called in Greeke *καυκαλις*: in Latine also *Caucalis*: of some, *Daucus sylvestris*: among the bastard names of *Democritus*, *Baker*: in Latine, *Pes Gallinaceus*, *Pes Pulli*: the Egyptians name it *Seselis*: the country-men of Hetruria, *Petrosello saluatico*: in English, bastard Parsley, and Hennes foot.

¶ The Temperature and Vertues.

Dioscorides saith, that bastard Parsley is a pot-herbe which is eaten either raw or boiled, and prouoketh vrine. A

Pliny doth reckon it vp also among the pot-herbes: *Galen* addeth, that it is preferred in pickle for sallades in winter. B

The seed of bastard Parsley is evidently hot and dry, and that in the second degree: it prouoketh vrine, and bringeth downe the desired sicknesse: it dissolueth the stone, and driueth it forth. C

It taketh away the stoppings of the liuer, spleene, and kidnies: it cutteth and concocteth raw and flegmaticke humours: it comforteth a cold stomack, dissolueth winde, it quickneth the sight, and refresheth the heart, if it be taken fasting. D

Matthiolus in his Commentaries vpon *Dioscorides*, the second booke, attributeth vnto it many excellent vertues, to prouoke venery and bodily lust, and erection of the parts. E

† The figure which belonged to the third description in this chapter was formerly put for English Saxifrage.

CHAP. 404. Of Candy Alexanders.

¶ The Description.

Dioscorides and *Pliny* haue reckoned *Smyrnum* among the kindes of Parsley, whose iudgements while this plant is young, and not growne vp to a stalke, may stand with very good reason, for that the young leaues next the ground are like to Parsley, but somewhat thicker and larger: among which riseth vp a stalke a cubit high, and somewhat more, garnished with round leaues, farre different from those next the ground, inclosing the stalke about like Thorow wax, or *Perfoliata*, which leaues are of a yellow colour, and do rather resemble the leaues of Fole-foot than Parsley: at

Smyrniū Creticum.
Candy Alexander.

at the top of the stalkes doe grow round spoke tufts of a yellow color, after which cometh round and blacke seed like Coleworts, of a sharpe and bitter taste like Myrrhe: the root is white and thicke, contrary to the opinion of *Dodonæus*, who saith it is blacke without, but I speake that which I haue seen and prooued.

¶ *The Place.*

Smyrniū groweth naturally vpon the hills and mountaines of Candy, and in my garden also in great plenty: also vpon the mountain Amanus in Cilicia.

¶ *The Time.*

Smyrniū floureth in Iune, and the seed is ripe in August.

¶ *The Names.*

This plant is called in Latine, *Smyrniū*: in Greeke, *quinn* in Cilicia, *Petroselinum*, and as *Galen* testifieth, some haue called it, *Hipposelinum agreste*: in English, Candy Alexanders, or Thorow bored Parsley.

¶ *The Nature.*

Smyrniū is hot and dry in the third degree.

¶ *The Vertues.*

The leaues of *Smyrniū* dissolue wens and hard swellings, dry vpon vlcers and excoriations, and glew wounds together.

- A** The seeds are good against the stoppings of the spleene, kidnies, and bladder.
- B** Candy Alexanders hath force to digest and wast away hard swellings, in other things it is like to garden Parsley, and stone Parsley, and therefore we vse the seed beereof to prouoke the desired sicknesse, and vrine, and to helpe those that are stuffed in the lungs, as *Galen* writeth.
- C** The root is hot, so is the herbe and seed, which is good to be drunke against the biting of serpents: it is a remedy for the cough, and profitable for those that cannot take their breath vnlesse they do sit or stand vpright: it helpeth those that can hardly make their water: the seed is good against the infirmity of the spleene or milt, the kidnies and bladder: it is likewise a good medicine for those that haue the dropisie, as *Dioscorides* writeth.

CHAP. 405. Of Parsneps.

¶ *The Description.*

1 The leaues of the tame or Garden Parsneps are broad, consisting of many small leaues fastened to one middle rib like those of the ash tree: the stalke is vpright, of the height of a man: the floures stand vpon spoke tufts, of colour yellow, after which commeth the seed flat and round, greater than those of Dil: the root is white, long, sweet, and good to be eaten.

2 The wilde Parsnep is like to that of the Garden, in leaues, stalke, tuft, yellow floures, flat and round seed, but altogether lesser: the root is small, hard, woody, and not fit to be eaten.

¶ *The Place.*

The garden Parsnep requireth a fat and loose earth, and that that is digged vp deepe.

The wilde Parsnep groweth in vntoiled places, especially in the salt marshes, vpon the bankes and borders of the same: the seed whereof being gathered and brought into the garden, and sowed

in

1 *Pastinaca latifolia sativa*:
Garden Parsneps.

2 *Pastinaca latifolia sylvestris*.
Wilde Parsneps.

in fertillground, do proue better roots, sweeter and greater than they that are sowne of seeds gathered from those of the garden.

They floure in Iuly and August, and seed the second yeare after they be sowne.

¶ *The Names.*

The Herbarists of our time do call the garden Parsneps *carolinus*, and *Pastinaca*, and therefore wee haue surnamed it *Latifolia*, or broad leaved, that it may differ from the other garden Parsnep with narrow leaues, which is truly and properly called *Staphylinus*, that is, the garden Carrot. Some Physicians doubting, and not knowing to what herbe of the Antients it should be referred, haue fained the wilde kinde hereof to be *Panacis species*, or a kind of Alheale: diuers haue named it *Baucia*; others, *Branca Leonina*, but if you diligently marke and confer it with *Elaphoboscum* of *Dioscorides*, you shal hardly finde any difference at all: but the plant called at Montpelier *Pakulum Ceruinum*: in English, Harts fodder, supposed there to be the true *Elaphoboscum*, differeth much from the true notes thereof. Now *Baucia*, as *Iacobus Mantinus* reporteth in *Luminari maiore*, is *Dioscorides*, and the old Writers *Pastinaca*, that is to say, *Tenuifolia*, or Carrot: but the old writers, and especially *Dioscorides* haue called this wilde Parsnep by the name of *Elaphoboscum*: and wee doe call them Parsneps and Mypes.

¶ *The Temperature.*

The Parsnep root is moderately hot, and more drie than moist.

¶ *The Vertues.*

The Parsneps nourish more than doe the Turneps or the Carrots, and the nourishment is somewhat thicker, but not faultie nor bad; notwithstanding they be somewhat windy: they passe through the bodie neither slowly nor speedily: they neither binde nor loose the belly: they prouoke vrine, and lust of the bodie: they be good for the stomacke, kidneies, bladder, and lungs.

There is a good and pleasant food or bread made of the roots of Parsneps, as my friend M^r. *Plat* hath set forth in his booke of experiments, which I haue made no triall of, nor meane to do.

The seed is hotter and drier euen vnto the second degree, it mooueth vrine, and consumeth winde.

D It is reported, saith *Dioscorides*, that Deare are preserved from bitings of Serpents, by eating of the herbe *Elaphoboscum*, or wilde Parsnep, wherupon the seed is given with wine against the bitings and stings of Serpents.

^f Both the figures that formerly were in this chapter were of the Garden Parsnep; the first being that of *Lobel*, and the second that of *Tabernaemontanus*: that which should haue bene in the second place, was formerly put for *Sphondylium*.

CHAP. 406. Of Skirrets.

Sisarum. Skirrets.

¶ The Description.

THE leaues of the Skirret do likewise consist of many small leaues fastened to one rib, euerie particular one whereof is something nicker in the edges, but they are lesser, greener, and smoother than those of the Parsnep. The stalks be short, and seldome a cubit high; the floures in the spoked tufts are white, the roots be many in number, growing out of one head an hand breadth long, most commonly not a finger thick, they are sweet, white, good to be eaten, and most pleasant in taste.

¶ The Place and Time.

This Skirret is planted in Gardens, and especially by the root, for the greater and thicker ones being taken away, the lesser are put into the earth againe: which thing is best to be done in March or Aprill, before the stalks come vp, and at this time the roots which be gathered are eaten raw, or boiled.

¶ The Names.

This herbe is called in Latin *Sisarum*, and also in Greeke *σισαρυ*; the Latines do likewise call it *Siser*; and diuers of the later Herbarists, *Seruillum* or *Chernillum*, or *Seruilla*: the Germans name it *Sierlin*: *Tragus*, *Zam garten Rapunkelen*: in the Low-countries, *Supcker wortelen*, that is to say, Sugar roots, and oftentimes *Serillen*: in Spanish, *Cherinia*: in Italian, *Sisaro*: in French, *Cheruy*: in English, Skirret and Skirwort. And this is that *Siser* or Skirret which *Tiberius* the

Emperour commanded to be conueied vnto him from Gelduba a castle about the river of Rhene, as *Pliny* reporteth in *lib. 19. cap. 5*. The Skirret is a medicinable herb, and is the same that the foresaid Emperour did so much commend, inso much that he desired the same to be brought vnto him euery yeare out of Germanie. It is not, as diuers suppose, *Serapio* his *Secacul*, of which he hath written in his 89. chapter: for *Secacul* is described by the leafe of *Iulben*, that is to say, of the pease, as *Matthiolus Syluaticus* expoundeth it: and it bringeth forth a black fruit of the bignesse of a Ciche pease, full of moisture, and of a sweet taste, which is called *Granum Culcul*: But the Skirret hath not the leafe of the pease, neither doth it bring forth fruit like to the Ciche pease; whereupon it is manifest, that the Skirret doth very much differ from *Serapio* his *Secacul*: so farre is it from beeing the same.

¶ The Nature and Vertues.

- A The roots of the Skirret be moderately hot and moist; they be easily concocted; they nourish meanly, and yeeld a reasonable good iuice: but they are something windie, by reason whereof they also prouoke lust.
- B They be eaten boiled, with vineger, salt, and a little oile, after the manner of a sallad, and oftentimes they be fried in oile and butter, and also dressed after other fashions, according to the skill of the cooke, and the taste of the eater.

The women in Sueuia, saith *Hieronymus Heroldus*, prepare the roots hereof for their husbands, and know full well wherefore and why, &c.

The iuice of the roots drunke with goats milke stoppeth the laske. The same drunke with wine putteth away windinesse out of the stomacke, and gripings of the belly, and helpeth the hicket or yeoxing. They stir vp appetite, and prouoke vrine.

CHAP. 407. Of Carrots.

¶ The Description.

The leaues of the garden Carrots are of a deepe Greene colour, composed of many fine Fennell-like leaues, very notably cut or iagged; among which riseth vp a stalk straight and round, foure cubits high, somewhat hairie and hollow, hauing at the top round spoked tufts, in which do grow little white floures: in their places commeth the seed, rough and hairie, of a sweet smell when it is rubbed. The root is long, thicke and single, of a faire yellow colour, pleasant to be eaten, and very sweet in taste.

1 *Pastinaca sativa tenuifolia.*
Yellow Carrot.

2 *Pastinaca sativa atro-rubens.*
Red Carrot.

2 There is another kinde hereof like to the former in all parts, and differeth from it only in the colour of the root, which in this is not yellow, but of a blackish red colour.

¶ The Place.

These Carrots are sowne in the fields, and in gardens where other pot herbes are: they require a loose and well manured soile.

¶ The Time.

They are to be sowne in Aprill; they bring forth their floures and seed the yeare after they be sowne.

¶ The Names.

The Carrot is properly called in Greeke *καρδαμύλη*, for that which we haue termed in Latine by the name

name of *Pastinaca latioris folij*, or the Garden Parsnep, is described of the old writers by another name: this Carrot is called in Latine likewise, *Pastinaca sativa*, but with this addition *tenuifolia*, that it may differ from the garden Parsnep with broad leaues, and white roots. *Theophrastus* in the ninth booke of his historie of plants nameth this *Staphylinus*, or Carrot, *δακνυς*, and writeth that it groweth in Arcadia, and saith that the best is found in *Spartensis Achaia*, but doubtlesse he meant that *Daucus* which we call *Cretensis*, that may be numbred among the Carrots: *Galen* in his booke of the faculties of Simple medicines doth also make it to be *Daucus*, but yet not simply *Daucus*; for he addeth also *Staphylinus* or *Pastinaca*: in High Dutch it is called **Geel ruben**: in Low Dutch, **Geel Been**, **Geel Pooten**, and **Geel wortelen**: in French, *Carrotte*, and *Racine iaulne*: in Italian, *Pastinaca*: in Spanish, *Canahoria*: in English, Yellow Carrots: the other is called red Carrot, and blacke Carrot.

¶ *The Temperature and Vertues.*

A The root of the yellow Carrot is most commonly boiled with fat flesh and eaten: it is temperately hot and something moist. The nourishment which commeth thereof is not much, and not verie good: it is something windie, but not so much as be the Turneps, and doth not so soon as they passe through the bodie.

B The red Carrot is of like facultie with the yellow. The seed of them both is hot and drie, it breaketh and consumeth windinesse, prouoketh vrine, as doth that of the wilde Carrot.

CHAP. 408. Of Wilde Carrot.

Pastinaca sylvestris tenuifolia.
Wilde Carrot, or Bees-nest.

¶ *The Description.*

THE leaues of the wilde Carrot are cut into diuers slender narrow parcels, very like vnto those of the garden Carrots, but they be somewhat whiter, and more hairie: the stalks be likewise hairie and somewhat rough: the floures are little, and stand vpon broad spoked tuftes, of a white color, of which tuft of floures the middlemost part is of a deep purple: the whole tuft is drawn together when the seed is ripe, resembling a birds nest; whereupon it hath been named of some Birds-nest: the root slender, and of a mean length.

¶ *The Place.*

It groweth of it selfe in vntoyled places, in fields, and in the borders thereof, almost euerie where.

¶ *The Time.*

It floures and flourishes in Iune and Iuly, the seed is ripe in August.

¶ *The Names.*

The wilde Carrot is called in Greeke *σαβωλι-νος δακνυς*: in Latine, *Pastinaca sylvestris tenuifolia*: in shops, *Daucus*: and it is vsed in stead of the true *Daucus*, and not amisse, nor vnprofitably: for *Galen* also in his time doth testifie that it was taken for *Daucus*, or bastard Parsly, and is without doubt *Danci sylvestris genus*, or a wilde kinde of bastard Parsly, so called of *Theophrastus*: in high Dutch it is named **wild Pastenen**, **Uogol nest**: in Low Dutch, **Uogels nest**, and **wilde Caroten**, **Crookens cruyt**: in French, *Pastena de Sauvage*: in English, wilde Carrot, and after the Dutch, Birds-nest, and in some places Bees-nest:

Athenaus citing *Diphilus* for his Author, saith, that the Carrot is called *φαιτρον*, because it serueth for loue matters; and *Orpheus*, as *Pliny* writeth, said, that the vse hereof winneth loue: which things be

be written of wilde Carrot, the root whereof is more effectually than that of the garden, and containeth in it, as *Galen* saith, a certaine force to procure lust.

¶ *The Temperature and Vertues.*

The seed of this wilde Carrot, and likewise the root is hot and drie in the second degree, and doth A withall open obstructions.

The root boiled and eaten, or boiled with wine, and the decoction drunke, prouoketh vrine, expelleth the stone, bringeth forth the birth, it also procureth bodily lust. B

The seed drunke bringeth downe the desired sicknesse, it is good for them that can hardly make C water, it breaketh and dissolueth winde, it remedieth the dropie, it cureth the collick and stone, being drunke in wine.

It is also good for the passions of the mother, and helpeth conception: it is good against the bitings of all manner of venomous beasts: it is reported, saith *Dioscorides*, that such as haue first taken of it are not hurt by them. D

CHAP. 409. Of Candie Carrots.

Daucus Cretensis verus.
Candie Carrots.

¶ *The Description.*

THIS *Daucus Cretensis*, being the true *Daucus* of *Dioscorides*, doth not grow in Candy only, but is found vpon the mountaines of Germany, and vpon the hills and rockes of Iura about Geneva, from whence it hath bene sent and conueied by one friendly Herbarist vnto another, into sundrie regions: it beareth leaues which are small, and very finely iagged, resembling either Fennel or wild Carrot: among which riseth vp a stalke of a cubit high, hauing at the top white spokie tufts, and the floures of Dill: which being past, there come great plentie of long seed, well smelling, not vnlike the seed of Cumin, saue that it is whitish, with a certaine mossiness, and a sharpe taste, and is in greater vse than any part of the plant. The root also is right good in medicine, being lesser than the root of a Parsnep, but hotter in taste, and of a fragrant smell.

¶ *The Time.*

This floures in Iune and Iuly, his seed is ripe in August.

¶ *The Names.*

There is sufficient spoken in the description as touching the name.

¶ *The Nature.*

These plants are hot and drie, especially the seed of *Daucus Creticus*, which is hot and drie in the third degree: but the seed of the wilde Carrot is hot and drie in the second degree,

¶ *The Vertues.*

The seed of *Daucus* drunken is good against the strangurie, and painfull making of water, it preuaileth against the grauell and stone, and prouoketh vrine. A

It asswageth the torments and gripings of the belly, dissolueth windines, cureth the collick, and B ripeneth an old cough.

The same beeing taken in VVine, is verie good against the bitings of beasts, and expelleth C poison.

The seed of *Daucus Creticus* is of great efficacie and vertue being put into Treacle, Mithridate, D or any antidotes, against poison or pestilence.

E The root thereof drunke in wine stoppeth the laske; and is also a foueraigne remedie against venome and poison.

CHAP. 410. Of stinking and deadly Carrots.

The Description.

THe great stinking Carrot hath very great leaues, spread abroad like wings, resembling those of Fennell gyant (whereof some haue taken it to be a kinde, but vnproperly) of a bright greene colour, somewhat hairie: among which riseth vp a stalk of the height of two cubits, and of the bignesse of a mans finger; hollow, and full of a spungious pith; whereupon are set at certaine ioints, leaues like those next the ground, but smaller. The floures are yellow, standing at the top of the stalkes in spokie rundles, like those of Dill: after which commeth the seed, flat and broad like those of the Parsnep, but much greater and broader. The root is thicke, garnished at the top with certaine capillaments or hairy threds, blacke without, white within, full of milkie iuice, of a most bitter, sharpe, and lothsome taste and smell, insomuch that if a man do stand where the wind doth blow from the plant, the aire doth exulcerate and blister the face, and euery other bare or naked place that may be subiect to his venomous blast, and poisonous qualitie.

1 *Thapsia latifolia* Clusij.
Stinking Carrots.

2 *Thapsia tenuifolia*.
Small leaved stinking Carrot.

2 This small kind of stinking or deadly Carrot is like to the last described in each respect, sauing that the leaues are thinner and more finely minced or iagged, wherein consists the difference.

3 The common deadly Carrot is like vnto the precedent, sauing that he doth more neerely resemble the stalkes and leaues of the garden carrot, and is not garnished with the like bush of haire about the top of the stalks: otherwise in seed, root, and euill smell, taste and qualitie like.

The Place.

These pernicious plants delight in stonie hills and mountaines: they are strangers in England.

The

3 *Thapsia vulgaris*.
Deadly Carrots.

¶ The Time.

They floure in August, or somewhat after.

¶ The Names.

The French Physicians haue accepted the root of *Thapsia* for a kinde of Turbith, calling it *Turpetum Cineritium*; notwithstanding vpon better consideration they haue left the vse thereof, especially in purging, for it mightily hurteth the principall parts, and doth often cause cruell gripings in the guts and belly, with convulsions and cramps: neuerthelesse the venomous qualitie may bee taken away with those correctiues which are vsed in mitigating the extreme heate and virulent qualitie of *Sarcocolla*, *Hammoniacum*, and *Turpetum*: but where there be so many wholesome Simples, and likewise compounds, they are not to be vsed.

Of some it is called *Turpetum Griseum*: it is called *Thapsia*, as some thinke, of the Island *Thapsus*, where it was first found; or as we deeme, of the likenesse it hath with Carrots.

Of the people of Sicilia and Apulia it is called *Ferulacoli*, where it doth grow in great abundance.

¶ The Temperature and Vertues.

The temperature and faculties in working haue been touched in the description, and likewise in the names.

CHAP. 4II. Of Fennell.

¶ The Description.

1 The first kinde of Fennell, called in Latine *Feniculum*: in Greeke, *Μαρις*, is so well knowne amongst vs, that it were but lost labour to describe the same.

2 The second kinde of Fennell is likewise well knowne by the name of Sweet Fennell, so called because the seeds thereof are in taste sweet like vnto Annise seeds, resembling the common Fennell, sauing that the leaues are larger and fatter, or more oleous: the seed greater and whiter, and the whole plant in each respect greater.

¶ The

Feniculum vulgare.
Common Fennell.

¶ *The Place.*

These herbs are set and sowne in gardens; but the second doth not prosper well in this Countrey: for being sowne of good and perfect seed, yet in the second year after his sowing it will degenerate from the right kinde, and become common Fennell.

¶ *The Time.*

They floure in Iune and Iuly, and the seed is ripe in the end of August.

¶ *The Names.*

Fennell is called in Greeke *μαραθρον*: in Latine, *Marathrum*, and *Feniculum*: in high Dutch, *Fenckell*: in low-Dutch, *Uenckell*: in Italian, *Finocchio*: in Spanish, *Hinoio*: in French, *Fenoil*: in English, Fennell, and Fenckell.

¶ *The Nature.*

The seed of Fennell is hot and dry in the third degree.

¶ *The Vertues.*

The powder of the seed of Fennell drunke for certaine dayes together fasting preserueth the eye-sight: whereof was written this Distichon following:

*Feniculus, Rosa, Verbena, Chelidonia, Ruta,
Ex his fit aqua qua lumina reddit acuta.*

Of Fennell, Roses, Veruain, Rue, and Celandine,
Is made a water good to cleere the sight of eie.

- B The greene leaues of Fennell eaten, or the seed drunken made into a Ptisan, do fill womens breasts with milke.
- C The decoction of Fennell drunke easeth the paines of the kidnies, causeth one to auoid the stone, and prouoketh vrine.
- D The roots are as effectuell, and not onely good for the intents aforesaid, but against the dropisie also, being boyled in wine and drunken.
- E Fennell seed drunke asswageth the paine of the stomacke, and wambling of the same, or desire to vomit, and breaketh winde.
- F The herbe, seed, and root of Fennell are very good for the lungs, the liuer, and the kidneyes, for it openeth the obstructions or stoppings of the same, and comforteth the inward parts.
- G The seed and herbe of sweet Fennell is equall in vertues with Annise seed.

CHAP. 412. Of Dill.

¶ *The Description.*

Dill hath a little stalke of a cubit high, round and ioynted; whereupon doe grow leaues verie finely cut, like to those of Fennell, but much smaller: the floures be little and yellow, standing in a spokie tuft or rundle: the seed is round, flat and thin: the whole plant is of a strong smell: the root is threddy.

¶ *The Place.*

It is sowne in gardens, and is also sometimes found wilde.

¶ *The*

Anethum.
Dill.

¶ The Time.

It bringeth forth floures and seed in August.

¶ The Names.

Dill is called in Greek *Ανέθον*; in Latine likewise *Anethum*, and *Anetum*; in high-Dutch, *Dyllen*; in low-Dutch, *Dille*; in Italian, *Anetho*; in Spanish, *Eneldo*; in French, *Anet*; in English, Dill, and Anet.

¶ The Temperature.

Dill, as *Galen* saith, is hot in the end of the second degree, and dry in the beginning of the same, or in the end of the first degree.

¶ The Vertues.

The decoction of the tops of dried Dill, and likewise of the seed, being drunke, ingendreth milke in the breasts of nurses, allayeth gripings and windinesse, prouoketh vrine, increaseth feed, stayeth the yeox, hicket, or hicquet, as *Dioscorides* teacheth.

The seed likewise if it be smelled vnto stayeth the hicket, especially if it be boyled in wine, but chiefly if it be boyled in Wormewood Wine, or Wine and a few branches of Wormewood, and Rose leaues, and the stomacke bathed therewith.

Galen saith, that being burnt and layd vpon moist vlcers, it cureth them, especially those in the secret parts, and likewise those *sub Præputio*, though they be old and of long continuance.

Common oyle, in which Dill is boyled or sunned, as we do oyle of Roses, doth digest, mitigate paine, procureth sleepe, bringeth raw and vnconcocted humors to perfect digestion, and prouoketh bodily lust.

Dill is of great force or efficacie against the suffocation or strangling of the mother, if the woman do receiue the fume thereof being boyled in wine, and put vnder a close stoole or hollow seat fit for the purpose.

CHAP. 413. Of Caruwaies.

¶ The Description.

Caruwaies haue an hollow stalke foure square, of two cubits high, full of knots or ioynts; from which proceed sundry other small branches, set full of leaues very finely cut or iagged, like vnto those of Carrots or Dill: at the top of the stalkes grow spokie white tufts like those of Dill: after which commeth the seed, sharpe in eating, yet of a pleasant taste: the root is like that of Parsley, often white, feldome yellow, and in taste like vnto the Carrot.

¶ The Place.

It groweth almost euery where in Germanie and in Bohemia, in fat and fruitfull fields, and in meadowes that are now and then ouer-run with water: it groweth also in Caria, as *Dioscorides* sheweth, from whence it tooke his name.

¶ The Time.

It floureth and seedeth from May to the end of August.

¶ The

Carum, sine Careum.
Caruwaies.

¶ The Names.

It is called in Greeke *καριον* : in Latine, *Carum* and *Careum* : in shops, *Carui*. *Simeon Zethy* calleth it *Carnabadion* : in high-Dutch, *Kym*, and *Kymmel* : in low-Dutch, *Caruy saet* : in French, *du Caruy* : in Italian, *Caro* : in Spanish, *Caranea*, and an article being ioyned vnto it, *Alkaranea* : in English, Caruwaie, and the seed is called Caruwaie seed.

¶ The Temperature.

The seed of Caruwaies, as *Galen* saith, is hot and dry in the third degree, and hath a moderate biting qualitie.

¶ The Vertues.

It consumeth winde, it is delightfull to the stomacke and taste, it helpeth concoction, prouoketh vrine, and is mixed with counterpoysons : the root may be sodden, and eaten as the *Parfenep* or *Carrot* is.

The seeds confected, or made with sugar into Comfits, are very good for the stomacke, they helpe digestion, prouoke vrine, assuage and dissolue all windinesse : to conclude in a word, they are answerable to *Anise* seed in operation and vertues.

CHAP. 414. Of *Anise*.

¶ The Description.

1 **T**He stalke of *Anise* is round and hollow, diuided into diuers small branches, set with leaues next the ground somewhat broad and round : those that grow higher are more iagged, like those of yong *Parsley*, but whiter : on the top of the stalkes do stand spokie rundles or tufts of white floures, and afterward seed, which hath a pleasant taste as euerie one doth know.

‡ 2 This other *Anise* (whose umbels *Clusius* had out of England from Master *Morgan* the Queenes Apothecarie, and *Iames Garret* ; and which were brought from the Philippines by Mr. *Tho. Candish* in his voyage when he incompassed the world) is thus described by *Clusius* : The umbels were large, no lesse than those of the *Archangelica*, made of diuers thicke stiffe foot-stalks, each whereof carried not double seed as the common *Anise*, but more, in a round head some inch ouer, made of cods set star-fashion, six, 8, or more, of a dusky colour, wrinkled, diuided into two equall parts, and open aboue : most of these huskes were empty, yet some of them contained one smooth shining ash-coloured seed, of the bignesse of that of *Orobis* ; the taste and smell was the same with our common *Anise* seed, wherefore they which sent it to *Clusius* called it *Anise* : yet in the place where it grew it was called *Damor* ; for Mr. *Candish* had the name so written in the China characters, after their manner of writing. ‡

¶ The Place.

It groweth plentifully in Candy, Syria, Egypt, and other countries of the East. I haue often sowne it in my garden, where it hath brought forth his ripe seed when the yeare hath fallen out to be temperate.

¶ The

1 *Anisum*.
Anise.‡ 2 *Anisum Indicum stellatum*.
Starry headed Anise.

¶ The Time.

It is to be sowne in these cold regions in the moneth of May : the seed is ripe in August.

¶ The Names.

It is called in Latine *Anisum* : in Greeke, *Ανισον* : in high-Dutch, *Anisz* : in low-Dutch, *Anissaet* : in Italian, *Aniso* : in Spanish, *Matahalua* : in French, *Anis* : in English, Anise, and Annise seed.

¶ The Temperature.

Galen writeth, That the seed of Anise is hot and dry in the third degree : after others, it is hot in the second degree, and much lesse than dry in the second degree ; for it ingendreth milke, which it could not do if it were very dry, as *Galen* in his chapter of Fennell doth whether hee will or no declare and testifie ; in that it doth ingender milke, his opinion is that it is not hot above the first degree : which thing also may be in Anise seed, both by this reason, and also because it is sweet. Therefore to conclude, Anise seed is dry in the first degree, and hot in the second.

¶ The Vertues.

The seed wasteth and consumeth winde, and is good against belchings and vpbraidings of the stomacke, allayeth gripings of the belly, prouoketh vrine gently, maketh aboundance of milke, and stirreth vp bodily lust : it stayeth the laske, and also the white flux in women.

Being chewed it makes the breath sweet, and is good for them that are short winded, and quen- cheth thirst, and therefore it is fit for such as haue the dropsie : it helpeth the yeoxing or hicker, both when it is drunken or eaten dry : the smell thereof doth also preuaile very much.

The same being dried by the fire and taken with honey clenseth the brest very much from fleg- maticke superfluities : and if it be eaten with bitter almonds it doth helpe the old cough.

It is to be giuen to yong children and infants to eate which are like to haue the falling sicknes, or to such as haue it by patrimonie or succession.

It taketh away the Squinancie or Quincie (that is, a swelling in the throat) being gargled with honey, vineger, and a little Hyssop gently boiled together.

CHAP. 414.

Of Bishops Weed, Herbe-William, or Ameos.

¶ The Description.

1 **T**He common Ameos, especially with vs here in England, hath round greene stalks, with diuers boughes and branches, and large long leaues, diuided into diuers other narrow long and small leaues, dented or snipt about the edges, hauing at the top of the stalke white floures in great spoky tufts, which bring forth a little sharpe and bitter seed: the root thereof is white and threddie.

2 This excellent and aromaticall Ameos of Candy hath tufts and leaues like *Daucus Creticus*, and a root like vnto the garden Carrot, of a yellow colour, and hot seed like *Origanum*, of an excellent spicie saour or smell, growing in spoky tufts or roundles like *Carum*: it hath beene brought from Candy and Syria into Venice, and from Venice into France, Flanders, and England, where we haue often sowne it; but without doubt we haue beene beguiled therein by the deceitful drug-masters, who haue first boyled it, or vsed some other false and deceitfull deuce, to bring greater admiration vnto the Venice treacle, for the confection whereof this seed is a chiefe and most principall ingredient.

Ammi vulgare.
Common Bishops-weed.

† 2 *Ammi Creticum.*
Candy Bishops-weed.

3 There is another kinde of Ameos, which is an herbe very small and tender, hauing stalkes a foot and a halfe high, very small and tender, beset with leaues like vnto Dill, finely iagged, and somewhat slender; and at the top of the stalkes grow little tufts or spokie white rundles, which afterwards do turne into small gray seed, hot and sharpe in taste. The root is small and slender.

¶ The Place.

These plants do all grow in my garden, except *Ammi Creticum*, whereof hath beene sufficiently spoken in the description.

¶ The

‡ 3 *Ammi perpusillum*.
Small Bishops-weed.

¶ The Time.

They floure in Iune and Iuly, and yeeld their seed in the end of August.

¶ The Names.

The Grecians call it *Ammi*: the Latines also *Ammi*: diuers call it *Cuminum Ethiopicum*: others, *Cuminum Regium*, or *Comin Royall*: in shops, *Ammios*, or *Ameos* in the Genitiue case: the Germanes, *Amey*: in English, *Ameos*, or *Ammi*: of some, *Herbe-William*, *Bull-wort*, and *Bishops-weed*.

¶ The Temperature.

The seed of *Ameos* is hot and dry in the latter end of the third degree.

¶ The Vertues.

It auaieth against gripings of the belly in making of vrine, against the bitings of serpents taken in wine, and also it bringeth downe the floures: being applied with honey it taketh away blacke and blew spots which come of stripes: the seed of *Sison* doth also the like, for it is hot and dry, and that in the third degree; likewise of thin parts, prouoking vrine, and bringing downe the desired sicknesse.

The seed of *Ameos* is good to be drunken in wine against the biting of all manner of venomous beasts, and hath power against all manner of poyson & pestilent feuers, or the plague, and is vsed in the correcting of *Cantharides*, whereby those flies are made medicinable to be applied to the body without danger.

Ameos brayed and mingled with honey scattereth congealed blood, and putteth away blacke and blew markes which come by stripes or falls, if it be applied thereto in manner of a plaister.

† The figure which was formerly in the second place was of the *Hippomarathium album* of *Tabernaemontanus*.

CHAP. 415. Of Cheruill.

¶ The Description.

THE leaues of Cheruill are slender, and diuersly cut, something hairy, of a whitish green: the stalks be short, slender, round, and hollow within, which at the first together with the leaues are of a whitish green, but tending to a red when the seeds are ripe: the floures be white, and grow vpon scattered tufts. The seed is long, narrow, slender, sharpe pointed: the root is full of strings.

‡ 2 There is found in Iune and Iuly, almost in euerie hedge, a certaine plant which *Tabernaemont.* and *Bauhine* fitly call *Cherophyllum*, or *Cerfolium sylvestre*, and the figure was vnfitly giuen by our Author for *Thysselinum*: It hath a whitish woody root, from which arise round red and hairy stalkes some two cubits high, sometimes more, and oft times somewhat big and swolne about the ioynts, and they are not hollow but full of pith: toward the top it is diuided into sundry branches, which on their tops carry umbels of small pure white little floures, which are succeeded by longish seeds. The leaues are vsually parted into three chiefe parts, and these againe subdiuided into fiue, and they are snipt about the edges, soft and hairy, of a darke Greene or else reddish colour. It flouret in Iune and Iuly, and then ripens the seed. ‡

‡ 3 Great Cheruill hath large leaues deeply cut or iagged, in shew very like vnto Hemlocks, of a very good and pleasant smell and taste like vnto Cheruill, and something hairy, which hath caused vs to call it sweet Cheruill. Among these leaues riseth vp a stalke somewhat crested or furrowed, of the height of two cubits, at the top whereof grow spoky tufts or rundles with white floures,

floures, which do turne into long browne crested and shining seed, one seed being as big as foure Fennell seeds, which being greene do taste like Anise seed. The root is great, thicke, and long, as big as *Enula Campana*, exceeding sweet in smell, and tasting like vnto Anise seeds.

1 *Cerofolium vulgare sativum.*
Common Cheruill.

† 2 *Cerofolium sylvestre.*
Hedge Cheruill.

† 4 There is found in some parts of the Alps, as about Geneva and in other places, another *Myrrhis*, which in the leaues and vmbels is like that of the last described, but the whole plant is lesse; the seed is long, small, smooth, and shaped like an Oat, and in taste somewhat like that of the *Daucus Creticus*. *Lobel* hath this by the same name as we here giue it you.

5 About mud walls, high-wayes, and such places, here about London, and in diuers other places, is found growing a small plant, which in all things but the smell and height agrees with that referred to this kinde by *Fabius Columna*, and called *Myrrhis Aquicolorum noua*. The root hereof is small and white, perishing euery year when it hath perfected his seed: the stalks are slender, hollow, smooth, and not hairy, seldome exceeding the height of a cubit, or cubit and halfe; it is diuided into sundry branches, vpon the sides whereof against the setting on of the leaues, or out of their bosomes, grow forth the stalks, which carry vmbels of small white floures: after which follow the seeds, growing two together, and these longish, rough, round, and hairy, about the bignesse of Anise seeds. The leaues are small, and finely cut or diuided like those of Hemlock, but of a whitish colour, and hairy: it comes vp in March, floures in May, and ripens his seed in Iune. In Italy they eate the yong leaues in sallads, and call it wilde Cheruile: we may in English for distinctions sake call it small Hemlocke Cheruill.

6 To these we may fitly adde that plant which in the *hist. Lugd.* is called *Cicutaria alba*, and by *Camerarius*, *Cicutaria palustris*; for it floures at the same time with the last mentioned, and is found in floure and seed in May and Iune very frequently almost in all places; but afterwards his stalkes die downe, yet his roots liue, and the leaues are greene all the yeare. The root of this is very large, and diuided into sundry parts, white also and spungie, of a pleasing strong smell, with a hot and biting taste: the stalks grow vp in good ground to be some three cubits high, and they are hollow, ioyned, pretty thicke, greene, and much crested, sending forth of the bosomes of the leaues many branches, which vpon their tops carry vmbels composed of many white floures, each floure consisting of foue little leaues, whereof the lowest is twice as big as the rest, the two side ones lesse, and the vppermost the least of all. The leaues are large like those of *Myrrhis*, but of a dark green colour, and

and those that grow about the tops of the stalkes are commonly diuided into into three parts, and these subdiuided into sundry long sharpe pointed and snipt leaues like as in *Myrrhis*. The seeds grow two together, being longish, round, sharpe pointed, blacke, and shining. We may fitly terme this plant, wilde Cicely, for that it so much resembles the *Myrrhis* or garden Cicely, not onely in shape, but (if I be not deceiued) in vertues also. ‡

3 *Cerofolium magnum, siue Myrrhis.*
Great Cheruill or Myrrh.

‡ 4 *Myrrhis altera parua.*
Small sweet Cheruill.

¶ The Place.

The common Cheruill groweth in gardens with other pot-herbes: it prospers in a ground that is dinged and somewhat moist. The great sweet Cheruill groweth in my garden, and in the gardens of other men who haue been diligent in these matters.

¶ The Time.

These herbes do floure in May, and their seed is ripe in Iuly.

¶ The Names.

Cheruill is commonly called in Latine *Cerofolium*, and as diuers assume, *Cherofolium*, with *o* in the second syllable. *Columella* nameth it *Charephyllum*, and it is thought to be so called because it delighteth to grow with many leaues, or rather in that it causeth ioy and gladnes: in high-Dutch, *Korffelkraut*: in low-Dutch, *Beruell*: in Italian, *Cerofoglio*: in French, *Du Cerfueil*: in English, *Cheruill*, and *Cheruill*.

Myrrhis is also called *Myrrha*, taken from his pleasant saueur of Myrrh: of some, *Conila*, as it is found noted among the bastard names. It is also, by reason of the similitude it hath with Hemlocke, called by most late writers, *Cicutaria*. Of this, *Pliny* maketh mention, lib. 24. cap. 16. where he reporteth that it is called *Smyrrhiza*: in English it is called *Cheruill*, sweet *Cheruill*, or sweet *Cicely*.

¶ The Temperature and Vertues.

Cheruill is held to be one of the pot-herbes, it is pleasant to the stomacke and taste: it is of a temperate heate and moderate drinesse, but nothing so much as the Parsleyes.

It prouoketh vrine, especially being boyled in wine, and applied hot to the share or nethermost part of the belly, and the wine drunke in which it was boyled.

It hath in it a certaine windinesse, by meanes whereof it procureth lust.

It is vsed very much among the Dutch people in a kinde of Loblolly or hoteh-pot which they do eate, called *Warmus*.

- E The leaues of sweet Cheruill are exceeding good, wholesome, and pleasant, among other fallad herbs, giuing the taste of Anise seed vnto the rest.
- F The root, saith *Galen*, is hot in the second degree, hauing a thinnesse of substance ioined with it.
- G *Dioscorides* teacheth, that the root drunke in wine is a remedie against the bitings of the venomous spiders called in Latine *Phalangia*; and that it bringeth downe the menses and secondines; and being boyled and drunke it is good for such as haue the ptylick or consumption of the lungs.
- H The seeds eaten as a fallad whilest they are yet greene, with oyle, vineger, and pepper, exceed all other fallads by many degrees, both in pleasantnesse of taste, sweetnesse of smell, and wholsomnesse for the cold and feeble stomacke.
- I The roots are likewise most excellent in a fallad, if they be boyled and after dressed as the cunning Cooke knoweth how better than my selfe: notwithstanding I doe vse to eate them with oile and vineger, being first boyled; which is very good for old people that are dull and without courage; it reioyceth and comforteth the heart, and increaseth their lust and strength.

CHAP. 417. Of Shepheards needle or wilde Cheruill.

¶ The Description.

1 *Scandix*, or *Pecten Veneris*, doth not much differ in the quantitie of the stalks, leaues, and floures, from Cheruill; but *Scandix* hath no such pleasant smell as Cheruill hath: the leaues be lesser, more finely cut, and of a browne Greene colour: the floures grow at the top of the stalkes in small white tufts; after which come vp long seeds very like vnto pack-needles, orderly set one by another like the great teeth of a combe, whereof it tooke the name *Pecten Veneris*, or Venus combe, or Venus needle: the root is white, a finger long.

1 *Pecten Veneris*, siue *Scandix*.
Shepheards needle, or Venus combe.

† 2 *Scandix minor*, siue *Anthriscus*.
Small Shepheards needle.

† 2 This from a slender long and whitish root sends vp many small leaues like those of the last described, but of a pleasing smell and taste something like that of the common Cheruill; amongst these leaues grow vp slender stalks a little hairy, diuided into short green and slender branches carrying little umbels, consisting of five, six, seuen, or eight smal white floures, composed of five leaues apiece,

apiece, with a darke purplish chiue in the middle: the floures are succeeded by, or rather grow vpon long slender cods, which become some inch long, and resemble those of the last described. It floures in Iune, as *Clusius* affirmeth, who giues vs the history of it; and he receiued it from *Honorius Bellus* out of Candy; who writes, that in the Spring time it is much vsed in fallads, and desired, for that it much excites to Venery. He also thinks this plant to be the *Anthriscus* of *Pliny*, and by the same name *Clusius* sets it forth. *Columna* hath called it *Aniso-marathrum*, because the smell and taste is betweene that of Anise and Fennell. ‡

¶ The Place.

It groweth in most corne fields in England, especially among wheate and barley.

¶ The Time.

It floureth in May: the seed is ripe in August with corne.

¶ The Names.

The Latines call it *Scandix*, hauing borrowed that name of the Grecians, who call it *Σκάνδιξ*: we finde among the bastard words, that the Romans did call it *Scanaria*, and *Acula*, of the seed that is like vnto a needle. *Ruellius* describeth it vnder the name *Pecten Veneris*: of others, *Acus Veneris*, and *Acus Pastoris*, or Shepherds Needle, wilde Cheruill, and Ladies combe: in high-Dutch, *Paelde Karnel*: This is that herbe (saith *Pliny*, lib. 22. cap. 22.) which *Aristophanes* objected in sport to the Poet *Euripides*, that his mother was wont to sell no right pot-herbe but *Scandix*, or Shepherds needle, meaning, as I take it, *Visnaga*, wherewith the Spaniards doe picke their teeth when they haue eaten no meate at all except a few oranges or such a like trifle, called also *Scandix*.

¶ The Temperature.

Shepherds needle, saith *Galen*, is an herbe somewhat binding, and bitter in taste, inso much that it is hot and dry either in the later end of the second degree, or in the beginning of the third.

¶ The Vertues.

Dioscorides saith it is eaten both raw and boyled, and that it is an wholesome pot-herbe among the Greekes; but in these dayes it is of small estimation or value, and taken but for a wilde Wort, as appeareth by *Aristophanes* taunting of *Euripides*, as aforesaid.

The decoction thereof is good for the bladder, kidneyes, and liuer; but as I deeme hee meant *Cheruill*, when he set the same downe to be vsed in phyficke.

CHAP. 418. Of Tooth-picke Cheruill.

¶ The Description.

THe first of these Tooth-picke Cheruills beareth leaues likewilde Turneps, a round stalke furrowed, ioyned, blackish, and hairy, diuided into many branches, on the tops whereof grow spokie tufts, beset round about with many small leaues. The floures thereof are whitish: after commeth the seed, which being once ripe do cluster and are drawne together, in a round thicke tuft like a small birds nest, as be those of the wilde Carrot, whose seeds who so toucheth, they will cleaue and sticke to his fingers, by reason of the glutinous or slimie matter they are possessed with. The root is small and whitish, bitter in taste, as is all the rest of the plant.

2 The Spanish Tooth-picke hath leaues, floures, and knobby stalkes like vnto wilde carrots, sauing that the leaues are somewhat finer, cut or iagged thicker, and tenderer, but not rough or hairy at all as is the former, of a bitter taste, and a reasonable good smell: among which rise vp bushie rundles or spokie tufts like those of the wilde Carrot or Birds nest, closely drawne together when the seed is ripe; at what time also the sharpe needles are hardned, fit to make Tooth-pickes and such like, for which purpose they do very fitly serue.

¶ The Place.

Both of them grow in Syria, and most commonly in Cilicia: the later is to be found likewise in Spaine almost euery where; and I haue it likewise in my garden in great plentie.

¶ The Time.

They floure in my garden about August, and deliuer their seed in October.

¶ The Names.

That which the Grecians call *Τριφύλον*, the Latines do likewise name *Gingidium*: and it is called in Syria *Lepidium*: yet is there another *Lepidium*. It is reported among the bastard names to be called by the Romans, *Bisacutum*: of which name some shew remaines among the Syrians, who commonly call the later, *Gingidium*, *Visnaga*: this is named in English, Tooth-picke Cheruill.

1 *Gingidium latifolium*.
Broad Tooth-picke Cheruill.

2 *Gingidium Hispanicum*.
Spanish Tooth-picke Cheruill.

¶ The Temperature and Vertues.

A There is, saith *Galen*, great increase of *Gingidium* in Syria, and it is eaten no otherwise than *Scandex* is with vs at Pergamum: it is, saith he, very wholesome for the stomacke, whether it be eaten raw or boyled; notwithstanding it is euident that it is a medicine rather than a nourishment. As it is bitter and binding, so is it likewise of a temperate heate and drinesse. The heate is not very apparant, but it is found to be dry in the later end of the second degree, as also the said Author alledgeth in his discourse of the faculties of simple medicines.

B *Dioscorides* doth also write the same: This pot-herbe (saith he) is eaten raw, sodden, and preferred with great good to the stomacke; it prouoketh vrine, and the decoction thereof made with wine and drunke; is profitable to scoure the bladder, prouoketh vrine, and is good against the grauell and stone.

C The hard quills whereon the seeds do grow are good to cleanse the teeth and gums, and do easily take away all filth and baggage sticking in them, without any hurt vnto the gums, as followeth after many other Tooth-picks, and they leaue a good sent or sauer in the mouth.

CHAP. 419. Of Mede-sweet, or Queene of the Medowes.

¶ The Description.

I This herbe hath leaues like those of *Agrimonia*, consisting of diuers leaues set vpon a middle rib like those of the *Ash* tree, euery small leafe sleightly snipt about the edges, white on the inner side, and on the vpper side crumpled or wrinkled like vnto those of the *Elme* Tree; whereof it tooke the name *Vlmaria*, of the similitude or likenesse that the leaues haue with the *Elme* leaues. The stalke is three or foure foot high, rough, and very fragile or easie to bee broken, of a reddish purple colour: on the top whereof are very many little floures clustering and growing together, of a white colour tending to yellownesse, and of a pleasant sweete smell,

I *Regina prati.*

Queene of the Meadow.

smell, as are the leaues likewise : after which come the seeds, small, crookedly turning or winding one with another, made into a fine little head. The root hath a sweet smell, spreading far abroad, blacke without, and of a darkish red colour within.

‡ 2 There is also another which by *Fuchsius, Tragus, Lonicerus, Gesner*, and others, is called *Barba Capri* : it hath large wooddie rootes, leaues of the bignesse, and growing somewhat after the manner of the wild *Angelica* : the stalks are crested, and diuided into sundry branches, which carry long bending spikes or eares of white floures & seeds somewhat like those of the common kinde. This floures at the same time as the former, and I haue not yet heard of it wilde with vs, but onely seene it growing with Mr. *Tradescant*. ‡

¶ *The Place.*

It groweth in the brinks of waterie ditches and riuers sides, and also in meadows : it liketh waterie and moist places, and groweth almost euery where.

¶ *The Time.*

It floureth and flourisheth in Iune, Iuly, and August.

¶ *The Names.*

It is called of the later age *Regina prati*, & *Barba Capri* : of some, *Vlmaria*, à foliorum *Vlmi* *similitudine*, from the likenesse it hath with the Elme tree leafe : in high Dutch, *Scilbart*. It is called *Barba Hirci*, which name belongeth to the plant which the Grecians do call *Tragopogon* : of *Anguillara*, *Potentilla maior*. It hath some likenesse with *Rhodora Plinij*, but yet we cannot affirme it to be the same. It is called in low Dutch *Reijnnette* : in French, *Barbe de Cheure*, *Reine des Praiz* : in English, *Mede-sweet*, *Meadow-sweet*, and *Queene of the meadows*. *Camerarius* of Noremberg saith it is called of the Germanes his countymen, *Nurme kraut* : because the roots, saith he, seem to be eaten with wormes. I rather suppose they call it so, because the antient hackny men and horse-leaches do giue the decoction therof to their horses and asses, against the bots and wormes, for the which it is greatly commended.

¶ *The Temperature.*

Mede-sweet is cold and drie, with an euident binding qualitie adioined.

¶ *The Vertues.*

The root boiled, or made into powder and drunke, helpeth the bloody flux, staieth the laske, and all other fluxes of blood in man or woman.

It is reported, that the floures boiled in wine and drunke, do take away the fits of a quartaine ague, and make the heart merrie.

The leaues and floures farre excell all other strowing herbes, for to decke vp houses, to straw in chambers, halls, and banqueting houses in the sommer time; for the smell thereof makes the heart merrie, delighteth the senses : neither doth it cause head-ache, or lothfomenesse to meat, as some other sweet smelling herbes do.

The distilled water of the floures dropped into the eies, taketh away the burning and itching thereof, and cleareth the sight.

CHAP. 420. Of Burnet Saxifrage.

¶ *The Description.*

I **T**His great kinde of Pimpinell, or rather Saxifrage, hath great and long roots, fashioned like a Parsnep, of an hot and biting taste like Ginger : from which riseth vp an hollow stalke

stalkewith ioints and knees two cubits high, beset with large leaues, which do more neerely represent Smallage than Pimpernell, or rather the garden Parsnep. This plant consisteth of many small leaues growing vpon one stem, snipt or dented about the edges like a saw: the floures do grow at the top of the stalkes in white round tufts: the seed is like the common Parsley, sauing that it is hotter and biting vpon the tongue.

‡ There is a bigger and lesser of this kinde, which differ little, but that the stalkes and veins of the leaues of the lesser are of a purplish colour, and the root is hotter. Our Authour formerly gaue the figure of the lesser in the second place, in stead of that of *Bipinella*. ‡

1 *Pimpinella Saxifraga*.
Burnet Saxifrage.

‡ 2 *Bipinella*, siue *Saxifraga minor*.
Small Burnet Saxifrage.

2 *Bipinella* is likewise a kinde of Burnet or Pimpinell, vpon which *Pena* hath bestowed this addition *Saxifraga minor*: vnder which name *Saxifraga* are comprehended diuers herbs of diuers kinds, and the one very vnlike to the other: but that kinde of Saxifrage which is called *Hircina*, which is rough or hairie Saxifrage, of others *Bipinella*, is best knowne, and the best of all the rest, like vnto the small Burnet, or common Parsley, sauing that it is void of haire, as may appeare by the old Latine verse,

Pimpinella habet pilos, Saxifraga non habet villos.

Pimpinell hath haire some, but Saxifrage hath none.

Notwithstanding, I haue found a kinde hereof growing in our pastures adioining to London, the leaues whereof if you take and tenderly breake with your hands, you may draw forth small threds, like the web of a spider, such as you may draw from the leaues of Scabious. The stalke is hollow, diuiding it selfe from the ioints or knees, into sundry other small branches, at the top whereof doe grow small tufts or spokie rundles, of a white colour: after which commeth the seed like to *Carui*, or *Caruwaies*, of a sharpe taste: the root is also sharpe and hot in taste.

¶ The Place.

These plants do grow in drie pastures and medowes in this countrey very plentifully.

¶ The Time.

They floure from Iune to the end of August.

¶ The Names.

That which *Fuchsius* calleth *Pimpinella maior*, *Dodonæus* termeth *Saxifraga maior*, which kinde of Saxifrage doth more absolutely answer the true *Phellandrium* of *Pliny*, than any other plant whatsoever:

soener: wherein the Physicians of Paris haue been deceiued, calling or supposing the meadow Rue to be the right *Phellandrium*, whereunto it is not like either in shape or facultie: for it is nothing so effectually in breaking the stone, or prouoking of vrine, as either of these plants, especially *Pimpinella Hircina*, which is not so called, because it hath any rammish smell of a goat, but because practitioners haue vsed to feed goats with it, whose flesh and blood is singular good against the stone, but we rather take it to be named *Hircina*, of *Hircinia sylua*, where it doth grow in great abundance, the saueur of the herbe not being vnpleasant, somewhat resembling the smell and taste of *Daucus*, *Ligustrum*, and *Pastinaca*: so to conclude, both these are called *Saxifraga*: the smaller is called of some *Petrasidula*, *Bipinella*, and *Bipenula*: of *Baptista Sardus*, and also of *Leonardus Fuchsius*, *Pimpinella maior*: wherefore diuers call it *Pimpinella Saxifraga*: for there is also another *Pimpinella*, called *Pimpinella Sanguisorba*: notwithstanding the verse before rehearsed sheweth a difference betweene *Pimpinella* and *Saxifraga*: in high Dutch, it is called *Bibernel*: in Low Dutch, *Bauenaert*: in English the greater may be called great Saxifrage, and the other small Saxifrage.

Bipinella is called *Saxifraga minor*: in English, Small Saxifrage, as *Pimpinella* is called great Saxifrage. † *Columna* iudges it to be the *Tragium* of *Dioscorides*. †

¶ The Nature.

Saxifrage of both kindes, with their seed, leaues, and roots, are hot and drie in the third degree, and of thin and subtile parts.

¶ The Vertues.

The seed and root of Saxifrage drunken with wine, or the decoction thereof made with wine, A causeth to pisse well, breaketh the stone in the kidnies and bladder, and is singular against the strangurie, and the stoppings of the kidnies and bladder: whereof it tooke the name *Saxifraga*, or break stone.

The iuice of the leaues of Saxifrage doth cleanse and take away all spots and freckles of the face, B and leaueth a good colour.

The distilled water thereof mingled with some vinegar in the distillation, cleareth the sight, and C taketh away all obscuritie and darknesse of the same.

CHAP. 421. Of Burnet.

1 *Pimpinella hortensis*.
Garden Burnet.

2 *Pimpinella sylvestris*.
Wilde Burnet:

¶ The

¶ The Kinds.

Burnet of which we will intreat, doth differ from *Pimpinella*, which is also called *Saxifraga*. One of the Burnets is lesser, for the most part growing in gardens, notwithstanding it groweth in barren fieldes, where it is much smaller: the other greater, is altogether wilde.

¶ The Description.

1 **G**arden Burnet hath long leaues made vp together of a great many vpon one stem, euery one whereof is something round, nicked on the edges, somewhat haire: among these riseth a stalke that is not altogether without leaues, something chambered: vpon the tops whereof grow little round heads or knaps, which bring forth small floures of a browne purple colour, and after them cornered seeds, which are thrust vp together. The root is long: the whole plant doth smell something like a Melon, or Cucumber.

2 Wilde Burnet is greater in all parts, it hath wider and bigger leaues than those of the former: the stalke is longer, sometimes two cubits high: the knaps are greater, of a darke purple colour, and the seed is likewise cornered and greater: the root longer, but this Burnet hath no pleasant smell at all.

3 There is kept in some gardens another of this kinde, with very large leaues, stalkes, and heads, for the heads are some inch and halfe long, yet but slender considering the length, and the floures (as I remember) are of a whitish colour: in other respects it differs not from the precedent: it may fitly be called *Pimpinella sanguisorba hortensis maxima*, Great Garden Burnet. ‡

¶ The Place.

The small *Pimpinella* is commonly planted in gardens, notwithstanding it doth grow wilde vpon many barren heaths and pastures.

The great wilde Burnet groweth (as Mr. Lyte saith) in dry medowes about Viluord, and my selfe haue found it growing vpon the side of a causey which crosseth the one halfe of a field, whereof the one part is earable ground, and the other part medow, lying between Paddington and Lysson green neere vnto London, vpon the high way.

¶ The Time.

They floure from Iune, vnto the end of August.

¶ The Names.

The later herbarists doe call Burnet *Pimpinella sanguisorba*, that it may differ from the other, and yet it is called by seuerall names, *Sanguisorba*, and *Sanguinaria*: Gesner had rather it should be called *Peponella* of the smell of Melons or Pompions, to which it is like, as we haue said: of others it is named *Pimpinella*, or *Bipennula*: of most men, *Solbastrella*: in High Dutch, *Kolbleskraut*, her *Gots Bartlin*, *Blutkraut*, *megekraut*: in French, *Pimpennelle*, *Sanguisorbe*: in English, Burnet. It agreeth cum altera *Dioscoridis Sideritide*, that is to say, with *Dioscorides* his second Iron-woort: the leafe (and especially that of the lesser sort) which we haue written to consist of many nicks in the edges of the leaues, and this may be the very same which *Pliny* in his 24 book, chapter 17. reporteth to be named in Persia, *Sissitiepterus*, because it made them merry; he also calleth the same *Protomedia*, and *Casigneta*, and likewise *Dionysionymphas*, for that it doth maruellously agree with wine, to which also this *Pimpinella* (as we haue said) doth giue a pleasant sent: neither is that repugnant, that *Pliny* in another place hath written, *De Sideritibus*, of the Iron-woorts; for it often falleth out that he intreateth of one and the selfe same plant in diuers places, vnder diuers names: which thing then hapneth sooner when the writers themselves do not well know the plant, as that *Pliny* did not well know *Sideritis* or Iron-woort, it is euen thereby manifest, because he setteth not downe his owne opinion hereof, but other mens.

¶ The Temperature.

Burnet, besides the drying and binding facultie that it hath, doth likewise meanly coole: and the lesser Burnet hath likewise withall a certaine superficial, sleight, and temperate sent, which when it is put into the wine it doth leaue behind it: this is not in the dry herbe, in the iuice, nor in the decoction.

¶ The Vertues.

- A** Burnet is a singular good herb for wounds (which thing *Dioscorides* doth attribute to his second Ironwoort) and commended of a number: it stancheth bleeding, and therefore it was named *Sanguisorba*, as well inwardly taken, as outwardly applied.
- B** Either the iuice is giuen, or the decoction of the poudre of the drie leaues of the herbe, beeing bruised, it is outwardly applied, or else put among other externall medicines.
- C** It staith the laske and bloody flux: it is also most effectuell to stop the monthly course.
- D** The lesser Burnet is pleasant to be eaten in fallads, in which it is thought to make the heart merry and glad, as also being put into wine, to which it yeeldeth a certaine grace in the drinking.

The

The decoction of Pimpinell drunken, cureth the bloody flux, the spitting of blood, and all other fluxes of blood in man or woman.

The herbe and seed made into powder, and drunke with wine, or water wherein iron hath beene quenched doth the like.

The leaues of Pimpinell are very good to heale wounds, and are receiued in drinckes that are made for inward wounds.

The leaues of Burnet steeped in wine and drunken, comfort the heart, and make it merry, and are good against the trembling and shaking thereof.

CHAP. 422. Of English Saxifrage.

¶ The Description.

This kinde of Saxifrage our English women Physitions haue in great vse, and is familiarly knowne vnto them, vouchsafing that name vnto it of his vertues against the stone: it hath the leaues of Fennel, but thicker and broader, very like vnto *Seseli pratense*, *Monspeliensium* (which addition *Pena* hath bestowed vpon this our English Saxifrage) among which riseth vp a stalke, of a cubit high or more, bearing at the top spokie rundles beset with whitish yellow floures: the root is thicke, blacke without, and white within, and of a good sauour.

† 1 *Saxifraga Anglicana facie Seseli pratensis*.
English Saxifrage.

† 2 *Saxifraga Pannonica Clusij*.
Austrian Saxifrage.

† 2 *Clusius* hath set forth another plant not much different from this our common Saxifrage, and called it *Saxifraga Pannonica*, which I haue thought fit here to insert: the leaues, saith he, are much shorter than those of Hogs-Fennel, and somewhat like those of Fumitorie: the stalkes are some foot high, slender, hauing some few small leaues, and at the top carrying an umbel of white floures: the root is not much vnlike that of Hogs-Fennel, but shorter and more acride; it is hairie at the top thereof.

thereof, whence the stalkes and leaues come forth: it growes vpon some hils in Hungarie and Austria, and floures in Iuly. †

¶ The Place.

Saxifrage groweth in most fields and medowes euery where throughout this our kingdome of England.

¶ The Time.

It floureth from the beginning of May to the end of August.

¶ The Names.

Saxifraga Anglicana is called in our mother tongue Stone-breake or English Saxifrage: *Pena* and *Lobel* call it by this name *Saxifraga Anglicana*: for that it groweth more plentifully in England than in any other countrey.

¶ The Nature.

Stone-breake is hot and drie in the third degree.

¶ The Vertues.

- A A decoction made with the seeds and roots of Saxifrage, breaketh the stone in the bladder and kidneies, helpeth the strangurie, and causeth one to pisse freely.
- B The root of Stone-breake boiled in wine, and the decoction drunken, bringeth downe womens sicknesse, expelleth the secondine and dead childe.
- C The root dried and made into pouder, and taken with sugar, comforteth and warmeth the stomack, cureth the gnawings and griping paines of the belly.
- D It helpeth the collicke, and driueth away ventosities or windinesse.
- E Our English women vse to put it in their running or rennet for cheese, especially in Cheshire (where I was borne) where the best cheese of this Land is made.

† I haue formerly Chap. 188. deliuered the history of the *Saxifraga maior* of *Matthiolum*, and *Saxifraga Antiquorum* of *Lobel*; not think'ng that our Author had put their descriptions here amongst the *Umbelliferae*, for if I had, I should haue spared my labour there bestowed, and haue giuen their figures here to the descriptions of our Author, which are now omitted. The figure formerly here was of the *Caucalis*, described in the third place of the 403 Chapter.

CHAP. 423. Of Siler Mountaine or bastard Louage.

† 1 *Siler montanum Officinarium*.
Bastard Louage.

† 2 *Seseli pratense Monspeliensium*.
Horse Fennell.

¶ The

¶ The Description.

1 **T**He naturall plants of *Seseli*, being now better knowne than in times past, especially among our Apothecaries, is called by them *Siler montanum*, and *Sescleos*: this plant they haue retained to very good purpose and consideration; but the error of the name hath caused diuers of our late writers to erre, and to suppose that *Siler montanum*, called in shops, *Sescleos*, was no other than *Seseli Masiliensium* of *Dioscorides*. But this plant containeth in his substance much more acrimony, sharpenesse, and efficacy in working, than any of the plants called *Seselios*. It hath stalkes like *Ferula*, two cubits high. The root smelleth like *Ligusticum*: the leaues are very much cut or diuided, like the leaues of *Fennell* or *Seseli Masiliense*, and broader than the leaues of *Peucedanum*. At the top of the stalkes grow spoky tufts like *Angelica*, which bring forth a long and leafie seed like *Cumine*, of a pale colour; in taste seeming as though it were condited with sugar, but withall somewhat sharpe, and sharper than *Seseli pratense*.

2 There is a second kinde of *Siler* which *Pena* and *Lobel* set forth vnder the title of *Seseli pratense Monspeliensium*, which *Dodonaeus* in his last edition calleth *Siler pratense alterum*, that is in shew very like the former. the stalkes thereof grow to the height of two cubits, but his leaues are somewhat broader and blacker: there are not so many leaues growing vpon the stalke, and they are lesse diuided than the former, and are of little fauour. The seed is smaller than the former, and fauouring very little or nothing. The root is blacke without, and white within, diuiding it selfe into sundry diuisions.

¶ The Place.

It groweth of it selfe in *Liguria*, not far from *Genua* in the craggy mountaines, and in the gardens of diligent Herbarists.

¶ The Time.

These plants do floure from Iune to the end of August.

¶ The Names.

It is called commonly *Siler Montanum*: in French and Dutch by a corrupt name *Ser-Mountain*: in diuers shops, *Sescleos*, but vntuly: for it is not *Seseli*, nor a kinde thereof: in English, *Siler mountaine*, after the Latine name, and bastard *Louage*. ‡ The first is thought to be the *Ligusticum* of the Antients, and it is so called by *Matthiolus* and others. ‡

¶ The Nature.

This plant with his seed is hot and dry in the third degree.

¶ The Vertues.

The seeds of *Siler* drunke with *Wormewood* wine, or wine wherein *Wormewood* hath been A
fodden, moueth womens diseases in great abundance: cureth the suffocation and strangling of the
matrix, and causeth it to returne vnto the naturall place againe.

The root stamped with hony, and applied or put into old sores, doth cure them, and couer bare B
and naked bones with flesh.

Being drunke it prouoketh vrine, easeth the paines of the guts or entrailes proceeding of crudi- C
tie or rawnesse, it helpeth concoction, consumeth winde, and swelling of the stomacke.

The root hath the same vertue or operation, but not so effectually, as not being so hot and dry. D

† The figure which formerly was here was of the *Seseli Masiliense* described in the next chapter in the fourth place, and that which belonged to this place was put for our common *Louage*. Also that figure which belonged to the second description was formerly vnder the title of *Feniculum dulce*.

CHAP. 224. Of *Seselios*, or *Harte-worts* of Candy.

¶ The Description.

1 **T**His plant being the *Seseli* of Candy, and in times past not elsewhere found, tooke his surname of that place where it was first found, but now adaies it is to be seen in the corne fields about *Narbon* in *France*, from whence I had seeds, which prosper well in my garden. This is but an annuall plant, and increaseth from yeere to yeere by his owne sowing. The leaues grow at the first euen with the ground, somewhat hairy, of an ouerworne Greene colour, in shape much like vnto *Cheruell*, but thicker: among which riseth vp an hairy rough stalke, of the height of a cubit, bearing at the top spokie tufts with white floures: which being vaded, there followeth round and flat seed, compassed and cunningly wreathed about the edges like a ring.

T t t t

The

The seed is flat like the other, ioyned two together in one, as you may see in the seed of *Ferula* or *Angelica*, in shape like a round target, in taste like *Myrrhis*. *Matthiolus* did greatly mistake this plant.

2 There is a kinde of *Seseli Creticum*, called also *Tordylion*: and is very like vnto the former, sauing that his leaues are more like vnto common *Parfneps* than *Cheruil*, and the whole plant is bigger than the former.

1 *Seseli Creticum minus*:
Small Seseleos of Candie.

2 *Seseli Creticum maius*.
Great Seseleos of Candie.

3 There is likewise a kinde of *Seseli* that hath a root as big as a mans arme, especially if the plant be old, but the new and young plants beare roots an inch thicke, with some knobs and tuberous sprouts, about the lower part, the root is thicke, rough, and couered ouer with a thicke barke, the substance whereof is first gummie, afterward sharpe, and as it were full of spattle; from the vpper part of the root proceed many knobs or thicke swelling roots, out of which there issueth great and large wings or branches of leaues, some whereof are notched and dented round about, growing vnto one side or rib of the leafe, standing also one opposite vnto another, of a darke and delaid green colour, and somewhat shining aboue, but vnderneath of a grayish or ashe colour: from amongst these leaues there ariseth a straked or guttered stalke, a cubit and a halfe high, sometimes an inch thicke, hauing many ioints or knees, and many branches growing about them, and vpon each ioint lesser branches of leaues. At the top of the stalke, and vpper ends of the branches grow little cups or umbels of white floures; which being vaded, there commeth in place a seed, which is very like *Siler montanum*. I take this here described to be the *Seseli montanum* 1. of *Clusius*, or *Ligusticum alterum Belgarum* of *Lobel*: and therefore I haue giuen you *Clusius* his figure in this place. ‡

There is also a kinde of *Seseli*, which *Pena* setteth forth for the first kinde of *Daucus*, wherof I take it to be a kinde, growing euery where in the pastures about London, that hath large leaues, growing for a time euen with the earth, and spred thereupon, and diuided into many parts, in manner almost like to the former for the most part in all things, in the round spokie tufts or umbels, bearing stiffe and faire white floures in shape like them of *Cinkefoile*; in smell like *Sambucus* or *Elder*. When the floure is vaded, there commeth in place a yellow guttered seed, of a spicie and very hot taste. The root is thicke, and blacke without, which rotteth and perisheth in the ground (as wee may

may see in many gummie or Ferulows plants) after it hath seeded, neither will it floure before the second or third yeare after it is sowne. ‡ I am ignorant what our Author means by this description. ‡

‡ 3 *Seseli Creticum maius*.
Mountaine Sefelios.

‡ 4 *Seseli Massiliense*.
Sefelios of Massilles.

4 There is likewise a kinde of *seseli* called *seseli Massiliense*, which hath leaues very much cloven or cut, and finely iagged, very much like vnto the leaues of sweet Fennell, greater and thicker than the common Fennell. The stalke groweth to the height of three cubits, hauing knotty ioints, as it were knees; bearing at the top thereof tufts like vnto Dill, and seed somewhat long and cornered, of a sharpe and biting taste. The root is long and thicke like vnto great Saxifrage, of a pleasant smell, and sharpe in taste.

There is another *Seseli* of Massilia, which hath large and great leaues like vnto Ferula, and not much vnlike *Siler Montanum*: among which rise vp stalkes foure cubits high, bearing at the tops spokie tufts like vnto the last before rehearsed, of a good sauour. The root is like vnto the former in shape, substance, and sauour, but that it is greater.

¶ The Place.

These plants are strangers in England, notwithstanding I haue them in my garden.

¶ The Time.

They floure and flourish in September.

¶ The Names.

Their names haue been touched in their seuerall descriptions.

¶ The Temperature and Vertues.

It prouoketh vrine, and helpeth the strangurie, bringeth downe the sicknesse and dead birth: it helpeth the cough and shortnesse of breath, the suffocation of the mother, and helpeth the falling sicknesse.

The seed drunke with wine concocteth raw humours, taketh away the griping and torments of the belly, and helpeth the ague, as *Dioscorides* saith.

The iuice of the leaues is giuen to Goats and other cattell to drinke, that they may the sooner be deliuered of their young ones, as the same Author reporteth.

CHAP. 425. Of Spignell, Spicknell, or Mewe.

¶ The Description.

1 Spignell hath stalkes rising vp to the height of a cubit and a halfe, beset with leaues resembling Fennell or Dill, but thicker, more bushie, and more finely iagged; and at the top of the stalkes do grow spokie tufts like vnto Dil. The roots are thick, and full of an oleous substance, smelling well, and chafing or heating the tongue, of a reasonable good saour.

1 *Meum*.
Spignell.

2 *Meum alterum Italicum*.
Italian Spignell.

2 There is a bastard kinde of Spignell like vnto the former, sauing that the leaues are not so finely cut or iagged: the floures are tufted more thicker than the former: the roots are many, thick, and full of sap.

¶ The Place.

Mew, or Meon, groweth in Westmerland, at a place called Round-twhat betwixt Aplebie and Kendall, in the parish of Orton.

Bastard Mewe, or *Meum*, groweth in the waste mountaines of Italie, and the Alps, and (as it hath been told me) vpon Saint Vincents rocke by Bristow, where I spent two daies to seeke it, but it was not my hap to find it, therefore I make some doubt of the truth thereof.

¶ The Time.

These herbes doe floure in Iune and Iuly, and yeeld their seed in August.

¶ The Names.

It is called of the Grecians *μῆον* or *μῆον*: likewise of the Latines, *Meum*: of the Italians, *Meo*: in Apulia, as *Matthiolus* declareth, it is called *Imperatrix*: in diuers places of Spaine, *Sistra*: in others, *Pinello*: in High Dutch, *Beerewurtz*: in French, *Sistre*: *Ruellius* saith that it is named in France *Anethum tortuosum*, and *syluestre*, or writhed Dil, and wilde Dill: also it is called in English, Spignell, or Spicknell, of some Mew, and Bearewoort.

The second may be called bastard Spicknell.

¶ The

¶ The Temperature.

These herbes, especially the roots of right Meon, is hot in the third degree, and drie in the second.

¶ The Vertues.

The roots of Meon, boiled in water and drunke, mightily open the stoppings of the kidnies A and bladder, prouoke vrine and bodily lust, ease and helpe the strangurie, and consume all windiness and belchings of the stomacke.

The same taken with honie doth appease the grieve of the belly, and is exceeding good against all Catarrhes, rheumes, and aches of the iointes, as also any phlegme which falls vpon the Lungs.

If the same be laied plaisterwise vpon the bellies of children, it maketh them to pisse well. C

They cleanse the entrails, and deliuer them of obstructions or stoppings: they prouoke vrine, D driue forth the stone, and bring downe the floures: but if they be taken more than is requisite, they cause the head-ache; for seeing they haue in them more heat than driness, they carry to the head raw moisture and windie heat, as Galen saith.

CHAP. 426. Of Horestrange, or Sulphurwoort.

¶ The Description.

1 S Vlpurwoort or Hogs-fennell hath a stiffe and hard stalke full of knees or knots, beset with leaues like vnto Fennell, but greater, comming neerer vnto Ferula, or rather like the leaues of wilde Pine-tree, and at the top of the stalkes round spokie tufts full of little yellow floures, which do turne into broad browne seed. The root is thicke and long: I haue digged vp roots thereof as big as a mans thigh, blacke without, and white within, of a strong and grievous smell, and full of yellow sap or liquour, which quickly waxeth hard or dry, smelling not much vnlike brimstone, called *Sulphur*; which hath induced some to call it Sulphurwoort, hauing also at the top toward the vpper face of the earth, a certain bush of haire, of a browne colour, among which the leaues and stalkes do spring forth.

2 The second kinde of *Peucedanum* or Hogs-fennell is very like vnto the former, sauing that the leaues be like Ferula: the roots are nothing so great as the former, but all the rest of the plant doth far exceed the other in greatnesse.

3 There is another kinde of *Peucedanum* or Hogs Fennell, which *Pena* found vpon Saint Vincents rock by Bristow, whose picture he hath set forth in his *Aduersaria*, which that famous English Physition of late memorie, D. *Turner* found there also, supposing it to be the right and true *Peucedanum*, whereof no doubt it is a kinde: it groweth not aboue a foot high, and is in shape and leaues like the right *Peucedanum*, but they be shorter and lesser, growing somewhat like the writhed Fennell of Massilia, but the branches are more largely writhed, and the leaues are of the colour of the branches, which are of a pale Greene colour. At the top of the branches grow small white tufts, hauing seed like Dill, but shorter and slenderer, of a good taste, somewhat sharpe. The root is thicker than the smalnesse of the herb will well beare. Among the people about Bristow, and the rocke aforesaid, this hath been thought good to eat.

4 The figure of this our Authour formerly gaue (yet vnfitly, it not agreeing with that description) for *Oroselinum*: it may be he thought it the same with that of *Dodon.* his description, because he found it vnder the same title in *Tabernaemontanus*. This is the *Selinum montanum pumilum* of *Clusius*; and the *Peucedani facie pusilla planta* of *Pena* and *Lobel*; wherefore *Bauhine* was mistaken in his *Pinax*, whereas he refers that of *Lobel* to his third *Peucedanum*: the root of this is black without, and white within, but short, yet at the top about the thicknesse of ones finger: the leaues are small and green, commonly diuided into fve parts; and these againe subdiuided by threes: the stalke is some sixe inches or halfe a foot high, diuided into sundry branches, crested, broad, and at the toppes of the branches, euen when they first shoot vp, appeare little umbels of white floures very small, and consisting of fve leaues apiece. The seed is blacke, shining and round, two being ioined together, as in most umbelliferous plants. It floures in May, and ripens the seede in Iuly: I receiued in Iuly 1632, some plants of this from Bristow, by the meanes of my oft mentioned friend Master *George Bowles*, who gathered it vpon Saint Vincents Rocke, whereas the Authours of the *Aduersaria* report it to grow. ‡

1 *Peucedanum*.
Sulphurwoort.

2 *Peucedanum maius*.
Great Sulphurwoort.

3 *Peucedanum pumilum*.
Dwarfe Hogs-Fennell.

¶ The Place.

The first kinde of *Peucedanum* or Hogs Fennell groweth very plentifully on the South side of a wood belonging to Waltham, at the Nafe in Essex by the high-way side; also at Whitstable in Kent, in a meadow neere to the sea side, sometime belonging to Sir Henry Crispe, and adioyning to his house there. It groweth also in great plenty at Feuerham in Kent, neere vnto the hauen vpon the bankes thereof, and in the meadowes adioyning.

The second kinde groweth vpon the sea coasts of Montpellier in France, and in the coasts of Italy.

¶ The Time.

These plants do floure in Iune, Iuly, and August.

¶ The Names.

The Grecians call it *πυρραειος*; the Latines in like manner *Peucedanos*, or *Peucedanum*, and also *Pinastellum*: most of the shops, and likewise the common people name it *Feniculum Porcinum*: of diuers, *Stataria*: of the Prophets, *αγριος δασυαν*: that is to say, a good Angell or Ghost: in high-Dutch, *Harstrang*, *Schwefel wurckel*, *Sewfenckel*: in Italian and French, *Peucedano*: in Spanish, *Herbatum*: in English, Hore-strange, and Hore-strong, Sow-Fennell, or Hogs Fennell, Sulphur-wort, or Brimstone-wort. It is called *Peucedanum* and *Pinastellum*, of the Greeke and Latine words, *πυρραειος* and *Pinus*.

¶ The Temperature.

These herbes, especially the yellow sap of the root, is hot in the second degree, and dry in the beginning of the third.

¶ The Vertues.

The yellow sap of the root of Hogs Fennell, or as they call it in some places of England, Hore-strange, taken by it selfe, or with bitter almonds and Rue, is good against the shortnesse of breath, it asswageth the griping paines of the belly, dissolueth and driueth away ventositie or windinesse of the stomacke; it wasteth the swelling of the milt or spleene, looseth the belly gently, and purgeth by siege both flegme and choler.

The same taken in manner aforesaid prouoketh vrine, easeth the paine of the kidneyes and bladder, causeth easie deliuerance of childe, and expelleth the secondine, or after-birth, and the dead childe.

The sap or iuyce of the root mixed with oyle of Roses, or Vineger, and applied, easeth the palse, crampes, contraction or drawing together of sinewes, and all old cold diseases, especially the Sciatica.

It is vsed with good successe against the rupture or burstings in yong children, and is very good to be applied vnto the nauels of children that stand out ouer much.

The decoction of the root drunke is of like vertue vnto the iuyce, but not altogether so effectually all against the foresaid diseases.

The root dried and made into pouder doth mundifie and clense old stinking and corrupt sores and vlcers, and healeth them: it also draweth forth the corrupt and rotten bones that hinder the same from healing, and likewise splinters and other things fixed in the flesh.

The said pouder or iuyce of the root mixed with oyle of Roses, causeth one to sweat, if the body be anointed therewith, and therefore good to be put into the vnction or ointment for the French disease.

The congealed liquor tempered with oyle of Roses, and applied to the head after the manner of an ointment, is good for them that haue the Lethargie, that are franticke, that haue dizziness in the head, that are troubled with the falling sicknesse, that haue the palse, that are vexed with convulsions and crampes, and generally it is a remedie for all infirmities of the sinewes, with Vineger and oyle, as *Dioscorides* teacheth.

The same being smelt vnto reuiueth and calleth them again that be strangled with the mother, and that lie in a dead sleepe.

Being taken in a reare egge it helpeth the cough and difficultie of breathing, gripings and windinesse, which, as *Galen* addeth, proceedeth from the grossnesse and clamminesse of humors.

It purgeth gently, it diminisheth the spleene, by cutting, digesting, and making thin humors that are thicke: it causeth easie trauell, and openeth the matrix.

A small piece of the root holden in the mouth is a present remedie against the suffocation of the mother.

CHAP. 427.

Of Herbe *Ferula*, or Fennell Gyant.

¶ The Kindes.

Dioscorides maketh mention of a *Ferula*, out of which is gathered the Gum *Sagapene*; and also he declareth, that the Gums *Galbanum* and *Ammoniacum* are liquors of this herb *Ferula*: but what difference there is in the liquors, according to the clymat or countrey where it groweth, he doth not set downe; for it may be that out of one kinde of *Ferula* sundry iuyces may be gathered, that is to say, according to the diuersitie of the countries where they grow, as we haue said: for as in *Lasfer*, the iuyce of *Lasferwort* that groweth in *Cyrene* doth differ from that liquor which groweth in *Media* and *Syria*; so it is likely that the herbe *Ferula* doth bring forth in *Media* *Sagapenum*, in *Cyrene* *Ammoniacum*, and in *Syria* *Galbanum*. *Theophrastus* saith that the herbe *Ferula* is diuided into mo Kindes, and he calleth one great, by the name of *Ferula*; and another little, by the name *Ferulago*.

1 *Ferula*.
Fennell Gyant.

2 *Ferulago*.
Small Fennell-Gyant.

¶ The Description.

1 **F***erula*, or Fennell Gyant, hath very great and large leaues of a deepe Greene colour, cut and iagged like those of Fennell, spreading themselues abroad like wings: amongst which riseth vp a great hollow stalke, somewhat reddish on that side which is next vnto the Sun, diuided into certaine spaces, with ioynts or knees like those of Hemlocks or Kexes, of the bignesse of a mans arme in the wrest, of the height of foure or fve cubits where it groweth naturally, as in *Italy*, *Greece*, and other hot countries; notwithstanding it hath attained to the height of foureene or fisteene foot in my garden, and likewise groweth fairer and greater than from whence it came, as it fareth with other plants that come hither from hot regions: as for example our great *Artichoke*, which first was brought out of *Italy* into *England*, is become (by reason of the great moisture which our countrey is subiect vnto) greater and better than those of *Italy*; insomuch

insomuch that diuers Italians haue sent for some plants of our Artichokes, deeming them to be of another kinde; neuerthelesse in Italy they are small and dry as they were before. Even so it happeneth to this *Ferula*, as we haue said. This foresaid stalke diuideth it selfe toward the top into diuers other smaller branches, whereon are set the like leaues that grow next the ground, but much lesser. At the top of the branches at the first budding of the floures appeare certaine bundles inclosed in thin skins, like the yolke of an egge, which diuers call *Corculum Ferula*, or the little heart of *Ferula*; which being brought to maturitie, open themselues into a tuft or umbel like that of *Dill*, of a yellowish colour: after which come the seed, in colour and fashion like those of the Parsnep, but longer and greater, alwaies growing two together, so closely ioyned, that it cannot be discerned to be more than one seed vntill they be diuided: the root is very thicke and great, full of a certaine gummie iuyce, that floweth forth, the root being bruised, broken, or cut; which being dried or hardned, is that gum which is called *Sagapenum*, and in some shops *Serapinum*.

‡ 3 *Panax Asclepium Ferulae facie.*
Esculapius his All-heale.

2 There is likewise another smaller *Ferula* like vnto the former in each respect, sauing that it is altogether lesse: the root likewise being wounded yeeldeth forth a sap or iuyce, which when it is hardned is called *Galbanum*: of the Assyrians, *Metopium*.

I haue likewise another sort sent mee from Paris, with this title *Ferula nigra*; which prospereth exceeding well in my garden, but difference I cannot finde any from the former, save that the leaues are of a more blacke or swart colour.

‡ 3 I know not where more fitly than in this place to giue you the historie of that *Ferula* or Ferulaceous plant that *Dodonaeus*, *Lobel*, and others haue set downe vnder the name of *Panax Asclepium*. The stalke hereof is slender, a cubit high, crested and ioyned, and from these ioyns proceed leaues bigger than those of Fennell, and also rougher, and of a strong smell: at the tops of the branches grow umbels of yellow floures: the seed is flattish, like that of the other *Ferula*: the root long, white, and of a strong smell. This growes naturally in Istria. ‡

¶ The Place.

These plants are not growing wilde in England; I haue them all in my garden.

¶ The Time.

They floure in Iune and Iuly; they perfect their seed in September; not long after, the stalke with his leaues perish: the root remaineth fresh and greene all Winter.

¶ The Names.

The first is called in Greeke *Νεραν*: in Latine, *Ferula*: in Italian, *Ferola*: in Spanish, *Cananheia*: in English, Herbe Ferula, and Fennell Gyant.

¶ The Temperature.

These plants with their Gums are hot in the third degree, and dry in the second.

¶ The Vertues.

The pith or marrow, called *Corculum Ferula*, as *Galen* teacheth, is of an astringent or binding A
qualitie, and therefore good for them that spit bloud, and that are troubled with the flux.

Dioscorides saith, that being put into the nostrils it stayeth bleeding, and is giuen in Wine to B
those that are bitten with Vipers.

It is reported to be eaten in Apulia roasted in the embers, first wrapped in leaues or in old clouts, C
with pepper and salt; which, as they say, is a pleasant sweet food, that stirreth vp lust, as they report.

The seed doth heate, and attenuate or make thinne: it is a remedie against cold fits of an Ague, D
by procuring sweat, being mixed with oyle, and the body anointed therewith.

A dram of the iuyce of *Ferula* which beareth *Sagapenum*, purgeth by siege tough and slimie humors, E

mors, and all grosse flegme and choler, and is also good against all old and cold diseases which are hard to be cured; it purgeth the brain, and is very good against all diseases of the head, against the Apoplexie and Epilepsie.

Being taken in the same manner, it is good against crampes, palsies, shrinkings and paines of the sinewes.

It is good against the shortnesse of breath, the cold and long cough, the paine in the side and brest, for it mundifieth and clenseth the brest from all cold flegme and rheumaticke humors.

Sagapenum infused or steeped in vineger all night, and spread vpon leather or cloath, scattereth, dissolueth, and driueth away all hard and cold swellings, tumors, botches, and hard lumpes growing about the ioynts or elsewhere, and is excellent good to be put into or mingled with all ointments or emplasters which are made to mollifie or soften.

The iuyce of *Ferula Galbanifera*, called *Galbanum*, drunke in wine with a little myrrh, is good against all venome or poyson that hath bene taken inwardly, or shot into the body with venomous darts, quarrels, or arrowes.

It helps womens painefull trauel, if they do take therof in a cup of wine the quantitie of a bean. The perfume of *Galbanum* helpeth women that are griued with the rising of the mother, and is good for those that haue the falling sicknesse.

Galbanum softneth, mollifieth, and draweth forth thornes, splinters, or broken bones, and consumeth cold and flegmaticke humors, seruing in sundry ointments and emplasters for the vse of Surgerie, and hath the same physcall vertues that are attributed vnto *Sagapenum*.

CHAP. 428. Of Drop-wort, or *Filipendula*.

1 *Filipendula*.
Drop-wort.

2 *Filipendula montana*.
Mountaine Drop-wort.

¶ The Kindes.

There be diuers sorts of Drop-worts, some of the champion or fertill pastures, some of more moist and dankish grounds, and some of the mountaine.

¶ The

¶ The Description.

1 **T**He first kinde of Filipendula hath leaues growing and spread abroad like feathers, each leafe consisting of sundry small leaues dented or snipt round about the edges, growing to the stalke by a small and slender stem: these leaues resemble wilde Tanfie or Burnet, but that they be longer and thicker, set like feathers, as is aforesaid: among these rise vp stalkes a cubit and a halfe high, at the top whereof grow many faire white floures, each small floure consisting of six slender leaues, like a little star, bushing together in a tuft like the floures of Medesweet, of a soft sweet smell: the seed is small, and groweth together like a button: the roots are small and blacke, whereupon depend many little knops or blacke pellets, much like the roots of the female Peonie, sauing that they be a great deale smaller.

2 The second kinde of Filipendula, called of *Pena* in his Obseruations, *Oenanthe*, sive *Philipendula altera montana*, is neither at this day very well knowne, neither did the old writers heretofore once write or speake of it: but *Pena* that painefull Herbarist found it growing naturally in Narbone in France, neere vnto Veganium, on the top of the high hills called *Paradisus Dei*, and neere vnto the mountaine Calcaris: this rare plant hath many knobby long roots, in shape like to *Asphodelus luteus*, or rather like the roots of *Corruda*, or wilde Asparagus; from which riseth vp a stalke a foot high, and more, which is thicke, round, and chanelled, beset full of leaues like those of common Filipendula, but they be not so thicke set or winged, but more like vnto the leaues of a Thistle, consisting of sundry small leaues, in fashion like to *Coronopus Ruellij*, that is, *Ruellius* his Bucks horne: round about the top of the stalke there groweth a very faire tuft of white floures, resembling fine small hoods, growing close and thicke together like the floures of *Pedicularis*, that is, Red Rattle, called of *Carolus Clusius*, *Alectorolophos*, whereof he maketh this plant a kinde, but in my iudgement and opinion it is rather like *Cynosorchis*, a kinde of Satyrion.

3 *Filipendula angustifolia*.
Narrow leaved Drop-wort.

† 4 *Filipendula Cicutae facie*.
Hemlocke Drop-wort.

3 There is another kinde of Filipendula set forth vnder the name of *Oenanthe*, that hath many tuberous and thicke roots like those of Drop-wort, but white of colour, and euery one of those knobs hath a certaine string or fibre annexed thereto; from whence ariseth a crested stalk two foos high,

5 *Filipendula aquatica*.
Water Drop-wort.

high, diuiding it self toward the top into sundry armes or branches : from the hollow place or bosome of euery ioynt (out of which doe grow those branches) the leaues doe also proceed, very much cut or iagged like Fennell : at the top of those branches come forth spokie rundles of white floures fashioned like stars.

† 4 The fourth kinde of Filipendula is as strange a plant as the former, especially with vs here in England, except in the waterie places and rilles in the North, where *Paludapium* or water Smallage groweth ; whereunto in leaues it is not vnlike, but more like *Ruta pratensis* : it hath many large branches, a naughty fauor, and in colour and shape like *Cicuta*, that is, Hemlocke. The stalkes are more than two cubits high, comming from a root which exceedingly multiplies it selfe into bulbes, like *Asphodelus albus*. The smell of this plant is strong and grieuous ; the taste hot and biting, it being full of a iuyce, at first milky, but afterwards turning yellow. The spokie tufts or rundles growing at the top are like *Cicuta*, yea, it much resembleth Hemlocke in propertie and qualities, and so doe they affirme that haue proued and seene the experience of it : for being eaten in sallads it did well nigh poyson those which ate of it, making them giddie in their heads, waxing very pale, staggering and reeling like drunken men. Beware and take good heed of this and such like Simples ; for there is no Physitian that will giue it, because

there be many other excellent good Simples which God hath bestowed vpon vs from the preuenting and curing of diseases. ‡ Pernitious and not excusable is the ignorance of some of our time, that haue bought and (as one may probably coniecture) vsed the roots of this plant in stead of those of Peonie ; and I know they are dayly by the ignorant women in Cheape-side sold to people more ignorant than themselues, by the name of water Louage ; *Caueat Emptor*. The danger that may ensue by vsing them may be gathered by that which our Author hath here set downe, being taken out of the *Aduersaria*, pag. 326. ‡

5 The fifth and last kinde of Filipendula, which is the fourth according to *Matthiolus* his account, hath leaues like water Smallage, which *Pliny* calleth *Sylaus*, the leaues very much resembling those of *Lauer Cratena* : among which riseth vp a small stalke deeply furrowed or crested, bearing at the top thereof spokie or bushy rundles of white floures thicke thrust together. The roots are compact of very many filaments or threds, ; among which come forth a few tuberous or knobbie roots like vnto the second.

¶ The Place and Time.

The first groweth plentifully vpon stonie rockes or mountaines, and rough places, and in fertile pastures. I found great plenty thereof growing in a field adioyning to Sion house, sometime a Nunnerie, neere London, on the side of a meadow called Sion Meadow.

The second hath been sufficiently spoken of in the description. The third groweth neere vnto brookes and riuers sides. The fourth groweth betweene the plowed lands in the moist and wet furrowes of a field belonging to Battersey by London. ‡ It also groweth in great abundance in many places by the Thames side ; as amongst the oysiers against Yorke house, a little about the Horse-ferrey, against Lambeth, &c. ‡ The fifth groweth neere the sides of riuers and water-streames, especially neere the riuer of Thames or Tems, as in S. Georges fields, and about the Bishop of Londons house at Fulham, and such like places.

They floure from May to the end of Iune.

¶ The Names.

They are commonly called *Filipendula*. The first is called of *Nicolaus Myrepsus*, *Philipendula* : of some, *Saxifraga rubra*, and *Millefolium sylvestre* : of *Pliny*, *Molon* : in Italian and Spanish, *Filipendula* : in English, Filipendula and Drop-wort. Water Filipendula is called *Filipendula aquatica*, *Oenanthe aquatica*, and *Silans Pliny*.

The fourth, whose leaues are like to Homlocks, is as some thinke called of *Cordus*, *Olsenichium* : in English Homlocke Filipendula.

¶ The Nature.

These kindes of Filipendula are hot and dry in the third degree, opening and clenfing, and yet with a little astringtion or binding. All the kindes of Oenantes haue the same facultie, except the fourth, whose pernicious facultie we haue formerly touched.

¶ The Vertues.

The root of common Filipendula boiled in wine and drunken, is good against all paines of the bladder, causeth one to make water, and breaketh the stone. The like *Dioscorides* hath written of Oenante; the root, saith he, is good for them that pisse by drops.

The powder of the roots of Filipendula often vsed in meate, will preserue a man from the falling sicknesse.

The figures that were formerly in the fourth and fifth places, were both of the plant described in the fifth place. I haue given you in the fourth place the figure which *Lobel* and others haue giuen for the plant there described, but it is not well exprest, for the leaues are large like those of Smalage, the stalke, branches and vmbells very large, and like those of Hemlocke, but rather bigger.

CHAP. 429. Of Homlocks, or herbe Bennet.

¶ The Description.

1 The first kinde of Hemlocke hath a long stalke, fise or six foot high, great and hollow, full of joints like the stalkes of Fennell, of an herby colour; powdered with small red spots, almost like the stems of Dragons. The leaues are great, thicke, and small cut or jagged like the leaues of Cheruill, but much greater, and of a very strong and vnpleasant sauor. The floures are white, growing by tufts or spokie tops, which do change and turne into a white flat seed: the root is short, and somewhat hollow within.

1 *Cicuta*.
Hemlocks.

2 The Apothecaries in times past not knowing the right *Seseli Peloponnense*, haue erroneously taken this *Cicuta latifolia* for the same. The leaues whereof are broad, thicke, and like vnto *Cicutaria*, yet not the same; they called it *Seseli Peloponnense cum folio Cicuta*, the faculties whereof deny and refute that assertion and opinion, yea and the plant it selfe, which being touched, yeeldeth or breatheth out a most virulent or lothsome smell: these things sufficiently argue, that it is not a kinde of *Seseli*, besides the reasons following: *Seseli* hath a reasonable good sauour in the whole plant, the root is bare and single, without fibres, like a Carrot; but *Cicuta* hath not onely a lothsome smell, but his roots are great, thicke, and knobby, like the roots of *Myrrhis*: the whole plant doth in a manner resemble the leaues, stalkes and floures of *Myrrhis odorata*, whose small white floures doe turne into long and crooked seeds, growing at the top of the branches three cubits high.

3 This in leaues, stalkes, and roots is larger than the last described, the stalkes equalling or exceeding the height of a man; the smell is strange and greiuous, and in all the parts thereof it is like to the other plants of this kinde. *Lobel* figures it by the name of *Cicutaria maxima Brancionis*, and questions whether it be not *Thapsia tertia Salamanticensium* of *Clusius*; but *Clusius* denies it so to be. ‡

2 *Cicuta latifolia fatidissima*.
Broad leaved stinking Hemlocks.

3 *Cicuta latifolia altera*.
Gyant Hemlocke.

¶ The Place.

Common Hemlocke groweth plentifully about towne walls and villages in shadowie places, and fat soiles neere ditches.

The second groweth vpon mountaines and defart places, and is a stranger in England; yet I haue plants thereof in my garden.

¶ The Time.

They flourish and seed in September.

¶ The Names.

Homlocke is called in Greeke *κατακλις*: in Latine, *Cicuta*: in high Dutch, *Schierling*: in low Dutch, *Scheerlinck*: in Spanish, *Ceguta* y *Canahia*: in French, *Cigue*: in English, Hemlocke, Homlocke, Kexe, and herbe Bennet.

The second is called *Cicuta latifolia*, and *Cicutaria latifolia*, and *Seseli Peloponnense quorundam*: in English, great Hemlockes, and garden Homlocke.

¶ The Temperature.

Galen saith, that Homlocke is extreme cold in operation, euen in the fourth degree of coldnesse.

¶ The

¶ The Vertues.

It is therefore a very rash part to lay the leaues of Hemlocke to the stones of yong boyes or virgin brests, and by that meanes to keepe those parts from growing great; for it doth not only easily cause those members to pine away, but also hurteth the heart and liuer, being outwardly applied: then must it of necessitie hurt more being inwardly taken; for it is one of the deadly poysons which killeth by his cold qualitie, as *Dioscorides* writeth, saying, Hemlocke is a very euill, dangerous, hurtfull, and poysonous herbe, insomuch that whosoever taketh of it into his body dieth remediless, except the party drinke some wine that is naturally hot, before the venome haue taken the heart, as *Pliny* saith: but being drunke with wine the poyson is with greater speed caried to the heart, by reason whereof it killeth presently; therefore not to be applied outwardly, much lesse taken inwardly into the body.

The great Hemlocke doubtlesse is not possessed with any one good facultie, as appeareth by his lothsome smell, and other apparant signes, and therefore not to be vsed in physicke.

CHAP. 430. Of wilde and water Hemlockes.

¶ The Description.

† 1 This wilde kinde of Hemlocke hath a small tough white root, from which arise vnder diuers stiffe stalkes, hollow, somewhat reddish toward the Sun, ioyned or kneed at certaine distances: from which ioyns spring forth long leaues very Greene, and finely minced or iagged like the common Cheruill or Parsley: the floures stand at the tops of the stalks in small spokie vmbels, with little longish Greene leaues about them: the seed followeth, like those of Hemlocke, or as they grow together on the tops of the stalks they resemble Coriander seeds, but lesser: the whole plant is of a naughty smell.

† 1 *Cicutaria tenuifolia.*
Thin leaved wilde Hemlocke.

2 *Cicutaria palustris.*
Wilde water Hemlocke.

2 Water Hemlock, which *Lobel* calleth *Cicutaria palustris*: *Clusius* and *Dodoneus*, *Phellandrium*, riseth vp with a thicke fat and empty hollow stalke, full of knees or ioyns, crested, chamfered, or furrowed, Yuuu 2

furrowed, of a yellowish Greene colour: the leaues shoot forth of the ioynts and branches, like vnto wilde Hemlocke, but much thicker, fatter, and oileous, very finely cut or iagged, almost like those of the smallest *Visnaga*, or Spanish Tooth-pickes: the floures stand at the top of the stalkes in small whitish tufts: the seed followeth, blackish, of the bignesse of Anise seed, and of a sweet fauour: the root is thicke and long, within the water, very soft and tender, with very many strings fastned thereto.

¶ *The Place.*

1 This growes among stones and rubbish, by the walls of cities and towns almost euery where. The other groweth in the midst of water ditches and standing pooles and ponds, in most places of England: it groweth very plentifully in the ditches by a causey, as you goe from Redriffe to Detford neere London, and in many other places.

¶ *The Time.*

They floure and flourish in Iuly and August.

¶ *The Names.*

† 1 This is *Petroselinum vitium* of *Tragus*; and *Dauci inntilis* genus of *Gesner*: *Thalium* calls it *Apium cicutarium*: *Lobel*, *Cicutaria fatua*: *Tabernamontanus*, *Petroselinum caninum*; which name we may fitly make English, and call it Dogs-parsley.

2 This is *Ligusticum syl.* & *Feniculum syl.* of *Tragus*: *Cicutaria palustris* of *Lobel* and others: *Dodonaeus* thinks it *Plinies Phellandrium*; and *Casalpinus* iudges it his *Silauus*. †

¶ *The Temperature and Vertues.*

Their temperature and faculties are answerable to the common Hemlocke, which haue no vse in physicke, as we haue said.

† The figure formerly in the first place was of *Myrrhis*; the description I thinke was intended, yet not thoroughly agreeing with this I here giue you, wherefore I haue a little altered it.

CHAP. 431.

Of Earth-nut, Earth Chest-nut, or Kipper-nut.

1 *Bulbocastanon minus.*
Small Earth-nut.

2 *Bulbocastanon mains.*
Great Earth-nut.

¶ The Description.

1 **E**arth-nut or Kipper-nut, called after *Lobelius*, *Nucula terrestris*, hath small euen crested stalkes a foot or somewhat more high : whereon do grow next the ground leaues like those of Parsley, and those that doe grow higher like vnto those of Dill ; the white floures doe stand on the top of the stalkes in spokie rundles, like the tops of Dill, which turne into small seed, growing together by couples, of a very good smell, not vnlike to those of Fennell, but much smaller : the root is round, knobbed, with certaine eminences or bunchings out ; browne without, white within, of a firme and sollid substance, and of a taste like the Chesse-nut or Chest-nut, whereof it tooke his name.

2 There is also another Earth-nut that hath stalkes a foot high, whereon doe grow iagged leaues like those of English Saxifrage, of a bright Greene colour : the floures grow at the top of the branches, in small spokie tufts consisting of little white floures : the root is like the other, bulbous fashion, with some few strings hanging at the bottome, of a good and pleasant taste. ‡ This differs from the former, in that the leaues are larger and greener : the root also is not so far within the ground, and it also sends forth some leaues from the bulbe it selfe ; whereas our common kind hath only the end of a small root that carries the stem and leaues vpon it, fastned vnto it as you see it exprest in the former figure. ‡

¶ The Place.

These herbes do grow in pastures and corne fields almost euery where : there is a field adioining to High-gate, on the right side of the middle of the village, couered ouer with the same ; and likewise in the next field vnto the conduit heads by Maribone, neere the way that leadeth to Paddington by London, and in diuers other places. ‡ I haue not yet obserued the second to grow wilde with vs. ‡

¶ The Time.

They floure in Iune and Iuly : the seed commeth to perfection afterward.

¶ The Names.

Alexander Trallianus hath made mention of *Βολβοκαστανον*, *Lib. 7.* reckoning it vp among those kinds of meate or sustenances which be good for such as haue rotten lungs : of some it is called *Agriocastanon*.

Guinterius thought the word was corrupted, and that *Balanocastanon* should be read : but this is as strange a word as *Bolbocastanon*, which was deriued of the forme of a bulbe, and the tast of a Chest-nut : of some, *Nucula terrestris*, or the little Earth-nut : it is thought to be *Bunium Dioscoridis* of some ; but we thinke not so : of *D^r. Turner*, *Apios* ; yet there is another *Apios*, being a kinde of *Thymale* : of *Matthiolus*, *Oenanthe*, making it a kinde of *Filipendula* : in high-Dutch, *Cerdnusz* : in low-Dutch, *Cerfnoten* : the people of Sauoy call it *Fauerottes* : in English, Earth-nuts, Kipper-nuts, and Earth Chest-nuts.

¶ The Temperature.

The roots of Earth-nuts are moderately hot and dry, and also binding : but the seed is both hotter and drier.

¶ The Vertues.

The seed openeth and prouoketh vrine, and so doth the root likewise.

The root is good for those that spit and pisse bloud, if the root be eaten raw, or roasted in the embers.

The Dutch people doe vse to eat them boyled and buttered, as we doe Parseneps and Carrots, which so eaten comfort the stomacke, and yeeld nourishment that is good for the bladder and kidneies.

There is a plaister made of the seeds hereof, whereof to write in this place were impertinent to our historie.

CHAP. 432. Of Cumin.

¶ The Description.

This garden Cumin is a low or base herbe of a foot high : the stalke diuideth it selfe into diuers small branches, whereon doe grow little iagged leaues very finely cut into small parcels, like those of Fennell, but more finely cut, shorter and lesser : the spokie tufts grow at the top of the branches and stalkes, of a red or purplish colour : after which come the seed, of a strong or rancke smell, and a biting taste : the root is slender, which perisheth when it hath ripened his seed.

Cuminum sativum Dioscoridis.
Garden Cumin.

¶ The Place.

Cumin is husbanded and sown in Italy and Spain, and is very common in other hot countries, as in Æthiopia, Egypt, Cilicia, and all the lesser Asia.

It delights to grow especially in putrified and hot soiles: I have proved the seeds in my garden, where they have brought forth ripe seed much fairer and greater than any that commeth from beyond the seas.

¶ The Time.

It is to be sown in the middle of the spring; a shewre of raine presently following doth much hinder the growth thereof, as Ruellius saith.

My selfe did sow it in the midst of May, which sprung vp in six days after: and the seed was ripe in the end of Iuly.

¶ The Names.

It is called in Greeke *κομινον* *κομινον*, that is, tame or garden Cumin, that it may differ from the wilde ones: it is named in Latine *Cuminum*: in shops, *Cuminum*: in high-Dutch, *Roomitche kymmel*: in Italian, *Comino*: in Spanish, *Cominchos*: in French, *Comin*: in English, Cumin.

¶ The Temperature.

The seed of garden Cumin, as Galen saith, is hot and dry in the third degree: Dioscorides saith that it hath in it also a binding qualitie.

¶ The Vertues.

- A The seed of Cumin scattereth and breaketh all the windinesse of the stomacke, belly, guts, and matrix: it is good against the griping torments, gnawing or fretting of the belly, not onely received inwardly by the mouth, but also in clisters, and outwardly applied to the belly with wine and barley meale boyled together to the forme of a pultis.
- B Being handled according to art, either in a cataplasme, pultis, or plaister, or boyled in wine and so applied, it taketh away blastings, swellings of the cods or genitors: it consumeth windie swellings in the ioynts, and such like.
- C Being taken in a supping broth it is good for the chest and for cold lungs, and such as are oppressed with abundance of raw humors.
- D It stancheth bleeding at the nose, being tempered with vineger and smelt vnto.
- E Being quilted in a little bag with some small quantitie of Bay salt, and made hot vpon a bedpan with fire or such like, and sprinkled with good wine vineger, and applied to the side very hot, it taketh away the stich and paines thereof, and easeth the pleurisie very much.

CHAP. 433. Of wilde Cumin.

¶ The Kindes.

There be diuers plants differing very notably one from another in shape, and yet all comprehended vnder the title of wilde Cumin.

¶ The Description.

The wilde Cumin hath small white roots with some fibres thereto appendant; from the which arise sundry little iagged leaues, consisting of many lesser leaues, finely dented about the edges, in fashion like the smallest leaues of wilde Parsnep: among which springeth vp a slender bending stalke a foot high, like vnto *Pecten Veneris*, bearing at the top thereof white round

1 *Cuminum sylvestre.*
Wilde Cumin.

2 *Cuminum siliquosum.*
Coddled wilde Cumin.

3 *Cuminum Corniculatum, sive Hypocoum Clusij.*
Horned wild Cumin.

round and hairie buttons or knops, like *Arction*, as *Dioscorides* hath right well observed: within which knoppes is contained a tender downie substance, among which is the seed, like the seed of *Dens Leonis*, but much lesser.

2 The second kinde of Cumin is verie like vnto the foresaid wilde Cumin, saue that it beareth a number of horned or crooked cods, after the manner of *Scorpioides*, but thicker, and lesse crooked, and the feedes within the cods are seuerally distinct and separated one from another by equall partitions, in small crosses, yellow of colour, & somewhat long: the stalkes are little and tender, beset with leaues much like vnto the small leaues of *Carui*, or *Pecten Veneris*: and at the top of the stalks there do grow pretty yellow floures, like those of great *Celandine* or *Rocket*, sauing that they be somewhat lesser.

† 3 The third kinde of Cumin is verie like vnto the last before mentioned, but the leaues are much greater, more slender, & more finely cut or iagged, like the leaues of *Seseli* of *Masylia*: among which riseth vp a stalke a cubit high or somewhat more, verie smooth and whitish: at the top whereof spring forth fine yellow floures, not like the former, but consisting of six leaues apiece, whereof

whereof two are large, and edged with greene on the outside: the other foure are small ones, and grow two on a side betweene the two larger leaues: these floures being vaded, there succeed crooked cods, greater, and more full of knots or diuisions than the former, wherein is contained a small and flat yellow seed like *Galega*: the root is long, thicke, and single.

¶ *The Place.*

These wilde Cumins do grow in Lycia, and Galatia, a prouince of Asia, and in Carthage a citie of Spaine; seldome seene in these Northerne parts: notwithstanding at the impression hereof, the last did floure and flourish in my garden. ‡ These grow in Prouince in France, and in diuers parts of Spaine. ‡

¶ *The Time.*

They floure in August, and perfect their seed in September.

¶ *The Names.*

Their names haue been touched in their titles in as ample manner as hath been set down by any Author.

¶ *The Temperature and Vertues.*

Their temperature and vertues are referred to the garden Cumin; notwithstanding I cannot reade in any Author of their vse in Physicke.

CHAP. 434. Of Flixweed.

1 *Sophia Chirurgorum.*
Flixweed.

¶ *The Description.*

1 Flixweed hath round and hard stalks, a cubit & a halfe high, wheron do grow leaues most finely cut and diuided into innumerable fine iags, like those of the sea Wormewood called *Seriphium*, or *Absinthium tenuifolium*, but much finer and smaller, drawing neere vnto the smallest leaues of Corianders, of an over-worne greene colour: the floures grow alongst the tops of the spriggie branches, of a dark yellow colour: after which come long cods full of small red seeds: the root is long, straight, and of a wooddie substance:

2 The second sort differeth not from the precedent, sauing that the leaues of this plant are broader, wherein especially consisteth the difference; notwithstanding in mine opinion *Tabernamontanus* found this second sort growing in some fertill place, whereby the leaues did grow broader and greater, which moued him to make of this a second sort, whereas in truth they are both but one and the selfe same plant.

¶ *The Place.*

This Flixeweede groweth in most places of England, almost euery where in the ruins of old buildings, by high waies, and in filthie obscure base places.

¶ *The Time.*

It floureth and seedeth from Iune to the end of September.

¶ *The Names.*

Flixweed is called *Thalictrum*; and of some, *Thalictum*, but vnproperly; for *Thalictrum* belongeth to English Rubarbe: the Paracelsians do vaunt and brag very much of an herbe called *Sophia*, adding thereto the surname *Paracelsi*, wherewith they imagine to do wonders, whether this be the same plant it is disputable, the controuersie not as yet decided; neuerthelesse we must be content

to accept of this for the true *Sophia*, until some disciple or other of his do shew or set forth the plant wherewith their master *Paracelsus*, did such great matters: in English we call it Flixweed, of his facultie against the flix.

¶ *The Temperature.*

Sophia drieth without any manifest sharpenesse or heate.

¶ *The Vertues.*

The seed of *Sophia* or Flixweed drunk with wine, or Smithes water, stoppeth the bloudy flix, the *Alaske*, and all other issues of blood.

The herbe bruised or put into vnguent, closeth and healeth vlcers, or old fores and wounds, as *B Paracelsus* saith, and that because it drieth without acrimonie or sharpnesse.

CHAP. 435. Of the great Celandine, or Swallow-woort.

¶ *The Description.*

1 **T**He great Celandine hath a tender brittle stalke, round, hairie, and full of branches, each whereof hath diuers knees or knottie ioints, set with leaues not vnlike to those of *Colubine*, but tenderer and deeper cut or iagged, of a grayish Greene vnder, and Greene on the other side tending to blewnesse: the floures do grow at the top of the stalkes, of a gold yellow colour, in shape like those of the *Wall-floure*: after which come long cods, full of bleake or pale seeds: the whole plant is of a strong smell, nothing pleasant, and yeeldeth a thicke iuice of a milkie substance, of the colour of *Saffron*: the root is thicke and knobbie, with some threds annexed thereto, which being broken or bruised, yeeldeth a sap or iuice of the colour of gold.

1 *Chelidonium maius.*
Great Celandine.

2 *Chelidonium majus folio magis dissecto.*
Great Celandine with more cut leaues.

2 This other doth not in forme and magnitude differ from the former, but in the leaues, which are finelie cut and iagged, and somewhat in their shape resemble an *Oken* leafe: the floures also

also are a little jagged or cut about the edges : and in these two particulars consists the whole difference. *Clusius* calls it *Chelidonium maius laciniato flore* ; and *Bauhine*, *Chelidonium maius folijs quernis*. †

¶ The Place.

It groweth in vntilled places, by common way sides, among briers and brambles, about old wals, and in the shade, rather than in the Sun.

¶ The Time.

It is greene all the yeare, it floureth from Aprill to a good part of Sommer, the coddies are perfected in the meane time.

¶ The Names.

It is called in Greeke *χελιδώνιον* : in Latine, *Chelidonium maius*, and *Hirundinaria maior* : amongst the Apothecaries, *Chelidonia* : diuers miscall it by the name *Celidonium* : it is named in Italian, *Celidonia* : in Spanish, *Celidubenha*, *Terna de las golundrinhas* : in high Dutch, *Grosz Scho. wurtz* : in low Dutch *Stinkende Gouwe* : in French, *Esclere*, or *Esclayre*, and *Celidoine* : in English, *Celandine*, or great *Celandine*, *Swallow-woort*, and *Tetterwoort*.

It is called *Celandine*, not because it then first springeth at the coming in of the Swallows, or dieth when they goe away : for as we haue said, it may be found all the yeare, but because some hold opinion, that with this herbe the dammes restore sight to their young ones when their eies be out : the which things are vaine and false ; for *Cornelius Celsus* in his sixth booke doth witness, that when the sight of the eies of diuers young birds be put forth by some outward meanes, it will after a time be restored of it selfe, and soonest of all the sight of the Swallow, wherupon (as the same Author saith) that the tale or fable grew, how thorow an herbe the dams restore that thing, which healeth of it selfe : the very same doth *Aristotle* alledge in the sixth booke of the historie of Liuing creatures : [The eies of Swallowes (saith he) that are not fledged, if a man do pricke them out, do grow againe, and afterwards do perfectly recover their sight.]

¶ The Temperature.

The great *Celandine* is manifestly hot and drie, and that in the third degree, and withall scoures and clenseth effectually.

¶ The Vertues.

- A The iuice of the herbe is good to sharpen the sight, for it clenseth and consumeth away slimie things that cleaue about the ball of the eie, and hinder the sight, and especially being boiled with honie in a brasen vessell, as *Dioscorides* teacheth.
- B The root cureth the yellow iaundise, which commeth of the stopping of the gall, especially when there is no ague adioined with it, for it openeth and deliuereth the gall and liuer from stoppings.
- C The root being chewed, is reported to be good against the tooth-ache.
- D The iuice must be drawn forth in the beginning of Sommer, and dried in the Sunne, saith *Dioscorides*.
- E The root of *Celandine* boiled with Annise-seed in white wine, openeth the stoppings of the liuer, and cureth the iaundies very safely, as hath been often proued.
- F The root cut in small pieces is good to be giuen vnto Haukes against sundry diseases, whereunto they are subiect, as wormies, craie, and such like.
- G † I haue by experience found (saith *Clusius*) that the iuice of the great *Celandine* dropped into small greene wounds of what sort soeuer, wonderfully cures them. †

CHAP. 436. Of Coxcombe, or Yellow Rattle.

¶ The Description.

Crista Galli, or *Crista Gallinacea*, hath a straight vpright stalke, set about with narrow leaues, snipt round about the edges : the floures grow at the top of the stems, of a yellow colour, after which come vp little flat pouches or purses, couered ouer or contained within a little bladder, or flat skin, open before like the mouth of a fish, wherein is contained flat yellowish seed, which being ripe and drie, will make a noise or rattling when it is shaken or moued, of which propertie it tooke the name yellow Rattle.

¶ The

Crista Galli.

Yellow Rattle, or Coxcombe.

*Pedicularis.*

Lousewoort, or red Rattle.

¶ The Place.

It groweth in drie meadowes and pastures, and is to them a great annoiance.

¶ The Time.

It floureth most part of the Sommer.

¶ The Names.

It is called in low Dutch *Ratelen*, and *Geele Ratelen*: commonly in Latine, *Crista Galli*, and *Gallinacea Crista*: in English, Coxcombe, Penie-grasse, yellow or white Rattle: in High Dutch it is called *geel Rodel*: in French *Creste de Coc*: diuers take it to be the old writers *Alectorolophos*. † Some thinke it to be the *Mimulus*: or as others (& that more fitly) reade it, *Nummulus*, mentioned by Pliny, lib. 18. cap. 28. †

¶ The Temperature and Vertues.

But what temperature or vertue this herbe is of, men haue not as yet beene carefull to know, seeing it is accounted vnprofitable.

CHAP. 437. Of red Rattle, or Lousewoort.

¶ The Description.

Red Rattle (of *Dodoneus* called *Fistularia*, and according to the opinion & censure of *Carolus Clusius*, *Pena* & others, the true *Alectorolophos*) hath very small, rent, or iagged leaues, of a browne red colour, and weake, small and tender stalkes, whereof some lie along trailing vpon the ground, within very moorish meadowes they grow a cubit high and more, but in moist and wet heathes, and such like barren grounds not aboue an handfull high: the floures grow round about the stalke, from the middest thereof euen to the top, and are of a brown red colour, in shape like the floures of dead Nettle: which being past, there succeed little flat pouches, wherein is contained flat and blackish seed, in shew very like vnto the former: the root is small, white, and tender.

¶ The Place.

It groweth in moist and moorish meadowes, the herbe is not onely vnprofitable, but also hurtfull, and an infirmitie of the meadowes.

¶ The Time.

It is found with his floures and stalkes in May and Iune.

¶ The Names.

It is called in Greeke *ῥαττελ*: in High Dutch, *Braun Rodel*: in Latine, *Pedicularis*, of the effect, because it filleth sheep and other cattel that feed in meadowes where this groweth full of lice: diuers of the later Herbarists call it *Pistularia* of some, *Crista Galli*: and diuers take it to be *Mimulus herba*: in English, Rattle-grasse, Red Rattle-grasse, and Lousewoort.

¶ The

¶ The Temperature.

It is cold and drie and astringent.

¶ The Vertues.

A It is held to be good for Fistulaes and hollow vlcers, and to stay the ouermuch flowing of the menses, or any other flux of bloud, if it be boiled in red wine and drunke.

CHAP. 438. Of Yarrow, or Nose-bleed.

¶ The Description.

1 Common Yarrow hath very many stalkes comming vp a cubit high, round, and somewhat hard: about which stand long leaues, cut in the sides sundry wise, and as it were made vp of many small iagged leaues, euery one of which seeme to come neere to the slender leaues of Coriander: there stand at the top tufts or spoked rundles: the floures whereof are either white or purple, which being rubbed do yeeld a strong smell, but vnpleasant; the root sendeth downe many strings.

1 *Millefolium terrestre vulgare.*
Common Yarrow.

2 *Millefolium flore rubro.*
Red flowered Yarrow.

2 The second kinde of Milfoile or Yarrow hath stalkes, leaues and roots like vnto the former, sauing that his spokie tufts are of an excellent faire red or crimson colour, and being a little rubbed in the hand, of a reasonable good fauour.

¶ The Place.

The first groweth euery where in drie pastures and medowes: red Milfoile groweth in a field by Sutton in Kent called Holly-Deane, from whence I brought those plants that do grow in my Garden; but it is not common euery where as the other is.

¶ The Time.

They floure from May to the end of October.

¶ The

¶ The Names.

Yarrow is called of the Latine Herbarists *Millefolium*: it is *Dioscorides* his *agrostis*: in Latine, *Achillea*, and *Achillea sideritis*, which thing he may very plainly see that will compare with that description which *Dioscorides* hath set downe: this was found out, saith *Pliny* in his 25. booke, chap. 5. by *Achilles*, *Chirons* disciple, which for that cause is named *Achilleos*: of others, *Sideritis*: among vs, *Millefolium*: yet be there other *Sideritides*, and also another *Panaces Heracleion*, whereof we will intreat in another place: *Apuleius* setteth downe diuers names hereof, some of which are also found among the bastard names in *Dioscorides*: in Latine it is called *Militaris*, *Supercilium Veneris*, *Acrum*, or *Acorum syluaticum*: of the French-men, *Millefeuille*: in high Dutch, *Garben*, *Scharffgras*: in low Dutch, *Geruwet*: in Italian, *Millefoglio*: in Spanish, *Milhojas yerua*: in English, Yarrow, Nose-bleed, common Yarrow, red Yarrow, and Milfoile.

¶ The Temperature.

Yarrow, as *Galen* saith, is not vnlike in temperature to the *Sideritides*, or Iron worts, that is to say, clenfing, and meanelly cold, but it most of all bindeth.

¶ The Vertues.

The leaues of Yarrow doe close vp wounds, and keepe them from inflammation, or fiery swelling: it stancheth bloud in any part of the body, and it is likewise put into bathes for women to sit in: it stoppeth the laske, and being drunke it helpeth the bloody fluxe. A

Most men say that the leaues chewed, and especially Greene, are a remedy for the tooth-ache. B

The leaues being put into the nose, do cause it to bleed, and ease the paine of the megrim. C

It cureth the inward excorations of the yard of a man, comming by reason of pollutions or extreme flowing of the seed, although the issue do cause inflammation and swelling of those secret parts, and though the spermaticke matter do come downe in great quantity, if the juice be injected with a syringe, or the decoction. This hath been prooued by a certain friend of mine, sometimes a Fellow of Kings Colledge in Cambridge, who lightly brused the leaues of common Yarrow, with Hogs-grease, and applied it warme vnto the priuie parts, and thereby did diuers times helpe himselfe, and others of his fellowes, when he was a student and a single man liuing in Cambridge. D

One dram in powder of the herbe giuen in wine, presently taketh away the paines of the colicke. E

CHAP. 439. Of yellow Yarrow, or Milfoile.

1 *Millefolium luteum*.
Yellow Yarrow.

† 2 *Achillea, sine Millefolium nobile*.
Achilles Yarrow.

XXXX

¶ The

¶ The Description.

1 Yellow Yarrow is a small plant seldome aboue a span high: the stalkes whereof are couered with long leaues, very finely cut in the edges like feathers in the wings of little birds: the tufts or spokie rundles bring forth yellow floures, of the same shape and forme of the common Yarrow: the root consisteth of threddy strings.

2 Achilles Yarrow, or noble Milfoile, hath a thicke and tough root, with strings fastened thereto: from which immediately rise vp diuers stalkes, very Greene and crested, whereupon doe grow long leaues composed of many small jagges, cut euen to the middle rib: the floures stand on the top of the stalkes with spokie vmbels or tufts, of a whitish colour, and pleasant smell.

¶ The Place.

These kinds of Yarrow are seldome found: they grow in a fat and fruitfull soile, and sometimes in medowes, and are strangers in England.

¶ The Time.

They floure from May vntill August.

¶ The Names.

Dioscorides description doth sufficiently declare, that this herbe is *Stratiotes Millefolium*: in Greeke, *σενναρις χυμικουμος*: the height of the herbe sheweth it, the forme of the leaues agree; there is some ambiguity or doubt in the colour of the floures, which *Dioscorides* describeth to be white, as the vulgar copies haue; but *Andreas Lacuna* addeth out of the old booke, of a yellow colour: it is named of the later age, *Millefolium minus*, or little Yarrow, and *Millefolium luteum*, yellow Yarrow, or Nose-bleede: the Apothecaries and common people know it not.

¶ The Temperature.

Yarrow is meanelly cold and somewhat binding.

¶ The Vertues.

A It is a principall herbe for all kinde of bleedings, and to heale vp new and old vlcers and Greene wounds: there be some, saith *Galen*, that vse it for fistulaes.

B This plant *Achillea* is thought to be the very same wherewith *Achilles* cured the wounds of his souldiers, as before in the former chapter.

† The plant here figured and described in the second place, was also figured and described formerly in the fifth place of the 209. chapter of this booke, by the title of *Tanacetum minus album*, but the figure of *Lohels* which is put there being somewhat imperfect, I thought it not amisse here to giue that of *Dodonaeus* which is somewhat more exquisite, otherwise both the figure and history might in this place haue been omitted.

CHAP. 440. Of Valerian, or Setwall.

¶ The Description.

1 The tame or garden Valerian hath his first leaues long, broad, smooth, green, and vndiuided; and the leaues vpon the stalkes greater, longer, and deeply gashed on either side, like the leaues of the greater Parsnep, but yet lesser: the stalke is aboue a cubit high, smooth, and hollow, with certaine joints farre distant one from another: out of which joints grow forth a couple of leaues, and in the tops of the stalkes vpon spokie rundles stand floures heaped together, which are small, opening themselues out of a long little narrow necke, of colour whitish, and sometimes withall of a light red: the root is an inch thicke, growing aslope, fastned on the vpper part of the earth by a multitude of strings, the most part of it standing out of the ground, of a pleasant sweet smell when it is broken.

2 The greater wilde Valerian hath leaues diuided and jagged, as those of the former; those about the stalke hereof are also smooth, hollow, and jointed, and aboue a cubit high: the floures stand on spokie rundles like to those of the former, but of a light purple colour: the roots are slender, and full of strings and small threds, not altogether without smell.

3 The other wilde one is much like in forme to the garden Valerian, but farre lesser: the first leaues thereof be vndiuided, the other are parted and cut in sunder: the stalkes a span long: the floures which stand on spokie rundles are like to those of the others, of a light whitish purple colour: the roots be slender, growing aslope, creeping, and full of fine small threds, of little smell.

4 There is a small Valerian growing vpon rockes and stony places, that is like vnto the last described, sauing it is altogether lesse. ‡ The stalk is some halfe foot high, and strait, diuiding it selfe into branches toward the top, and that alwaies by couples: the bottome leaues are whole, the top leaues

1 *Valeriana hortensis.*
Garden Valerian, or Setwall.

2 *Valeriana maior sylvestris.*
Great wilde Valerian.

3 *Valeriana minor.*
Small Valerian.

4 *Valeriana Petrea.*
Stone Valerian.

leaves much diuided, the flowers are small, of a whitish purple colour, parted into five, and standing vpon round rough heads, which when the flowers are false, become star-fashioned, diuided into six parts: it flowers in Iune, and is an annuall plant. ‡

5 *Valeriana Græca.*
Greekish Valerian.

‡ 6 *Valeriana Mexicana.*
Indian Valerian.

5 The fifth sort of Valerian hath diuers small hollow stalkes, a foot high and somewhat more, garnished with leaues like vnto those that do grow on the vpper part of the stalkes of common Valerian, but smaller, cut or iagged almost to the middle rib: at the top of the stalkes doe grow the flowers clustering together, of a blew colour, consisting of five leaues apiece, hauing in the middle thereof small white threds tipped with yellow: the seed is small, growing in little huskes or seed vessels: the root is nothing else but as it were all of threds.

6 I haue another sort of Valerian (the seed whereof was sent me from that reuerend Physition Bernard Paludane, vnder the title of *Valeriana Mexicana*:) hauing small tender stalkes trailing vpon the ground, very weake and brittle: whereupon doe grow smooth greenish leaues like those of Corne Sallade (which wee haue set forth amongst the Lettuce, vnder the title *Lactuca Agriua*, or Lambs Lettuce:) among the leaues come forth the flowers clustering together, like vnto the great Valerian in forme, but of a deepe purple colour: the root is very small and threddie, which perisheth with the rest of the plant, when it hath brought his seed to maturitie or ripenesse, and must bee sowne anew the next yeare in May, and not before.

7 There is also another sort or kinde of Valerian called by the name *Phyteuma*, of the learned Physitions of Montpelier and others (set forth vnder the stocke or kindred of the Valerians, resembling the aforesaid Corn-sallad, which is called of some *Prolifera*, from the Greeke title *Phyteuma*; as if you should say, good to make conception, and to procure loue:) the lowest leaues are like those of the small Valerian, of a yellowish colour: the vpper leaues become more iagged: the stalks are an handfull high: on the tops whereof do stand small round spokie tufts of white flowers; which being past, the seeds appeare like small round pearles, which being ripe, grow to be somewhat flat, hauing in the middle of each seed the print of an hole, as it were grauen or bored therein. The root is small and single, with some fibres annexed thereto.

‡ 8 This sends forth from a white and wooddie root many leaues spred vpon the ground; green, and

‡ 8 *Valeriana annua*, Clus.
Annuall Valerian.

‡ 9 *Valeriana Alpina latifolia*.
Broad leaved Setwall of the Alps

‡ 10 *Valeriana Alpina angustifolia*.
Small Alpine Setwall.

and not vnlike those of the Star-Thistle: among these rise vp some round hollow branched stalks two cubites high: at each ioint grow forth two leaues leffer, yet like the lower: at the tops of the branches grow the floures as it were in little vmbels, consisting of fife leaues apiece; and these of a light red, or flesh colour: and then these as it were vmbels grow into longish branches bearing seed almost like, yet lesse than the red Valerian: it floures in Iuly, and perisheth when it hath ripened the seed. *Clusius* hath set this forth by the name of *Valeriana annua altera*. ‡

9 The same Author hath also giuen vs the historie of some other Plants of this kind; and this he calls *Valeriana syl. Alpina i latifolia*: the stalk hereof is some foot high, round, Greene, and crested: vpon which stand leaues longish, sharpe pointed, and cut in with two or three deepe gashes: but the bottome leaues are more round and larger, comming neere to these of *Trachelium*, yet lesse, slenderer, and bitter of taste: the floures which are white of colour, and the seed, are like those of the other Valerians: the root is small, creeping, fibrous, white and aromatick: it growes vpon the Alpes, and floures in Iune and Iuly.

10 This sendes forth leaues like those of the mountain Daisie: out of the midst of which

Xxxx 3

risseth

riseth vpa stalk some foot high, ioined, and at the top diuided into little branches, carrying white floures like the other Valerians: the root is as aromaticke as that of the last mentioned; and grows in the chinkes of the Alpine rockes, where it floures in Iune and Iuly. *Clusius* hath it by the name of *Valeriana syluestris Alpin. 2. Saxatilis.* ‡

¶ The Place.

The first and likewise the Greeke Valerian are planted in gardens; the wilde ones are found in moist places hard to riuers sides, ditches, and waterie pits; yet the greater of these is brought into gardens where it flourisheth, but the lesser hardly prospereth.

¶ The Time.

These floure in May, Iune, and Iuly, and most of the Sommer moneths.

¶ The Names.

Generally the Valerians are called by one name, in Latine, *Valeriana*: in Greeke, *ῥαψάνη*: in shoppes also *Phu*, which for the most part is meant by the garden Valerian, that is called of *Diosc.* *ῥαψάνη ἀγρία*: in Latine, *Syluestris*, or *Rustica Nardus*: of *Pliny*, *Nardus Cretica*: which names are rather referred to those of the next chapter, although these be reckoned as wilde kinds thereof: of certaine in our age, *Marinella*, *Amantilla*, *Valentiana*, *Genicularis*, *Herba Benedicta*, and *Theriacara*: in most shops, *Valeriana Domestica*: of *Theophrastus* *Paracelsus*, *Terdina*: in high Dutch, *Grosz baldrian*: in low Dutch, *Speercruyt*, *S. Joris cruyt*, and *Valeriane*: in English, Valerian, Capons taile, and Setwall, but vnproperly, for that name belongeth to *Zedoaria*, which is not Valerian: what hath been set downe in the titles shall serue for the distinctions of the other kinds.

¶ The Temperature.

The garden Valerian is hot, as *Dioscorides* saith, but not much, neither the green root, but the dried ones; for the green is easily perceived to haue very little heate, and the dried to be hotter, which is found by the taste and smell.

¶ The Vertues.

- A The drie root, as *Dioscorides* teacheth, prouoketh vrine, bringeth downe the desired sicknesse, helpeth the paine in the sides, and is put into counterpoisons and medicines preseruatiue against the pestilence, as are treacles, mithridates, and such like: whereupon it hath been had (and is to this day among the poore people of our Northerne parts) in such veneration amongst them, that no broths, pottage, or physicall meats are worth any thing, if Setwall were not at an end: whereupon somewoman Poet or other hath made these verses:

They that will haue their heale,
Must put Setwall in their keale.

- B It is vsed generally in sleight cuts, wounds, and small hurts.
C The extraction of the roots giuen, is a most singular medicine against the difficultie of making water, and the yellow iaundies.
D Wilde Valerian is thought of the later Herbarists to be good for them that are bursten, for such as be troubled with the crampe and other convulsions, and also for all those that are bruised with falls.
E The leaues of these and also those of the garden, are good against vlcers and sores of the mouth and gums, if the decoction thereof be gargarized or held in the mouth.
F Some hold opinion that the roots of wilde Valerian dried and poudered, and a dramme weight thereof taken with wine, do purge vppward and downeward.

CHAP. 441. Of Mountaine Setwall, or *Nardus*.

¶ The Description.

1 THE *Nardus* named *Celtica*, but now by some, *Ligustica Nardus*, flourisheth in high mountaines. The Vallesians in their mother tongue call it *Selliga*; whence *Gesner* thought it to be *Saliunca*; neither do I doubt, but that it is the same which *Virgil* speaketh of in these verses:

*Puniceis humilis quantum Saliunca rosetis,
Iudicio nostro tantum tibi cedit Amintas.*

For it is a very little herbe creeping on the ground, and afterward lifting vp it selfe with a stalke of a handfull high; whereupon from the lower part grow small thin leaues, first green, but afterwards somewhat yellowish: vpon the roughnesse of the root there are many scales, platted one vpon another; but vnder the root there are many browne strings and hairy threds, in smell like the roots of *Astrabacca*, or rather the wilde mountaine Valerian, whereof it seemes to be a kinde, in taste sharpe and bitter. The floures grow along the vpper branches, white or yellowish, and very small.

1 *Nardus Celtica.*
Celticke Spikenard.

3 *Hirculus.*
Vrine-wort.

4 † *Nardus montana germinans.*
Mountaine Nard at the first springing vp:

4 *Nardus montana.*
Mountaine Spikenard.

2 The second sort of Spikenard hath many threddy roots, from the which rise vp many scaly rough and thicke stalkes, hauing at the top certaine flat hoary leaues growing vpon smal and tender foot-stalkes. The whole plant is of a pleasant sweet smell.

3 *Hirculus* is a plant very rare, which as yet I neuer saw, notwithstanding we are greatly beholding to *Carolus Clusius* the father of forreine Simples, who finding this plant among many bunches or handfulls of mountaine Spikenard, hath made it knowne vnto posteritie, as he hath done many other rare plants, in translating

translating of *Garcias* the Lusitanian Physitian, he setteth it forth with a light description, saying, It is a base and low herbe two handfulls high, bringing forth leaues without any stalkes at all, † very hairy about the root, and blackish, hauing no pleasant sent at all. The leaues chewed yeeld no aromaticke taste, but are clammie, or viscide; whereas the leaues of Celticke Narde are hot, with a little astringion, and of a pleasant smell and taste. †

4 Mountaine Spikenard hath a great thicke knobbed root, set here and there with some tender fibres, of a pleasant sweet smel, from the which come forth three or foure smooth broad leaues, and likewise iagged leaues deeply cut euen to the middle rib: among which rise vp naked stalks, garnished in the middle with a tuft of iagged leaues. The floures grow at the top of the stalks, in an umbel or tuft like those of the wilde Valerian in shape and colour, and such also is the seed. † I haue giuen you the figure of the root and whole leaues as they shew themselues when they first appeare, as it was taken by *Clusius*. †

5 *Nardus Indica*.
Indian Spikenard.

6 *Nardus Narbonensis*.
French Spikenard.

5 The Spikenard of India is a low plant, growing close vnto the ground, composed of many rough browne hairy cloues, of a strong, yet not vnpleasant smell. The root is small and threddie. † It hath certainly stalkes, floures, and seeds; but none of our Indian Writers or Trauellers haue as yet described them. I haue seene little pieces of slender hollow stalkes some two inches long fastned to the roots that are brought to vs. †

† 6 This French Spikenard, being a bastard kinde, groweth close vpon the ground like the precedent, compact of scaly rough leaues: in the middle whereof commeth forth a great bush of round greene stiffe and rusby leaues: among the which shoot vp diuers round stalkes a cubit high, set from the middle to the top with greenish little cods, standing in chaffie huskes like those of Schoenanth. The root is small and threddy: the whole plant is altogether without smell, which sheweth it to be a bastard kinde of Spikenard.

¶ The Place.

These plants [the first foure] are strangers in England, growing in great plentie vpon the mountaines of Iudenberg and Heluetia, on the rockes among the mosse, and in the mountains of Tiroll and Saltzburg.

The first and second, if my memorie faile me not, do grow in a field in the North part of England

land, called Crag close, and in the foot of the mountaine called Ingleborow Fels. ‡ The fourth may be found in some gardens with vs. The fifth growes in the East Indies, in the prouinces of Mandou and Chito in the kingdome of Bengala and Decan. The last growes in Prouince in France, neere a little city called Gange. ‡

¶ The Time.

The leaues grow to withering in September, at which time they smell more pleasantly than when they flourished and were Greene.

¶ The Names.

Nardus is called in Pannonia or Hungarie, of the countrey people, *Speick*: of some, *Bechi fin*; that is, the herbe of Vienna, because it doth grow there in great abundance, from whence it is brought into other countries: of *Gesner*, *Saliunca*: in English, Celticke Spikenard: of the Vallentians, *Selliga*, and *Nardus Celtica*.

¶ The Temperature and Vertues.

Celticke Narde mightily prouokes vrine, as recordeth *Rondeletius*; who traouelling through the defart countrey, chanced to lodge in a monasterie where was a Chanon that could not make his water, but was presently helped by the decoction of this herbe, through the aduice of the said *Rondeletius*. A

‡ The true Spikenard or Indian Nard hath a heating and drying facultie, being (according to *Galen*) hot in the first degree [yet the Greeke copy hath the third] and dry in the second. It is composed of a sufficiently astringent substance, and not much acride heate, and a certaine light bitterness. Consisting of these faculties, according to reason, both inwardly and outwardly vsed it is conuenient for the liuer and stomacke. B

It prouoketh vrine, helps the gnawing paines of the stomacke, dries vp the defluxions that trouble the belly and intrals, as also those that molest the head and brest. C

It stayes the fluxes of the belly, and those of the wombe, being vsed in a pessarie, and in a bath it helps the inflammation thereof. D

Drunke in cold water, it helps the nauousefnesse, gnawings, and windinesse of the stomacke, the liuer, and the diseases of the kidneyes, and it is much vsed to be put into Antidotes. E

It is good to cause haire to grow on the eye lids of such as want it, and is good to be strewed vpon any part of the body that abounds with superfluous moisture, to dry it vp. F

The Celticke-Nard is good for all the forementioned vses, but of lesse efficacie, vnlesse in the prouoking of vrine. It is also much vsed in Antidotes. G

The mountaine Nard hath also the same faculties, but is much weaker than the former, and not in vse at this day that I know of. ‡

CHAP. 442. Of Larkes heele or Larkes claw.

¶ The Description.

THe garden Larks spur hath a round stem ful of branches, set with tender iagged leaues very like vnto the small Sothernwood: the floures grow alongst the stalks toward the tops of the branches, of a blew colour, consisting of five little leaues which grow together and make one hollow floure, hauing a taile or spur at the end turning in like the spurre of Tode-flax. After come the seed, very blacke, like those of Leekes: the root perisheth at the first approach of Winter.

2 The second Larks spur is like the precedent, but somewhat smaller in stalkes and leaues: the floures are also like in forme, but of a white colour, wherein especially is the difference. These floures are sometimes of a purple colour, sometimes white, murrey, carnation, and of sundry other colours, varying infinitely, according to the soile or countrey wherein they liue.

‡ **3** Larks spur with double floures hath leaues, stalkes, roots, and seeds like the other single kinde, but the floures of this are double; and hereof there are as many seuerall varieties as there be of the single kinde, to wit, white, red, blew, purple, bluish, &c.

4 There is also another varietie of this plant, which hath taller stalkes and larger leaues than the common kinde: the floures also are more double and larger, with a lesser heele: this kind also yeeldeth vsually lesse seed than the former. The colour of the floure is as various as that of the former, being either blew, purple, white, red, or bluish, and sometimes mixed of some of these. ‡

5 The wilde Larks spur hath most fine iagged leaues, cut and hackt into diuers parts, confusedly set vpon a small middle tendrell: among which grow the floures, in shape like the others, but a great

1 *Consolida regalis satina.*
Garden Larks heele.

2 *Consolida satina flore albo vel rubro.*
White or red Larks spur.

3 *Consolida regalis flore duplici.*
Double Larks spur.

4 *Consolida reg. elatior flo. pleno.*
Great double Larks spur.

a great deale lesser, sometimes purple, otherwhiles white, and often of a mixt colour. The root is small and threddy.

5 *Consolidaregalis sylvestris.*
Wilde Larkes heele.

¶ The Place.

These plants are set and sowne in gardens: the last groweth wilde in corne fields, and where corn hath grown, ‡ but not with vs, that I haue yet obserued; though it be frequently found in such places in many parts of Germanie. ‡

¶ The Time.

They floure for the most part all Sommer long, from Iune to the end of August, and oft-times after.

¶ The Names.

Larks heele is called *Flos Regius*: of diuers, *Consolidaregalis*; who make it one of the Confounds or Comfreyes. It is also thought to be the *Delphinium* which *Dioscorides* describes in his third booke; wherewith it may agree. It is reported by *Gerardus* of Veltwijcke, who remained Lieger with the great Turke from the Emperor *Charles* the fifth, That the said *Gerard* saw at Constantinople a copy which had in the chap. of *Delphinium*, not leaues but floures like Dolphines: for the floures, and especially before they be perfected, haue a certaine shew and likenesse of those Dolphines, which old pictures and armes of certain antient families haue exprest with a crooked and bending figure or shape; by which signe also the heauenly Dolphine is set forth. And it skilleth not, though the chapter of *Delphinium* be thought

to be falsified and counterfeited; for although it be some other mans, and not of *Dioscorides*, it is notwithstanding some one of the old Writers, out of whom it is taken, and foisted into *Dioscorides* his bookes: of some it is called *Bucinus*, or *Bucinum*: in English, Larks spur, Larks heele, Larks toes, and Larks claw: in high-Dutch, *Bidder spooren*; that is, *Equitis calcar*, Knights spur: in Italian, *Sperone*: in French, *Pied d'alonette*.

¶ The Temperature.

These herbes are temperate and warme of nature.

¶ The Vertues.

We finde little extant of the vertues of Larks heele, either in the antient or later writers, worth the noting, or to be credited; for it is set downe, that the seed of Larks spur drunken is good against the stings of Scorpions; whose vertues are so forcible, that the herbe onely thrown before the Scorpion or any other venomous beast, causeth them to be without force or strength to hurt, insomuch that they cannot moue or stirre vntill the herbe be taken away: with many other such trifling toys not worth the reading.

CHAP. 443. Of Gith, or Nigella.

¶ The Kindes.

There be diuers sorts of Gith or Nigella, differing some in the colour of the floures, others in the doubleness thereof, and in smell of the seed.

¶ The Description.

1 The first kind of Nigella hath weake and brittle stalks of the height of a foot, full of branches, beset with leaues very much cut or iagged, resembling the leaues of Fumiterie, but much greener: the floures grow at the top of the branches, of a whitish blew colour, each floure being

1 *Melanthium*.
Garden Nigella.

2 *Melanthium sylvestre*.
Wilde Nigella.

3 *Melanthium Damascenum*.
Damaske Nigella.

4 *Melanthium Damascenum flo. pleno*.
Double floured Damaske Nigella.

being parted into five small leaues, starre fashion: the floures being vaded, there come vp small knobs or heads, hauing at the end thereof five or six little sharpe hornes or pointalls, and euery knob or head is diuided into sundry small cels or partitions, wherein the seed is contained, which is of a blackish colour, very like vnto Onion seed, in taste sharpe, and of an excellent sweet fauour.

2 The wilde Nigella hath a streaked stalke a foot or more high, beset full of grayish leaues, very finely jagged, almost like the leaues of Dil: the floures are like the former, saue that they are blewer: the cods or knops are like the heads or huskes of Columbines, wherein is contained the sweet and pleasant seed, like the former.

5 *Nigella flore albo multiplici.*
Damaske Nigella.

† 6 *Nigella Hispanica flore amplo.*
Great Spanish Nigella.

3 The third kinde of Nigella, which is both faire and pleasant, called Damaske Nigella, is very like vnto the wilde Nigella in his small cut and jagged leaues, but his stalke is longer: the floures are like the former, but greater, and euery floure hath five small Greene leaues vnder him, as it were to support and beare him vp: which floures being gone, there succeed and follow knops and seed like the former, but without smell or fauour.

† 4 This in the smalnesse, and shape of the leaues and the manner of growing is like to the last described hauing smal leaues growing vnder the floure, which is not single, as in the last described, but double, consisting of five or more rankes of little blewish leaues, which are succeeded by such cornered heads as those of the former, hauing in them a blacke seed without any manifest smell. †

5 The fifth kinde of Nigella hath many small and slender stalkes, set full of slender and thin leaues deeply cut or jagged, of a faint yellowish Greene colour: the floures grow at the top of the stalkes, of a whitish colour, and exceeding double: which being vaded, there succeed bowles or knobs, full of sweet blacke seed like the former: the root is small and tender.

† 6 The root of this is slender, and yellowish; the stalke some cubit high, round, green, crested, and toward the top diuided into sundry branches, the leaues toward the bottome are somewhat small cut, but somewhat larger vpon the stalkes. The floure is much larger than any of the former, composed of five leaues, of a light blew aboue, and somewhat whitish vnderneath, with large

large veines running about them : in the middle stands vp the head, encompassed with blackish threds, and some 7. or 8. little gaping blewish floures at the bottomes of them ; the leaues of the floures decaying the head becomes bigger, hauing at the tops thereof 6. 7. or 8. longish twined hornes growing, in a star fashion; the inside is parted into cels conteyning a yellowish green, or else blackish seed. It is set forth in the *Hortus Eystettensis* by the name of *Melanthium Hispanicum maius*; by Mr. *Parkinson* it is called *Nigella Hispanica flore simplici*; and *Bauhine* in his *Prodromus* hath it by the name of *Nigella latifolia flore maiore simplici ceruleo*. It is an annuall plant, and floures in Iuly; it is sometimes to be found in the gardens of our Florists. ‡

¶ The Place.

The tame are sowne in gardens: the wilde ones do grow of themselues among corne and other graine, in diuers countries beyond the seas.

¶ The Time.

The seed must be sowne in Aprill: it floureth in Iuly and August.

¶ The Names.

Gith is called in Greeke *μελάνθιον*; in Latine also *Melanthium*: in shops, *Nigella*, and *Nigella Romana*: of diuers, *Gith*, and *Salusandria*, and some among the former bastard names, *Papauer nigrum*: in high Dutch, *Swartzkymnich*: in low Dutch, *Pardus saet*: in Italian, *Nigella*: in Spanish, *Axenuz*, *Alipiure*: in French, *Nielle odorante*: in English, *Gith*, and *Nigella Romana*, in Cambridgeshire, *Bishops woort*: and also *Dine Catharine flos*, *Saint Katharines floure*.

¶ The Temperature.

The seed of the garden *Nigella* is hot and dry in the third degree, and of thin parts.

¶ The Vertues.

- A The seed of *Nigella Romana* drunke with wine, is a remedy against the shortnes of breath, dissolueteth and putteth forth windinesse, prouoketh vrine, the menfes, increaseth milke in the breasts of nurses if it be drunke moderately; otherwise it is not onely hurtfull to them, but to any that take thereof too often, or in too great a quantity.
- B The seed killeth and driueth forth wormes, whether it be taken with wine or water, or laid to the nauell in manner of a plaister.
- C The oile that is drawne forth thereof hath the same property.
- D The seed parched or dried at the fire, brought into pouder, and wrapped in a piece of fine lawne or farcenet, cureth all murs, catarrhes, rheumes, and the pose, drieth the braine, and restoreth the sense of smelling vnto those which haue lost it, being often smelled vnto from day to day, and made warme at the fire when it is vsed.
- E It takes away freckles, scurfs, and hard swellings, being laid on mixed with vineger. To be brieft, as *Galen* saith, it is a most excellent remedy where there is need of clensing, drying, and heating.
- F It serueth well among other sweets to put into sweet waters, bagges, and odoriferous powders.

† The figures of the third and fourth of the former edition were transposed.

CHAP. 444. Of Cockle.

¶ The Description.

Cockle is a common and hurtfull weed in our Corne, and very well knowne by the name of Cockle, which *Pena* calleth *Pseudomelanthium*, and *Nigellastrum*, by which names *Dodonæus* and *Fuchsius* do also terme it; *Mouton* calleth it *Lolium*; and *Tragus* calleth it *Lychnoides segetum*. This plant hath straight, slender, and hairy stems, garnished with long hairy and grayish leaues, which grow together by couples, inclosing the stalke round about: the floures are of a purple colour, declining to rednesse, consisting of five small leaues, in proportion very like to wilde Campions; when the floures be vaded there follow round knobs or heads full of blackish seed, like vnto the seed of *Nigella*, but without any smell or saour at all.

¶ The Place and Time.

The place of his growing, and time of his flouering, are better knowne then desired.

¶ The Names.

Cockle is called *Pseudomelanthium*, and *Nigellastrum*, wilde or bastard *Nigella*; of *Fuchsius*, *Lolium*: of *Mouton*, *Lychnoides segetum*: of *Tragus*, *Githago*: in high Dutch, *Kornegele*; in low Dutch, *Coerne roosen*: in French, *Nielle des Bleds*: in English, *Cockle*, *field Nigella*, or wilde *Nigella*: in Italian, *Githone*; whereupon most Herbarists being mooued with the likenesse of the word, haue thought it to be the true *Gith* or *Melanthium*; but how farre they are deceiued it is better knowne, than needfull to be confuted: for it doth not onely differ in leaues from the true *Gith*, but also in other properties, and yet it is called *Gith* or *Melanthium*, and that is of the blackenes of the seed, yet not properly, but with a certain addition, that it may differ from the true *Melanthium*: for

Hippocrates

Pseudomelanthium.
Bastard Nigella, or Cockle.

Hippocrates calleth it *Melanthium ex Tritico*, of wheate: *Octavius Horatianus* calleth that Gith which groweth among Corne: and for the same cause it is named of the learned of this our time *Nigellastrum*, *Gigatho*, and *Pseudomelanthium*: *Ruellius* saith it is called in French *Niele*, and *Flos Micancalus*.

¶ The Temperature.

The seed of Cockle is hot and dry in the later end of the second degree.

¶ The Vertues.

The seed made in a pessarie or mother suppositorie, with honey put vp, bringeth downe the desired sicknesse, as *Hippocrates* in his booke of womens diseases doth witness.

Octavius Horatianus giueth the seed parched and beaten to powder to be drunke against the yellow jaundice.

Some ignorant people haue vsed the seed hereof for the seed of Darnell, to the great danger of those who haue received the same: what hurt it doth among corne, the spoyle vnto bread, as well in colour, taste, and vnwholesomnes, is better known than desired.

CHAP. 445. Of Fumitorie.

¶ The Kindes.

There be diuers herbes comprehended vnder the title of Fumitorie; some wilde, and others of the garden; some with bulbous or tuberous roots, and others with fibrous or threddy roots: and first of those whose roots are nothing but strings.

¶ The Description.

Fumitorie is a very tender little herbe: the stalkes thereof are slender, hauing as it were little knots or ioynts full of branches, that scarce grow vp from the ground without proppings, but for the most part they grow sidelong: the leaues round about are small, cut on the edges as those of Coriander, which as well as the stalkes are of a whitish Greene: the floures be made vp in clusters at the tops of the small branches, of a red purple colour: then rise vp huskes, round and little, in which lieth the small seed: the root is slender, and groweth straight downe. † This is also found with floures of a purple violet colour, and also sometimes with them white. †

2 The second kinde of Fumitorie hath many small long and tender branches, wherupon grow little leaues, commonly set together by threes or fives, in colour and taste like vnto the former; hauing at the top of the branches many small clasping tendrels, with which it taketh hold vpon hedges, bushes, and whatsoever groweth next vnto it: the floures are small, and clustering together, of a white colour, with a little spot in their middles; after which succeed cods containing the seed: the root is single, and of 2 fingers length.

3 The third kinde of Fumitorie hath a very small root, consisting of diuers little strings; from which arise small and tender branches trailing here and there vpon the ground, beset with many small and tender leaues most finely cut and iagged, like the little leaues of Dill, of a deepe Greene colour tending to blewnesse: the floures stand on the tops of the branches, in bunches or clusters thicke thrust together, like those of the meadow Clauer, or three leaved grasse, of a most bright red colour, and very beautifull to behold: the root is very small and threddy.

Y y y 2

4 The

1 *Fumaria purpurea.*
Common or purple Fumitory.

3 *Fumaria tenuifolia.*
Fine leaved Fumitorie.

† 2 *Fumaria alba latifolia clauiculata.*
White broad leaved Fumitorie.

4 *Fumaria lutea.*
Yellow Fumitorie.

4 The yellow Fumitorie hath many crambling threddy roots, somewhat thicke, grosse, and fat, like those of *Asparagus*: from which rise diuers vpright stalkes a cubit high, diuiding themselves toward the top into other smaller branches, wheron are confusedly placed leaues like those of *Thalictrum*, or English Rubarb, but lesser and thinner: alongst the tops of the branches grow yellow floures, resembling those of Sage: which being past, there followeth small seed like vnto dust.

¶ The Place.

The Fumitories grow in corne fields among Barley and other graine; in vineyards, gardens, and such like manured places. I found the second and third growing in a corne field betweene a small village called Charleton and Greenwich.

¶ The Time.

Fumitorie is found with his floure in the beginning of May, and so continues to the end of summer. When it is in floure is the best time to gather it to keepe dry, or to distill.

¶ The Names.

Fumitorie is called in Greeke *Kamde*, and *Kamio*, and often *Kamime*: in Latine, *Fumaria*: of *Pliny*, *Capnos*: in shops, *Fumus terræ*: in high-Dutch, *Erdtrauch*: in low-Dutch, *Grisecom*, *Duyuen Her- nel*: in Spanish, *Palomilha*: in French and English, *Fumiterre*.

¶ The Temperature.

Fumitorie is not hot, as some haue thought it to be, but cold and something dry; it openeth and clenseth by vrine.

¶ The Vertues.

It is good for all them that haue either scabs or any other filth growing on the skinne, and for A them also that haue the French disease.

It remoueth stoppings from the liuer and spleene: it purifieth the bloud, and is oft times good B for them that haue a quartane ague.

The decoction of the herbe is vsed to be giuen, or else the syrrup that is made of the iuyce: the C distilled water thereof is also profitable against the purposes aforesaid.

It is oftentimes boyled in whay, and in this manner it helpeth in the end of the Spring and in D Sommer time those that are troubled with scabs.

Paulus Aegineta saith that it plentifully prouoketh vrine, and taketh away the stoppings of the E liuer, and feebleness thereof; that it strengthneth the stomacke, and maketh the belly soluble.

Dioscorides affirmeth, that the iuyce of Fumitorie, of that which groweth among Barley, as *E- F gineta* addeth, with gum Arabicke, doth take away vnprofitable haire that pricke the eyes, growing vpon the eye lids, the haire being first plucked away, for it will not suffer others to grow in their places.

The decoction of Fumitorie drunken driueth forth by vrine and siege all hot cholericke burnt G and hurtfull humors, and is a most singular digester of salt and pituitous humors.

† There were formerly six figures and descriptions in this chapter; whereof the two first figures were of the common Fumitorie, the one with purple, the other with white floures; and the two later were of the *Fumaria lausolia clauiculata*, differing onely in the largenesse and smallnesse of the leafe. The description in the second place belonged to the *Fumaria clauiculata*, which also was againe described in the fifth and sixth places, yet not to much purpose; wherefore I haue put the figure to the second, and omitted the other as superfluous.

CHAP. 446. Of bulbous Fumitorie, or Hollow-root.

¶ The Description.

1 **T**He leaues of great Hollow-root are iagged and cut in sunder, as be those of *Coriander*, of a light greenish colour, that is to say, like the gray colour of the leaues of *Columbine*, whereunto they be also in forme like, but lesser: the stalks be smooth, round, and slender, an handfull long; about which, on the vpper part stand little floures orderly placed, long, with a little horne at the end like the floures of *Tode-flax*, of a light red tending to a purple colour: the seed lieth in flat cods, very soft and greenish when it is ready to yeeld vp his black shining ripe seed: the root is bumped or bulbous, hollow within, and on the vpper part pressed down somewhat flat, couered ouer with a darke yellow skin or barke, with certaine strings fastned there-to, and of a bitter and austere taste.

2 The second is like vnto the first in each respect, sauing that it bringeth floures of a white colour, and the other not so.

3 The small purple Hollow-root hath roots, leaues, stalkes, floures, and seeds like the precedent, the especiall difference is, that this plant is somewhat lesse.

4 The small white Hollow-root likewise agreeth with the former in each respect, sauing that this plant bringeth white floures, and the other not so.

1 *Radix cana maior purpurea.*
Great purple Hollow-root.

2 *Radix cana maior alba.*
Great white Hollow-root.

5 This kinde of Hollow-root is also like the last described, sauing that the floures hereof are mixed with purple and white, which maketh it to differ from the others.

6 There is no difference in this, that can possibly be distinguished, from the last described, sauing that the floures hereof are of a mixt colour, white and purple, with some yellow in the hollownesse of the same, wherein consisteth the difference from the precedent.

7 This thin leaved Hollow-root hath likewise an hollow root, couered ouer with a yellow pil-ling, of the bignesse of a tennise ball: from which shoot vp leaues spred vpon the ground, very like vnto the leaues of Columbines, as well in forme as colour, but much thinner, more iagged, and altogether lesser: among which rise vp small tender stalkes, weake and feeble, of an handfull high, bearing from the middle thereof to the top very fine floures, fashioned vnto one piece of the Columbine floure, which resembleth a little bird of a purple colour.

8 This other thin leaved Hollow-root is like the precedent, sauing that this plant brings forth white floures tending to yellownesse, or as it were of the colour of the field Primrose.

9 **Bunnykens holwortele**, as the Dutch men doe call it, hath many small iagged leaues growing immediately from the ground, among which rise vp very slender stalkes, whereon doe grow such leaues as those next the ground: on the top of the branches stand faire purple floures like vnto the others of his kinde, sauing that the floures hereof are as it were small birds, the bellies or lower parts whereof are of a white colour, wherein it differeth from all the rest of the Hollow-roots.

10 The last and small hollow-root is like the last described, sauing that it is altogether lesse, and the floures hereof are of a Greene colour, not vnlike in shape to the floures of Cinkefoile. ‡ This plant, whose figure our Author here gaue with this small description, is that which from the smel of muske is called *Moschatella*, by *Cordus* and others: it is the *Denticulata* of *Daleschampsius*: the *Fumaria bulbosa tuberosa minima* of *Tabernamontanus*: and the *Ranunculus minimus septentrionalium herbido muscoso flore* of *Lobel*. The root hereof is small and toothed, or made of little bulbes resembling teeth, and ending in white hairy fibres: it sendeth vp diuers little branches some two or

or three inches high: the leaues are somewhat like those of the yellow Fumitorie, or *Radix cava*, but much lesse: the floures grow clustering on the top of the stalke, commonly five or seven together, each of them made of foure yellowish green leaues with some threds in them; it floures in Aprill, and is to be found in diuers places amongst bushes at that time, as in Kent about Chislehurst, especially in *Pits* his wood, and at the further end of Cray heath, on the left hand vnder a hedge among bryers and brambles, which is his proper seat. †

9 *Radix cava minor*.
Bunnikens Holwoort.

10 *Radix cava minima viridi flore*.
Small Bunnikens Holwoort.

¶ The Place.

These plants do grow about hedges, brambles, and in the borders of fields and vineyards, in low and fertile grounds, in Germanie and the Low-countries, neuerthelesse the two first, and also the two last described do grow in my garden.

¶ The Time.

These do floure in March, and their seed is ripe in Aprill: the leaues and stalke are gon in May, and nothing remaining saue onely the roots, so little a while do they continue.

¶ The Names.

Hollow root is called in high Dutch *Holwurtz*: in low Dutch, *Hoolewoortele*, that is, *Radix cava*: in English, Hollow root, and Holewoort: it is vsed in shops in steed of *Aristolochia*, or round Birthwoort, which error is better knowne than needfull to be confuted: and likewise their error is apparant, who rashly iudge it to be *Pistolochia*, or little Birthwoort. It should seem the old Writers knew it not; wherefore some of our later Authors haue made it *Leontopetalis species*, or a kinde of Lions Turnep: others, *Eriphium*: and other some, *Thesium*: most men, *Capnos Chelidonia*: it seemeth to agree with *Leontopetalon* in bulbed roots, and somewhat in leaues, but in no other respects, as may be perceiued by *Dioscorides* and *Plinies* description of *Leontopetalon*. And if *Eriphium* haue his name *ἔριφον*, that is to say of the Spring, then this root may be not vnproperly *Eriphium*, and *Veris Planta*: or the Plant of the Spring: for it is euident that it appeareth and is Greene in the Spring onely: some thinke it hath beene called *Eriphium, ab Hædo*, or of the Goat: but this *Eriphium* is quite another plant, as both *Apuleius* writeth, and that booke also mentioneth which is attributed to *Galen*, and dedicated to *Paternianus*. In the booke which is dedicated to *Paternianus*, there be read these words; [*Eriphium* is an herbe which is found vpon high mountaines, it hath leaues like Smallage, a fine floure like the Violet, and a root as great as an Onion: it hath likewise other roots which

which send forth roots after roots. Whereby it is euident that this root whereof we intreat is not this kinde of *Eriphium*. Concerning *Thesium* the old Writers haue written but little: *Theophrastus* saith, that the root thereof is bitter, and being stamped purgeth the belly. *Pliny* in his 21. booke, chap. 17. sheweth, that the root which is called *Thesium* is like the bulbed plants, and is rough in taste: *Athenaeus* citing *Timachida* for an Authour, saith, that *Thesium* is called a floure, of which *Ariadnes* garland was made. These things seeme well to agree with Hollow root; for it is bumped or bulbous, of taste bitter and austere, or something rough, which is also thought to purge: but what certaintie can be affirmed, seeing the old writers are so brieue? what manner of herbe *Capnos Chelidonia* is, which groweth by hedges, and hereupon is surnamed *capnos*, *Aetius* doth not expound, onely the name thereof is found in his second Tetrab. the third booke, chap. 110. in *Martianus* his *Collyrium*, and in his Tetrab. 3. booke, 2. chap. among such things as strengthen the liuer. But if *Capnos Chelidonia* be that which *Pliny* in his 25. booke, chap. 13. doth call *Prima Capnos*, or the first *Capnos*, and commendeth it for the dimnesse of the sight, it is plain enough that *Radix caua*, or the Hollow root, is not *Capnos Chelidonia*: for *Plinies* first *Capnos* is branched, and foldeth it selfe vpon hedges: but Hollow root hath no such branches growing on it, and is a low herbe, and is not held vp with props, nor needeth them. But if *Aetius* his *Capnos Chelidonia* be another herb differing from that of *Pliny* (which thing perchance was the cause why it should bee surnamed *Chelidonia*) there is some reason why it should be called *Capnos Chelidonia*; for it is somewhat like *Fumitorie* in leaues, though greater, and commeth vp at the first spring, which is about the time when the Swallowes do come in; neuertheless it doth not follow, that it is true and right *Capnos Chelidonia*, for there be also other herbs coming vp at the same season, and perish in short time after, which notwithstanding are not called *Chelidonia*.

¶ The Temperature.

Hollow root is hot and drie, yet more drie than hot, that is to say, dry in the third degree, and hot in the second; it bindeth, clenseth, and somewhat wasteth.

¶ The Vertues.

- A Hollow root is good against old and long lasting swellings of the Almonds in the throat, and of the iawes: it likewise preuaileth against the paines of the hemorrhoides, which are swolne and painefull, being mixed with the ointment of Poplar buds, called *Vng. Populeon*.
- B It is reported that a dram weight hereof being taken inwardly, doth purge by siege, and draweth forth flegme.

† I haue reduced the eight figures which were formerly here put to the first 8. descriptions, being all of one and the same plant, to two, yet haue I left the descriptions, which in my opinion might haue been as well spared as the figures, for excepting the various colour of the floures there are but two distinct differences of the *Fumaria bulbosa maior*, the one hauing a hollownesse in the bottome of the root, and the other wanting it; and this which hath the solid root hath also the greene leaues betwene the floures cut in or diuided, the floures also are lesse, more in number, and of an elegant red purple colour; and seldome found of any other colour, whereas the other varies much in the colour of the floures.

CHAP. 447. Of Columbine.

¶ The Description.

1 **T**He blew Columbine hath leaues like the great Celandine, but somewhat rounder, indented on the edges, parted into diuers sections, of a blewish greene colour, which being broken yeeld forth little iuice or none at all: the stalke is a cubit and a halfe high, slender, reddish, and sleightly haired: the slender sprigs whereof bring forth euerie one one floure with five little hollow hornes, as it were hanging forth, with small leaues standing vpright, of the shape of little birds: these floures are of colour sometimes blew, at other times of a red or purple, often white, or of mixt colors, which to distinguish feuerally would be to smal purpose, being things so familiarly knowne to all: after the floures grow vp cods, in which is contained little blacke and glittering seed: the roots are thicke, with some strings thereto belonging, which continue manie yeares.

2 The second doth not differ sauing in the colour of the floures; for like as the others are described to be blew, so these are of a purple red, or horse-flesh colour, which maketh the difference.

3 The double Columbine hath stalks, leaues, and roots, like the former: the floures hereof are very double, that is to say, many of those little floures (hauing the forme of birds) are thrust one into the belly of another, sometimes blew, often white, and other whiles of mixt colours, as nature list to play with her little ones, differing so infinitely, that to distinguish them apart would require mor

1 *Aquilegia carulea.*
Blew Columbines.

2 *Aquileia rubra.*
Red Columbines.

3 *Aquilina multiplex.*
Double Columbines.

4 *Aquilegia variegata.*
Variegated Columbine.

‡ 5 *Aquilegia flo. inverso rubro.*
Columbine with the inverted red floure.

‡ 7 *Aquilegia flore roseo.*
Rose Columbine.

‡ 6 *Aquilegia flo. inverso albo.*
Inverted Columbine with the white floure.

‡ 8 *Aquilegia degener.*
Degenerate Columbine.

more time than were requisite to leese: and therefore it shall suffice what hath beene said for their descriptions.

‡ 4 There are also other varieties of this double kinde, which haue the floures of diuers or partie colours, as blew and white, and white and red variously marked or spotted.

5 This kinde hath the floures with their heeles or spurres turned outward or in the middle of the floure, whence it is called *Aquilina inversa*: the floures of this are commonly reddish, or of a light or darke purple colour, and double.

6 This differs from the last in the colour of the floures which are white, yet double, and inuered as the former.

7 The roots, leaues, and stalks of this are not vnlike those of the precedent, but the floure is much different in shape; for it hath no heels or spurs, but is made of fundrie long leaues lying flat open, being sometimes more single, and otherwhiles more double. The colour of the floure is either red, white, blew, or variously mixt of these as the former.

8 This though it be termed degenerate, is a kinde of it selfe, and it differs from the last described in that the vtmost leaues are the largest, and the colour thereof is commonly greene, or greene somewhat inclining to a purple. ‡

¶ The Place.

They are set and sowne in gardens for the beautie and variable colours of the floures.

¶ The Time.

They floure in May, Iune, and Iuly.

¶ The Names.

Columbine is called of the later Herbarists *Aquileia*, *Aquilina*, and *Aquilegia*: of *Costeus*, *Pothos*: of *Gesner*, *Leontostomum*: of *Dalechampsius*, *Iouis flos*: of some, *Herba Leonis*, or the herbe wherein the Lion doth delight: in High Dutch, *Agley*: in Low Dutch, *Akeleyen*: in French, *Ancoiles*: in English, *Columbine*. ‡ *Fabius Columna* iudges it to be the *Isopyrum* described by *Dioscorides*. ‡

¶ The Temperature.

Columbines are thought to be temperate betweene heate and moisture.

¶ The Vertues.

Notwithstanding what temperature or vertues Columbines haue is not yet sufficiently known; A for they are vsed especially to decke the gardens of the curious, garlands, and houses: neuerthelesse *Tragus* writeth, that a dram weight of the seed, with halfe a scruple or ten graines of Saffron giuen in wine, is a good and effectuell medicine for the stopping of the liuer, and the yellow iaundise, but saith he, that who so hath taken it must be well couered with cloathes, and then sweat.

Most in these daies following others by tradition, do vse to boile the leaues in milke against the B forenesse of the throat, falling and excoriation of the uvula: but the antient writers haue said nothing hereof: *Ruellius* reporteth, that the floures of Columbines are not vsed in medicine: yet some there be that do affirme they are good against the stopping of the liuer, which effect the leaues doe also performe.

‡ *Clusius* saith, that Dr. *Francis Rapard* a Physition of Bruges in Flanders, told him that the C seed of this common Columbine very finely beaten to poudre, and giuen in wine, was a singular medicine to be giuen to women to hasten and facilitate their labour, and if the first taking it were not sufficiently effectuell, that then they should repeat it againe. ‡

CHAP. 448. Of Wormewood.

¶ The Description.

1 THE first kind being our common and best knowne Wormewood, hath leaues of a grayish colour, very much cut or iagged, and very bitter: the stalkes are of a wooddie substance, two cubits high, and full of branches, alongst which doe grow little yellowish buttons, wherein is found small seed like the seed of Tansey, but smaller: the root is likewise of a wooddie substance, and full of fibres.

2 The second kinde of Wormewood bringeth forth slender stalkes about a foot high or somewhat more, garnished with leaues like the former, but whiter, much lesser, and cut or iagged into most fine and small cuts or diuisions: the floures are like the former, hanging vpon small stemmes with their heads downward: the roots are whitish, small and many, crawling and crambling one ouer another, and thereby infinitely do increase, of fauour lesse pleasant than the common Wormewood.

wood. Some haue termed this plant *Absinthium santonicum*, but they had slender reason so to do: for if it was so called because it was imagined to grow in the Prouince of Santoinge, it may very well appeare to the contrarie; for in the Alpes of Galatia, a countrey in Asia minor, it groweth in great plenty, and therefore may rather be called *Galatium sardonium*, and not *Santonium*; but leauing controuerfies impertinent to the History, it is the Ponticke Wormwood of *Galens* description, and so holden of the learned *Paludane* (who for his singular knowledge in plants is worthy triple honor) and likewise many others.

1 *Absinthium latifolium* sive Ponticum.
Broad leaved Wormwood.

† 2 *Absinthium tenuifolium* Ponticum Galeni.
Small Ponticke VVormwood.

¶ The Place.

This broad leaved Wormwood delighteth to grow on rocks and mountaines, and in vntilled places; it groweth much vpon dry bankes, it is common euery where in all countries: the best, saith *Dioscorides*, is found in Pontus, Cappadocia, and on mount Taurus: *Pliny* writeth, that Ponticke Wormwood is better than that of Italie: *Ouid* in these words doth declare that Ponticke Wormwood is extreme bitter.

*Turpia deformes gignunt Absinthia campi,
Terraque de fructu, quam sit amara docet.*

Vntilled barren ground the lothsome Wormwood yeelds,
And knowne it's by the fruit how bitter are the fields.

And *Bellonius* in his first booke of Singularities, chap. 76. doth shew, that there is also a broad leaved Wormwood like vnto ours, growing in the Prouinces of Pontus, and is vsed in Constanti-nople by the Physitions there, it is likewise found in certain cold places of Switzerland, which by reason of the chilnesse of the aire riseth not vp, but creepeth vpon the ground, whereupon diuers call it creeping Wormwood.

¶ The Time.

The little flours and seeds are perfected in Iuly and August, then may Wormwood be gathered and laied vp for profitable vses.

¶ The Names.

It is called in Greeke *Apuleius*, *Absinthium rusticum*, countrey Wormwood,
or

or pefants Wormewood: we haue named it *Absinthium latifolium*, broad leafed Wormewood, that it may differ from the rest: the Interpreters of the Arabians call the better sort, which *Dioscorides* nameth Ponticke Wormewood, *Romanum Absinthium*, Roman Wormewood: and after these, the barbarous Physitions of the later age: the Italians name Wormewood *Assenso*: the Spaniards, *Axenxios*, *Assensios*, most of them *Donzell*: the Portingales, *Alofna*: in high Dutch, *werommut*, *wermut*: in French, *Aluyme*: in English, common VVormwood.

Victor Trincauilla, a singular Physition, in his practise tooke it for *Absinthium Ponticum*.

2 This is commonly called *Absinthium Romanum*: and in low Dutch, *Roomfche Affense*: by which name it is knowne to very many Physitions and Apothecaries, who vse this in stead of Ponticke wormwood: furthermore it hath a leafe and floure far lesse than the other wormwoods: likewise the smell of this is not onely pleasant, but it yeeldeth also a spicie sent, whereas all the rest haue a strong and lothsome smell: and this Ponticke VVormwood doth differ from that which *Dioscorides* commendeth: for *Dioscorides* his Pontick wormwood is accounted among them of the first kinde, or of broad leafed wormwood, which thing also *Galen* affirmeth in his sixt booke of the Faculties of medicines, in the chapter of Sothernwood. There be three kinds of Wormwood (saith he) whereof they vse to call one by the generall name, and that is especially Pontick: whereby it is manifest that *Galen* in this place hath referred Ponticke to no other than to the first wormwood; and therefore many not without cause maruell, that *Galen* hath written in his booke of the Method of curing, how Pontick wormwood is lesse in floure and leafe: many excuse him, and lay the fault vpon the corruption of the booke, and in his 9. booke of Method, the lesse they would haue the longer: therefore this wormwood with the lesse leafe is not the right Pontick wormewood, neither againe the Arabians Romane wormewood, who haue no other Romane than Ponticke of the Grecians. Also many beleue that this is called *Santonicum*, but this is not to be sought for in Mysia, Thracia, or other countries Eastward, but in France beyond the Alps, if we may beleue *Dioscorides* his copies there be that would haue it grow not beyond the Alps of Italy, but in Galatia a countrie in Asia, & in the region of the Sardines, which is in the lesse Asia, whereupon it was called in Greeke *Σανδύριον*, which was changed into the name *Santonicum* through the error of the translators: *Dioscorides* his copies keep the word *Sardonium*, & *Galen* copies *Santonicum*, which came to posterity as it seemeth. is called in English, Romane Wormewood, garden or Cypres Wormewood, and French Wormwood.

¶ The Temperature.

Wormewood is of temperature hot and drie, hot in the second degree, and drie in the third: it is bitter and clenfing, and likewise hath power to binde or strengthen.

¶ The Vertues.

It is very profitable to a weake stomacke that is troubled with choler, for it clenfeth it through A his bitternesse, purgeth by siege and vrine: by reason of the binding qualitie, it strengthneth and comforteth the stomacke, but helpeth nothing at all to remoue flegme contained in the stomacke, as *Galen* addeth.

If it be taken before a surfeit it keepeth it off, and remoueth lothsome nesse, saith *Dioscorides*, and B it helpeth not only before a surfeit, but also it quickly refresheth the stomack and belly after large eating and drinking.

It is oftentimes a good remedie against long and lingring agues, especially tertians: for it doth C not onely strengthen the stomacke and make an appetite to meat, but it yeeldeth strength to the liuer also, and riddeth it of obstructions or stoppings, clenfing by vrine naughtie humours.

Furthermore, Wormewood is excellent good for them that vomite bloud from the spleene, the D which hapneth when the spleene being ouercharged and filled vp with grosse bloud doth vburden it selfe, and then great plenty of bloud is oftentimes cast vp by vomite. It happeneth likewise that store of blacke and corrupt bloud mixed with excrements passeth downewards by the stoole, and it oftentimes hapneth that with violent and large vomiting the sicke man fainteth or swooneth, or when he is reuiued doth fall into a difficult and almost incurable tympanie, especially when the disease doth often happen; but from these dangers Wormewood can deliuer him, if when he is refreshed after vomite, and his strength any way recovered, he shall a good while vse it, in what manner soeuer he himselfe shall thinke good.

Againe, VVormewood voideth away the wormes of the guts, not onely taken inwardly, but applied outwardly: it withstandeth all putrifactions; it is good against a stinking breath, it keepeth E garments also from the Mothes; it driueth away gnats, the bodie being annointed with the oile thereof.

Likewise it is singular good in pulteffes and fomentations to binde and to drie. F

Besides all this *Dioscorides* declareth, that it is good also against windinesse and griping pains of G the stomacke and belly, with Sefeli and French Spikenard: the decoction cureth the yellow iaudies or the infusion, if it be drunke thrise a day some ten or twelue spoonfuls at a time.

H It helpeth them that are strangled with eating of Mushrooms, or toad stools, if it be drunk with vineger.

I And being taken with wine, it is good against the poison of *Ixia* (being a viscous matter proceeding from the thistle *Chamalion*) and of Hemlock, and against the biting of the shrew mouse, and of the Sea Dragon: it is applied to the squincie or inflammations of the throat with honie and niter, and with water to night wheales, and with hony to swartish markes that come vpon bruises.

K It is applied after the same manner to dim eies, and to mattering eares.

L *Ioachimus Camerarius* of Noremberg commendeth it greatly against the iaundice, giuing of the floures of Wormwood, Rosemarie, Sloes, of each a small quantitie, and a little saffron, boiled in wine, the body first being purged and prepared by the learned Physition.

† The figure which formerly was in the second place, was of a small wormwood, not different from the common kinde, but only in the smallnesse, and more aromaticke taste; it growes on mountainous places, and *Gesner* calls it *Abinthium commune minus*, vel *Alpinum*; now our Authors description was intended for this, whose figure we haue giuen you, for it is the *Abinthium santonicum*, of some, as *Ruellius* and *Cesalpinus*; and the *Galatium sardonium* of *Pena* and *Lobel*.

CHAP. 449. Of Small leaved Wormewood.

Abinthium tenuifolium Austriacum.
Austrian Wormewood.

¶ The Description.

Small leaved Wormewood bringeth forth very many little branches, slender, a span or a foot high, full of leaues, lesse by a great deale, and tenderer than the former, most finely and nicely minced: the floures like those of the former, hang vpon the little branches and sprigs: the roots are small, creeping ouertwhart, from whence do rise a great number of yong sprouts: this VVormwood also is somewhat white, and no lesse bitter than the broad leaved one, and hath not so ranke, or so vnpleasant a smell, but rather delightfull.

¶ The Place.

It grows plentifully in Myfia, Thracia, Hungarie, and Austria, and in other regions neere adioining: it is also found in Bohemia, and in many vntilled places of Germanie; it is a garden plant in the low Countries, and in England.

¶ The Time.

It bringeth forth floures and seed in Autumne: a little while after when winter cometh, the herbe withereth away, but the roote remaineth alieue, from which leaues and stalks do come againe in the spring.

¶ The Names.

† This *Lobel* calls *Abinthium Ponticum Tridentinum Herbariorum*: *Clusius*, *Abinthium tenuifolium Austriacum*: *Tabernamontanus*, *Abinthium Nabathæum Auicenna*: wee may call it in English, small leaved Wormewood. †

¶ The Temperature.

Small leaved VVormwood is of facultie hot and drie, it is as bitter also as the broad leaved one, and of like facultie.

¶ The Vertues.

The faculties are referred vnto the common VVormwood.

CHAP. 450. Of Sea Wormewood.

¶ The Description.

1 The white or common Sea VVormwood hath many leaues cut and diuided into infinite fine iags, like those of Sothernwood, of a white hoarie colour and strong smell, but not vnpleasant: among which rise vp tough hoarie stalks set with the like leaues, on the top wherof do grow smal yellowish floures: the root is tough, and creepeth far abroad, by means whereof it greatly increaseth.

1 *Abfintium marinum album.*
VVhite Sea VVormwood.

2 *Abfintium marinum repens.*
Creeping Sea VVormwood.

2 The broad leaved Sea VVormwood hath very many soft leaues, growing close by the ground, of a darke swart colour, nothing so finely cut or iagged as the other of his kinde: the floures grow vpon the tops of the stalks, of a yellowish colour: the root is tough and creeping. † This hath many weake slender branches commonly two foot long at their ful growth, red of colour, and creeping vpon the ground: the leaues are small, narrow, long and iagged, or parted towards their ends into sundry parcels: they are greene aboue, and grayish vnderneath: the toppes of the branches are set with many little stalkes, some inch long: which vpon short foot-stalkes comming out of the bowmes of little longish narrow leaues carry small round knops, like as in other plants of this kind: the taste is a little bitterish, and the smell not vnpleasant: this growes with M^r. Parkinson and others, and (as I remember) it was first sent ouer from the Isle of Rees by M^r. Iohn Tradescant. Lobel in his Obseruations mentions it by the name of *Abfint. Ponticum supinum Herbariorum*, and Tabern: sets it forth by the title of *Abfintium repens*. †

¶ The Place.

These VVormwoods do grow vpon the raised grounds in the salt marshes neere vnto the sea, in most places of England, which being brought into gardens doth there flourish as in his naturall place, and retaineth his smell, taste, and naturall qualitie, as hath beene often proued. † I haue not heard

heard that the later growes wilde in any place with vs in England. ‡

¶ The Time.

These bring forth floures and seeds when the other Wormwoods doe. ‡ The later scarce feedes with vs, it floures so late in the yeare. ‡

¶ The Names.

Sea VVormwood is called in Greeke *ἁλὴ θάλασσης*: in Latine, *Absinthium maritimum*, and likewise *Seriphium*: in Dutch, *See Alene*: of diuers, *Santonicum*, as witnesseth *Dioscorides*: neuerthelesse there is another *Santonicum* differing from sea VVormwood: in English of some women of the countrey, Garden Cypress.

¶ The Temperature.

Sea VVormwood is of nature hot and drie, but not so much as the common.

¶ The Vertues.

- A *Dioscorides* affirmeth, that being taken of it selfe, or boiled with Rice, and eaten with hony, it killeth the small wormes of the guts, and gently looseth the belly, the which *Pliny* doth also affirme.
- B The iuice of sea VVormwood drunke with wine resisteth poison, especially the poison of Hemlockes.
- C The leaues stamped with figs, salt-peter, and the meale of Dandel, and applied to the belly, sides, or flanks, help the drop sicke, and such as are spleenticke.
- D The same is singular against all inflammations, and heat of the stomacke and liuer, exceeding all the kindes of VVormwood for the same purposes that common VVormwood serueth.
- E It is reported by such as dwell neere the sea side, that the cattell which do feed where it groweth become fat and lusty very quickly.
- F The herbewith his stalks laid in chests, presses, and ward-robbs, keepeth clothes from moths and other vermine.

CHAP. 451. Of Holy Wormewood.

Sementina.

Holie VVormewood.

¶ The Description.

THIS Wormwood called *Sementina*, and *Semen sanctum*, which we haue Englished, Holy, is that kinde of Wormwood which beareth that seed which we haue in vse, called VVormseed: in shops, *Semen Santolinum*: about which there hath been great controuersie amongst writers: some holding that the seed of *Santonicum Galaticum* to be the true VVormseed: others deeming it to be that of *Romanum Absinthium*: it doth much resemble the first of the sea VVormwoods in shape and proportion: it riseth vp with a wooddie stalke, of the height of a cubite, diuided into diuers branches and wings, whereupon are set very small leaues: among which are placed clusters of seeds in such abundance, that to the first view it seemeth to be a plant consisting all of seed.

¶ The Place.

It is a forreine plant: the seeds being sowne in the gardens of hot regions doe prosper well; in these cold countries it will not grow at all. Neuertheles there is one or two companions about London, who haue reported vnto mee that they had great store of it growing in their gardens yearly, which they sold at a great price vnto our London Apothecaries, and gained much money thereby; one of the men dwelleth by the Bagge and Bottle neere London, whose name is *Cornwall*; into whose garden I was brought to see the thing that I would not beleue; for being often told

wall; into whose garden I was brought to see the

told that there it did grow, I still persisted it was not true: but when I did behold this great quantity of VVormwood, it was nothing else but common *Amos*. How many Apothecaries haue been deceiued, how many they haue robbed of their money, and how many children haue been nothing the better for taking it, I refer it to the iudgement of the simplest, considering their owne report, to haue sold many hundreth pounds weight of it; the more to their shame be it spoken, and the lesse wit or skill in the Apothecaries: therefore haue I set downe this as a caueat vnto those that buy of these seeds, first to taste and trie the same before they giue it to their children, or commit it to any other vse. ‡ Certainly our Author was either misinformed, or the people of these times were very simple, for I dare boldly say there is not any Apothecary, or scarce any other so simple as to be thus deceiued now. ‡

¶ The Time.

It floureth and bringeth forth his seed in Iuly and August.

¶ The Names.

The French men call it *Barboline*; the Italians, *Semen Zena*: whereupon also the Latine name *Sementina* came: the seed is called euery where *Semen sanctum*: Holy-seed; and *Semen contra Lumbros*: in English, VVormseed; the herb it selfe is also called VVormseed, or wormseed-wort: some name it *Semen Zedoarie*, Zedoarie seede, because it hath a smell somewhat resembling that of Zedoarie.

¶ The Temperature.

The seed is very bitter, and for that cause of nature hot and drie.

¶ The Vertues.

It is good against wormes of the belly and entrailes, taken any way, and better also if a little *Rubarbe* be mixed withall, for so the wormes are not onely killed, but likewise they are driuen downe by the siege, which thing must alwaies be regarded.

The seed mixed with a little *Aloe succotrina*, and brought to the forme of a plaister, and applied to the nauell of a childe doth the like.

CHAP. 452. *Offorreine and Bastard Wormewoods.*1 *Absinthium album.*

VVhite wormwood.

2 *Absinthium Egyptium.*

VVormwood of Egypt.

¶ The Description.

† 1 **A**bsinthium album hath straight and vpright stalkes, a foot high, beset with broad leaues, but very deeply cut or clouen, in shew like vnto those of the great Daisy, but white of colour: at the top of the stalkes, out of scaly heads, as in an vmbell grow floures, compact of six small white leaues: the root is long, with some fibres annexed vnto it.

2 This kinde of Wormwood Gesner and that learned Apothecarie Valerandus Donraz, called *Absinthium Egyptium*: the leaues of this plant are very like to the leaues of *Trichomanes*, which is our common Maiden haire, of a white colour, euery small leafe standing one opposite against another, and of a strong saour.

3 This VVormwood, which Dodonæus calleth *Absinthium inodorum*, and *Inspidum*, is very like vnto the sea VVormwood, in his small and tender leaues: the stalke beareth flowers also like vnto the foresaid Sea-Wormwood, but it is of a sad or deep colour, hauing neither bitter taste, nor any saour at all; whereupon it was called, and that very fitly, *Absinthium inodorum*, or *Absinthium inspidum*: in English, foolish, or vsauory wormwood. ‡ Dodonæus saith not that his *Absinthium inspidum* is like the sea wormwood, but that it is very like our common broad leaved VVormwood, and so indeed it is, and that so like, that it is hard to be discerned therefrom, but onely by the want of bitternesse and smell. ‡

3 *Absinthium inodorum.*
Vnsauorie VVormwood.

4 *Absinthium maritimum, Abrotani famina facie.*
Small Lauander Cotton.

4 This kinde of Sea-wormwood is a shrubby and wooddie plant, in face and shew like to Lauander Cotton, of a strong smel; hauing floures like those of the common wormwood, at the first shew like those of Lauander Cotton: the root is tough and wooddie.

¶ The Place.

These plants are strangers in England, yet we haue a few of them in Herbarists gardens.

¶ The Time.

The time of their flourishing and seeding is referred to the other wormwoods.

¶ The Names.

The whitewormwood Conradus Gesnerus nameth *Seriphium famina*, and saith, that it is commonly called *Herba alba*, or white herbe: another had rather name it *Santonicum*; for as Dioscorides saith, *Santonicum* is found in France beyond the Alpes, and beareth his name of the same country

countrey where it groweth : but that part of Swisserland which belongeth to France is accounted of the Romans to be beyond the Alps ; and the prouince of Santon is far from it : for this is a part of Guines, scituate vpon the coast of the Ocean, beneath the floud Gerond Northward : therefore Santon Wormwood, if it haue his name from the Santons, groweth farre from the Alps : but if it grow neere adioyning to the Alps, then hath it not his name from the Santons.

¶ The Temperature and Vertues.

White Wormwood is hot and somewhat dry.

Vnsauorie Wormwood, as it is without smell and taste, so is it scarce of any hot qualitie, much lesse hath it any scouring facultie. These are not vsed in physicke, where the others may be had, being as it were wilde or degenerate kindes of Wormwood ; some of them participating both of the forme and smell of other plants.

† The figure which was here formerly in the first place, by the name of *Abfichium arborescens*, is the first of the next chapter saue one, where you may see more the self. The white Wormwood mentioned here in the Names, but no where else in the Chapter, is either the same with, or one very like our Sea Wormwood. Lettich is are curious lookers into *Camperius* his *hort. Med.* in the title of *Abfichium Santonicum* : and in *Dodonæus*, *Pempt.* 1. lib. 2. cap. 5. where the first description is of this Wormwood.

CHAP. 453. Of Mugwort.

I *Artemisia, mater Herbarum.*
Common Mugwort.

¶ The Description.

1 The first kinde of Mug wort hath broad leaues, very much cut or clouen like the leaues of common Wormewood, but larger, of a darke greene colour aboue, and hoarie vnderneath : the stalkes are long and straight, and full of branches, whereon do grow small round buttons, which are the floures, smelling like Marierome when they wax ripe : the root is great, and of a wooddie substance.

2 The second kinde of Mugwort hath a great thicke and wooddy root, from whence arise sundry branches of a reddish colour, beset full of small and fine iagged leaues, verie like vnto sea Sothernwood : the seed groweth alongst the small twiggy branches, like vnto little berries, which fall not from their branches in a long time after they be ripe. † I know not how this differeth from the former, but only in the colour of the stalk and floures, which are red or purplish ; whereas the former is more whitish. †

3 There is also another Mugwort, which hath many branches rising from a wooddie root, standing vpright in distances one from another, of an ashie colour, beset with leaues not much vnlike sea Purslane ; about the lower part of the stalkes, and toward the top of the branches they are narrower and lesser, and cut with great and deepe iaggies, thicke in substance, and of a whitish colour, as all the rest

of the plant is : it yeeldeth a pleasant smell like *Abrotanum marinum*, and in taste is somewhat sal-tish : the floures are many, and yellow : which being vaded, there followeth mossie seed like vnto that of the common Wormwood. † The leaues of this plant are of two sorts ; for some of them are long and narrow, like those of Lauander (whence *Clusius* hath called it *Artemisia folio Laven-dale*) other some are cut in or diuided almost to the middle rib ; as you may see it exprest apart in a figure by it selfe, which shewes both the whole, as also the diuided leaues.

¶ The

3 *Artemisia marina.*
Sea Mugwort.

‡ *Artemisia marina ramulus, folia integra & dissecta exprimens.*

A branch shewing the cut and vncut leaues.

¶ *The Place.*

The common Mugwort groweth wilde in sundry places about the borders of fields, about high waies, brooke sides, and such like places.

Sea Mugwort groweth about Rie and Winchelsea castle, and at Portsmouth by the Isle of Wight.

¶ *The Time.*

They floure in Iuly and August.

¶ *The Names.*

Mugwort is called in Greeke *Αρtemisia*: and also in Latine *Artemisia*, which name it had of *Artemisia* Queene of Halicarnassus, and wife of noble *Mausolus* King of Caria, who adopted it for her owne herbe: before that it was called *Παρθένια*, *Parthenis*, as *Pliny* writeth. *Apuleius* affirmeth that it was likewise called *Parthenion*; who hath very many names for it, and many of them are placed in *Dioscorides* among the bastard names: most of these agree with the right *Artemisia*, and diuers of them with other herbes, which now and then are numbred among the Mugworts: it is also called *Mater Herbarum*: in high-Dutch, *Beifus*, and *Sant Iohanus Gurtell*: in Spanish and Italian, *Artemisa*: in French, *Armoisa*: in low-Dutch, *Bijuoet*, *Sint Jans krypt*: in English, Mugwort, and common Mugwort.

¶ *The Temperature.*

Mugwort is hot and dry in the second degree, and somewhat astringent.

¶ *The Vertues.*

- A *Pliny* saith that Mugwort doth properly cure womens diseases.
 B *Dioscorides* writeth, that it bringeth downe the termes, the birth, and the after-birth.
 C And that in like manner it helpeth the mother, and the paine of the matrix, to be boyled as bathes for women to sit in; and that being put vp with myrrh, it is of like force that the bath is of. And that the tender tops are boyled and drunk for the same infirmities; and that they are applied in manner of a pulsette to the shere, to bring downe the monethly course.
 D *Pliny* saith, that the traueeller or wayfaring man that hath the herbe tied about him feeleth no wearisomnesse at all; and that he who hath it about him can be hurt by no poysonsome medicines, nor by any wilde beast, neither yet by the Sun it selfe; and also that it is drunke against *Opium*, or the

the iuyce of blacke Poppy. Many other fantasticall deuices inuented by Poets are to be seene in the Works of the antient Writers, tending to witchcraft and forcerie, and the great dishonour of God; wherefore I do of purpose omit them, as things vnworthie of my recording, or your reviewing.

Mugwort pound with oyle of sweet almonds, and laid to the stomacke as a plaister, cureth all the paines and griefes of the same.

It cureth the shakings of the ioynts, inclining to the palsie, and helpeth the contraction or drawing together of the nerues and sinewes.

† There were formerly two descriptions of the *Artemisia marina*; wherefore I omitted the former, being the more vnperfect.

CHAP. 454. Of Sothernwood.

¶ The Kindes.

Dioscorides affirmeth that Sothernwood is of two kinds, the female and the male, which are euery where knowne by the names of the greater and of the lesser: besides these there is a third kinde, which is of a sweeter smell, and lesser than the others, and also others of a bastard kinde.

† 1 *Abrotanum femina arborescens.*
Female Sothernwood.

2 *Abrotanum mas.*
Male Sothernwood.

¶ The Description.

The greater Sothernwood by carefull manuring doth oftentimes grow vp in manner of a shrub, and commeth to be as high as a man, bringing forth stalkes an inch thicke, or more; out of which spring very many sprigs or branches, set about with leaues diuersly iagged and finely indented, somewhat white, and of a certaine strong smell: in stead of floures, little smal clusters of buttons do hang on the sprigs, from the middle to the very top, of colour yellow, and at the length turne into seed. The root hath diuers strings.

2 The

3 *Abrotanum humile.*

Dwarfe Sothernwood.

4 *Abrotanum inodorum.*

Vnsauorie Sothernwood.

5 *Abrotanum campestre.*

Wilde Sothernwood.

2 The lesser Sothernwood groweth low, full of little sprigs of a woody substance: the leaues are long, and smaller than those of the former, not so white: it beareth clustering buttons vpon the tops of the stalks: the root is made of many strings.

3 The third kinde is also shorter: the leaues hereof are iagged and deeply cut after the maner of the greater Sothernwood, but they are not so white, yet more sweet, wherein they are like vnto Lauander cotton. This kinde is very full of seed: the buttons stand alongst on the sprigs, euen to the very top, and be of a glittering yellow. The root is like to the rest.

4 The vnsauorie Sothernwood groweth flat vpon the ground, with broad leaues deeply cut or iagged in the edges like those of the common Mugwort: among which rise vp weake and feeble stalkes trailing likewise vpon the ground, set confusedly here and there with the like leaues that grow next the ground, of a grayish or hoary colour, altogether without smell. The floures grow alongst the stalkes, of a yellowish colour, small and chaffie: the root is tough and woody, with some strings anexed thereto.

5 This wilde Sothernwood hath a great long thicke root, tough and woody, covered ouer

ouer with a scaly barke like the scaly backe of an adder, and of the same colour: from which rise very many leaues like those of Fennell, of an ouerworne Greene colour: among which grow small twiggy branches on the tops, and alongst the stalkes do grow small clustering floures of a yellow colour: the whole plant is of a darke colour, as well leaues as stalkes, and of a strong vsfauourie smell.

¶ *The Place.*

Theophrastus saith that Sothernwood delighteth to grow in places open to the Sun: *Dioscorides* affirmeth that it groweth in Cappadocia, and Galatia a countrey in Asia, and in Hierapolis a city in Syria: it is planted in gardens almost euery where: that of Sicilia and Galatia is most commended of *Pliny*.

¶ *The Time.*

The buttons of Sothernwood do flourish and be in their prime in August, and now and then in September.

¶ *The Names.*

It is called in Greeke *Abrotanon*: the Latines and Apothecaries keepe the same name *Abrotanum*: the Italians and diuers Spaniards call it *Abrotano*: and other Spaniards, *Yerna lombriguera*: in high Dutch, *Stabwurtz*: in low-Dutch, *Auerdone*, and *Auereruit*: the French, *Aurone*, and *Auroesme*: the English men, Sothernwood: it hath diuers bastard names in *Dioscorides*; the greater kinde is *Dioscorides* his *Fœmina*, or female Sothernwood; and *Pliny* his *Montanum*, or mountaine Sothernwood: the mountaine Sothernwood we take for the female, and the champion for the male. There be notwithstanding some that take Lauander Cotton to be the female Sothernwood; grounding thereupon, because it bringeth forth yellow floures in the top of the sprigs like cluster buttons: but if they had more diligently pondered *Dioscorides* his words, they would not haue been of this opinion: the lesser Sothernwood is *Mas*, the male, and is also *Plinies* champion Sothernwood; in Latine, *Campestre*. The third, as we haue said, is likewise the female, and is commonly called sweet Sothernwood, because it is of a sweeter sent than the rest. *Dioscorides* seemeth to call this kind *Siculum*, Sicilian Sothernwood.

¶ *The Temperature.*

Sothernwood is hot and dry in the end of the third degree: it hath also force to distribute and to rarifie.

¶ *The Vertues.*

The tops, floures, or seed boyled, and stamped raw with water and drunke, helpeth them that cannot take their breaths without holding their neckes straight vp and is a remedie for the cramp, and for sinewes shrunke and drawne together; for the sciatica also, and for them that can hardly make water; and it is good to bring downe the termes.

It killeth wormes, and driueth them out: if it be drunke with wine it is a remedie against deadly poysons.

Also it helpeth against the stinging of scorpions and field spiders, but it hurts the stomacke.

Stamped and mixed with oyle it taketh away the shiuering cold that commeth by the ague fits, and it heateth the body if it be anointed therewith before the fits do come.

If it be pouned with barley meale and laid to pushes it taketh them away.

It is good for inflammations of the eyes, with the pulpe of a roasted Quince, or with crummes of bread, and applied pultis wise.

The ashes of burnt Sothernwood, with some kinde of oyle that is of thin parts, as of *Palma Christi*, Radish oyle, oyle of sweet Marierome, or Organie, cureth the pilling of the haire off the head, and maketh the beard to grow quickly: being firewed about the bed, or a fume made of it vpon hot embers, it driueth away serpents: if but a branch be layd vnder the beds head they say it pro-uoketh venerie.

The seed of Sothernwood made into poulder, or boyled in wine and drunke, is good against the difficultie and stopping of vrine; it expelleth, wasteth, consumeth, and digesteth all cold humors, tough slime and flegme, which do vsually stop the spleene, kidneyes, and bladder.

Sothernwood drunke in wine is good against all venome and poyson.

The leaues of Sothernwood boyled in water vntill they be soft, and stamped with barley meale and barrowes greafe vnto the forme of a plaister, dissolue and waste all cold tumors and swellings, being applied or laid thereto.

† The description here in the first place is that of the *Abrotanum fœmina arborescens* of *Dodonæus*, being the very first in his *Pemptades*. The figure which our Author put thereto was of the Lauander Cotton, which should haue bene in the next chapter saue one: Now the figure that hee should haue put here was put two chapters before, by the name of *Alsatium arborescens*, by which name *Lobel* also calls it: but I haue thought it fitter to put it here, because here was the better description, and the plant is the better referred to this kinde.

CHAP. 455.

Of Oke of Ierusalem, and Oke of Cappadocia.

1 *Botrys.*
Oke of Ierusalem.2 *Ambrosia.*
Oke of Cappadocia.

¶ The Description.

1 **O**ke of Ierusalem, or *Botrys*, hath sundry small stems a foot and a halfe high, diuiding themselves into many small branches, beset with small leaues deeply cut or iagged, very much resembling the leafe of an Oke, which hath caused our English women to call it Oke of Ierusalem; the vpper side of the leafe is of a deepe greene, and somewhat rough and hairy, but vnderneath it is of a darke reddish or purple colour: the seedie floures grow clustering about the branches, like the yong clusters or blowings of the Vine: the root is small and threddy: the whole herbe is of a pleasant smell and sauour, and of a feint yellowish colour, and the whole plant dieth when the seed is ripe.

2 The fragrant smell that this kind of *Ambrosia* or Oke of Cappadocia yeeldeth, hath moued the Poets to suppose that this herbe was meate and food for the gods: *Dioscorides* saith it groweth three handfuls high: in my garden it groweth to the height of two cubits, yeelding many weake crooked and streaked branches, diuiding themselves into sundrie other small branches, hauing from the middest to the top thereof many mossie yellowish floures not much vnlike common Wormwood, standing one before another in good order; and the whole plant is as it were couered ouer with bran or a mealy dust: the floures do change into small prickly cornered buttons, much like vnto *Tribulus terrestris*; wherein is contained blacke round seed, not vnpleasant in taste and smell: the leaues are in shape like the leaues of Mugwort, but thinner and more tender: all the whole plant is hoary, and yeeldeth a pleasant sauer: the whole plant perished with me at the first approach of Winter.

¶ The Place.

These plants are brought vnto vs from beyond the seas, especially from Spaine and Italy.

¶ The Time.

They floure in August, and the seed is ripe in September.

¶ The

¶ The Names.

Oke of Ierusalem is called in Greeke *Βίτρις*: in Latine *Botrys*: In Italian, *Botri*: in Spanish, *Blenda*: in high-Dutch, *Traukenkraut*, and *Krottenkraut*: in French and low-Dutch, *Pyment*: in English, Oke of Ierusalem; and of some, Oke of Paradise.

Oke of Cappadocia is called in Greeke *Αμβροσία*: in Latine, *Ambrosia*; neither hath it any other knowne name. Pliny saith that *Ambrosia* is a wandering name, and is giuen vnto other herbes: for *Botrys* (Oke of Ierusalem, as we haue written) is of diuers also called *Ambrosia*: In English it is called Oke of Cappadocia.

¶ The Temperature.

These plants are hot and dry in the second degree, and consist of subtile parts.

¶ The Vertues.

These plants be good to be boyled in wine, and ministred vnto such as haue their breasts stopt, and are short winded, and cannot easily draw their breath; for they cut and waste grosse humours and tough flegme. The leaues are of the same force; being made vp with sugar they commonly call it a conserue.

It giueth a pleasant taste to flesh that is sodden with it, and eaten with the broth.

It is dried and layd among garments, not onely to make them smell sweet, but also to preserue them from moths and other vermine; which thing it doth also performe.

There were formerly two more descriptions in this chapter, both which were made by looking vpon the figures in *Lobels Icones*; the former being of his *Ambrosia frigidior*, which is nothing else but the *Coronopus Ruellii*, or Swines Cresses. The later was of his *Ambrosia tenuifolia*, which our Author in the last chapter set forth by the name of *Abrotanum campestre*.

CHAP. 456. Of Lauander Cotton.

† *Chamacyparissus*.
Lauander Cotton.

¶ The Description.

Lauander Cotton bringeth forth clustred buttons of a golden colour, and of a sweet smell, and is often vsed in garlands, and decking vp of gardens and houses. It hath a woody stocke, out of which grow forth branches like little boughes, slender, very many, a cubit long, set about with little leaues, long, narrow, purled, or crumpled; on the tops of the branches stand vp floures, one alone on euery branch, made vp with short threds thrust close together, like to the floures of Tansie, and to the middle buttons of the floures of Cammomill, but yet something broader, of colour yellow, which be changed into seed of an obscure colour. The root is of a woody substance. The shrub it selfe is white both in branches and leaues, and hath a strong sweet smell.

† There are some varieties of this plant, which *Matthiolus*, *Lobel*, and others refer to *Abrotanum femina*, and so call it; and by the same name our Authour gaue the figure thereof in the last chapter saue one, though the description did not belong thereto, as I haue formerly noted. Another sort thereof our Authour, following *Tabernamontanus* and *Lobel*, set forth a little before by the name of *Absinthium maritimum Abrotani feminae facie*, that *Dodonaeus* calls *Santolina prima*; and this here figured, *Santolina altera*. He also mentioneth three other differences thereof, which chiefly consist in the

leaues; for his third hath very short and small leaues like those of Heath; whence *Bauhine* calls it *Abrotanum feminae folijs Erica*. The fourth hath the leaues lesse toothed, and more like to Cypresse,

Aaaaa

hence

hence it is called in the *Advers.* *Abrotanum peregrinum cupressi folijs*. The fifth hath not the stalkes growing vpright, but creeping: the leaues are toothed, more thicke and hoary than the rest; in other respects alike. *Bauhine* calls it *Abrotanum femina repens canescens*. ‡

¶ The Place.

Lauander Cotton groweth in gardens almost euery where.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

They are called by one name *Santolina*, or Lauander Cotton: of most *Chamacyparissus*. But *Pliny* concerning *Chamacyparissus* is so short and briefe, that by him their opinions can neither be reiected nor receited.

They are doubtlesse much deceiued that would haue Lauander Cotton to be *Abrotanum femina*, or the female Sothernwood: and likewise they are in the wrong who take it to be *Scrophium*, sea Wormewood; and they who first set it abroch to be a kinde of Sothernwood we leaue to their errors; because it is not absolutely to be referred to one, but a plant participating of Wormewood and Sothernwood.

¶ The Temperature.

The seed of Lauander Cotton hath a bitter taste, being hot and dry in the third degree.

¶ The Vertues.

A *Pliny* saith, That the herbe *Chamacyparissus* being drunke in wine is a good medicine against the poysons of all serpents and venomous beafts.

B It killeth wormes either giuen greene or dry, and the seed hath the same vertue against wormes, but auoideth them with greater force. It is thought to be equall with the vsuall worne-feed.

† The figure which formerly was in this place was of a kinde of Mosse, which *Tragus* set forth by the name of *Sauia sylvestris*: *Turner* and *Tabernaemontanus* called it *Chamacyparissus*. See more thereof in the Mosses.

CHAP. 457. Of Sperage, or Asparagus.

1 *Asparagus sativus*.
Garden Sperage.

2 *Asparagus petreus*.
Stone or mountaine Sperage.

¶ The Description.

1 The first being the manured or garden Sperage, hath at his first rising out of the ground thicke tender shoots very soft and brittle, of the thickenesse of the greatest swans quill, in taste like vnto the greene beane, hauing at the top a certaine scaly soft bud, which in time groweth to a branch of the height of two cubits, diuided into diuers other smaller branches, whereon are set many little leaues like haire, more fine than the leaues of Dill: among which come forth small mossie yellowish floures, which yeeld forth the fruit, greene at the first, afterward red as Corall, of the bignesse of a small pease; wherein is contained grosse blackish seed exceeding hard, which is the cause that it lieth so long in the ground after the sowing, before it do spring vp. The roots are many thicke soft and spongie strings hanging downe from one head, and spred themselves all about, whereby it greatly increaseth.

2 We haue in our marish and low grounds neere vnto the sea, a Sperage of this kinde, which differeth a little from that of the garden, and yet in kinde there is no difference at all, but only in manuring, by which all things or most things are made more beautifull, and larger. This may be called *Asparagus palustris*, marish Sperage.

4 *Asparagus sylvestris aculeatus*.
Wilde prickly Sperage.

5 *Asparagus sylvestris spinosus Clusij*.
Wilde thornie Sperage.

3 Stone or mountaine Sperage is one of the wilde ones, set forth vnder the title of *Corruda*, which *Lobel* calleth *Asparagus petraeus*; and *Galen*, *Myacanthinus*, that doth very well resemble those of the garden, in stalkes, roots, and branches, sauing that those fine hairy leaues which are in the garden Sperage be soft, blunt, and tender; and in this wilde Sperage, sharpe hard and pricking thornes, though they be small and slender: the root hereof is round, of the bignesse of a pease, and of a blacke colour: the roots are long, thicke, fat, and very many.

4 This fourth kinde differeth from the last described, being a wilde Sperage of Spaine and Hungarie: the plant is altogether set with sharpe thornes (three or foure comming forth together) as are the branches of Whinnes, Gose, or Fursen: the fruit is blacke when it is ripe, and full of a greenish pulpe, wherein lie hard and blacke seeds, sometimes one, otherwhiles two in a berry: the roots are like the others, but greater and tougher.

‡ 6 *Drypis*.
Sperage Thistle.

5 *Carolus Clusius* describeth also a certain wilde Sperage with sharp prickles all alongst the stalkes, orderly placed at every ioynt one, hard, stiffe, and whitish, the points of the thornes pointing downward: from the which ioynts also doe grow out a few long Greene leaues fastned together, as also a little yellow floure, and one berry three cornered, and of a blacke colour, wherein is contained one black seed, seldome more: the roots are like the other.

6 *Drypis* being likewise a kinde hereof, hath long and small roots, creeping in the ground like Couch grasse, from which spring vp branches a cubit high, full of knotty ioynts: the leaues are small like vnto Iuniper, not much differing from *Corruda* or *Nepa*: the floures grow at the top of the stalke in spokie tufts or rundles, of a white colour, closely thrust together: the seed before it bee taken out of the huske is like vnto Rice; being taken out, like that of Melilot, of a saffron colour.

¶ The Place.

The first being our garden Asparagus groweth wild in Essex, in a meadow adjoining to a mill, beyond a village called Thorp; and also at Singleton not far from Carbie, and in the meadows neere Moulton in Lincolnshire.

Likewise it groweth in great plentie neere vnto Harwich, at a place called Bandamar lading, and at North Moulton in Holland, a part of Lincolnshire.

The wilde Sperages grow in Portugal and Biscay among stones, one of the which *Petrus Bellonius* doth make mention to grow in Candie, in his first booke of Singularities, cap. 18.

¶ The Time.

The bare naked tender shoots of Sperage spring vp in Aprill, at what time they are eaten in salads; they floure in Iune and Iuly; the fruit is ripe in September.

¶ The Names.

The garden Sperage is called in Greeke *Ἀσπαραγός*: in Latine likewise *Asparagus*: in shops, *Sparagus*, and *Speragus*: in high-Dutch, *Spargen*: in low-Dutch, *Asparges*, and *Coralcruist*; that is to say, *Herba Coralli*, or Corall-wort, of the red berries, which beare the colour of Corall: in Spanish, *Asparagos*: in Italian, *Asparago*: in English, Sperage, and likewise Asparagus, after the Latine name: in French, *Asperges*. It is named *Asparagus* of the excellencie, because *asparagi*, or the springs hereof are preferred before those of other plants whatsoever; for this Latine word *Asparagus* doth properly signifie the first spring or sprout of euerie plant, especially when it is tender, and before it do grow into a hard stalke, as are the buds, tendrels, or yong springs of wild Vine or hops, and such like.

Wilde Sperage is properly called in Greeke *Μουσάρδα*, which is as much to say as Mousse prickles, and *Ἀσπαραγός πέτρας*, that is to say, *Petræus Asparagus*, or Stone Sperage: it is also named in Latine, *Asparagus sylvestris*, and *Corruda*.

¶ The Temperature.

The roots of the garden Sperage, and also of the wilde, doe cleanse without manifest heate and drinesse.

¶ The Vertues.

A The first sprouts or naked tender shoots hereof be oftentimes sodden in flesh broth and eaten, or boyled in faire water, and seasoned with oyle, vineger, salt, and pepper, then are serued at mens tables for a sallad; they are pleasant to the taste, easily concocted, and gently loose the belly.

B They somewhat prouoke vrine, are good for the kidnies and bladder, but they yeeld vnto the body little nourishment, and the same moist, yet not faultie: they are thought to increase seed, and stir vp lust.

† The *Nepa* formerly mentioned in this chapter, but now omitted, was againe set forth by our Author amongst the Furfes, where you may finde it.

CHAP. 458.

Of Horse-taile, or Shaue-grasse.

¶ The Description.

1 **G**reat Horse-taile riseth vp with a round stalke, hollow within like a Reed, a cubit high, compact as it were of many small pieces, one put into the end of another, sometimes of a reddish colour, very rough, and set at euery ioint with many stiffe rush-like leaues or rough bristles, which maketh the whole plant to resemble the taile of a horse, whereof it tooke his name: on the top of the stalke do stand in stead of floures clustered and thicke Catkins, not vnlike to the first shoots of Sperage, which is called *Myacantha*: the root is ioynted, and creepeth in the ground.

2 This small or naked Shaue-grasse, wherewith Fletchers and Combe-makers do rub and polish their worke, riseth out of the ground like the first shoots of Asparagus, iointed or kneed by certaine distances like the precedent, but altogether without such bristly leaues, yet exceeding rough and cutting: the root groweth aslope in the earth, like those of the Couch-grasse.

1 *Equisetum maius.*
Great Horse-taile.

2 *Equisetum nudum.*
Naked Horse-taile.

3 Horse-taile which for the most part groweth among corne, and where corne hath been, hath a very slender root, and single; from which rise vp diuers iointed stalkes, whereon doe grow verie long rough narrow iointed leaues, like vnto the first described, but thicker and rougher, as is the rest of the plant.

4 Water Horse-taile, that growes by the brinks of riuers and running streams, and often in the midst of the water, hath a very long root, according to the depth of the water, grosse, thicke, and iointed, with some threds annexed thereto: from which riseth vp a great thick iointed stalke, whereon do grow long rough rushy leaues, pyramide or steeple fashion. The whole plant is also tough, hard, and fit to shaue and rub wooden things as the other.

5 This kinde of Horse-taile that growes in woods and shadowie places, hath a small root, and single, from which riseth vp a rough chamfered stalke iointed by certaine spaces, hauing at each ioynt two bushes of rough bristly leaues set one against another like the other of his kinde.

3 *Equisetum segetale*.
Corne Horse-taile.

4 *Equisetum palustre*.
Water Horse-taile.

5 *Equisetum sylvaticum*.
Wood Horse-taile.

6 *Cauda equina femina*.
Female Horse-taile.

9 *Iuncaria Salmanticensis*.
Italian rushie Horſe-taile.

6 The female Horſe taile groweth for the moſt part in wateriſh places, and by the brinks of ſmall rills and pirling brookes; it hath a long root like that of Couch graſſe, from which riſe vp diuers hollow ſtalkeſ, ſet about at certaine diſtances with ſmal leaues in rundles like thoſe of Woodrooſe, altogether barren of ſeed and floure, whereof it was called by *Lobel*, *Polygonon ſemina ſemine Vidua*. ‡ This is ſometimes found with tenne or more ſeedes at each ioynt; whence *Bauhine* hath called it *Equiſetum paluſtre breuioribus folijs polyſpermon*. ‡

‡ 7 In ſome boggie places of this kingdome is found a rare and pretty *Hippuris* or Horſe taile, which growes vp with many little branches, ſome two or three inches high, putting forth at each ioynt many little leaues, cluſtering cloſe about the ſtalke, and ſet after the manner of other Horſe-taileſ: towards the tops of the branches the ioynts are very thicke: the colour of the whole plant is gray, a little inclining to green, very brittle, and as it were ſtony or grauelly like Coralline, and will craſh vnder your feet, as if it were frozen; and if you chew it, you ſhall finde it all ſtonie or grauelly. My friend Mr. *Leonard Buckner* was the firſt that found this plant, and brought it to me; he had it three miles beyond Oxford, a little on this ſide Euansham-ferry, in a bog vpon a common by the Beacon hill neere Cumner-wood, in

the end of Auguſt, 1632. Mr. *Bowles* hath ſince found it growing vpon a bog not far from Chiffel-hurſt in Kent. I queſtion whether this bee not the *Hippuris lacuſtris quadam folijs manſu arenoliſ* of *Gefner*: but if *Gefners* be that which *Bauhine* in his *Prodromus* pag. 24. ſets forth by the name of *Equiſetum nudum minus variegatum*, then I iudge it not to be this of my deſcription: for *Bauhines* differs from this in that it is without leaues, and oftentimes bigger: the ſtalkeſ of his are hollow, theſe not ſo: this may be called *Hippuris Coralloides*, Horſe-taile Coralline.

8 Towards the later end of the yeare, in diuers ditches, as in Saint Iames his Parke, in the ditches on the backe of Southwarke towards Saint Georges fields, &c. you may finde covered ouer with water a kinde of ſtinking Horſe-taile: it growes ſometimes a yard long, with many ioynts and branches, and each ioynt ſet with leaues, as in the other Horſe-taileſ, but they are ſomewhat iagged or diuided towards the tops. I take this to be the *Equiſetum ſetidum ſub aqua repens*, deſcribed in the fiſt place of *Bauhine* his *Prodromus*: we may call it in Engliſh, Stinking water Horſe-taile. ‡

9 *Cluſius* hath ſet forth a plant, that he referreth vnto the ſtocke of Horſe-taileſ, which he thus deſcribeth: it hath many twiggie or ruſhie ſtalkeſ, whereupon it was called *Iuncaria*: and may bee Engliſhed, Ruſh-weed: the leaues grow vpon the branches like thoſe of Flax: on the toppes of the ſtalkeſ grow ſmall chaſſie floures of a whitish colour. The ſeed is ſmall, and blacke of colour. The root is little and white: the whole plant is ſweetiſh in taſte.

10 *Dodonæus* ſetteth forth another Horſe-taile, which he called climbing Horſe-taile, or horſe-taile of Olympus. There is (ſaith he) another plant like Horſe-taile, but greater and higher. It riſeth vp oftentimes with a ſtalke as big as a mans arme, diuided into many branches: out of which there grow long ſlender ſprigs very full of ioynts, like to the firſt Horſe-taile. The floures ſtand about the ioynts, of a moſſie ſubſtance, ſmall as are thoſe of the Cornell tree; in places whereof grow vp red fruit full of ſowre iuice, not vlike to little Mulberries, in which is the ſeed. The root is hard and wooddie. This growes now and then to a great height, and ſometimes lower. *Bellonius* writeth in his *Singularities*, that it hath been ſcene to be equall in height with the Plane tree: it cometh vp lower, neere to ſhorter and leſſer trees or ſhrubs, yet doth it not faſten it ſelfe to the trees with any tendrels or claspings aglets; much leſſe doth it winde it ſelfe about them, yet doth it delight to ſtand neere and cloſe vnto them.

¶ The Place.

The titles and descriptions shew the place of their growing : the last *Belonius* reporteth to grow in diuers vallies of the mountaine Olympus, and not far from Ragusa a citie in Sclauonia.

¶ The Time.

They floure from Aprill to the end of Sommer.

¶ The Names.

Horse-taile is called in Greeke *ἵππουρος*, *Hippuris* : in Latine, *Equisetum* and *Equinalis* : of *Plinie* in his 15. booke, 28 chap. *Equisetis*, of the likenesse of a horse haire : of some, *Salix equina* : in shoppes, *Cauda equina* : in high Dutch, *Schaffthew* : in low Dutch, *Peertsteert* : in Italian, *Coda di Cavallo* : in Spanish, *Coda de mula* : in French, *Quene de chenal* : and *Caquene* : in English, Horse-taile, and Shaue-grasse.

Shaue-grasse is not without cause named *Asprella*, of his ruggednesse, which is not vnknowne to women, who scour their pewter and wooden things of the kitchin therewith : which the German women call *Kannenkraut* : and therefore some of our huswiues do call it Pewterwoort. Of some the tenth is called *Ephedra*, *Anobasis*, and *Caucon*.

¶ The Temperature.

Horse-taile, as *Galen* saith, hath a binding facultie, with some bitternesse, and therefore it doth mightily dry, and that without biting.

¶ The Vertues.

- A *Dioscorides* saith, that Horse-taile being stamped and laied to, doth perfectly cure wounds, yea though the sinewes be cut in sunder, as *Galen* addeth. It is of so great and so singular a vertue in healing of wounds, as that it is thought and reported for truth, to cure the wounds of the bladder, and other bowels, and helpeth ruptures or burstings.
- B The herbe drunke either with water or wine, is an excellent remedy against bleeding at the nose, and other fluxes of blood. It staieth the ouermuch flowing of womens floures, the bloody flix, and the other fluxes of the belly.
- C The iuice of the herbe taken in the same manner can do the like, and more effectually.
- D Horse-taile with his roots boiled in wine, is very profitable for the vlcers of the kidnies & bladder, the cough and difficultie of breathing.

CHAP. 459. Of Sea-Cluster, or Sea Raisin.

† *Vuamarina minor*.
Small Sea Grape.

¶ The Description.

1 Small Sea Grape is not vnlike to horse-taile: it bringeth forth slender stalks, almost like rushes, set with many little ioints, such as those are of the Horse-taile, and diuided into many wings and branches; the tops whereof are sharpe pointed, somewhat hard and pricking: it is without leaues: the flours grow in clusters out of the ioints, with little stems, they are small and of a whitish green colour: the fruit consisteth of many little pearles, like to the vnripe berries of Raspis, or Hind-berry: when it is ripe it is red with a saffron colour, in taste sweet and pleasant: the seede or kernell is hard, three square, sharpe on euery side, in taste binding: the root is iointed, long, and creeps aslope: the plant it selfe also doth rather lie on the ground than stand vp: it groweth all full of small stalkes and branches, casting themselues all abroad.

2 *Carolus Clusius* hath set forth another sort of sea Grape, far different from the precedent; it riseth vp to the height of a man, hauing manie branches of a wooddie substance, in form like to Spanish Broome, without any leaues at all: whereupon doe grow clusters of floures vpon slender foot-stalks, of a yellowish mossie or herby colour, like those of the Cornell tree: after which come the fruit like vnto the mulberrie, of a reddish colour and sower taste, wherein lieth hid one or two seeds

feeds like those of Millet, blacke without, and white within: the root is hard, tough, and wooddie.

2 *Vua marina maior.*

Great shrubbie sea Grape.

3 *Tragos Matthioli.*

Bastard Sea Grape.

3 *Tragon Matthioli*, or rather *Tragos improbus*, *Matthioli*, which he vnaduisedly called *Tragon*, is without controuersie nothing else but a kinde of *Kali*: this plant riseth vp out of the ground with stalks seldome a cubite high, diuided into sundry other grosse, thicke, and writhen branches, set, or armed with many pricking leaues, of the colour and shape of *Aizoon*, and somewhat thicke and fleshie: among which come forth such prickley burres, as are to be seen in *Tribulus terrestris*, as that it is hard for a man to touch any part thereof without pricking of the hands: the floures are of an herbie colour, bringing forth flat seed like vnto *Kali*: the root is slender, and spreadeth vnder the turfe of the earth: the whole plant is full of clammie iuice, not any thing astringent, but somewhat saltish, and of no singular vertue that is yet knowne: wherefore I may conclude, that this cannot be *Tragos Dioscoridis*, and the rather, for that this *Tragon* of *Matthiolus* is an herbe, and not a shrub, as I haue before spoken in *Vua marina*, neither beareth it any berries or graines like wheat, neither is it pleasant in taste and smell, or any thing astringent, all which are to be found in the right *Tragos* before expressed; which (as *Dioscorides* saith) is without leaues, neither is it thorney as *Tragos improbus* *Matthioli* is: this plant I haue found growing in the Isle of Shepey, in the tract leading to the house of Sir Edward Hobby, called Sherland.

¶ The Place.

It loueth to grow vpon dry banks and sandy places neere to the sea: it is found in Languedocke, not far from Montpelier, and in other places by the sea side, and is a stranger in England.

¶ The Time.

When it groweth of it selfe the fruit is ripe in Autumne, the plant it selfe remaineth long green, for all the cold in Winter.

¶ The Names.

It is called of the later Herbarists, *Vua marina*: in French, *Raisin de Mer*, of the pearled fruit, and the likenesse that it hath with the Raspis berrie, which is as it were a Raisin or Grape, consisting of many little ones: it is named in Greeke *ῥαγος*, but it is not called *Tragus*, or *Traganos*, of a Goat (for so signifieth the Greeke word) or of his ranke and rammish smell, but because it bringeth forth fruit.

fruit fit to be eaten, of the Verbe *σφαγος*, which signifieth to eat: it may be called Scorpion, because the sprigs thereof are sharpe pointed like to the Scorpions taile.

¶ The Temperature.

The berries or Raifons, and especially the seed that is in them haue a binding quality, as we haue said, and they are drie in the later end of the second degree.

¶ The Vertues.

A *Dioscorides* writeth, that the Raifons of sea Grape do stay the flux, and also the whites in women, when they much abound.

† Our Author as you see gaue the history of the lesser in the first place, but formerly the figure was in the third place, and another figure of the same in the second place, and the figure of the greater was in the first place.

CHAP. 460. Of Madder.

¶ The Kindes.

There is but one kinde of Madder onely which is manured or set for vse, but if all those that are like vnto it in leaues and manner of growing were referred thereto, there should be many sorts: as Goose-grasse, soft Cliuer, our Ladies Bedstraw, Woodroose, and Crosse-woort, all which are like to Madder in leaues, and therefore they be thought to be wilde kinds thereof.

1. *Rubia tinctorum.*
Red Madder.

2. *Rubia sylvestris.*
Wilde Madder.

¶ The Description.

1. The garden or manured Madder hath long stalks or trailing branches disperfed farre abroad vpon the ground, square, rough, and full of ioints; at euery ioint set round with Greene rough leaues, in manner of a starre, or as those of Woodroose: the floures grow at the toppe of

of the branches, of a faint yellow colour: after which come the seed, round, Greene at the first, afterward red, and lastly of a blacke colour: the root long, fat, full of substance, creepeth far abroad within the vpper crust of the earth, and is of a reddish colour when it is Greene and fresh.

2 Wilde Madder is like in forme vnto that of the garden, but altogether smaller, and the leaues are not forough, but smooth and shining: the floures are white: the root is very small and tender, and oftentimes of a reddish colour.

3 *Rubiamarina.*
Sea Madder.

4 *Rubia spicata Cretica.*
Small Candie Madder.

3 Sea Madder hath a root two foot long, with many dry threds hanging thereat, of a reddish colour like Alkanet, on the outside of the same forme and bignesse, but within it of the colour of the scrapings of Iuniper, or Cedar wood, sending forth diuers slender stalks round and full of ioints: from which come forth small thin leaues, stiffe and sharpe pointed, somewhat hairie, in number commonly foure, standing like a Burgonion crosse; from the bosome of which come forth certain tufts of smaller leaues thrust together vpon a heape: the floures grow at the top of the stalks, of a pale yellowish colour.

4 *Rubia spicata Cretica Clusij.*

4 This hath proceeding from the root many knottie foure square rough little stalks, a foot high, diuided immediately from the root into many branches, hauing but one side branch growing forth of one ioint: about which ioints grow spred abroad foure or fve, sometimes sixe narrow, short, sharpe pointed leaues, somewhat rough: the toppes of the stalkes and branches are nothing but long small foure square spikes or eares, made of three leaved Greene huskes: out of the top of each huske groweth a very small greenish yellow floure, hauing foure exceeding smal leaues scarce to be seene: after which followeth in each huske one small blackish seed, somewhat long, round on the one side, with a dent or hollownesse on the other. The root is small, hard, wooddie, crooked or scragged, with many little branches or threds, red without, and white within, and perisheth when the seeds are ripe. Iuly, 19. 1621.

Synanchica

Synanchica Lug. p. 1185.

5 The root is crooked, blackish without, yellow vnderneath the skinne, white within that and wooddie; about five or six inches long, with many hairy strings: from the root arise many foure-square branches trailing vpon the ground, sometimes reddish towards the root: the leaues are small and sharpe pointed, like those of *Gallium*, and grow along the stalke, on certaine knees or ioints, foure or five together, sometimes fewer: from those ioints the stalk diuideth it selfe towards the top into many parts, whereon grow many floures, each floure hauing foure leaues, sometimes white, sometimes of a flesh colour, and euery leafe of these flesh coloured leaues is artificially straked in the middle, and neere the sides with three lines of a deeper red, of no pleasant smell: after which commeth the seed something round, growing two together like stones. It floureth all the Sommer long, and groweth in drie Chalkie grounds abundantly. August 13. 1619. *Iohn Goodyer*. ‡

‡ 6 *Rubia minima*.
Dwarfe Madder.

‡ 6 *Lobel* thus describes this Dwarfe Madder: there is another (saith hee) which I gathered, growing vpon Saint Vincents rocks not farre from Bristow: the leaues are of the bignesse of those of Rupture-woort, sharpe pointed, and growing after the manner of those of Madder, vpon little creeping stalkes, some inch and halfe high, whereon grow yellowish small floures. The root is small, and of the colour of Corall. ‡

¶ The Place.

Madder is planted in gardens, and is verie common in most places of England. Master *George Bowles* found it growing wilde on Saint Vincents rocke; and out of the Clifles of the rockes at Aberdovie in Merioneth shire.

The second groweth in moist medowes, in moorish grounds, and vnder bushes almost euery where.

3 This grows by the sea side in most places.

‡ The fourth growes onely in some few gardens with vs, but the fifth may bee found wilde in many places: I found it in great plenty on the hill beyond Chattam in the way to Canturburie. ‡

¶ The Time.

They flourish from May vnto the end of August: the roots are gathered and dried in Autumne, and sold to the vse of Diers and Medicine.

¶ The Names.

Madder is called in Greeke *ερυθροδανον*, *Erythrodanum*: in Latine, *Rubia*, and *Rubeia*: in shops, *Rubia tinctorum*: *Paulus Aegineta* sheweth that it is named *Thapsos* which the Diers vse, and the Romanes call it *Herba Rubia*: in Italian *Rubbia*, and *Robbia*: in Spanish, *Ruvia*, *Roya*, and *Granza*: in French, *Garance*: in high Dutch, *Rotte*: in low Dutch, *Mee*, and *Mee Crappen*: in English, *Madder*, and red Madder.

¶ The Temperature.

Of the temperature of Madder, it hath beene disputed among the learned, and as yet not censured, whether it doe binde or open, some say both; diuers diuersly deeme: a great Physition (I do not say the great learned) called me to account as touching the faculties heereof, although he had no commission so to doe, notwithstanding I was content to be examined vpon the point, what the nature of Madder was, because I haue written that it performeth contrary effects, as shall be shewed: the roots of Madder, which both the Physitions and diers doe vse, as they haue an obscure binding power

power and force; so be they likewise of nature and temperature cold and dry: they are withall of diuers thin parts, by reason whereof there colour doth easily pierce: yet haue they at the first a certain little sweetnes, with an harsh binding quality presently following it; which not onely we our selues haue obserued, but also *Auicenna* the prince of Physitions, who in his 58. Chapter hath written, that the root of Madder hath a rough and harsh taste: now M^r. Doctor, whether it binde or open I haue answered, attending your censure: but if I haue erred, it is not with the multitude, but with those of the best and best learned.

¶ *The Vertues.*

The decoction of the roots of Madder is euery where commended for those that are bursten, A
brused, wounded, and that are fallen from high places.

It stencheth bleeding, mitigateth inflammations, and helpeth those parts that be hurt and B
brused.

For these causes they be mixed with potions, which the later Physitions call wound drinckes: in C
which there is such force and vertue, as *Matthioli* also reporteth, that there is likewise great hope of curing of deadly wounds in the chest and intrails.

Our opinion and judgement is confirmed by that most expert man, sometimes Physition of D
Louaine, *Iohannes Spiringus*, who in his *Rapsodes* hath noted, that the decoction of Madder giuen with *Triphera*, that great composition is singular good to stay the reds, the hemorrhoides and bloudy fluxe, and the same approoued by diuers experiments: which confirmeth Madder to be of an astringent and binding qualitie.

Of the same opinion as it seemeth is also *Eros Iulia* her freed man (commonly called *Trotula*) E
who in a composition against vntimely birth doth vse the same: for if he had thought that Madder were of such a qualitie as *Dioscorides* writeth it to be of, he would not in any wise haue added it to those medicines which are good against an vntimely birth.

For *Dioscorides* reporteth, that the root of Madder doth plentifully prouoke vrine, and that F
grosse and thicke, and oftentimes bloud also, and it is so great an opener, that being but onely applied, it bringeth downe the menses, the birth, and after-birth: but the extreme rednes of the vrine deceiued him, that immediately followeth the taking of Madder, which rednesse came as he thought, from bloud mixed therewith, which notwithstanding commeth no otherwise then from the colour of the Madder.

For the root hereof taken any maner of way doth by & by make the vrine extreme red: no other- G
wise than *Rubarb* doth make the same yellow, not changing in the meane time the substance thereof, nor making it thicker than it was before, which is to be vnderstood in those which are in perfect health, which thing doth rather shew that it doth not open, but binde, no otherwise than *Rubarbe* doth: for by reason of his binding quality the waterish humors do for a while keepe their colour. For colours mixed with binding things do longer remaine in the things coloured, and do not so soone vade: this thing they will know that gather colours out of the juices of floures and herbes, for with them they mixe allume, to the end that the colour may be retained and kept the longer, which otherwise would be quickly lost. By these things it manifestly appeareth that Madder doth nothing vehemently either clense or open, and that *Dioscorides* hath rashly attributed vnto it this kinde of qualitie, and after him *Galen* and the rest that followed, standing stiffely to his opinion.

Pliny saith, that the stalkes with the leaues of Madder, are vsed against serpents. H

The root of Madder boiled in Meade or honied water, and drunken, openeth the stopping of the I
liuer, the milt and kidnies, and is good against the jaundise.

The same taken in like maner prouoketh vrine vehemently, insomuch that the often vse thereof K
causeth one to pisse bloud, as some haue dreamed.

Langius and other excellent Physitions haue experimented the same to amend the lothsome L
colour of the Kings-cuill, and it helpeth the vlcers of the mouth, if vnto the decoction be added a little allume and hony of *Roses*.

¶ 5 The fifth being the *Synanchica* of *Daleschamps*, dries without biting, and it is excellent M
against squinancies, either taken inwardly, or applied outwardly, for which cause they haue called it *Synanchica*, *Hist. Lugd.* ¶

CHAP. 461. Of Goose-grasse, or Cliuers.

¶ *The Description.*

I **A** *Parine*, Cliuers or Goose-grasse, hath many small square branches, rough and sharpe, full of joints, beset at euery joint with small leaues star fashion, and like vnto small Madders: the

B b b b b

the floures are very little and white, peaking on the tops of the sprigs: the seeds are small, round, a little hollow in the middest in maner of a nauell, set for the most part by couples: the roots slender and full of strings: the whole plant is rough, and his ruggednesse taketh hold of mens vestures and woollen garments as they passe by: being drawne along the tongue it fetcheth bloud: *Dioscorides* reports, that the shepheards in stead of a Cullender do vse it to take haire out of milke, if any remaine therein.

2 The great Goose-grasse of *Pliny* is one of the Moone-worts of *Lobel*, it hath a very rough tender stalke, whereupon are set broad leaues somewhat long, like those of Scorpion grasse, or *Alysson Galeni*, *Galen*s Moone-wort, very rough and hairy, which grow not about the joints, but three or foure together on one side of the stalke: the floures grow at the top of the branches, of a blew colour: after which commeth rough cleauing seeds, that do sticke to mens garments which touch it: the root is small and single.

1 *Aparine*.
Goose-grasse or Cleuers.

2 *Aparine maior Plinij*.
Great Goose-grasse.

¶ The Place.

Goose-grasse groweth neere the borders of fields, and oftentimes in the fields themselues mixed with the corne also by common waies, ditches, hedges, and among thornes: *Theophrastus* and *Galen* write, that it groweth among Lentles, and with hard embracing it doth choke it, and by that meanes is burdensome and troublesome vnto it.

¶ The Time.

It is found plentifully euery where in summer time.

¶ The Names.

It is named in Greeke *ἀπαρίνη*: *Aparine*: in Latine, *Lappa minor*, but not properly: *Pliny* affirmeth it to be *Lappaginis speciem*: of some, *Philanthropos*, as though he should say, a mans friend, because it taketh hold of mens garments; of diuers also for the same cause, *Philadelphos*: in Italian, *Speronella*: in Spanish, *Presera*, or *amor di Hortalano*: in high Dutch, *Bleebkraut*: in French, *Reble*, or *Grateron*: in low Dutch, *Bleefcrup*: in English, Goose-share, Goose-grasse, Cleuer, or Clauer.

¶ The Temperature.

It is, as *Galen* saith, moderately hot and dry, and somewhat of thin parts.

¶ The

¶ The Vertues.

The iuice which is pressed out of the seeds, stalks, and leaues, as *Dioscorides* writeth, is a remedie A
for them that are bitten of the poisonfome spiders called in Latine *Phalangia*, and of vipers if it be
drunke with wine.

And the herbe stamped with swines grease wasteth away the kernels by the throte. B

Pliny teacheth that the leaues being applied do also stay the aboundance of bloud issuing out C
of wounds.

Women do vsually make pottage of Cleuters with a little mutton and Otemeale, to cause lank- D
nesse, and keep them from fatnesse.

CHAP. 462. Of Crosse-woort.

¶ The Description.

1 Crosse-woort is a low and base herbe, of a pale Greene colour, hauing many square feeble
rough stalks full of ioints or knees, couered ouer with a soft downe: the leaues are little,
short, & smal, alwaies foure growing together, and standing crossewise one right against
another, making a right Burgunion crosse: toward the top of the stalke, and from the bosome of
those leaues come forth very many small yellow floures, of a reasonable good sauour, each of which
is also shaped like a Burgunion crosse: the roots are nothing else but a few small threds or fibres.

1 *Cruciata.*
Crosse-woort.

2 *Rubia Cruciata levis.*
Crosse-woort Madder.

2 This in mine opinion may be placed here as fitly as any where els; for it hath the leaues
standing crosse-waies foure at a ioint, somewhat like those of the largest Chickweed: the stalkes
are betweene a foot and a halfe and two cubites high. The white Starre-fashioned floures stand in
roundles about the tops of the stalks. It growes plentifully in Piemont, on the hills not farre from
Turine. *Lobel* sets it forth by the name of *Rubia Levis Taurinensium*. †

B b b b b 2

¶ The

¶ The Place.

Cruciata, or Crosse-woort, groweth in moist and fertile medowes; I found the same growing in the Churchyard of Hampstead neere London, and in a pasture adjoining thereto, by the mill; also it groweth in the Lane or high way beyond Charlton, a small village by Greenwich, and in sundry other places.

¶ The Time.

It floureth for the most part all Sommer long.

¶ The Names.

It is called *Cruciata*, and *Cruciatis*, of the placing of the leaues in manner of a Crosse: in English, Crosse-woort, or Golden Mugweat.

¶ The Temperature.

Crossewoort seemeth to be of a binding and dry qualitie.

¶ The Vertues.

A Crossewoort hath an excellent propertie to heale, iointe, and close wounds together, yea it is very fit for them, whether they be inward or outward, if the said herbe be boiled in wine and drunke.

B The decoction thereof is also ministred with good successe to those that are bursten: and so is the herbe, being boiled vntill it bee soft, and laied vpon the bursten place in manner of a pultis.

CHAP. 463. Of Woodrooffe.

1. *Asperula*.

Woodrooffe.

2. *Asperula flore caruleo*.
Blew Woodrooffe.

¶ The Description.

1 **W**oodrooffe hath many square stalkes full of ioints, and at euery knot or ioint seuen or eight long narrow leaues, set round about like a star, or the rowell of a spurre: the floures grow at the top of the stems, of a white colour, and of a very sweet smell, as is the rest of the herbe, which being made vp into garlands or bundles, and hanged vp in houses in the heat of Sommer, doth very wel attemper the aire, coole and make fresh the place, to the delight and comfort of such as are therein.

‡ 3 *Sagina Spargula*.
Spurrie.

lowish threds in the middle: after which follow cups or seed vessels, which open into foure parts, and containe a little flat reddish seed: it grows in the salt marshes about Dartford, and other such places, floures in Iuly and August, and in the meane space ripens the seed. We may call this in English, Sea Spurrie.

5 This other hath a large root, considering the smalnesse of the plant: from which arise many weak slender branches some three or foure inches long, sometimes more, lying commonly flat on the ground, hauing many knots or ioints: at each whereof vsually grow a couple of white scaly leaues, and out of their bosomes other small sharpe pointed little greene leaues: at the tops of the branches grow little red floures, succeeded by such, yet lesser heads than those of the former: it floures in Iuly and August, and growes in sandy grounds, as in Tuthill-fields nigh Westminster: the figure set forth in *Hist. Lugd. p. 2179*, by the title of *Chamaepeuce Plinij*, *Camphorata minor Dalechampi*, seems to be of this plant, but without the floure: *Bauhine* in his *Prodromus* describes it by the name of *Alfina Spargula facie*. This may be called Chickweed Spurrie, or small red Spurrie. ‡

¶ The Place.

White Woodrooffe groweth vnder hedges, and in woods almost euery where: the second groweth in many places of Essex, and diuers other parts in sandy grounds. The third in Corne fields.

¶ The Time.

They floure in Iune and Iuly.

¶ The Names.

Most haue taken Woodrooffe to be *Pliny* his *Alyssos*, which as he saith, doth differ from *Erythrodanum*, or Garden Madder, in leaues onely, and lesser stalks: but such a one is not onely this, but also that with blew floures: for *Galen* doth attribute to *Alyssos*, a blew floure: notwithstanding *Galen* and *Plinies Alyssos* are thought to differ by *Galen*s owne words, writing of *Alyssos* in his second booke of Counterpoisons, in *Antonius Cous* his composition, in this maner: *Alyssos* is an herb very like vnto Horehound, but rougher and fuller of prickles about the circles: it beareth a floure tending to blew.

Woodrooffe is named of diuers in Latine *Asperula odorata*, and of most men *Aspergula odorata*: of others, *Cordialis*, and *Stellaria*: in high Dutch, *Hertzfrejdt*: in low Dutch, *Leuerkraut*: that is to

say *Iecoraria*, or *Hepatica*, Liuerwoort : in French, *Muguet* : in English, Woodrooffe, Woodrowe, and Woodrowell.

¶ *The Temperature.*

Woodrooffe is of temperature something like vnto our Ladies Bedstraw, but not so strong, being in a meane between heate and drinesse.

¶ *The Vertues.*

A It is reported to be put into wine, to make a man merry, and to be good for the heart and liuer: it preuaileth in wounds, as *Cruciata*, and other vulnerarie herbes do.

CHAP. 464. Of Ladies Bedstraw.

¶ *The Kindes.*

There be diuers of the herbes called Ladies Bedstraw, or Cheefe-renning ; some greater, others lesse ; some with white floures, and some with yellow.

¶ *The Description.*

Ladies Bedstraw hath small round euen stalkes, weake and tender, creeping hither and thither vpon the ground : whereon doe grow very fine leaues, cut into small iags, finer than those of Dill, set at certaine spaces, as those of Woodrooffe : among which come forth floures of a yellow colour, in clusters or bunches thicke thrust together, of a strong sweet smel but not vnpleasant: the root is small and threddie.

1 *Gallium luteum.*

Yellow Ladies Bedstraw.

2 *Gallium album.*

Ladies Bedstraw with white floures.

2 Ladies Bedstraw with white floures is like vnto Cleauers or Goose-grasse, in leaues, stalkes, and manner of growing, yet nothing at all rough, but smooth and soft: the floures be white, the seed round : the roots slender, creeping within the ground: the whole plant rampeth vpon bushes, shrubs and all other such things as stand neere vnto it: otherwise it cannot stand, but must reele and fall to the ground.

3 This

3 This small *Gallium*, or Ladies little red bed-strow, hath been taken for a kind of wild Mad-der; neuerthelesse it is a kinde of Ladies bed-strow, or cheese-renning, as appeareth both by his vertues in turning milke to cheese, as also by his forme, being in each respect like vnto yellow *Gallium*, and differs in the colour of the floures, which are of a dark red colour, with a yellow pointal in the middle, consisting of foure small leaues: the seed hereof was sent me from a Citisen of Straus-burg in Germanie, and it hath not been seen in these parts before this time.

4 There is likewise another sort of *Gallium* for distinctions sake called *Mollugo*, which hath stalks that need not to be propped vp, but of it selfe standeth vpright, and is like vnto the common white *Gallium*, but that it hath a smother leafe. The floures thereof be also white, and very small. The root is blackish.

† 3 *Gallium rubrum*.
Ladies Bed-strow with red floures.

4 *Gallium*, sine *Mollugo montana*.
Great bastard Madder.

¶ The Place.

The first groweth vpon sunnie bankes neere the borders of fields, in fruitfull soiles almost enery where.

The second groweth in marish grounds and other moist places.

The third groweth vpon mountaines and hilly places, and is not yet found in England.

The fourth and last groweth in hedges among bushes in moist places.

¶ The Time.

They floure most of the Sommer moneths.

¶ The Names.

The first is called in Greeke γαλιον: it hath that name of milke, called in Greeke γαλα, into which it is put as cheese-renning: in Latine likewise *Gallium*: in high-Dutch, *Magerkraut*, *Walstroo*: in low-Dutch, *Walstroo*: in French, *Petit Muguet*: in Italian, *Galio*: in Spanish, *Coia leche yerna*: in English, our Ladies Bed-strow, Cheese-renning, Maids haire, and pety Mugwet.

The others are *Species Lappaginis*, or kindes of small Burres, so taken of the Antients: The last, of the softnesse and smoothnesse of the leaues, is commonly called *Mollugo*: diuers take it for a kinde of wilde Madder, naming it *Rubia sylvestris*, or wilde Madder.

¶ The Temperature.

These herbes, especially that with yellow floures, is dry and something binding, as Galen saith.

¶ The

¶ The Vertues.

- A The floures of yellow Maids haire, as *Dioscorides* writeth, is vsed in ointments against burnings, and it stancheth bloud: it is put into the Cerote or Cere-cloath of Roses: it is set a sunning in a glasse, with Oyle Oliue, vntill it be white: it is good to anoint the wearied Traueller: the root thereof drunke in wine stirreth vp bodily lust, and the floures smelled vnto worke the same effect.
- B The herbe thereof is vsed for Rennet to make cheefe, as *Matthiolus* reporteth, saying, That the people of Tuscanie or Hetruria do vse to turne their milke, that the Cheefe which they make of Sheeps and Goats milke might be the sweeter and more pleasant in taste, and also more wholsome, especially to breake the stone, as it is reported.
- C The people in Cheshire, especially about Namptwich, where the best cheefe is made, do vse it in their Rennet, esteeming greatly of that cheefe aboue other made without it.
- D We finde nothing extant in the antient writers, of the vertues and faculties of the white kinde, but are as herbes neuer had in vse either for physicke or Surgerie.

† The figure that was formerly in the third place was of the *Galium album minus* of *Tabern.* which commonly hath but two leaues at a ioynt, yet sometimes it is found with three.

CHAP. 465. Of Ferne.

¶ The Kindes.

There be diuers sorts of Ferne, differing as well in forme as place of growing; whereof there be two sorts according to the old writers, the male and the female; and these be properly called Ferne: the others haue their proper names, as shall be declared.

1 *Filix mas.*
Male Ferne.

2 *Filix femina.*
Female Ferne, or Brakes.

¶ The

¶ The Description.

THe male Ferne bringeth forth presently from the root broad leaues and rough, somewhat hard, easie to be broken, of a light Greene colour, and strong smell, more than a cubit long, spread abroad like wings, compounded as it were of a great number standing vpon a middle rib, euerie one whereof is like a feather, nicked in the edges, and on the backside are sprinkled as it were with a very fine earthy-coloured dust or spots, which many rashly haue taken for seed: the root consisteth of a number of tufts or threds, and is thicke and blacke, and is without stalke and seed, and altogether barren.

‡ *Filicis (vulgo) maris varietates & differentia.*

Differences of the male Ferne.

I haue obserued foure sorts of Ferne, by most writers esteemed to be the male Ferne of *Dioscorides*: by *Anguillara*, *Gesner*, *Casalpini*, and *Clusius*, accounted to be the female, and so indeed doe I thinke them to be, though I call them the male, with the multitude. If you looke on these Fernes according to their seuerall growths and ages, you may make many more sorts of them than I haue done; which I am afraid hath beene the occasion of describing more sorts than indeed there are in nature. These descriptions I made by them when they were in their perfect growths.

1 *Filix mas ramosa pinnulis dentatis.*

The roots are nothing but an abundance of small blacke hairy strings, growing from the lower parts of the maine stalkes (for stalkes I will call them) where those stalkes are ioyned together. At the beginning of the Spring you may perceiue the leaues to grow forth of their folding clusters, couered with brownish scales at the superficies of the earth, very closely ioyned together: a young plant hath but a few leaues; an old one, ten, twelue, or more: each stalke at his lower end neere the ioyning to his fellowes, at his first appearing, before he is an inch long hauing some of those blacke fibrous roots for his sustenance. The leaues being at their full growth hath each of them a three-fold diuision, as hath that Ferne which is commonly called the female: the maine stalke, the side branches growing from him, and the nerues growing on those side branches bearing the leaues: the maine stalke of that plant I describe was fully foure foot long (but there are vsually from one foot to foure in length) full of those brownish scales, especially toward the root, firme, one side flat, the rest round, naked fully one and twenty inches, to the first paire of side branches. The side branches, the longest being the third paire from the root, were nine inches long, and shorter and shorter towards the top, in number about twenty paire, for the most part towards the root they grow by couples, almost opposite, the neerer the top the further from opposition: the nerues bearing the leaues, the longest were two inches and a quarter long, and so shorter and shorter toward the tops of the side branches; about twentie in number on each side of the longest side branch. The leaues grow for the most part by couples on the nerue, eight or nine paire on a nerue; each leafe being gashed by the sides, the gashes ending with sharpe points, of a deep green on the vpper side, on the vnder side paler, and each leafe hauing two rowes of dusty red scales, of a browne or blackish colour: toward the top of the maine stalke those side branches change into nerues, bearing only the leaues. When the leaues are at their full growth, you may see in the midst of them at their roots the said scaly folding cluster; and as the old leaues with their blacke threddy roots wholly perish, they spring vp; most yeares you may finde many of the old leaues Greene all the Winter, especially in warme places. This groweth plentifully in the boggy shadowie moores neere Durford Abbey in Suffex, and also on the moist shadowie rockes by Mapledurham in Hampshire, neere Peters-field; and I haue found it often on the dead putrified bodies and stems of old rotten okes, in the said moores; neere the old plants I haue obserued verie many small yong plants growing, which came by the falling of the seed from those dusty scales: for I belecue all herbes haue seeds in themselves to produce their kindes, *Gen. 1. 11. & 12.*

The three other haue but a twofold diuision, the many stalks and the nerues bearing the leaues. The roots of them all are blacke fibrous threds like the first, their maine stalks grow many thicke and close together at the root, as the first doth: the difference is in the fashion of their leaues, and manner of growing, and for distinctions sake I haue thus called them:

2 *Filix mas non ramosa pinnulis latis densis minutim dentatis.*

The leaues are of a yellowish Greene colour on both sides, set very thicke and close together on the

the nerue, that you cannot see betweene them, with maruellous small nickes by their sides, and on their round tops: each leafe hath also two rowes of dusty seed scales; the figures set forth by *Lobel*, *Tabern.* and *Gerard*, vnder the title of *Filix mas*, do well resemble this Ferne. This growes plentifully in most places in shadowie woods and copses.

3 *Filix mas non ramosa pinnulis angustis, raris, profunde dentatis.*

The leaues are of a deepe greene, not closely set together on the the nerue, but you may far off see betwixt them, deeply indented by the sides, ending with a point not altogether sharpe: each leafe hath also two rowes of dusty seed scales. I haue not seene any figure well resembling this plant. This groweth also in many places in the shade.

4 *Filix mas non ramosa pinnulis latis auriculatis spinosis.*

The leaues are of a deeper greene than either of the two last described, placed on the nerue not very close together, but that you may plainly see between them; each leafe (especially those next the stalke) hauing on that side farthest off the stalk a large eare or outgrowing ending, with a sharp pricke like a haire, as doth also the top of the leafe: some of the sides of the leaues are also nicked, ending with the like pricke or haire. Each leafe hath two rowes of dusty seed scales. This I take to be *Filix mas aculeata maior Bauhini*. Neither haue I seene any figure resembling this plant. It groweth abundantly on the shadowie moist rockes by *Maple-durham* neere *Peters-field* in *Hampshire*. *John Goodyer.* Iuly 4. 1633. †

2 The female Ferne hath neither floures nor seed, but one only stalke, chamfered, something edged, hauing a pith within of diuers colours, the which being cut aslope, there appeareth a certain forme of a spread-Eagle: about this stand very many leaues which are winged, and like to the leaues of the male Ferne, but lesser: the root is long and blacke, and creepeth in the ground, being now and then an inch thicke, or somewhat thinner. This is also of a strong smell, as is the male.

¶ The Place.

Both the Fernes are delighted to grow in barren dry and desert places: and as *Horace* testifieth,

Neglectis vrenda Filix innascitur agris.

It comes not vp in manured and dunged places, for if it be dunged (as *Theophrastus*, lib. 8. cap. 8. reporteth) it withereth away.

The male ioyeth in open and champion places, on mountaines and stony grounds, as *Dioscorides* saith. † It growes commonly in shadowie places vnder hedges. †

The female is often found about the borders of fields vnder thornes and in shadowie woods.

¶ The Time.

Both these Fernes wither away in winter: in the spring there grow forth new leaues, which continue greene all Sommer long.

¶ The Names.

The former is called in Greeke *μαρμαρις*: *Nicander* in his discourse of Treacle nameth it *μαρμαρις*: in Latine *Filix mas*: in Italian, *Felce*: in Spanish, *Helecho*, *Falguero*, and *Feyto*: in high-Dutch, *waldt farne*: in French, *Fougere*, or *Feuchiere masle*: in low-Dutch, *Uaren Manneken*: in English, male Ferne.

The second kinde is called in Greeke *θηλυμαρις*, that is, *Filix femina*, or female Ferne: in Latine, as *Dioscorides* noteth among the bastard names, *Lingna ceruina*: in high-Dutch, *waldt farn weiblin*, and *Groß farnkraut*: in low-Dutch, *Uaren wijken*: in French, *Fougere femelle*: in English, Brake, common Ferne, and female Ferne.

¶ The Temperature.

Both the Fernes are hot, bitter, and dry, and something binding.

¶ The Vertues.

A The roots of the male Ferne being taken to the weight of halfe an ounce, driueth forth long flat wormes out of the belly, as *Dioscorides* writeth, being drunke in Mede or honied water; and more effectually, if it be giuen with two scruples or two third parts of a dram of Scamonie, or of blacke Hellebor: they that will vse it, saith he, must first eate Garlicke. After the same manner, as *Galen* addeth, it killeth the childe in the mothers wombe. The root hereof is reported to be good for them that haue ill spleenes: and being stamped with swines grease and applied, it is a remedie against the pricking of the reed: for prooffe hereof, *Dioscorides* saith the Ferne dieth if the Reed be planted about it; and contrariwise, that the Reed dieth if it be compassed with Ferne: which is vaine to thinke, that it hapneth by any antipathie or naturall hatred, and not by reason this Ferne prospereth not in moist places, nor the Reed in dry.

B The female Ferne is of like operation with the former, as *Galen* saith. *Dioscorides* reports, That this bringeth barrenesse, especially to women; and that it causeth women to be deliuered before their time: he addeth, that the poulder hereof finely beaten is laid vpon old vlcers, and healeth the

the galled neckes of oxen and other cattell: it is also reported, that the root of Ferne cast into an hogshead of wine keepeth it from fouling.

The root of the male Ferne sodden in Wine is good against the hardnesse and stopping of the milt: and being boyled in water, stayeth the laske in yong children, if they be set ouer the decoction thereof to ease their bodies by a close stoole.

CHAP. 466. Of Water-Ferne, or Osmund the water-man.

¶ The Description.

Water Ferne hath a great triangled stalke two cubits high, beset vpon each side with large leaues spred abroad like wings, and dented or cut like Polypodie; these leaues are like the large leaues of the Ash tree; for doubtlesse when I first saw them afar off it caused me to wonder thereat, thinking that I had seene yong Ashes growing vpon a bog; but beholding it a little neerer, I might easily distinguish it from the Ash, by the browne rough and round graines that grew on the top of the branches, which yet are not the seed thereof, but are very like vnto the seed. The root is great and thicke, folded and couered ouer with many scales and interlacing roots, hauing in the middle of the great and hard wooddy part thereof some small whitenesse, which hath beene called the heart of Osmund the water-man.

Filix florida, sine Osmunda Regalis.
Water Ferne, or Osmund Royall.

¶ The Place.

It groweth in the midst of a bog at the further end of Hampsted heath from London, at the bottom of a hill adioyning to a small cottage, and in diuers other places, as also vpon diuers bogges on a heath or common neere vnto Bruntwood in Essex, especially neere vnto a place there that some haue digged, to the end to finde a nest or mine of gold; but the birds were ouer fledged, and flowne away before their wings could be clipped. ‡ It did grow plentifully in both these places, but of late it is all destroyed in the former. ‡

¶ The

¶ The Time.

It flourisheth in Sommer, as the former Fernes : the leaues decay in Winter : the root continueth fresh and long lasting ; which being brought into the garden prospereth as in his native soile, as my selfe haue proued.

¶ The Names.

It is called in Latine *Osmunda* : it is more truly named *Filix palustris*, or *aquatilis* : some terme it by the name of *Filicasterum* : most of the Alchimists call it *Lunaria maior* : *Valerius Cordus* nameth it *Filix latifolia* : it is named in high-Dutch, **Grosz Farn** : in low-Dutch, **Groot Waren, wilt Waren** : in English, Water-Ferne, Osmund the Water-man : of some, Saint Christophers herbe, and Osmund.

¶ The Temperature.

The root of this also is hot and dry, but lesse than they of the former ones.

¶ The Vertues.

A The root, and especially the heart or middle part thereof, boiled or else stamped, and taken with some kinde of liquor, is thought to be good for those that are wounded, dry-beaten, and bruised ; that haue fallen from some high place : and for the same cause the Empericks do put it in decoctions, which the later Physitians do call wound-drinks : some take it to be so effectually, and of so great a vertue, as that it can dissolue cluttered blood remaining in any inward part of the body, and that it also can expell or driue it out by the wound.

B The tender sprigs thereof at their first comming forth are excellent good vnto the purposes aforesaid, and are good to be put into balmes, oyles, and consolidatiues, or healing plaisters, and into vnguents appropriate vnto wounds, punctures, and such like.

CHAP. 467. Of Polypodie or wall-Ferne.

1 *Polypodium*.

Wall Ferne, or Polypodie of the wall.

2 *Polypodium quercinum*.

Polypodie of the Oke.

¶ The

‡ 3 *Polypodium Indicum.*
Indian Polypody.

¶ The Description.

THe leaues of Polypodie might be thought to be like those of male Ferne, but that they are far lesser, and not nicked at all in the edges: these do presently spring vp from the roots, being cut on both the edges with many deepe gashes, euen hard to the middle rib; on the vpper side they are smooth, on the nether side they are lightly powdered as it were with dusty markes: the root is long, not a finger thick, creeping aslope, on which are seen certaine little buttons like to those pits and dents that appeare in the tailles of cuttle fishes; this hath in it a certaine sweetnesse, with a taste something harsh; this kinde of Ferne likewise wanteth not onely floures and seed, but stalkes also.

2 Polypodie of the Oke is much like vnto that of the wall, yet the leaues of it are more finely cut, smooth on the vpper side, of a pale green color, together with the stalkes and middle ribs; on the nether side rough like those of Ferne: this Ferne also liueth without a stalke: it groweth without seed: the root hath many strings fastned to it, one folded within another, of a meane bignesse, and sweet in taste: it sendeth forth heere and there new dodkins or springs, whereby it increaseth.

‡ 3 *Clusius* in his *Exoticke*, lib. 4. cap. 17. giues vs the History of an Indian Ferne or

Polypody found amongst the papers of one Dr. *Nicholas Colie* a Dutch Physitian, who died in his returne from the East-Indies. The root of it was six inches long, and almost one thicke, of the same shape and colour as the ordinarie one is: from this came vp three leaues, of which the third was lesser than the other two; the two larger were eleuen inches long, and their breadth from the middle rib (which was very large) was on each side almost five inches; the edges were diuided almost like an Oken case: from the middle rib came other veines that ran to the ends of the diuisions, and betweene these be smaller veines variouly diuicuated and netted, which made the leafe shew prettily. The colour of it was like that of a dry oken leafe. Where Dr. *Colie* gathered this it was vncertaine, for he had left nothing in writing. ‡

¶ The Place.

It groweth on the bodies of old rotten trees, and also vpon old walls, and the tops of houses: it is likewise found among rubbish neere the borders of fields, especially vnder trees and thornes, and now and then in woods: and in some places it groweth ranke and with a broader leafe, in others not so ranke, and with a narrower leafe.

That which groweth on the bodies of old Okes is preferred before the rest, in stead of this most do vse that which is found vnder the Okes, which for all that is not to be termed *Quercinum*, or Polypodie of the Oke.

¶ The Time.

Polypody is greene all the yeere long, and may be gathered at any time; it bringeth forth new leaues in the first spring.

¶ The Names.

The Grecians call it *πολυπόδιον*, of the holes of the fishes *Polypi*, appearing in the roots: it is called in Latine, *Polypodium*, after the Greeke name, and many times *Filicula*, as though they should say *Parna Filix*, or little Ferne: the Italians name it *Polipodio*: the Spaniards, *Filipodio*, and *Polypodio*: in high Dutch, *Engelsulz*, *Baumfarn*, *Dropfsoortz*: in low Dutch, *Boom varen*: in French, *Polypode*: and we of England, Polypodie: that which groweth vpon the wall we call Polypodie of the wall, and that on the Oke, Polypodie of the Oke.

¶ The Temperature.

Polypodie doth dry, but yet without biting as *Galen* writeth,

CCCC

¶ The

¶ The Vertues.

A *Dioscorides* writeth, that it is of power to purge and to draw forth choler and flegme. *Actuarius* addeth, that it likewise purgeth melancholy: other suppose it to be without any purging force at all, or else to haue very little: of the same minde is also *Iohannes Monardus*, who thinketh it purgeth very gently; which thing is confirmed by Experience, the mistress of things. For in very deed Polypody of it selfe doth not purge at all, but onely serueth a little to make the belly soluble, being boiled in the broth of an old cocke, with Beetes or Mallowes, or other like things that mooue to the stoole by their slipperines. *Ioannes Mesue* reckoneth vp Polypodie among those things, that do especially dry and make thin: peraduenture he had respect to a certaine kinde of *Arthritis*, or ache in the joints: in which not one only part of the body, but many together most commonly are touched: for which it is very much commended by the Brabanders and other inhabitants about the riuer Rhene, and the Maze. In this kinde of disease the hands, the feet, and the joints of the knees and elbowes do swell. There is joined withall a feeblenes in moouing, through the extremity of the paine: sometimes the vpper parts are lesse griued, and the lower more. The humors do also easily run from one place to another, and then settle. Against this disease the Geldres and Cleuelanders do vse the decoction of Polypodie, whereby they hope that the superfluous humours may be wasted and dried vp, and that not by and by, but in continuance of time: for they appoint that this decoction should be taken for certaine daies together.

B But this kinde of gout is sooner taken away either by blood letting, or by purgations, or by both, and afterwards by sweate: neither is it hard to be cured if these generall remedies be vled in time: for the humors do not remaine fixed in those joints, but are rather gathered together than settled about them.

C Therefore the body must out of hand be purged, and then that which remaineth is to be wasted and consumed away by such things as procure sweate.

D Furthermore, *Dioscorides* saith, that the root of Polypody is very good for members out of joint, and for chaps betweene the fingers.

E The root of Polypodie boiled with a little honie, water, and pepper, and the quantitie of an ounce giuen, emptieth the belly of cholericke and pituitous humours; some boile it in water and wine, and giue thereof to the quantitie of three ounces for some purposes with good successe.

CHAP. 468. Of Oke-Ferne.

¶ Our Author here (as in many other places) knit knots, somewhat intricate to loose, for first he confounds in the names and nature the Polypody of the Oke, or lesser Polypodie with the *Dryopteris*, or Oke-Ferne, but that I haue now put backe to the former chapter; his fit place; then in the second place did he giue the Description of the *Dryopteris* of the *Aduers.* taken from thence, pag. 263. Then were the place, times, names, &c. taken out of the chapter of *Dryopteris Candida* of *Dodonaeus*, being, *Pempt. 3. lib. 5. cap. 4.* But the figure was of the *Filicula femina petraea 4.* of *Tabernamontanus*. Now I will in this chapter giue you the *Dryopteris* of the *Aduersaria*, then that of *Dodonaeus*, and thirdly that of *Tragus*; for I take them to be different; and this last to be that figured by our Author, out of *Tabernamontanus*.

¶ The Description.

I **T**His kinde of Ferne called *Dryopteris*, or *Filix querna*, hath leaues like vnto the female Ferne before spoken of, but much lesser, smaller, and more finely cut or jagged, and is not aboue a foot high, being a very slender and delicate tender herbe. The leaues are so finely jagged that in shew they resemble feathers, set round about a small rib or sinew; the backe side being sprinkled, not with russet or browne markes, or specks, as the other Fernes are, but as it were painted with white spots or markes, not standing out of the leaues in scales, as the spots in the male Ferne, but they are double in each leafe close vnto the middle rib or sinew. The root is long, browne, and somewhat halry, very like vnto Polypody, but much slenderer, of a sharpe and causticke taste. ¶ *Rondeletius* affirmed that he found the vse of this deadly, being put into medicines in stead of Polypody by the ignorance of some Apothecaries in Dauphenye in France. M^r. *Goodyer* hath sent me an acurate description together with a plant of this Ferne which I haue thought good here also to set forth.

Dryopteris

‡ *Dryopteris Aduers.*
True Oke Ferne.

‡ 2 *Dryopteris alba* Dod.
White Oke-Ferne.

‡ 3 *Dryopteris Tragi.*
Tree Ferne.

Dryopteris Pena & Lobelij.

The roots creepe in the ground or mire, neere the turfe or vpper part thereof, and fold amongst themselves, as the roots of *Polypodium* do, almost as big as a wheat straw, and about five, six, or seven inches long, cole blacke without, and white within, of a binding taste inclining to sweetnesse, with an innumerable companie of small blacke fibres like haire growing thereunto. The stalkes spring from the roots in severall places, in number variable, according to the length and encrease of the root; I haue seene small plants haue but one or two, and some bigger plants haue fourteene or fifteene: they haue but a two-fold diuision, the stalke growing from the root, and the nerue bearing the leaues: the stalke is about five, six, or seven inches long, no bigger than a bennet or small grasse stalke, one side flat, as are the male Fernes, the rest round, smooth, and green. The first paire of nerues grow about three inches from the root, and so do all the rest grow by couples, almost exactly one against another, in number about eight, nine, or ten couples, the longest seldome exceeding an inch in length. The leaues grow on those nerues also by couples, eight or nine couples on a nerue, without any nickes or indentures, of a yellowish greene colour. This Ferne may be said

to be like *Polypodium* in his creeping root, like the male Ferne in his stalke, and like the female Ferne in his nerues and leaues. I could finde no seed-scales on the backesides of any of the leaues of this Ferne. Many yeares past I found this same in a very wet moore or bog, being the land of *Richard Austen*, called Whitrow Moore, where Peate is now digged, a mile from Peters-field in Hamphire; and this sixth of Iuly, 1633, I digged vp there many plants, and by them made this description. I neuer found it growing in any other place: the leaues perish at Winter, and grow vp againe very late in the Spring. *John Goodyer*. Iuly 6. 1633.

2 *Dodonæus* thus describes his: *Dryopteris* (saith he) doth well resemble the male Ferne, but the leaues are much smaller, and more finely cut, smooth on the foresaid, and of a yellowish green together with the stalkes and middle nerues; on the backe it is rough as other Fernes, and also lieth without stalke or seed. The root consists of fibres intricately folded together, of an indifferent thicknesse, here and there putting vp new buds. This is the *Adiantum* of the *Aduers.* who affirme the vse thereof to be safe, and not pernicious and deleterie, as that of *Dryopteris*. It thus differs from the former; the leaues of this are not set directly one opposite to another, the diuisions of the leaues are larger and more diuided. The root is more threddy, and creepes not so much as that of the former.

3 This (which is *Clusius* his *Filix pumila saxatilis prima*, and which I take to be the *Dryopteris* or *Filix arborea* of *Tragus*) hath blacke slender long creeping roots, with few small hard hairy fibres fastned to them, of a very astringent taste: from these rise vp sundry stalkes a foot high, diuided into certaine branches of winged leaues, like to those of the female Ferne, but much lesse, tenderer and finer cut, and hauing many blackish spots on their lower sides. This differs from the two former, in that the leaues are branched, which is a chiefe difference; and *Bauhinus* did very well obserue it, if he had as well followed it, when he diuided *Filix* into *ramosa* & *nonramosa*. ‡

¶ The Place.

It is oftentimes found in sunny places, in the vallies of mountains and little hills, and in the tops of the trunks of trees in thicke woods.

¶ The Time.

The leaues hereof perish in Winter; in the Spring new come forth.

¶ The Names.

This is called in Greeke *Δρυοπτερίς*: in Latine, *Querna Filix*: *Oribasius* in his eleuenth book of physickall Collections calleth it *Bryopteris*, of the mosse with which it is found; for, as *Dioscorides* writeth, it groweth in the mosse of Oakes. The Apothecaries in times past miscalled it by the name of *Adiantum*: but they did worse in putting it in compound medicines in stead of *Adiantum*. *Valerius Cordus* calleth it *Pteridion*: in low-Dutch, *Eijcken varen*: the Spaniards, *Helecho de Roble*: it is named in English, Oke-Ferne, Petty-Ferne; and it may most fitly be called Mosse-Ferne.

¶ The Temperature and Vertues.

A Oke-Ferne hath many tastes, it is sweet, biting, and bitter, it hath in the root a harsh or choking taste, and a mortifying qualitie, and therefore it taketh away haire. *Dioscorides* saith further, that Oke-Ferne stamped roots and all is a remedie to root vp haire, if it be applied to the body after sweating, the sweat being wiped away.

CHAP. 469. Of blacke Oke-Ferne.

¶ The Description.

1 **T**Here is also a certaine other kinde of Ferne like to the former Oke-Ferne of *Dodonæus* his description, but the stalkes and ribs of the leaues are blackish, and the leaues of a deeper greene colour: this groweth out also immediately from the root, and is likewise diuersly, but not so finely indented: the root is made vp of many strings, not vnlike to the male Ferne, but much lesser.

2 The female blacke Ferne is like vnto the male, sauing his leaues are not so sharpe at the points, more white and broad than the male, wherein consisteth the difference.

¶ The Place.

They grow likewise vpon trees in shadowie woods, and now and then in shadowie sandy banks, and vnder hedges.

¶ The

1 *Onopteris mas.*

The male blacke Ferne.

¶ The Time.

They remaine greene all the yeare long, otherwise than Polypodie & Maidens haire do; yet do they not cease to bring forth new leaues in Summer: they are destitute of floures and seed, as is the former.

¶ The Names.

This is called of diuers of the later Herbarists, *Dryopteris nigra*, or blacke Oke-Ferne; of the likenesse that it hath with *Dryopteris*; which we haue called in English, Oke-Ferne, or mosse Ferne: of others, *Adiantum nigrum*, or blacke Maidens haire, that it may differ from the former, which is falsly called *Adiantum*. There are of the later Herbarists who would haue it to be *Lonchitis aspera*, or rough Spleen-wort; but what likenesse hath it with the leaues of *Scolopendrium*? none at all: therefore it is not *Lonchitis aspera*, much lesse *Adiantum Plinij*, which differeth not from *Adiantum Theophrasti*; for what he hath of *Adiantum*, the same he taketh out of *Theophrastus*: the right *Adiantum* we will describe hereafter. Notwithstanding blacke Oke-Ferne was vsed of diuers vnlearned Apothecaries of France and Germany for *Adiantum*, or Maiden-haire of Lumbardy: but these men did erre in doing so; yet not so much as they who take Polypodie of the Oke for the true Maiden-haire.

¶ The Temperature and Vertues.

The blacke Oke-Ferne hath no stipticke qualitie at all, but is like in facultie to *Trichomanes*, or English Maiden-haire.

CHAP. 470. Of Harts-tongue.

¶ The Description.

1 The common kinde of Harts-tongue, called *Phyllitis*, that is to say, a plant consisting only of leaues, bearing neither stalke, floure, nor seed, resembling in shew a long tongue, whereof it hath been and is called in shops *Lingua ceruina*, that is, Harts tongue: these leaues are a foot long, smooth and plaine vpon one side, but vpon that side next the ground straked ouerthwart with certaine long rough markes like small wormes, hanging on the backside thereof. The root is blacke, hairy, and twisted, or so growing as though it were wound together.

2 The other kind of Ferne, called *Phyllitis multifida*, or *Laciniata*, that is, iagged Harts tongue, is very like vnto the former, sauing that the leaues thereof are cut or iagged like a mans hand, or the palme and browantles of a Deare, bearing neither stalke, floure, nor seed.

3 There is another kinde of Harts-tongue called *Hemionitis*, which hath bred some controuersie among writers: for some haue tooke it for a kinde of Harts-tongue, as it is indeed; others describe it as a proper plant by it selfe, called *Hemionitis*, of *ἡμιονος*, that is, *Mulus*, a Mule, because Mules do delight to feed thereon: it is barren in seeds, stalkes, and floures, and in shape it agreeth very well with our Harts-tongue: the roots are compact of many blackish haire: the leaues are spotted on the backside like the common Harts-tongue, and differ in that, that this *Hemionitis* in the base or lowest parts of the leaues is arched after the manner of a new Moone, or a forked arrow, the yongest and smallest leaues being like vnto the great Binde-weed, called *Volubilis*.

4 There is a kinde of Ferne called likewise *Hemionitis sterilis*, which is a very small and base herbe not aboue a finger high, having foure or fve small leaues of the same substance and colour, spotted on the backe part, and in taste like Harts-tongue; but the leaues beare the shape of them of *Totabona*, or good *Henry*, which many of our Apothecaries do abusiuely take for Mercurie: The roots are very many, smooth, blacke, and threddie, bearing neither stalke, floure, nor seed: this plant

1 *Phyllitis*.
Harts-tongue.

2 *Phyllitis multifida*.
Finger Harts-tongue.

3 *Hemionitis maior*.
Mules Ferne, or Moone-Ferne.

4 *Hemionitis minor*.
Small Moone-Ferne.

‡ 5 *Hemionitis perigrina*.
Handed Moone-Ferne.

my very good friend Mr. *Nicholas Belfon* found in a grauelly lane in the way leading to Oxey parke neere vnto Watford, fiftene miles from London: it growes likewise on the stone walls of Hampton Court, in the garden of Mr. *Huggens*, keeper of the said house or pallace.

5 There is a kinde of Ferne called also *Hemionitis*, but with this addition *Peregrina*, that is very seldome found, and hath leaues very like to Harts-tongue, but that it is palmed or branched in the part next the ground, almost in manner of the second *Phyllitis*, at the top of the leaues; otherwise they resemble one another in nature and forme.

¶ *The Place.*

The common Harts-tongue groweth by the waies sides as you trauell from London to Exeter in great plenty, in shadowie places, and moist stonie vallies and wels, and is much planted in gardens.

The second I found in the garden of Master *Cranwich* a Chirurgion dwelling at Much-dunmow in Essex, who gaue me a plant for my garden.

‡ Mr. *Goodyer* found it wilde in the banks of a lane neere Swaneling, not many miles from Southampton. ‡

It groweth vpon Ingleborough hils, and diuers other mountains of the North of England.

¶ *The Time.*

It is greene all the yeare long, yet lesse greene in winter: in Sommer it now and then bringeth forth new leaues.

¶ *The Names.*

It is called in Greeke *σκολοπενδρία*: in Latine also *Phyllitis*: in shops, *Lingua ceruina*: and falsely *Scolopendria*, for it differeth much from the right *Scolopendria*, or Stone Ferne: it is called in high Dutch, *Hirtzong*: in low Dutch, *Herstonge*: in Spanish, *Lengua ceruina*: in French, *Langue de Cerf*: in English, Harts-tongue: of some, Stone Harts-tongue: *Apuleius* in his 83. Chapter nameth it *Radiolus*.

¶ *The Temperature.*

It is of a binding and drying facultie.

¶ *The Vertues.*

This common Harts-tongue is commended against the laske and bloudy flux: *Dioscorides* teacheth, that being drunke in wine it is a remedie against the bitings of serpents. A

It doth open the hardnesse and stopping of the spleen and liuer, and all other griefes proceeding of oppilations or stoppings whatsoeuer. B

CHAP. 471. Of Spleene-woort, or Milt-waste.

¶ *The Description.*

1 Spleene-woort being that kinde of Ferne called *Asplenium*, or *Ceterach*, and the true *Scolopendria*, hath leaues a span long, iagged or cut vpon both sides, euen hard to the middle ribbe; euery cut or incisure being as it were cut halfe round (whereby it is knowne from the rough Spleene-woort) not one cut right against another, but one besides the other, set in seuerall order, being slipperie and greene on the vpper side, soft and downie vnderneath; which when they be withered are folded vp together like a scrole, and hairie without, much like to the rough Beare-worme wherewith men bait their hookes to catch fish: the root is small, blacke, and rough, much platted or interlaced, hauing neither stalke, floure, nor seeds.

2 Rough

1 *Asplenium sive Ceterach.*
Spleenewoort or Miltwaste.

2 *Lonchitis aspera.*
Rough Spleenewoort.

† 3 *Lonchitis aspera maior.*
Great rough Spleene-woort.

† 4 *Lonchitis Maramba.*
Bastard Spleene-woort.

2 Rough Spleenewoort is partly like the other Fernes in shew, and beareth neither stalk nor seed, hauing narrow leaues a foot long, and somewhat longer, slashed on the edges euen to the middle rib, smooth on the vpper side, and of a swart Greene colour, vnderneath rough, as is the leaues of Polypodie: the root is blacke, and set with a number of slender strings.

† 3 This greater Spleenwoort hath leaues like *Ceterach*, of a spanne long, somewhat resembling those of Polypodie, but that they are more diuided, snipt about the edges, and sharpe pointed: the root is fibrous and stringie. This growes on the rockes and mountainous places of Italy, and is the *Lonchitis aspera* maior of *Matthiolus* and others. †

4 This kinde of Spleenwoort is not onely barren of stalks and seeds, but also of those spots and marks wherewith the others are spotted: the leaues are few in number, growing pyramidis or steeplewise, great and broad below, and sharper toward the top by degrees: the root is thick, black, and bushie, as it were a Crowes nest.

¶ The Place.

Ceterach groweth vpon old stone walls and rockes, in darke and shadowie places throughout the West part of England; especially vpon the stone walls by Bristow, as you go to Saint Vincents Rocke, and likewise about Bathe, VVells, and Salisburie, where I haue scene great plentie thereof.

The rough Spleenwoort groweth vpon barren heaths, drie sandie bankes, and shadowie places in most parts of England, but especially on a heath by London called Hampstead heath, where it groweth in great abundance.

¶ The Names.

Spleene-woort or Milt-waste is called in Greeke, *ασπληνιον*, in Latine likewise, *Asplenium*, and also *Scolopendria*: of *Gaza*, *Mula herba*: in shops, *Ceterach*: in high Dutch, *Steynfarn*: in low Dutch, *Steynuaren*, and *Miltcruyt*: in English, Spleenwoort, Miltwaste, Scaleferne, and Stoneferne: it is called *Asplenion*, because it is speciall good against the infirmities of the Spleene or Milt, and *Scolopendria*, of the likenesse that it hath with the Beare-worme, before remembred.

Rough Miltwaste is called of diuers of the later writers *Asplenium syluestre*, or wilde Spleenwoort: of some, *Asplenium magnum*, or great Spleene-woort: *Valerius Cordus* calleth it *Strutiopteris*: and *Dioscorides*, *Lonchitis aspera*, or rough Spleene-woort: in Latine according to the same Authour, *Longina*, and *Calabrina*: in English, rough Spleen-wort, or Miltwaste.

¶ The Temperature.

These plants are of thin parts, as *Galen* witnesseth, yet are they not hot, but in a meane.

¶ The Vertues.

Dioscorides teacheth, that the leaues boiled in wine and drunk by the space of forty daies, do take away infirmities of the spleen, help the strangurie, and yellow iaundice, cause the stone in the bladder to moulder and passe away, all which are performed by such things as be of thinne and subtile parts: he addeth likewise that they stay the hicket, or yeoxing, and also hinder conception, either inwardly taken, or hanged about the partie, and therefore, saith *Pliny*, Spleenewoort is not to be giuen to women, because it bringeth barrennesse.

There be Empericks or blinde practitioners of this age, who teach, that with this herbe not onely the hardnesse and swelling of the Spleene, but all infirmities of the liuer also may be effectually, and in very short time remooued, insomuch that the foddren liuer of a beast is restored to his former constitution againe, that is, made like vnto a raw liuer, if it bee boyled againe with this herbe.

But this is to be reckoned among the old wiues fables, and that also which *Dioscorides* telleth of, touching the gathering of Spleenewoort in the night, and other most vaine things, which are found here and there scattered in old books: from which most of the later Writers do not abstaine, who many times fill vp their pages with lies and friuolous toies, and by so doing do not a little deceiue yong students.

† Formerly vnder the title of *Lonchitis aspera* was put the figure now in the third place, and the figure which should haue bene there, was in the third place of the next chapter, vnder the title of *Filicula petraea*.

CHAP. 472. Of diuers small Fernes.

¶ The Description.

1 **T**His small or dwarfe Ferne, which is seldome found except in the banks of stony fountaines, wells, and rockes bordering vpon riuers, is very like vnto the common Brakes in leaues, but altogether lesler: the root is composed of a bundle of blacke threddie strings.

2 The female, which is found likewise by running streames, wells, and fountaines, vpon rockes, and stonie places, is like the precedent, but is a great deale smaller, blacker of colour, fewer rootes, and shorter.

1 *Filicula fontanamas.*

The male fountaine Ferne.

† 3 *Filicula petreamas.*

The male dwarfe stone Ferne.

3 The male dwarfe Ferne that groweth vpon the stonie mountaines of the North and West parts of England, especially toward the sea, and also in the ioints of stone walls among the mortar, hath small leaues deeply cut on both sides, like vnto *Ceterach* or *Spleene-woort*, barren both of seeds and stalks, as also of those spots or marks that are to be seene vpon the backe part of the other Fernes: the root creepeth along, set with some few hairie strings, resembling those of the Oke Ferne, called *Dryopteris*.

4 The female stone Ferne hath diuers long leaues rising from a threddy root, contrarie to that of the male, composed of many small leaues finely minced or cut like the teeth of a saw, of a whitish green colour, without any spots or marks at all, seeds or stalks, which groweth vnder shadowie rockes, and craggie mountaines in most places. † From a small root composed of many blacke, hairie, and intricately folding strings, come vp many leaues two or three inches high, stiffe, thicke, darke greene, and shining: in the diuision, growth, position, shape and taste, it resembles the male Ferne, and hath also rustie spots on the backe: the middle ribbe and stalke is of a shining brow-

nish

4 *Filicula petrae femina*, five *Chamaefilix marina*
The female dwarfe stone Ferne. (*Anglica*.)

nish filken colour: it growes in the chinkes
of the rockes by the Sea side in Cornewall.

¶ *The Place.*

The place is sufficiently touched in the de-
scription.

¶ *The Time.*

They flourish both Winter and Sommer,
for when the leaues wither by reason of age,
there arise young to supplie the place, so that
they are not to be seene without greene and
withered leaues both at once.

¶ *The Names.*

It sufficeth what hath bin said of the names
in their severall titles: notwithstanding the
last described we haue called *Chamaefilix mari-
na Anglica*: which groweth vpon the rockie
cliffe neere Harwich, as also at Douer, among
the Sampire that there groweth.

¶ *The Temperature and Vertues.*

Their temperature and faculties in working A
are referred vnto the kindes of blacke Oke
Fernes, called *Dryopteris*, and *Onopterus*.

† It is hard to say what our Author in this chapter meant, by his figures and descriptions, wherefore I haue left his descriptions as I found them: the second fi-
gure which was very like the first I haue omitted: for the third, which was of the *Lonchitis asarifolia*, mentioned in the foregoing chapter, I haue put *Clusius* his fi-
gure of his *Filix saxatilis* 2. which growes in such places, and reasonable well fits our Authors description: in the fourth place I haue put *Lobellus* *Chamaefilix marina*
Anglica, and his description, which our Author, as I iudge, intended in that place to haue given vs.

CHAP. 473. Of true Maiden-haire.

¶ *The Kindes.*

THEOPHRASTUS and PLINY haue set downe two Maiden-haires, the blacke and the white, whereunto,
may be added another called *Ruta muraria*, or wall Rue, equall to the others in facultie, where-
of we will intreat.

1 *Capillus Veneris verus*.
True Maiden-haire.

¶ *The Description.*

WHO will follow the variable opini-
ons of writers concerning the Ferne
called *Adiantum verum*, or *Capillus*
Veneris verus, must of necessitie be brought into a la-
byrinth of doubts, considering the diuers opinions
thereof: but this I know that Venus-haire, or Maiden-
haire, is a low herb growing an hand high, smooth, of
a darke crimson colour, and glittering withall: the
leaues be smal, cut in sunder, and nicked in the edges
something like those of Coriander, confusedly or
without order placed, the middle rib whereof is of a
blacke shining colour: the root consisteth of manie
small threddie strings.

2 This Assyrian Maiden-haire is likewise a base
or low herbe, hauing leaues, flat, smooth, and plaine,
set vpon a blackish middle rib, like vnto that of the
other Maiden-haire, cut or notched in the edges, na-
ture keeping no certaine forme, but making one leafe of this fashion, and another far different from
it: the root is tough and threddie.

This plant which we haue inserted among the *Adiantes* as a kinde thereof, may without
error so passe, which is in great request in Flanders and Germanie, where the practitioners in Phy-
sicke do vse the same in stead of *Capillus Veneris*, and with better successe than any of the *Capillare*
herbs;

herbs, although *Matthiolus* and *Dioscorides* himselfe hath made this wall Rue to be a kinde of *Paronychia*, or Nailwoort: notwithstanding the Germanes wil not leaue the vse thereof, but receiue it as the true *Adiantum*, esteeming it equal, if not far better, than either *Ceterach*, *Capillus Veneris verus*, or *Tricomanes*, called also *Polytrichon*: it bringeth forth very many leaues, round and slender, cut into two or three parts, very hard in handling, smooth and Greene on the outside, of an ill fauoured dead colour vnderneath, set with little fine spots, which euidently sheweth it to be a kinde of Ferne: the root is blacke and full of strings.

2 *Capillus Veneris Syriaca*.
Assyrian Maiden-haire.

3 *Ruta muraria*, sive *Salvia vite*.
Wall Rue, or Rue Maiden-haire.

¶ The Place.

The right Maiden-haire groweth vpon walls, in stonie, shadowie, and moist places, neere vnto fountaines, and where water droppeth: it is a stranger in England: notwithstanding I haue heard it reported by some of good credit, that it groweth in diuers places of the West countrey of England.

The Assyrian Maiden-haire taketh his surname of his natiue countrey Assyria, it is a stranger in Europe.

Stone Rue groweth vpon old walls neere vnto waters, wells, and fountaines: I found it vpon the wall of the churchyard of Dartford in Kent, hard by the riuer side where people ride through, and also vpon the walls of the Churchyard of Sittingburne in the same Countie, in the middle of the towne hard by a great lake of water, and also vpon the Church walls of Railey in Essex, and diuers other places.

¶ The Time.

These plants are Greene both winter and sommer, and yet haue neither floures nor seed.

¶ The Names.

Maiden-haire is called in Greek *Αδίατον*: *Theophrastus* and *Pliny* name it *Adiantum nigrum*, or black Maiden-haire: for they set downe two Maiden-haires, the blacke and the white, making this the blacke, and the Rue of the wall the white: it is called in Latine *Polytrichum*, *Callitrichum*, *Cincinalis*, *Terra Capillus*, *Supercilium terra*: of *Apuleius*, *Capillus Veneris*, *Capillaris*, *Crinita*: & of diuers, *Coriandrum putei*: the Italians keepe the name *Capillus Veneris*: in English, blacke Maiden haire, and Venus haire, and it may be called our Ladies haire.

It

It is called *Adiantum* because the leafe, as *Theophrastus* faith, is neuer wet, for it caſteth off water that falleth thereon, or being drowned or couered in water, it remaineth ſtill as if it were dry, as *Pliny* likewiſe writeth; and is termed *Callitricon* and *Polytricon*, of the effect it hath in dying haire, and maketh it to grow thicke.

Vvall Rue is commonly called in Latine, *Ruta muraria*, or *Ruta muralis*: of ſome, *Salvia vita*, but wherefore I know not, neither themſelues, if they were liuing: of the Apothecaries of the Low-Countries *Capillus Veneris*, or Maiden haire, and they haue uſed it a long time for the right Maiden haire; it is that kinde of *Adiantum* which *Theophrastus* termed *Adiantum Candidum*, or white Maiden haire, for he maketh two, one blacke, and the other white, as we haue ſaid. *Pliny* doth likewiſe ſet downe two kindes, one he calleth *Polytricon*; the other, *Tricomanes*, or Engliſh Maiden-haire, whereof we will intreate in the chapter following, which he hath falſely ſet downe for a kinde of *Adiantum*, for *Tricomanes* doth differ from *Adiantum*.

Some there be that thinke, Vvall-Rue is *Paronychia Dioſcoridis*, or *Dioſcorides* his Whitlow-wort, wherein they haue been greatly deceiued: it is called in high Dutch, *Maurrenien*: in low Dutch, *Steencrypt*: in French, *Rue de maraille*: in Engliſh, Wall-Rue, and white Maiden-haire.

¶ The Temperature and Vertues.

The true Maiden-haire, as *Galen* teſtifieth, doth dry, waſte away, and is in a meane betweene heate and coldneſſe: *Meſues* ſheweth that it conſiſteth of vnlike or diſagreeing parts, and that ſome are watery and earthy, and the ſame binding, and another ſuperficially hot and thinne: And that by this it taketh away obſtructions or ſtoppings, maketh things thinne that are thicke, looſeneth the belly, eſpecially when it is freſh and Greene: for as this part is thin, ſo is it quickly reſolued, and that by reaſon of his binding and earthy parts: it ſtoppeth the belly, and ſtayeth the laſke and other fluxes.

Being drunke it breaketh the ſtone, and expelleth not onely the ſtones in the kidnies, but alſo thoſe which ſticke in the paſſages of the vrine.

It raiſeth vp groſſe and ſlimie humors out of the cheſt and lungs, and alſo thoſe which ſticke in the conduits of the winde pipe, it breaketh and raiſeth them out by ſpetting, if a loch or licking medicine be made thereof.

Moreouer, it conſumeth and waſteth away the Kings-euill, and other hard ſwellings, as the ſame Author affirmeth, and it maketh the haire of the head or beard to grow that is fallen and pilled off.

Dioſcorides reckoneth vp many vertues and operations of this Maiden-haire, which do not onely differ, but are alſo contrary one to another. Among others he ſaith, that the ſame ſtancheth bloud: and a little before, that it draweth away the ſecondines, and bringeth downe the deſired ſickenes: which words do confound one another with contrarieties; for whatſoeuer things do ſtanch bloud, the ſame do alſo ſtay the termes.

He addeth alſo in the end, that it is ſowne about ſheepe-folds for the benefit of the ſheepe, but what that benefit ſhould be, he ſheweth not.

Befides, that it cannot be ſowne, by reaſon it is without ſeed, it is euident, neither can it fitly be remooued. Therefore in this place it ſeemeth that many things are tranſpoſed from other places, and falſly added to this chapter: and peraduenture ſome things are brought hither out of diſcourſe of *Cytisus*, or Milke Trefoile, whereof here to write were to ſmall purpoſe.

Wall-Rue is not much vnlike to blacke Maiden-haire in temperature and facultie.

Wall-Rue is good for them that haue a cough, that are ſhort winded, and that be troubled with ſitches and paine in their ſides.

Being boiled, it cauſeth concoction of raw humors which ſticke in the lungs; it taketh away the paine of the kidnies and bladder, it gently prouoketh vrine, and driueth forth ſtones.

It is commended againſt ruptures in young children, and ſome affirme it to be excellent good, if the powder thereof be taken continually for forty daies together.

CHAP. 474. Of Engliſh, or common Maiden-haire.

¶ The Deſcription:

Engliſh Maiden-haire hath long leaues of a darke green colour, conſiſting of very many ſmall round leaues ſet vpon a middle rib, of a ſhining blacke colour, daſhed on the nether ſide with ſmall rough markes or ſpeckes, of an ouerworne colour: the roots are ſmall and threddy.

Dddd

The

1 *Trichomanes mas.*
The Male English Maiden-haire.

2 The female English Maiden-haire is like vnto the precedent, sauing that it is lesser, and wanteth those spots or marks that are in the other, wherein consisteth the difference. ‡ Our Authors figure was of the *Trichomanes femina* of *Tabernamontanus*, which expresse a variety with branched leaues, and therein only was the difference. ‡

¶ The Place.

It growes for the most part nere vnto springs and brookes, and other moist places; vpon old stone walls and rockes: I found it growing in a shadowie sandie lane in Betfome, in the parish of Southfleet in Kent, vpon the ground where-as there was no stones or stony ground neere vnto it, which before that time I did neuer see; it groweth likewise vpon stone walls at her Majesties palace of Richmond, & in most stone wals of the West and North parts of England. ‡ M^r. *Goodyer* saith, that in Ianuary, 1624. he saw enough to lade an horse growing on the bancks in a lane, as he rode betweene Rake and Headly in Hampshire neere Wollmer Forrest. ‡

¶ The Time.

It continueth a long time, the coldnesse of winter doth it no harme, it is barren as the other Fernes are, whereof it is a kinde.

¶ The Names.

It is called in Greeke, *νεγκυανις*: in Latine, *Filicula*, as though we should say, *Parua Filex*, or little Ferne; also *Capillaris*: in shops, *Capillus Veneris*. *Apuleius* in his 51 chapter maketh it all one with *Callitrichon*: of some it is called *Polytrichon*: in English, common Maiden-haire.

¶ The Temperature and Vertues..

A These, as *Dioscorides* and *Galen* do write, haue all the faculties belonging to *Adiantum*, or blacke Maiden-haire.

B The decoction made in wine and drunke, helpeth them that are short winded, it helpeth the cough, ripeneth tough flegme, and auoideth it by spitting.

C The lie wherein it hath been sodden, or laid to infuse, is good to wash the head, causing the scurfe and scales to fall off, and haire to grow in places that are pild and bare.

CHAP. 475. Of Thistles.

¶ The Kindes.

THE matter of the Thistles is diuers, some Thistles serue for nourishment, as the Artichoke without prickles, and the Artichoke with prickles; other for medicine, as the root of Carline which is good for many things; the blessed thistle also, otherwise called *Carduus benedictus*; Sea Huluer, and diuers others: some are poisonfome, as *Chamaeleon niger*; one smooth, plaine, and without prickles, as the Thistle called Beares Breech, or *Acanthus sativus*, whereof there is another with prickles, which we make the wilde, of the which two we intend to write in this chapter.

¶ The Description.

1 BEARES breech of the garden hath broad leaues, smooth, somewhat blacke, gashed on both the edges, and set with many cuts and fine nickes: betweene which riseth vp in the midst a big stalke brauely deckt with floures, set in order from the middle vpward, of colour white, of forme long, which are armed as it were with two catkins, one higher, another lower: after them grow forth the huskes, in which is found broad seed: the roots be blacke without, and white within,

in, and full of clammy iuice, and are diuided into many off-springs, which as they creepe far, so do they now and then bud forth and grow afresh: these roots are so full of life, that how little soeuer of them remaine, it oftentimes also bringeth forth the whole plant.

1 *Acanthus sativus*.
Garden Beares-breech.

‡ 2 *Acanthus syl. aculeatus*.
Prickley Beares-breech.

2 Wilde Beares-breech, called *Acanthus sylvestris*, Pena setteth forth for *Chameleonta Monspeliensis*, and reporteth that he found it growing amongst the grauelly and moist places neere to the walls of Montpellier, and at the gate of Aegidia, betweene the fountaine and the brooke neere to the wall: this thistle is in stalk, floures, colour of leaues and seed like the first kinde, but shorter and lower, hauing large leaues, dented or iagged with many cuts and incisions, not onely in some few parts of the leaues, as some other Thistles, but very thickly dented or clouen, and hauing many sharpe, large, white and hard prickles about the sides of the diuisions and cuts, not very easie to be handled or touched without danger to the hand and fingers.

¶ The Place.

Dioscorides writeth, that garden Branke Vrsine groweth in moist and stonie places, and also in gardens: it were vnaduisedly done to seeke it in either of the Germanies any where, but in gardens onely, in my garden it doth grow very plentifully.

The wilde was found in certain places of Italy neere to the sea, by that notable learned man *Alfonso Pancius*, Physition to the Duke of Ferrara, and professor of simples and Physick, and is a stranger in England. ‡ I haue seene it growing in the garden of Mr. *John Parkinson*. ‡

¶ The Time.

Both the Branke Vrsines do floure in the sommer season, the seed is ripe in Autumne: the root remaineth fresh, yet now and then it perisheth in winter in both the Germanies, if the weather be too cold: but in England the former seldome or neuer dieth.

¶ The Names.

It is called in Greeke *ἀκανθός*: the Latines keepe the same name *Acanthus*: yet doth *Acanthus* signifie generally all kinde of Thistles, and that is called *Acanthus* by the figure *Antonomasia*: the English name is Branke Vrsine, and Beares breech.

The tame or garden Branke Vrsine is named in Latine *Sativus*, or *Hortensis* *Acanthus*: in Greeke, *καλλικάνθηος*: and of *Galen*, *Oribasius*, and *Pliny*, *μαλακάνθηος*: *Pliny* also calleth this *Acanthus lenis*, or smooth Branke

Branke Vrsine, and reporteth it to be a citie herbe, and to serue for arbors: some name it *Branca Vrsina* (others vse to cal Cow-parfne by the name of *Branca Vrsina*, but with the addition *Germanica*;) the Italians call it *Acantho*, and *Branca Orsina*: the Spaniards, *Yerua Giguarte*: the Ingrauers of old time were wont to carue the leaues of this Branke Vrsine in pillars, and other works, and also vpon the eares of pots, as among others *Virgill* testifieth in the third Eclog of his *Bucolicks*:

*Et nobis idem Alcimedon duo pocula ferit,
Et molli circum est ansas amplexus Acantha.*

‡ I take *Virgils Acanthus* to be that which we now commonly call *Pyracantha*, as I shall hereafter shew when I come to treat thereof. ‡

The other Branke Vrsine is named in Greeke *ἀκανθός*: and in Latine, *Sylvestris Acanthus*, or wilde Branke Vrsine, and they may be called properly *Acantha*, or *Spina*, a prickle; by which name it is found called of most Herbarists, *Acanthus*: yet there is also another *Acanthus* a thornie shrub: the liquour which issueth forth of it, as *Herodotus* and *Theophrastus* affirme, is a gumme: for difference wherof peraduenture this kinde of *Acanthus* is named *Herbacantha*: There is likewise found among the bastard names of *Acanthus* the word *Mamolaria*, and also *Crepula*, but it is not exprested to which of them, whether to the wilde or tame it ought to be referred.

¶ The Temperature.

The leaues of the garden Branke Vrsine consist in a meane as it were betweene hot and cold, being somewhat moist, with a mollifying and gentle digesting facultie, as are those of the Mallow, and therefore they are profitably boyled in clysters, as well as Mallow leaues. The root, as *Galen* teacheth, is of a more drying qualitie.

¶ The Vertues.

- A *Dioscorides* saith, that the roots are a remedie for lims that are burnt with fire, and that haue been out of ioint, if they be laied thereunto: that being drunke they prouoke vrine, and stop the belly: that they helpe those that be broken, and be troubled with the crampe, and be in a consumption of the lungs.
- B They are good for such as haue the ptificke and spet bloud withal; for those that haue fallen from some high place, that are bruised and drie beaten, and that haue ouerstrained themselues, and they are as good as the roots of the greater Comfrey, whereunto they are verie like in substance, tough iuice, and qualitie.
- C Of the same root is made an excellent plaister against the ache and numnesse of the hands and feet.
- D It is put into clysters with good successe against sundry maladies.

CHAP. 476. Of the Cotton Thistle.

¶ The Description.

1 THE common Thistle, whereof the greatest quantitie of down is gathered for diuers purposes, as well by the poore to stop pillows, cushions, and beds for want of feathers, as also bought of the rich Upholsters to mixe with the feathers and downe they do sell, which deceit would be looked vnto: this Thistle hath great leaues, long and broad, gashed about the edges, and set with sharp and stiffe prickles all alongst the edges, couered all ouer with a soft cotton or downe: out from the middest whereof riseth vp a long stalke about two cubits high, cornered, and set with filmes, and also full of prickles: the heads are likewise cornered with prickles, and bring forth floures consisting of many whitish threds: the seed which succeedeth them is wrapped vp in down; it is long, of a light crimson colour, and lesser than the seede of bastard saffron: the root groweth deep in the ground, being white, hard, wooddie, and not without strings.

2 The Illyrian cotton thistle hath a long naked root, beset about the top with a fringe of many small threds or iags: from which ariseth a very large and tall stalke, higher than any man, rather like a tree than an annuall herbe or plant: this stalke is garnished with scroles of thinne leaues, from the bottome to the top, set full of most horrible sharpe prickles, and so is the stalke and euerie part of the plant, so that it is impossible for man or beast to touch the same without great hurt or danger: his leaues are very great, far broader and longer than any other thistle whatsoeuer, couered with an hoarie cotten or downe like the former: the floures doe grow at the top of the stalkes, which

which is diuided into sundry branches, and are of a purple colour, set or armed round about with the like, or rather sharper thornes than the aforesaid.

1 *Acanthium album.*

The white Cotton Thistle.

2 *Acanthium Illyricum purpureum.*

The purple Cotton Thistle.

¶ The Place.

These Thistles grow by high waies sides, and in ditches almost euery where.

¶ The Time

They floure from Iune vntill August, the second year after they be sown: and in the mean time the seed waxeth ripe, which being thorow ripe the herbe perisheth, as doe likewise most of the other Thistles, which liue no longer than till the seed be fully come to maturitie.

¶ The Names.

This Thistle is taken for that which is called in Greeke *ακανθισ*, which *Dioscorides* describeth to haue leaues set with prickles round about the edges, and to be couered with a thin downe like a copweb, that may be gathered and spun to make garments of, like those of silke: in high Dutch it is called *weisse wege distel*: in Low Dutch, *witte wech distel*: in French, *Chardon argentin*: in English, Cotton-Thistle, white Cotton-Thistle, wilde white Thistle, Argentine or the Silver Thistle.

¶ The Temperature and Vertues.

Dioscorides saith, that the leaues and roots hereof are a remedy for those that haue their bodies drawne backwards; thereby *Galen* supposeth that these are of temperature hot.

CHAP. 477. Of our Ladies-Thistle.

¶ The Description.

THE leaues of our Ladies Thistle are as bigge as those of white Cotton-Thistle: for the leaues thereof be great, broad, large, gashed in the edges, armed with a multitude of stiffe and sharpe prickles, as are those of Ote-Thistle, but they are without down, altogether slippery, of a light

Carduus Maria.
Ladies Thistle.

green and speckled, with white and milky spots and lines drawne diuers waies: the stalk is high, and as big as a mans finger: the floures grow forth of heads full of prickles, being threds of a purple colour: the seed is wrapped in downe like that of Cotton Thistle: the root is long, thicke, and white.

¶ *The Place.*

It groweth vpon waste and common places by high waies, and by dung-hills almost euerie where.

¶ *The Time.*

It floureth and seedeth when Cotton Thistle doth.

¶ *The Names.*

It is called in Latine, *Carduus Lacteus*, and *Carduus Maria*; in high Dutch, *Onser Vrouwen Distell*: in French, *Chardon ae nestre dame*: in English, our Ladies Thistle: it may properly be called *Leucographus*, of the white spots and lines that are on the leaues: *Pliny* in his 27. booke, chap. 11. maketh mention of an herb called *Leucographus*, but what manner of one it is he hath not expresse, therefore it would be hard to affirme this to be the same that his *Leucographus* is; and this is thought to bee *Spina alba*, called in Greeke *αγθα λευκη*, or white Thistle, Milk Thistle, and *Carduus Ramptarius*: of the Arabians, *Bedo-ard*, or *Bedeguar*, as *Matthaeus Syluaticus* testifieth.

¶ *The Temperature and Vertues.*

The tender leaues of *Carduus Leucographus*, the prickles taken off, are sometimes vsed to bee eaten with other herbes.

- A** *Galen* writeth, that the roots of *Spina alba* do drie and moderately binde, that therefore it is good for those that be troubled with the lask and the bloody flux, that it staieth bleedings, wasteth away cold swellings; easeth the paine of the teeth if they bee washed with the decoction thereof.
- B** The seed thereof is of a thin essence and hot facultie, therefore he saith that it is good for those that be troubled with cramps.
- C** *Dioscorides* affirmeth that the seeds being drunke are a remedie for infants that haue their sinews drawne together, and for those that be bitten of serpents: and that it is thought to drie away serpents, if it be but hanged about the necke.

CHAP. 478. Of the Globe Thistle.

¶ *The Description.*

Globe Thistle hath a very long stalke, and leaues iagged, great, long, and broad, deeply gashed, strong of smell, somewhat Greene on the vpper side, and on the nether side whiter and downy: the floures grow forth of a round head like a globe, which standeth on the tops of the stalkes; they are white and small, with blew threds in the midst: the seed is long, with haire of a meane length: the root is thicke and branched.

2 There is another Globe Thistle that hath lesser leaues, but more full of prickles, with round heads also: but there groweth out of them besides the floures, certaine long and stiffe prickles.

3 There is likewise another kinde resembling the first in forme and figure, but much lesser, and the floures thereof tend more to a blew.

4 There is also another Globe Thistle, which is the least, and hath the sharpest prickles of all the rest: the head is small, the floures whereof are white, like to those of the first.

5 There

1 *Carduus globosus*.
The Globe-Thistle.

2 *Carduus globosus acutiss.*
Prickly headed Globe-Thistle.

3 *Carduus globosus minor*.
Small Globe-Thistle.

5 *Carduus globosus capitula latiora*.
Flat headed Globe-Thistle.

5 There is a certaine other kinde hereof, yet the head is not so round, that is to say, flatter and broader above; out of which spring blew floures: the stalke hereof is slender, and couered with a white thin downe: the leaues are long, gashed likewise on both sides, and armed in euery corner with sharpe prickles.

6 There

6 There is another called the Down-Thistle, which riseth vp with thicke and long stalks. The leaues thereof are iagged, set with prickles, white on the nether side: the heads be round and many in number, and are couered with a soft downe, and sharpe prickles standing forth on euerie side, being on the vpper part fraughted with purple floures all of strings: the seed is long, and shineth, as doth the seed of many of the Thistles.

‡ 6 *Cardus eriocephalus*.
Woolly headed Thistle.

¶ The Place.

They are sown in gardens, and do not grow in these countries that we can finde.

‡ I haue found the sixth by Pocklington and in other places of the Woldes in Yorkshire. Mr. Goodyer also found it in Hampshire. ‡

¶ The Names.

They floure and flourish when the other Thistles do.

¶ The Names.

Fuchsius did at the first take it to be *Chamaeleon niger*; but afterwards being better aduised, he named it *Spina peregrina*, and *Cardus globosus*. *Valerius Cordus* doth firly call it *Spherocephalus*: the same name doth also agree with the rest, for they haue a round head like a ball or globe. Most would haue the first to be that which *Matthiolus* setteth downe for *Spina alba*: this Thistle is called in English, Globe Thistle, and Ball-Thistle.

The downe or woolly headed Thistle is called in Latine, being destitute of another name, *Eriocephalus*, of the woolly head: in English, Downe Thistle, or woolly headed Thistle. It is thought of diuers to be that which *Bartholomaeus Vrbemateranus* and *Angelus Palea*, Franciscan Friers, report to be called *Corona Fratrum*, or Friers Crowne: but this Thistle doth far differ from that, as is euident by those things which they haue written concerning

Corona Fratrum; which is thus: In the borders of the kingdome of Aragon towards the kingdome of Castile we finde another kind of Thistle, which groweth plentifully there, by common wayes, and in wheate fields, &c. *Vide Dod. Pempt. 5. lib. 5. cap. 5.*

¶ The Temperature and Vertues.

Concerning the temperature and vertues of these Thistles we can alledge nothing at all.

CHAP. 479. Of the Artichoke.

¶ The Kindes.

There be three sorts of Artichokes, two tame or of the garden; and one wilde, which the Italian esteemeth greatly of, as the best to be eaten raw, which he calleth *Cardune*.

¶ The Description.

The leaues of the great Artichoke, called in Latine *Cinara*, are broad, great, long, set with deepe gashes in the edges, with a deepe channell or gutter alongst the middle, hauing no prickles at all, or very few, and they be of a greene ash colour: the stalke is aboue a cubit high, and bringeth forth on the top a fruit like a globe, resembling at the first a cone or Pine apple, that is to say, made vp of many scales, which is when the fruit is great or loosed of a greenish red colour within, and in the lower part full of substance and white; but when it opens it selfe there growes also

1 *Cinara maxima Anglica.*
The great red Artichoke.

2 *Cinara maxima alba.*
The great white Artichoke.

3 *Cinara sylvestris.*
Wilde Artichoke.

also vpon the cone a floure all of threds, of a gallant purple tending to a blew colour. The seed is long, greater and thicker than that of our Ladies thistle, lying vnder soft and downy haire which are contained within the fruit. The root is thicke, and of a meane length.

2 The second great Artichoke differeth from the former in the colour of the fruit, otherwise there is little difference, except the fruit hereof dilateth it selfe further abroad, and is not so closely compact together, which maketh the difference.

3 The prickly Artichoke, called in Latine *Carduus*, or *Spinosa Cinara*, differeth not from the former, saue that all the corners of the leaues hereof, and the stalkes of the cone or fruit, are armed with stiffe and sharp prickles, whereupon it beareth well the name of *Carduus*, or Thistle.

¶ The Place.

The Artichoke is to be planted in a fat and fruitfull soile: they do loue water and moist ground. They commit great error who cut away the side or superfluous leaues that grow by the sides, thinking thereby to increase the greatnesse of the fruit, when as in truth they deprive the root from much water by that meanes, which should nourish it to the feeding of the fruit; for if you marke the trough or hollow channell that is in euery leafe, it shall appeare very euidently, that the

Creator

Creator in his secret wisdom did ordaine those furrowes, euen from the extreme point of the leafe to the ground where it is fastned to the root, for no other purpose but to guide and leade that water which falls far off, vnto the root; knowing that without such store of water the whole plant would wither, and the fruit pine away and come to nothing.

¶ The Time.

They are planted for the most part about the Kalends of Nouember, or somewhat sooner. The plant must be set and dunged with good store of ashes, for that kinde of dung is thought best for planting thereof. Euery yeare the slips must be torne or slipped off from the body of the root, and these are to be set in Aprill, which will beare fruit about August following, as *Columella*, *Palladius*, and common experience teacheth.

¶ The Names.

The Artichoke is called in Latine *Cinara*, of *Cinis*, Ashes, wherewith it loueth to be dunged. *Galen* calleth it in Greeke *Kathara*, but with *k* and *v* in the first syllable: of some it is called *Cactos*: it is named in Italian, *Carcioffi*; *Archiochi*: in Spanish, *Alcarrhosa*: in English, Artichoke: in French, *Artichaux*: in low-Dutch, *Artichoken*: whereupon diuers call it in Latine *Articocalus*, and *Articoca*: in high-Dutch, *Strobildorn*.

The other is named in Latine commonly not onely *Spinosa cinara*, or prickly Artichoke, but also of *Palladius*, *Carduus*: of the Italians, *Cardo*, and *Cardino*: of the Spaniards, *Cardos*: of the French men, *Chardons*: *Leonhartus Fuchs* and most writers take it to be *Scolymus Dioscoridis*; but *Scolymus Dioscoridis* hath the leafe of Chameleon or *Spina alba*, with a stalke full of leaues, and a prickly head: but neither is *Cinara* the Artichoke which is without prickles, nor the Artichok with prickles any such kinde of herbe; for though the head hath prickles, yet the stalke is not full of leaues, but is many times without leaues, or else hath not past a leafe or two. *Cinara* doth better agree with that which *Theophrastus* and *Pliny* call *Kanthos*, *Cactus*, and yet it doth not bring forth stalkes from the root creeping alongst the ground: it hath broad leaues set with prickles; the middle ribs of the leaues, the skin pilled off, are good to be eaten, and likewise the fruit, the seed and down taken away; and that which is vnder is as tender as the braine of the Date tree: which things *Theophrastus* and *Pliny* report of *Cactus*. That which they write of the stalkes, sent forth immediately from the root vpon the ground, which are good to be eaten, is peradventure the ribs of the leaues: euerie side taken away (as they be serued vp at the table) may be like a stalke, except euen in Sicilia, where they grew only in *Theophrastus* time. It bringeth forth both certaine stalks that lie on the ground, and another also standing straight vp; but afterwards being remoued and brought into Italy or England, it bringeth forth no more but one vpright: for the soile and clyme do much preuaile in altering of plants, as not onely *Theophrastus* teacheth, but also euen experience it selfe declareth: and of *Cactus*, *Theophrastus* writeth thus; *Kanthos* (*Cactus*) groweth onely in Sicilia: it bringeth forth presently from the root stalkes lying along vpon the ground, with a broad and prickly leafe: the stalkes being pilled are fit to be eaten, being somewhat bitter, which may be preserued in brine: it bringeth forth also another stalke, which is likewise good to be eaten.

¶ The Temperature and Vertues.

- A The nailes, that is, the white and thicke parts which are in the bottome of the outward scales or flakes of the fruit, of the Artichoke, and also the middle pulpe whereon the downy seed stands, are eaten both raw with pepper and salt, and commonly boyled with the broth of fat flesh, with pepper added, and are accounted a dainty dish, being pleasant to the taste, and good to procure bodily lust: so likewise the middle ribs of the leaues being made white and tender by good cherishing and looking to, are brought to the table as a great seruice together with other junkets: they are eaten with pepper and salt as be the raw Artichokes: yet both of them are of ill iuyce; for the Artichoke containeth plenty of cholericke iuyce, and hath an hard substance, insomuch as of this is ingendred melancholy iuyce, and of that a thin and cholerick blood, as *Galen* teacheth in his book of the Faculties of nourishments. But it is best to eate the Artichoke boyled: the ribbes of the leaues are altogether of an hard substance: they yeeld to the body a raw and melancholy iuyce, and containe in them great store of winde.
- B It stayeth the inuoluntarie course of the naturall seed either in man or woman.
- C Some write, that if the buds of yong Artichokes be first steeped in wine, and eaten, they prouoke vrine, and stir vp the lust of the body.
- D I finde moreouer, that the root is good against the ranke smell of the arme-holes, if when the pith is taken away the same root be boyled in wine and drunke: for it sendeth forth plenty of stinking vrine, whereby the ranke and rammish fauor of the whole body is much amended.

CHAP. 480. Of Golden Thistles.

¶ The Description.

1 **T**He stalkes of Golden Thistle rise vp forthwith from the root, being many, round, and branched. The leaues are long, of a beautifull green, with deepe gashes on the edges, and set with most sharpe prickles: the floures come from the bolome of the leaues, set in a scale chaffie knap, very like to Succorie floures, but of colour as yellow as gold: in their places come vp broad flat and thin seeds, not great, nor wrapped in downe: the root is long, a finger thicke, sweet, soft, and good to be eaten, wherewith swine are much delighted: there issueth forth of this thistle in what part soeuer it is cut or broken, a iuyce as white as milke.

‡ There is some varietie of this Thistle; for it is found much larger about Montpelier than it is in Spaine, with longer branches, but fewer floures: the leaues also are spotted or streaked with white like as the milke Thistle: whence *Clusius*, whom I here follow, hath giuen two figures thereof; the former by the name of *Scolymus Theophrasti Hispanicus*; and the other by the title of *Scolymus Theophrasti Narbonensis*. This with white spots I saw growing this yere with M^r. *Tradescant* at South Lambeth. ‡

1 *Carduus Chrysanthemus Hispanicus.*
The Spanish golden Thistle.

‡ *Carduus Chrysanthemus Narbonensis.*
The French golden Thistle.

2 The golden Thistle of Peru, called in the West Indies, *Figue del Inferno*, a friend of mine brought it vnto me from an Island there called Saint Iohns Island, among other seeds. What reason the inhabitants there haue to call it so, it is vnto me vnkowne, vnlesse it be because of his fruit, which doth much resemble a fig in shape and bignesse, but so full of sharpe and venomous prickles, that whosoever had one of them in his throat, doubtlesse it would send him packing either to heauen or to hell. This plant hath a single wooddy root as big as a mans thumbe, but somewhat long: from which ariseth a brittle stalke full of ioyns or knees, diuiding it selfe into sundry other small branches, set full of leaues like vnto the milke Thistle, but much smaller, and streaked with many white lines or streakes: and at the top of the stalks come forth faire and goodly yellow floures, very like vnto the sea Poppy, but more elegant, and of greater beauty, hauing in the midst thereof

thereof a small knop or boll, such as is in the middle of our wild Poppy, but full of sharpe thorns, and at the end thereof a staine or spot of a deepe purple: after the yellow floures be fallen, this foresaid knop groweth by degrees greater and greater, vntill it come to full maturitie, which openeth it selfe at the vpper end, shewing his seed, which is very blacke and round like the seeds of mustard. The whole plant and each part thereof doth yeeld verie great abondance of milkie iuyce, which is of a golden colour, falling and issuing from any part thereof, if it be cut or bruised: the whole plant perisheth at the approach of Winter. The vertues hereof are yet vnkowne vnto me, wherefore I purpose not to set downe any thing thereof by way of coniecture, but shall, God willing, be ready to declare that which certaine knowledge and experience either of myne owne or others, shall make manifest vnto me.

¶ The Place.

The golden Thistle is sowne in gardens of the Low-Countries. *Petrus Bellonius* writes, That it groweth plentifully in Candy, and also in most places of Italy: *Clusius* reporteth that he found it in the fields of Spaine, and of the kingdome of Castile, and about Montpelier, with fewer branches, and of a higher growth.

The Indian Thistle groweth in Saint Iohns Island in the West Indies, and prospereth very well in my garden.

¶ The Time.

They floure from Iune to the end of August: the seed of the Indian golden Thistle must be sowne when it is ripe, but it doth not grow vp vntill May next after.

¶ The Names.

This Thistle is called in Latine *Carduus Chrysanthemus*: in Greeke of *Theophrastus*, *καρυφάρις*; for those things which he writeth of *Scolymus* in his sixth and seventh bookes doe wholly agree with this Thistle *Chrysanthemus*: which are these; *Scolymus*, doth floure in the Sommer solstice, brauely and a long time together; it hath a root that may be eaten both sod and raw, and when it is broken it yeeldeth a milky iuyce: *Gaza* nameth it *Carduus*. Of this *Pliny* also makes mention, lib. 21. ca. 16. *Scolymus*, saith he, differs from those kindes of Thistles, viz. *Acarua*, and *Atractilis*, because the root thereof may be eaten boyled. Againe, lib. 21. Cap. 22. The East Countries vse it as a meate: and he calleth it by another name *Αεικμήν*. Which thing also *Theophrastus* seemeth to affirme, in his sixth booke; for when he reckoneth vp herbes whose leaues are set with prickles, he addeth *Scolymus*, or *Limonia*.

Notwithstanding, *Pliny* maketh mention likewise of another *Scolymus*, which hee affirmeth to bring forth a purple houre, and betweene the middle of the prickles to wax white quickly, and to fall off with the winde; in his twentieth booke, cap. 23. Which Thistle doubtlesse doth nor agree with *Carduus Chrysanthemus*, that is, with *Theophrastus* his *Scolymus*, and with that which we mentioned before: so that there be in *Pliny* two *Scolymi*; one with a root that may be eaten, and another with a purple floure, turning into downe, and that speedily waxeth white. *Scolymus* is likewise described by *Dioscorides*; but this differs from *Scolymus Theophrasti*, and it is one of those which *Pliny* reckoneth vp, as we wil more at large declare hereafter. But let vs come againe to *Chrysanthemus*: This the inhabitants of Candy, keeping the marks of the old name, do call *Ascolymbros*: the Italians name it *Anconitani Rinci*: the Romans, *Spina borda*: the Spaniards, *Cardon lechar*: and of diuers it is also named *Glycyrrhizon*, that is to say, *dulcis Radix*, or sweet Root: it is called in English, golden Thistle: some would haue it to be that which *Vegetius* in *Arte Veterinaria* calls *Eryngium*: but they are deceiued; for that *Eryngium* whereof *Vegetius* writeth is *Eryngium maritimum*, or sea Huluer, of which we will intreat.

The golden Thistle of India may be called *Carduus Chrysanthemus*, of his golden colour, adding thereto his native countrey *Indianus*, or *Peruanus*, or the golden Indian Thistle, or the golden Thistle of Peru: the seed came to my hands by the name *Fique del Inferno*: in Latine, *Ficus infernalis*, the infernall fig, or fig of hell.

¶ The Temperature and Vertues.

A The root and tender leaues of this *Scolymus*, which are sometimes eaten, are good for the stomacke, but they containe very little nourishment, and the same thinne and waterie, as *Galen* teacheth.

B *Pliny* saith, that the root hereof was commended by *Erastosthenes*, in the poore mans supper, and that it is reported also to prouoke vrine especially; to heale tetters and dry scurfe, being taken with vineger; and with Wine to stir vp fleshly lust, as *Hesiod* and *Alcaeus* testifie; and to take away the stench of the arme-holes, if an ounce of the root, the pith picked out, be boyled in three parts of wine, till one part be wasted, and a good draught taken fasting after a bath, and likewise after meat: which

which later words *Dioscorides* likewise hath concerning his *Scolymus* : out of whom *Pliny* is thought to haue borrowed these things.

† The plant our Author here describes in the second place, is that which I described and figured formerly, pag. 371. by the name of *Papaver spinosum*. I must confesse, I there should haue omitted it, because it is here set forth sufficiently by our Author, whereof indeed I had a little remembrance, and therefore at that time sought his Index by all the names I could remember, but not making it a *Carduus*, I at that time missed thereof; but here finding it, I haue let the history stand as it was, and onely omitted the figure which you may finde before, and something also in the history not here deliuered.

CHAP. 481. Of white Carline Thistle of *Dioscorides*.

¶ The Description.

1 The leaues of Carline are very full of prickles, cut on both edges with a multitude of deepe gashes, and set along the corners with stiffe and very sharpe prickles; the middle ribs whereof are sometimes red: the stalke is a span high or higher, bringing forth for the most part onely one head or knap being full of prickles, on the outward circumference or compasse like the Vrchin huske of a chesnut: and when this openeth at the top, there groweth forth a broad floure, made vp in the middle like a flat ball, of a great number of threds, which is compassed about with little long leaues, oftentimes somewhat white, very seldome red: the seed vnderneath is slender and narrow, the root is long, a finger thicke, something blacke, so chinked as though it were split in sunder, sweete of smell, and in taste somewhat bitter.

‡ 1 *Carlina canescens magno flore.*
Tall Carline Thistle.

2 *Carlina, seu Chameleon albus Dioscoridis.*
The white Carline Thistle of *Dioscorides*
with the red floure.

2 There is also another hereof without a stalke, with leaues also very full of prickles, like almost to those of the other, lying flat on the ground on euery side: among which there groweth forth in the middle a round head or knap, set with prickles without after the same maner, but greater: the floure whereof in the middle is of strings, and paled round about with red leaues, and sometimes with white, in faire and calme weather the floures both of this and also of the other laie themselves

Eeeee

‡ 3 *Carlina acaulos minor flore purp.*
Dwarfe Carline Thistle.

themselues wide open, and when the weather is foule and misty, are drawne close together: the root hereof is long, and sweet of smell, white, found, not nicked or splitted as the other.

‡ 3 This small purple Carline Thistle hath a pretty large root diuided oft times at the top into diuers branches, from which rise many green leaues lying spread vpon the ground, deeply cut and set with sharpe prickles; in the midst of these leaues come vp sometimes one, but otherwhiles more scaly heads, which carry a pretty large floure composed of many purple threds, like that of the Knapweed, but larger, and of a brighter colour; these heads grow vsually close to the leaues, yet sometimes they stand vpon stalkes three or foure inches high: when the floure is past they turne into downe, and are carried away with the winde: the seed is small and grayish. This growes vpon Blacke-Hearth, vpon the chalky hills about Dartford, and in many such places. It floures in Iuly and August. *Tragus* calls it *Chamæleon albus, vel exiguus*; *Lobel*, *Carduus acaulis, Septentrionalium*, and *Chamæleon albus, Cordi*; *Clusius*, *Carlina minor purpureo flore*, and he saith in the opinion of some, it seemes not vnlike to the *Chamæleon* whereof *Theophrastus* makes mention, lib. 6. cap. 3. *Hist. plant.* ‡

¶ The Place.

They both grow vpon high mountaines in desert places, and oftentimes by high way sides: but that which bringeth forth a stalke groweth euery where in Germany, and is a stranger in England.

¶ The Time.

They floure and seed in Iuly and August, and many times later.

¶ The Names.

The former is called in Latine, *Carlina*, and *Cardopatum*, and of diuers, *Carolina*, of *Charlemaine*, the first Romane Emperor of that name, whose armie (as it is reported) was in times past through the benefit of this root deliuered and preserued from the plague: it is called in high Dutch, *Eberwurtz*; in low Dutch, French, and other languages, as likewise in English, *Carline*, and *Carline Thistle*: it is *Dioscorides* his *Leucacantha* the strong and bitter roots shew the same; the faculties also are answerable, as forthwith we will declare: *Leucacantha* hath also the other names, but they are counterfeit, as among the Romanes *Gniacardus*, and among the Thuscans, *Spina alba*, or white Thistle, yet doth it differ from that Thistle which *Dioscorides* calleth *Spina alba*, of which he also writting apart, doth likewise attribute to both of them their owne proper faculties and operations, and the same differing.

The later writers do also call the other *Carlina altera*, and *Carlina humilis*, or *minor*, low, or little Carline: but they are much deceiued who go about to referre them both to the *Chamæleons*; for in Italy, Germany, or France, *Chamæleons*, the *Chamæleons* do neuer grow, as there is one witnesse for many, *Petrus Bellonius*, in his fift booke of Singularities, who sufficiently declareth what difference there is betweene the *Carlines* and the *Chamæleons*; which thing shall be made manifest by the description of the *Chamæleons*.

¶ The Temperature and Vertues.

- A The root of Carline, which is chiefly vsed, is hot in the later end of the second degree, and dry in the third, with a thinnes of parts and substance; it procureth sweate, it driueth forth all kinde of wormes of the belly, it is an enemy to all maner of poisons, it doth not onely driue away infections of the plague, but also cureth the same, if it be drunke in time.
- B Being chewed it helpeth the tooth-ache; it openeth the stoppings of the liuer and spleene.
- C It prouoketh vrine, bringeth downe the menses, and cureth the drop sic.
- D And it is giuen to those that haue been dry beaten, and fallen from some high place.

The

The like operations *Dioscorides* hath concerning *Leucacantha*: *Leucacantha* (saith he) hath a root like *Cyperus*, bitter and strong, which being chewed easeth the paine of the teeth: the decoction thereof with a draught of wine is a remedie against paines of the sides, and is good for those that haue the *Sciatica* or ache in the huckle bones, and for them that be troubled with the crampe. The iuyce also being drunke is of like vertues.

CHAP. 482. Of wilde Carline Thistle.

¶ The Description.

1 The great wilde Carline Thistle riseth vp with a stalke of a cubit high or higher, diuided into certaine branches: the leaues are long, and very full of prickles in the edges, like those of Carline: the floures grow also vpon a prickely head, being set with threds in the midst, and paled round about with a little yellowish leaues: the root is slender, and hath a twinging taste.

2 *Carolus Clusius* describeth a certaine other also of this kinde, with one onely stalke, slender, short, and not aboue a handfull high, with prickly leaues like those of the other, but lesser, both of them couered with a certaine hoary downe: the heads or knaps are for the most part two; they haue a pale downe in the midst, and leaues standing round about, being somewhat stiffe and yellow: the root is slender, and of a reddish yellow.

1 *Carlina sylvestris maior.*

The great wilde Carline Thistle.

2 *Carlina sylvestris minor.*

The little wilde Carline Thistle.

¶ The Place.

The great Carline is found in vntoiled and desert places, and oftentimes vpon hills. † It groweth vpon Blacke Heath, and in many other places of Kent. †

The lesser Carline *Carolus Clusius* writeth that he found growing in dry stony and desert places, about Salmantica a city of Spaine.

¶ The Time.

They floure and flourish in Iune and Iuly.

¶ The Names.

It is commonly called in Latine, and that not vnfitly, *Carlina sylvestris*; for it is like to Carline in floures, and is not very vnlike in leaues. And that this is *Acorna*, it is so much the harder to affirme, by how much the briefer *Theophrastus* hath written hereof; for he saith that this is like bastard saffron, of a yellow colour and fat iuyce: and *Acorna* differs from *Acarna*; for *Acarna*, as *Hesychius* saith, is the Bay tree; but *Acorna* is a prickly plant.

¶ The Temperature and Vertues.

It is hot, especially in the root, the twinging taste thereof doth declare; but seeing it is of no vse, the other faculties be vnsearched out.

CHAP. 483. Of Chamæleon Thistle.

¶ The Kindes.

There be two Chamæleons, and both blacke: the vertues of their roots do differ, and the roots themselves do differ in kinde, as *Theophrastus* declareth.

† 1 *Chamæleon niger*.

The blacke Chamæleon Thistle.

2 *Chamæleon niger Salmanticensis*.

The Spanish blacke Chamæleon.

¶ The Description.

The leaues of blacke Chamæleon are lesser and slenderer than those of the prickely Artichoke, and sprinkled with red spots: the stalke is a cubit high, a finger thicke, and somewhat red: it beareth a tufted-rundle, in which are slender prickly floures of a blew colour like the Hyacinth. The root is thicke, blacke without, of a close substance, sometimes eaten away, which being cut is of a yellowish colour within, and being chewed it bites the tongue.

2 This blacke Chamæleon hath many leaues, long and narrow, very full of prickles, of a light greene, in a manner white: the stalke is chamfered, a foot high, and diuided into branches, on the tops whereof stand purple floures growing forth of prickly heads: the root is blacke, and sweet in taste. This is described by *Clusius* in his Spanish Obseruations, by the name of *Chamæleon Salmanticaensis*, of the place wherein he found it: for he saith that this groweth plentifully in the territory of Salmantica a city in Spaine: but it is very manifest that this is not blacke Chamæleon, neither doth *Clusius* affirme it.

¶ The Place.

It is very common, saith *Bellonius*, in Lemnos, where it beareth a floure of so gallant a blew, as that it seemeth to contend with the skie in beautie; and that the floure of Blew-Bottle being of this colour, seemes in comparison of it to be but pale. It groweth also in the fields neere Abydum, and hard by the riuers of Hellespont, and in Heraclea in Thracia.

Chamæleon Salmanticaensis groweth plentifully in the territorie of Salmantica a city in Spaine.

¶ The Time.

They floure and flourish when the other Thistles do.

¶ The Names.

The blacke Chamæleon is called in Greeke *χρυσάλευρον μέλας*: in Latine, *Chamæleon niger*: of the Romans, *Carduus niger*, and *Vernilago*: of some, *Crocodilion*: in English, the Chamæleon Thistle, or the Thistle that changeth it selfe into many shapcs and colours.

¶ The Temperature and Vertues.

The root hereof, as *Galen* saith, containeth in it a deadly qualitie: it is also by *Nicander* numbred among the poysonous herbes, in his booke of Treacles; by *Dioscorides*, lib. 6. and by *Paulus Aegineta*: and therefore it is vsed only outwardly, as for scabs, morphewes, tetters, and to be brieft, for all such things as stand in need of elensing: moreouer, it is mixed with such things as doe dissolve and mollifie, as *Galen* saith.

† The figure which was formerly in the first place did not agree with the historie (which was taken out of *Dodonæus*) though *Tabern.* gaue it for *Chamæleon niger*; for it is the *Picramnia Creta*, &c. of *Lebel*. You shall finde it hereafter with the *Mosna Valerandi*.

CHAP. 484. Of Sea Holly.

¶ The Kindes.

Dioscorides maketh mention onely of one sea Holly: *Pliny*, lib. 22. cap. 7. seemes to acknowledge two, one growing in rough places, another by the sea side. The Physitians after them haue obserued more.

¶ The Description.

1 **S**ea Holly hath broad leaues almost like to Mallow leaues, but cornered in the edges, and set round about with hard prickles, fat, of a blewish white, and of an aromaticall or spicie taste: the stalke is thicke, aboue a cubit high, now and then somewhat red below: it breaketh forth on the tops into prickly or round heads or knops, of the bignesse of a Wall-nut, held in for the most part with six prickly leaues, compassing the top of the stalke round about: which leaues as well as the heads are of a glistering blew: the floures forth of the heads are likewise blew, with white threds in the midst: the root is of the bignesse of a mans finger, very long, and so long, as that it cannot be all plucked vp, vlesse very seldome; set here and there with knots, and of taste sweet and pleasant.

2 The leaues of the second sea Holly are diuersly cut into sundry parcels, being all full of prickles alongst the edges: the stalke is diuided into many branches, and bringeth forth prickly heads, but lesser than those of the other: from which there also grow forth blew floures, seldome yellow: there stand likewise vnder euery one of these, six rough and prickly leaues like those of the other, but thinner and smaller: the root hereof is also long, blacke without, white within, a finger thicke, of taste and smell like that of the other, as be also the leaues, which are likewise of an aromaticall or spicie taste; which being new sprung vp, and as yet tender, be also good to be eaten.

Ecccc 3

¶ The

1 *Eryngium marinum*.
Sea Holly.

2 *Eryngium mediterraneum*.
Leuant sea Holly.

¶ *The Place.*

Eryngium marinum growes by the sea side vpon the baich and stony ground: I found it growing plentifully at Whitstable in Kent, at Rie and Winchelsea in Suffex, and in Essex at Landamer lading, at Harwich, and vpon Langtree point, on the other side of the water, from whence I haue brought plants for my garden.

Eryngium Campestre groweth vpon the shores of the Mediterranean sea, and in my garden likewise.

¶ *The Time.*

Both of them do floure after the Sommer solstice, and in Iuly.

¶ *The Names.*

This Thistle is called in Greeke *Ερύγγιον*: and likewise in Latine *Eryngium*: and of *Pliny* also *Erynge*: in shops, *Eringus*; in English, Sea Holly, sea Holme, or sea Huluer.

The first is called in Latine *Eryngium marinum*: in low-Dutch euery where, *Cryus distel*, *Cindeloo*, *Meerwortele*: in English, sea Holly.

The second is named of *Pliny*, lib. 22. cap. 8. *Centum capita*, or hundred headed Thistle: in high-Dutch, *Wanfstrew*, *Branchendistel*, *Radendistel*: in Spanish, *Cardo corredor*: in Italian, *Eringio*, and *Iringo*: this is tyrenamed *Campestre*, or Champion sea Holly, that it may differ from the other.

¶ *The Temperature.*

The roots of them both are hot, and that in a mean; and a little dry also, with a thinnesse of substance, as *Galen* testifieth.

¶ *The Vertues.*

A The roots of sea Holly boyled in wine and drunken are good for them that are troubled with the Collicke, it breaketh the stone, expelleth grauell, and helpeth also the infirmities of the kidneys, prouoketh vrine, greatly opening the passages, being drunke fifteene dayes together.

B The roots themselves haue the same propertie if they be eaten, and are good for those that be liuer-sicke, and for such as are bitten with any venomous beast: they ease cramps, convulsions, and the falling sicknesse, and bring downe the termes.

The

The roots condited or preserued with sugar, as hereafter followeth, are exceeding good to be gi- C
uen vnto old and aged people that are consumed and withered with age, and which want naturall
moisture: they are also good for other sorts of people that haue no delight or appetite to vnerie,
nourishing and restoring the aged, and amending the defects of nature in the younger.

¶ The manner to condite Eryngos.

Refine sugar fit for the purpose, and take a pound of it, the white of an egge, and a pint of cleere D
water, boile them together and scum it, then let it boile vntill it be come to good strong syrrup, and
when it is boiled, as it cooleth, adde thereto a saucer full of Rose-water, a spoone full of Cinnamon
water, and a graine of Muske, which haue been infused together the night before, and now strained;
into which syrrup being more than halfe cold, put in your roots to soke and infuse vntill the next
day; your roots being ordered in manner hereafter following:

These your roots being washed and picked, must be boiled in faire water by the space of foure E
houres, vntill they be soft, then must they be pilled cleane, as ye pill parsneps, and the pith must bee
drawne out at the end of the root; and if there be any whole pith cannot be drawne out at the end,
then you must slit them, and so take out the pith: these you must also keepe from much hand-
ling, that they may be cleane, let them remaine in the syrrup till the next day, and then set them
on the fire in a faire broad pan vntill they be verie hot, but let them not boile at all: let them there
remaine ouer the fire an houre or more, remoouing them easily in the pan from one place to ano-
ther with a wooden slice. This done, haue in a readinesse great cap or royall papers, whereupon
you must straw some Sugar, vpon which lay your roots after that you haue taken them out of the
pan. These papers you must put into a Stoue, or hot house to harden; but if you haue not such a
place, lay them before a good fire. In this manner if you condite your roots, there is not any that
can prescribe you a better way. And thus may you condite any other root whatsoeuer, which will
not onely bee exceeding delicate, but very wholesome, and effectuall against the diseases aboue
named.

A certaine man affirmeth, saith *Actius*, that by the continual vse of Sea Holly, he neuer afterward F
voided any stone, when as before he was very often tormented with that disease.

It is drunke, saith *Dioscorides*, with Carrot seed against very many infirmities, in the weight of a G
dramme.

The iuice of the leaues pressed forth with wine is a remedie for those that are troubled with the H
running of the reines.

They report that the herbe Sea Holly, if one Goat take it into her mouth, it causeth her first to I
stand still, and afterwards the whole flocke, vntill such time as the Shepheard take it forth of her
mouth, as *Plutarch* writeth.

CHAP. 485. Of bastard Sea Hollies.

¶ The Description.

THIS *Eryngium* which *Dodonæus* in his last edition calleth *Eryngium planum*, and *Pena*
more fitly and truly, *Eryngium Alpinum caruleum*, hath stalkes a cubite and a halfe high,
hauing spaces betweene euery ioint: the lower leaues are greater and broader, and notched about
the edges, but those aboue are lesser, compassing or enuironing each ioint star-fashion, beset with
prickles which are soft and tender, not much hurtful to the hands of such as touch them; the knobs
or heads are also prickley, and in colour blew. The root is bunchie or knottie, like that of *Helenium*,
that is, *Elecampane*, blacke without, and white within, and like the *Eringes* in sweetnesse and
taste.

2 The second bastard Sea Holly, whose picture is set forth in *Dodonæus* his last Edition verie
gallantly, being also a kind of Thistle, hath leaues like vnto the former Erynges, but broader next
the rootes than those which grow next the stalkes, somewhat long, greenish, soft, and not prickley,
but lightly creuised or notched about the edges, greater than Quince leaues. The stalks grow more
than a cubit high; on the tops whereof there hang downwards five or six knobs or heads, in colour
and floures like the other; hauing three or foure whitish roots of a foot long.

3 The third kinde of bastard *Eryngium* hath his first leaues (which grow next the ground)
great, broad, and soft, growing as it were in a rundle about the root. The stalke is small and slender,
diuided into some branches, which beare many little leaues, turning or standing many waies, which
be

1 *Eryngium ceruleum*.
Blew Sea Holly.

2 *Eryngium spurium primum* Dodonai.
Baltard Sea Holly.

3 *Eryngium pumilum* Clusij.
Dwarfe Sea Holly.

4 *Eryngium Montanum*.
Mountaine Sea Holly.

‡ 5 *Eryngium pusillum planum.*
Small smooth Sea Holly.

be also slender, prickly, and set about the stalks star-fashion. The knops or heads growing at the tops of the branches are round and prickly, bearing little blew floures and leaues, which compass them about: the root is slender, and lasteth but one yeare.

4 The fourth kinde of bastard Sea Holly, which Pena calleth *Eryngium montanum recentiorum*, and is the fourth according to *Dodonæus* his account, is like to the Erynges, not in shape but in taste: this beareth a very small and slender stalke, of a meane height, whereupon doe grow three or foure leaues, & seldom five, made of diuers leaues set vpon a middle rib, narrow, long, hard, and of a darke Greene colour, dented on both edges of the leafe like a saw: the stalke is a cubit high, iointed or kneed, and diuiding it selfe into many branches, on the tops whereof are round tufts or vmbels, wherein are contained the floures, and after they be vaded, the feedes, which are small, somewhat long, well smelling, and sharpe in taste: the root is white and long, not a finger thicke, in taste sweet, but afterwards somewhat sharpe, and in sent and sauour not vnpleasant: when the root is dried, it may be crumbled in pieces, and therefore quickly braied.

‡ 5 This is a low plant presently from the root diuided into sundry branches, slender, round & lying on the ground: at each ioint grow leaues without any certain order, broad toward their ends, and narrower at their setting on, snipt about their edges: those next the root were some

inch broad, and two or more long, of a yellowish Greene colour: the stalkes are parted into sundry branches; and at each ioint haue little leaues, and rough and Greene heads, with blewish floures in them: the roots creepe, and are somewhat like those of *Asparagus*. This neither *Clusius* nor *Lobel* found wilde; but it grew in the garden of *Iohn Mouton* of Tourney, a learned Apothecarie, verie skilfull in the knowledge of plants: whereupon they both called it *Eryngium pusillum planum Montoni*. ‡

¶ The Place.

These kindes of sea Holly are strangers in England: we haue the first and second in our London gardens.

¶ The Time.

They floure and flourish when the Thistles do.

¶ The Names.

These plants be *Eryngia spuria*, or bastard Sea Hollies, and are lately obserued: and therefore they haue no old names.

The first may bee called in Latine *Eryngium Borussicum*, or *Non spinosum*: Sea Hollie without prickles.

The second is called by *Matthiolum*, *Eryngium planum*, or flat Sea Holly: others had rather name it *Alpinum Eryngium*, or Sea Holly of the Alpes.

The third is rightly called *Eryngium pumilum*, little Sea Huluer.

Matthiolum maketh the fourth to be *Crithmum quartum*, or the fourth kinde of Sampier: and others, as *Dodonæus* and *Lobel*, haue made it a kinde of Sea Huluer.

¶ The Temperature and Vertues.

Touching the faculties hereof we haue nothing to set downe, seeing they haue as yet no vse in medicine, nor vsed to be eaten. But yet that they be hot, the very taste doth declare.

CHAP. 486. Of Star-Thistle.

¶ The Description.

THe Star-Thistle, called *Carduus stellatus*, hath many soft frizled leaues, deeply cut or gasht, altogether without prickles: among which riseth vp a stalke, diuiding it selfe into many other branches, growing two foot high; on the tops whereof are small knops or heads like the other Thistles, armed round about with many sharpe prickles, fashioned like a blasing star, which at the beginning are of a purple colour, but afterwards of a pale bleak or whitish colour: the seed is small, flat, and round; the root is long, and browne without.

1 *Carduus stellatus*.
The Star-Thistle.

† 2 *Carduus Solstitialis*.
Saint Barnabies Thistle.

2 Saint Barnabies Thistle is another kinde of Star-Thistle; notwithstanding it hath prickles no where faue in the head onely, and the prickles of it stand forth in manner of a star: the stalks are two cubits high, parted into diuers branches softer than are those of star-Thistle, which stalks haue velmes or thin skins cleauing vnto them all in length, by which they seeme to be foure-square: the leaues are somewhat long, set with deep gashes on the edges: the floures are yellow, and consist of threds: the seed is little; the root long and slender.

¶ The Place.

The two first do grow vpon barren places neere vnto cities and townes, almost euery where.

¶ The Time.

They floure and flourish especially in Iuly and August.

¶ The Names.

The first is called in Latine, *Stellaria*; as also *Carduus Stellatus*, and likewise *Carduus Calcitrapa*; but they are deceiued, who take it to be *Eryngium*, or Sea-Holly, or any kinde thereof. *Matthiolus* saith that it is called in Italian *Calcatrippa*: in high Dutch, *Wallen distel*: in low Dutch, *Sterre distell*: in French, *Chausse trappe*: in English, Star-Thistle.

S. Barnabies Thistle is called in Latine *Solstitialis spina*, because it floureth in the Sommer Solstice

stice, as *Gesner* saith, or rather because after the Solstice the prickles thereof be sharpest: of *Guillandinus*, *Eryngium*, but not properly, and *Stellaria Horatij Augerij*, who with good successe gaue it against the stone, dropies, Greene sicknesse, and quotidian feuers. It is called in English as aboue said, Saint Barnabies Thistle.

¶ The Temperature.

The Star-Thistle is of a hot nature.

¶ The Vertues.

The seed is commended against the strangurie: it is reported to driue forth the stone, if it bee A
drunke with wine.

Baptista Sardus affirmeth, that the distilled water of this Thistle is a remedie for those that are in- B
fected with the French Pox, and that the vse of this is good for the liuer, that it taketh away the
stoppings thereof.

That it clenseth the blood from corrupt and putrified humours.

That it is giuen with good successe against intermitting feuers; whether they be quotidian or C
tertian. D

As touching the faculties of Saint Barnabies Thistle, which are as yet not found out, we haue E
nothing to write.

† There were formerly three figures and descriptions in this chapter, and all of them out of the 14. and 15. chapter. of the fifth booke, and fifth *Pempta* of *Donatus*; but the first and second figures were both of the first described, the third figure was of the *Acanthium peregrinum* of *Tabernaemontanus*, which *Raouine* knowes not what to make of, but I thinke it was drawne for, and (if the tuberous clogs of the roots were somewhat larger) might very well serue for the *Cuscuta maximum*. *Asphodeli radice*, whose figure as I drew it from the plant I will hereafter giue you: the third description was of the *Lacea maior lutea*, described in the third place of the 249. Chap. pag. 727.

CHAP. 487 Of Teasels.

¶ The Kindes.

Ov age hath set downe two Kindes of Teasels: the tame, and the wilde. These differ not saue on-
ly in the husbanding; for all things that are planted and manured doe more flourish, and be-
come for the most part fitter for mans vse.

1 *Dipsacus sativus*.
Garden Teasell.

2 *Dipsacus sylvestris*.
Wilde Teasell.

¶ The

‡ 3 *Dipsacus minor*, sive *Virga pastoris*.
Shepherds-rod.

¶ The Description.

1 **G**arden Teasel is also of the number of the Thistles, it bringeth forth a stalke that is straight, very long, jointed, and full of prickles: the leaues grow forth of the ioints by couples, not onely opposite or set one right against another, but also compassing the stalke about, and fastened together; and so fastened, that they hold dew and raine water in manner of a little bason: these be long, of a light Greene colour, and like to those of Lettice, but full of prickles in the edges, and haue on the outside all alongst the ridge stiffer prickles: on the tops of the stalkes stand heads with sharpe prickles like those of the Hedge-hog, and crooking backward at the point like hookes: out of which heads grow little floures: The seed is like Fennell seed, and in taste bitter: the heads wax white when they grow old, and there are found in the midst of them when they are cut, certaine little magots: the root is white, and of a meane length.

2 The second kinde of Teasell which is also a kinde of Thistle, is very like vnto the former, but his leaues are smaller & narrower: his floures of a purple colour, and the hookes of the Teasell nothing so hard or sharpe as the other, nor good for any vse in dressing of cloath.

3 There is another kinde of Teasell, being a wilde kinde therof, and accounted among these

Thistles, growing higher than the rest of his kindes; but his knobbed heads are no bigger than a Nutmeg, in all other things else they are like to the other wilde kindes. ‡ This hath the lower leaues deeply cut in with one gash on each side at the bottome of the leafe, which little ears are omitted in the figure: the leaues also are lesse than the former, and narrower at the setting on, and hold no water as the two former do: the whole plant is also much lesse. ‡

¶ The Place.

The first called the tame Teasell is sowne in this countrey in gardens, to serue the vse of Fullers and Clothworkers.

The second kinde groweth in moist places by brookes, riuers, and such like places.

The third I found growing in moist places in the high way leading from Braintree to Henningham castle in Essex, and not in any other place except here & there a plant vpon the high way from Much-Dunmow to London. ‡ I found it growing in great plentie at Edgecombe by Croyden, close by the gate of the house of my much honoured friend Sir John Tunstall.

¶ The Time.

These floure for the most part in Iune and Iuly.

¶ The Names.

Teasell is called in Greeke *σι-λακε*, and likewise in Latine, *Dipsacus*, *Labrum Veneris*, and *Carduus Veneris*: it is termed *Labrum Veneris*, and *Lauer Lavacrum*, of the forme of the leaues made vp in fashion of a bason, which is neuer without water: they commonly call it *Virga pastoris minor*, and *Carduus fullonum*: in high Dutch, *Karden Distell*: in low Dutch, *Caerden*: in Spanish, *Cardencha*: and *Cardo Pentecador*: in Italian, *Dissaco*, and *Cardo*: in French, *Chardon de foullon*, *Verge à bergier*: in English, Teasell, Carde Teasell, and Venus bason.

The third is thought to be *Galedragon* Plinij: of which he hath written in his 27. book the tenth Chapter.

¶ The Temperature.

A

The rootes of these plants are drie in the second degree, and haue a certaine clensing facultie.

¶ The

¶ The Vertues.

There is small vse of Teasell in medicines: the heads (as we haue said) are vsed to dresse wool-
len cloth with.

Dioscorides writeth, that the root being boiled in wine, & stamped till it is come to the substance
of a salve, healeth chaps and fistulaes of the fundament, if it be applied thereunto; and that this me-
dicine must be referued in a box of copper, and that also it is reported to be good for all kindes of
warts.

It is needlesse here to alledge those things that are added touching the little wormes or magots
found in the heads of the Teasell, and which are to be hanged about the necke, or to mention the
like thing that *Pliny* reporteth of Galedragon: for they are nothing else but most vaine and trifling
toies, as my selfe haue proued a little before the impression hereof, hauing a most grievous ague,
and of long continuance: notwithstanding Physicke charmes, these worms hanged about my neck,
spiders put into a walnut shell, and diuers such foolish toies that I was constrained to take by fan-
tasticke peoples procurement; notwithstanding I say, my helpe came from God himselfe, for these
medicines and all other such things did me no good at all.

† The figure which formerly was put into the second place, was of the *Dipsacus secundus* of *Tabernaemontanus*, which differs from our common one, in that the leaues
are deeply diuided, or cut in on their edges.

CHAP. 488. Of Bastard Saffron.

† 1 *Carthamus sine Cnicus*.

Bastard Saffron.

† 2 *Cnicus alter caruleus*.

Blew flowered Bastard Saffron.

¶ The Description.

1 *Cnicus*, called also bastard Saffron, which may very wel be reckoned among the Thistles,
riseth vp with a stalke of a cubite and a halfe high, straight, smooth, round, hard, and
woody, & branched at the top: it is defended with long leaues, something broad, sharp
pointed,

FFFF

pointed, and with prickles in the edges: from the tops of the stalks stand out little heads or knops of the bignesse of an Oliue or bigger, set with many sharpe pointed and prickly scales: out of which come forth floures like threds, closely compact, of a deepe yellow shining colour, drawing neere to the colour of Saffron: vnder them are long seeds, smooth, white, somewhat cornered, bigger than a Barly corne, the huske whereof is something hard, the inner pulpe or substance is fat, white, sweet in taste: the root slender and vnprofitable.

2 There is also another kinde of Bastard Saffron, that may very well be numbred amongst the kindes of Thistles, and is very like vnto the former, sauing that his flockie or threddie floures, are of a blew colour: the root is thicker, and the whole plant is altogether more sharpe in prickles: the stalks also are more crested and hairie.

¶ The Place.

It is sowne in diuers places of Italy, Spaine, and France, both in gardens and in fields: *Pliny*, lib. 25. cap. 15. saith, that in the raigne of *Vespasian* this was not knowne in Italy; being in Egypt onely of good account, and that they vsed to make oile of it, and not meat.

¶ The Time.

The floures are perfected in Iuly and August: the root after the seed is ripe, the same yeare it is sowne withereth away.

¶ The Names.

It is called in Greeke *κνικος*: in Latine also *Cnicus*, or *Cnecus*: in shops, *Cartamus*, or *Carthamus*: of diuers, *Crocus hortensis*, and *Crocus Saracenicus*: in Italian, *Zaffarano Saracinesco*, and *Zaffarano saluatico*: in Spanish, *Alasor*, and *Semente de papagaios*: in high Dutch, *wilden Zaffran*: in French, *Safran Sauvage*: in English, Bastard Saffron, of some, Mocke Saffron, and Saffron D'orte, as though you should say Saffron de horte, or of the garden. *Theophrastus* and *Pliny* call it *Cnecus urbana*, and *satina*, or tame and garden bastard Saffron, that it may differ from *Atractilis*, which they make to be a kinde of *Cnicus syluestris*, or wilde Bastard Saffron, but rather a *species* of the Holy Thistle.

¶ The Temperature.

We vse saith *Galen*, the seed onely for purgations: it is hot, and that in the first degree, as *Mesues* writeth.

¶ The Vertues.

- A The iuice of the seed of bastard Saffron bruised and strained into honied water or the broth of a chicken, and drunke, prouoketh to the stoole, and purgeth by siege slimy flegme, and sharp humors: Moreouer it is good against the collicke, and difficultie of taking breath, the cough, and stopping of the brest, and is singular against the dropse.
- B The seed vsed as aforesaid, and strained into milke, causeth it to curdle and yeeld much cruds, and maketh it of great force to loose and open the belly.
- C The floures drunke with honied water open the liuer, and are good against the iaundice: and the floures are good to colour meat in stead of Saffron.
- D The seed is very hurtfull to the stomacke, causing desire to vomite, and is of hard slow digestion, remaining long in the stomacke and entrailes.
- E Put to the same seed things comfortable to the stomacke, as Annise seed, Galingale, or Mastick, Ginger, *Sal gemma*, and it shall not hurt the stomacke at all, and the operation thereof shall be the more quicke and speedy.
- F Of the inward pulpe or substance hereof is made a most famous and excellent composition to purge water with, commonly called *Diachartamon*, a most singular and effectual purgation for those that haue the dropse.
- G The perfect description hereof is extant in *Guido* the Surgion, in his first Doctrine, and the sixt Treatise.
- H We haue not read, or had in vse that Bastard Saffron with the blew floure, and therefore can say nothing of his vertues.

† The figure formerly was of the *Cnicus caruleus*.

CHAP. 489. Of Wilde Bastard Saffron.

¶ The Description.

A *Tractylis*, otherwise called wilde Bastard Saffron, bringeth forth a straight and firme stalk, verie fragile or brittle, diuided at the toppe into certaine branches: it hath long,

long iagged leaues set with prickles: the heads on the tops of the branches are very full of sharp prickles: out of which grow floures all of threds, like those of bastard Saffron, but they are of a light yellow colour, and sometimes purple: the seed is somewhat great, browne, and bitter, otherwise like that of bastard Saffron: the root is of a meane bignesse.

1 *Atractylis*.
Wilde Bastard Thistle.

2 *Carduus Benedictus*.
The blessed Thistle.

2 The stalkes of *Carduus Benedictus*, or Blessed Thistle, are round, rough, and pliable, and being parted into diuers branches, do lie flat on the ground: the leaues are iagged round about, and full of harmlesse prickles in the edges: the heads on the tops of the stalks are set with prickles, and inuironed with sharpe prickling leaues, out of which standeth a yellow floure: the seed is long, and set with haire at the top like a beard: the root is white, and parted into strings: the whole herb, leaues and stalks, and also the heads, are couered with a soft and thin downe.

¶ The Place.

Atractylis groweth in Candie, and in diuers prouinces and Islands of Greece, and also in Languedock: and is an herbe growing in our English gardens.

Carduus Benedictus is found euery where in Lemnos, an Island of the Midland Sea, in Champion grounds, as *Petrus Bellonius* testifieth: it is diligently cherished in Gardens in these Northerne parts.

¶ The Time.

Atractylis is very late before it floureth and seedeth.

Carduus Benedictus floureth in Iuly and August, at which time it is especially to be gathered for Physicke matters.

¶ The Names.

Atractylis is called in Greeke *Ατρακτύλις*: of the Latins likewise, *Atractylis*, and *Cnicus sylvestris*; and because women in the old time were wont to vse the stiffe stalk thereof *pro fusio aut colo*, for a spindle or a distaffe, it is named *Fusus agrestis*, and *Colus Rustica*; which thing *Petrus Bellonius* reporteth the women in Greece do also euen at this day; who call *Atractylis* by a corrupt name *Ardaetyla*: diuers of the later herbarists name it *Sylvestris Carthamus*: that is to say in low Dutch, *wilden Carthamus*: and in English, wilde Bastard Saffron: or Spindle Thistle.

Blessed Thistle is called in Latine euery where *Carduus Benedictus*, and in shops by a compound

word, *Cardo-benedictus*: it is most plaine, that it is *Species Atractylidis*, or a kind of wilde bastard Saffron: it is called *Atractylis hirsutior*, hairie wilde bastard Saffron: *Valerius Cordus* nameth it *Cnicus supinus*: it is called in high Dutch, *Beseegnete distell*, *cardo Benedict*: the later name whereof is knowne to the low Countrey men: in Spanish it is called *Cardo Sancto*: in French, *Chardon benoist*, or *benoist*: in the Isle Lemnos, *Gardacantha*: in English, Blessed Thistle, but more commonly by the Latine name *Carduus Benedictus*.

¶ The Temperature.

Wilde bastard Saffron doth drie and moderately digest, as *Galen* witnesseth.

As *Carduus Benedictus* is bitter, so is it also hot and drie in the second degree, and withall cleansing and opening.

¶ The Vertues.

- A The tops, seed, and leaues of *Atractylis*, saith *Dioscorides*, being beaten and drunk with pepper and wine, are a remedie for those that are stung of the scorpion.
- B Blessed Thistle taken in meat or drinke, is good for the swimming and giddinesse of the head, it strengthneth memorie, and is a singular remedie against deafenesse.
- C The same boiled in wine and drunke hot, healeth the griping paines of the belly, killeth and expelleth wormes; causeth sweat, prouoketh vrine, and driueth out grauel, clenseth the stomach, and is very good against the Feuer quartaine.
- D The iuice of the said *Carduus* is singular good against all poison, as *Hierome Boeke* witnesseth, in what sort soeuer the medicine be taken; and helpeth the inflammation of the liuer, as reporteth *Leachimus Camerarius* of Noremberg.
- E The poudre of the leaues ministred in the quantitie of halfe a dram, is very good against the pestilence, if it be receiued within 24. houres after the taking of the sicknes, and the party sweate vpon the same: the like vertue hath the wine, wherein the herbe hath been sodden.
- F The green herb pounded and laid to, is good against all hot swellings, as *Erysipelas*, plague sores, and botches, especially those that proceed of the pestilence, and is also good to be laied vpon the bitings of mad dogs, serpents, spiders, or any venomous beast whatsoeuer; and so is it likewise if it be inwardly taken.
- G The distilled water thereof is of lesse vertue.
- H It is reported that it likewise cureth stubborne and rebellious vlcers, if the decoction be taken for certaine daies together; and likewise *Arnoldus de Villanova* reporteth, that if it be stamped with Barrows grease to the form of an vnguent, adding thereto a little wheat floure, it doth the same, being applied twice a day.
- I The herbe also is good being stamped and applied, and so is the iuice thereof.
- K The extraction of the leaues drawne according to Art, is excellent good against the French disease, and quartaine agues, as reporteth the foresaid *Camerarius*.
- L The same Author reporteth, that the distilled water taken with the water of Louage, and Dodder, helpeth the sauce-flegme face, if it be drunke for certaine daies together.

CHAP. 490. Of Thistle vpon Thistle, and diuers other Wilde Thistles.

¶ The Description.

AMong all the Thornes and Thistles, this is most full of prickles; the stalks thereof are verie long, and seem to be cornered by reason of certaine thin skins growing to them, being sent downe forth of the leaues: the leaues are set round about with many deep gashes, being very full of prickles as well as the stalks: the heads are very thicke set in euery place with stiffe prickles, and consist of a multitude of scales; out of which grow purple floures, as they do out of other Thistles, seldome white: the root is almost straight, but it groweth not deep.

2 To this also may be referred that which *Lobel* writeth to be named of the Italians *Leo*, and *Carduus serox*, for it is so called of the wonderfull sharpe and stiffe prickles, wherewith the whole plant aboundeth: the stalke thereof is short, scarce a handfull high: the floure groweth forth of a prickly head, and is of a pale yellow colour, like that of wilde bastard Saffron, and it is also inuironed and set round about on euery side with long hard thornes and prickles.

3 The third groweth seldome aboue a cubite or two foot high: it bringeth forth many round stalkes, parted into diuers branches; the leaues are like those of white Cotton Thistle, but lesser, and blacker, and not couered with downe or Cotton: vpon the tops of the stalks grow little heads like

† 1 *Polyacanthos.*
Thistle vpon Thistle.

2 *Carduus ferox.*
The cruell Thistle.

† 3 *Carduus Asininus* five *Onopyxos.*
The Asses Thistle, or Asses box.

† 4 *Carduus vulgarissimus viarum.*
The Way Thistle.

like Hedge-hogs; out of which spring gallant purple floures, that at length are turned into downe, leaving feedes behinde them like those of the other Thistles: the root consisteth of many small strings.

4 The fourth riseth vp with an higher stalke, now and then a yard long, round, and not so full of branches nor leaues, which are sharpe and full of prickles, but lesser and narrower: the heads be also lesser, longer, and not so full of stiffe prickles: the floures are of a white colour, and vanish into downe: the root is blacke, and of a foot long.

5 This wilde Thistle which groweth in the fields about Cambridge, hath an vpright stalke, whereon do grow broad prickley leaues: the floures grow on the tops of the branches, consisting of a flockie downe, of a white colour tending to purple, of a most pleasant sweet smell, striuing with the fauour of muske: the root is small, and perisheth at the approach of Winter. ‡ I had no figure directly fitting this; wherefore I put that of *Dodonæus* his *Onopordon*, which may well serue for it, if the leaues were narrower, and more diuided. ‡

† 5 *Carduus Muscatus.*
The musked Thistle.

6 *Carduus lanceatus.*
The Speare Thistle.

6 The Speare Thistle hath an vpright stalke, garnished with a skinnie membrane, full of most sharpe prickles: whereon do grow very long leaues, diuided into diuers parts with sharp prickles; the point of the leaues are as the point of a speare, whereof it tooke his name: the floures grow on the tops of the branches, set in a scaly prickly head, like vnto the heads of Knapweed in forme, consisting of many threds of a purple colour: the root consisteth of many tough strings.

7 *Theophrastus* his fish Thistle called *Acarna*, which was brought from Illyria to Venice, by the learned *Valerandus Donrez*, described by *Theophrastus*, hath horrible sharpe yellow prickles, set vpon his greene indented leaues, which are couered on the backe side with an hoarie downe (as all the rest of the plant) hauing a stalke of a cubit and a halfe high, and at the top certaine scaly knops containing yellow thrummie floures, armed or fenced with horrible sharp prickles: the root is long and threddie.

8 The other kinde of fish Thistle, being also another *Acarna* of *Valerandus* description, hath long and large leaues, set full of sharpe prickles, as though it were set full of pins: all the whole plant is couered with a certaine hoarinesse, like the former: there ariseth vp a stalke nine inches long, yea in some fertile grounds a cubite high, bearing the floure of *Carduus benedictus*, standing thicke together, but lesser.

7 *Acarua* Theophrasti.
Theophrastus his fish Thistle.

8 *Acarua Valerandi* Donreæ.
Donreæ his fish Thistle.

† 9 *Picnomos*.
The thicke or bush headed Thistle.

† 9 This Thistle in the opinion of *Bauhine*, whereto I much incline, is the same with the former. The root is small, the leaues long, wetting the stalks at their setting on, and armed on the edges with sharpe prickles: the stalkes lie trailing on the ground like those of the star-Thistle, so set with prickles, that one knoweth not where to take hold thereof: it hath many closely compact umbels, consisting of pale yellowish little floures like those of Groundswell: the seed is like that of *Carthamus*, smal and chafie. *Pena* and *Lobel* call this *Picnomos Cretæ Saloniensis*, of a place in Prouince where they first found it, called the Crau, being not farre from the city Salon. *Tabernamontanus* set it forth for *Chamaeleon niger*, and our Author formerly gaue the figure hereof by the same title, though his historie belonged to another, as I haue formerly noted. ‡

¶ The Time.

The two first grow on diuers banks not farre from mount Apennine, and sometimes in Italy, but yet seldome.

The way Thistles grow euery where by highwaies sides and common paths in great plenty.

The places of the rest haue beene sufficiently spoken of in their descriptions.

¶ The

¶ The Time.

These kindes of Thistles do floure from the beginning of Iune vntill the end of September.

¶ The Names.

These Thistles comprehended in this present chapter are by one generall name called in Latine *Cardui sylvestres*, or wilde Thistles; and that which is the second in order is named *Scolymus*: but not that *Scolymus* which *Theophr.* declareth to yeeld a milky iuyce (of which wee haue written before) but one of those which *Pliny* in his twentieth booke, cap. 23. describeth: of some they are taken for kindes of *Chamæleon*: their feuerall titles do set forth their feuerall Latine names, and also the English.

‡ There was formerly much confusion in this chapter, both in the figures and historie, which I will here endeauour to amend, and giue as much light as I can, to the obscuritie of our Authour and some others; to which end I haue made choice of the names as the fittest place.

1 This description was taken out of *Dodonæus*, and the title also of *Onopordon* which was formerly put ouer the figure, and they belong to the Thistle our Author before described by the name of *Acanthium purp. Illyricum*, cap. 476. I haue therefore changed the title, yet let the description stand, for it reasonable well agrees with the figure which is of the *Carduus spinosissimus vulgaris* of *Lobel*, and *Polyacantha Theophrasti* of *Tabern.* Of this Thistle I obserue three kindes: the first is a Thistle some two cubits and a halfe high, with many slender stalkes and branches exceeding prickly, hauing commonly fiue prickly welts running alongst the stalks: the leaues on the vpper sides as also the stalkes are of a reasonable fresh Greene colour, but the vnder side of the leafe is somewhat whitish: the heads consist of sundry hairy Greene threds which looke like prickles, but they are weake, and not prickly: the floure is of the bignesse, and of the like colour and shape as the common Knapweed, yet somewhat brighter: it growes on ditch sides, and floures in Iuly. This I take to be the *Aculeosa Gasa* of the *Aduers.* pag. 374. but not that which *Lobel* figures for it in his *Icones.* This is that which *Tabernamontanus* figures for *Polyacantha*, and our Author gaue his figure in this place. The second of these I take to be that which *Lobel* hath figured for *Polyacantha*, and *Dodonæus* for *Carduus syl.* 3. (which figure we here giue you) and in the *Hist. Lugd.* pag. 1473. it is both figured and described by the name of *Polyacanthos Theophrasti.* In the figure there is little difference: in the things themselues this; the stalkes of this are as high as those of the last, but slenderer, with fewer and straighter branches, and commonly edged with foure large welts, which haue fewer, yet longer prickles than those of the former: the leaues and stalkes of this are of a grayish or whitish colour: the heads are longish, but much smaller than those of the former, and they seldom open or spread abroad their floures, but onely shew the tops of diuers reddish threds of a feint colour. This growes as frequently as the former, and commonly in the same places. The third, which I thinke may fitly be referred vnto these, growes on wet heaths and such like places, hauing a stalke sometimes foure or fiue cubits high, growing straight vp, with few branches, and those short ones: the floures are of an indifferent bignesse, and commonly purple, yet sometimes white. I thinke this may be the *Onopyxos alter Lugdunens.* or the *Carduus palustris* described in *Bauhinnus* his *Prodromus*, pag. 156.

2 The second, which is a stranger with vs, is the *Phœnix*, *Leo* & *Carduus ferox* of *Lobel* and *Dod.* *Bauhine* both refer'd it to *Acarina*, calling it *Acarina minor caule non folioso.*

3 The third description was also out of *Dodonæus*, being of his *Carduus sylvestris primus*, or the *Onopyxos Dodonæi* of the *Hist. Lugd.* The figures formerly both in the third and fourth place of this chapter were of the *Acanthium Illyricum* of *Lobel*; or the *Onopordon* of *Dodonæus*, formerly mentioned.

4 This description also was out of *Dodonæus*, being of his *Carduus sylvestris alter*, agreeing in all things but the colour of the floures, which should be purple. *Lobel* in his Observations describeth the same Thistle by the name of *Carduus vulgarissimus viarum*: but both he and *Dodon.* giue the figure of *Carlina sylvestris* for it: but neither the floures nor the heads of that agree with that description. I iudge this to be the Thistle that *Fabius Columna* hath set forth for the *Ceanothos* of *Theophrastus*; and *Tabern.* for *Carduus arvensis*: and our Author, though vnfitly, gaue it in the next place for *Carduus muscatus.*

5 The Muske-Thistle I haue seene growing about Deptford, and (as far as my memory serues me) it is very like to the third here described: it growes better than a cubit high, with reasonable large leaues, and also heads which are a little soft or downy, large, with purple floures: the heads before the floures open smell strong of muske. I haue found no mention of this but only in *Gesner, de Collectione in parte*, where he hath these words; *Carduus arvensis maior purpureo flore (qui flore nondum nato Moschum olebat) floret Iulio.* Our Author formerly gaue an vnfit figure for this, as I formerly noted.

There is sufficient of the rest in their titles and descriptions. ‡

The Temperature and Vertues.

These wild Thistles (according to *Galen*) are hot and dry in the second degree, and that through the propertie of their essence they driue forth stinking vrine, if the roots be boyled in Wine and drunke; and that they take away the ranke smell of the body and arme-holes.

Dioscorides saith, that the root of the common Thistle applied plaisterwise correcteth the filthy smell of the arme holes and whole body.

And that it workes the same effect if it be boyled in wine and drunke, and that it expelleth plentie of stinking vrine.

The same Author affirmeth also, that the herbe being as yet Greene and tender is vsed to be eaten among other herbes after the manner of Asparagus.

This being stamped before the floure appeareth, saith *Pliny*, and the iuyce pressed forth, causeth haire to grow where it is pilled off, if the place be bathed with the iuyce.

The root of any of the wilde Thistles being boyled in water and drunke, is reported to make them dry that drinke it.

It strengthneth the stomacke; and it is reported (if we beleuee it) that the same is also good for the matrix, that boyes may be ingendred: for so *Chereas* of Athens hath written, and *Glaucoas*, who is thought to write most diligently of Thistles.

This Thistle being chewed is good against stinking breath. Thus farre *Pliny*, in his twentieth booke, cap. 23.

CHAP. 491. Of the Melon or Hedge-hog Thistle.

Melocardus Echinatus Pena & Lob.

The Hedge-hog Thistle.

The Description.

Who can but marvel at the rare and singular workmanship which the Lord God almighty hath shewed in this Thistle, called by the name *Echino-Melocactos*, or *Melocardus Echinatus*? This knobby or bunchy masse or lump is strangely compact and context together, containing in it sundry shapes and formes, participating of a Pepon or Melon, and a Thistle, both being incorporate in one body; which is made after the forme of a cock of hay, broad and flat below, but sharp toward the top, as big as a mans body from the belly vpward: on the outside hereof are fourteene hard ribbes, descending from the crowne to the lowest part, like the bunchy or out swelling rib of a Melon standing out, and chanelled betweene: at the top or crowne of the plant issueth forth a fine silken cotton, wherewith it is full fraught; within which cotton or flockes lie hid certain smal sheaths or cods, sharpe at the point, and of a deep sanguine colour, answering the cods of *Capsicum* or Indian Pepper, not in shew only, but in colour, but the cods are somewhat smaller. The furrowed or chanelled ribs on the outside are garnished or rather armed with many prickly stars, standing in a compasse like sharpe crooked hornes or hookes, each star consisting of ten or twelue pricks, wherewith the outward barke or pilling is garded, so that without

hurt to the fingers it cannot be touched: this rinde is hard, thicke, and like vnto Aloes, of the colour of the Cucumber: the flesh or inner pulpe is white, fat, waterish, of taste soure, vnfauory, and cooling, much like vnto the meate of a raw Melon or Pompion. This plant groweth without leafe or stalke, as our Northerne Thistle doth, called *Carduus Acaulos*, and is bigger than the largest Pompion:

Pompion: the roots are small, spreading farre abroad in the ground, and consisting of blacke and tough twigs, which cannot endure the iniurie of our cold clymate.

¶ *The Place.*

This admirable Thistle groweth vpon the cliffes and grauelly grounds neere vnto the sea side, in the Islands of the West Indies, called *S. Margarets* and *S. Johns Isle*, neere vnto *Puerto rico*, or *Porto rico*, and other places in those countries, by the relation of diuers traellers that haue iournied into those parts, who haue brought me the plant it selfe with his seed; the which would not grow in my garden by reason of the coldnesse of the clymate.

¶ *The Time.*

It groweth, floureth, and flourisheth all the yeare long, as do many other plants of those Countries.

¶ *The Names.*

It is called *Carduus Echinatus*, *Melocarduus Echinatus*, and *Echino Melocactos*: In English, the Hedge-hog Thistle, or prickly Melon Thistle. ‡ Such as are curious may see more hereof in *Clusius* his *Exoticks*, lib. 4. cap. 24. ‡

¶ *The Temperature and Vertues.*

There is not any thing extant set forth of the antient or of the later writers, neither by any that haue trauelled from the Indies themselves: therefore we leaue it to a further consideration.

CHAP. 492. Of the gummie Thistle, called *Euphorbium*.

1 *Euphorbium.*

The poysonous gum Thistle.

2 *Anteuphorbium.*

The Antidote against the poysonous Thistle!

¶ *The Description.*

E*uphorbium* (whereout that liquor or gum called in shops *Euphorbium* is extracted) hath very great thicke grosse and spreading roots, dispersed far abroad in the ground: from which arise long and round leaues, almost like the fruit of a great Cucumber, a foot and a halfe long, ribbed, walled, and furrowed like vnto the Melon: these branched ribs are set or armed

armed for the most part with certaine prickles standing by couples, the point or sharpe end of one garding one way, and the point of another looking directly a cleane contrarie way: these prickles are often found in the gumme it selfe, which is brought vnto vs from Libya and other parts: the leaues hereof being planted in the ground will take root well, and bring forth great increase, which thing I haue proued true in my garden: it hath perished againe at the first approch of winter. The sap or liquor that is extracted out of this plant is of the colour and substance of the Creame of Milke; it burneth the mouth extremely, and the dust or powder doth very much annoy the head and the parts thereabout, causing great and vehement sneefing, and stuffing of all the pores.

2 This rare plant called *Anteuphorbium* hath a very thicke grosse and farre spreading root, very like vnto *Euphorbium*; from which riseth vp many round Greene and fleshie stalkes, whereupon do grow thicke leaues like Purslane, but longer, thicker, and fatter: the whole plant is full of cold and clammie moisture, which represseth the scorching force of *Euphorbium*, and it wholly seemes at the first view to be a branch of Greene Corall.

3 *Cereus Peruvianus spinosus Lobelij.*
The Torch-Thistle or thorny Euphorbium.

4 *Calamus Peruvianus spinosus Lobelij.*
The thorny Reed of Peru.

3 There is not among the strange and admirable plants of the world any one that giues more cause of maruell, or more moueth the minde to honor and laud the Creator, than this plant, which is called of the Indians in their mother tongue *Vragua*, which is as much to say, a torch, taper, or wax candle; whereupon it hath been called in Latine by those that vnderstood the Indian tongue, *Cereus*, or a Torch. This admirable plant riseth vp to the height of a speare of twenty foot long, although the figure expresse not the same; the reason is, the plant when the figure was drawn came to our view broken: it hath diuers bunches and vallies, euen as is to be seene in the sides of the Cucumber, that is, furrowed, guttered, or chamfered alongst the same, and as it were laid by a direct line, with a welt from one end vnto the other: vpon which welt or line do stand small star-like Thistles, sharpe as needles, and of the colour of those of the Melon Thistle, that is to say, of a browne colour: the trunk or body is of the bignesse of a mans arme, or a cable rope; from the middle whereof thrust forth diuers knobby elbowes of the same substance, and armed with the like prickles that the body of the trunk is set withall: the whole plant is thicke, fat, and full of a fleshie substance, hauing much iuyce like that of Aloes, when it is hardned, and of a bitter taste: the

floures

floures grow at the top or extreme point of the plant: after which follow fruit in shape like a fig, full of a red iuyce, which being touched staineth the hands of the colour of red leade: the taste is not vnpleasant.

There hath been brought from the Indies a prickly reed of the bignesse of a good big staf, of the length of six or eight foot, chamfered and furrowed, hauing vpon two sides growing vnto it an vneuen membrane or skinny substance, as it were a iag or welt set vpon the wing of a garment, and vpon the very point of euery cut or iagge armed with most sharpe prickles: the whole trunk is filled full of a spongy substance, such as is in the hollownes of the brier or bramble; amongst the which is to be seene as it were the pillings of Onions, wherein are often found liuing things, that at the first seeme to be dead. The plant is strange, and brought dry from the Indies, therefore we cannot write so absolutely hereof as we desire; referring what more might be said to a further consideration or second edition.

¶ The Place.

These plants grow vpon Mount Atlas, in Libya, in most of the Islands of the Mediterranean sea, in all the coast of Barbarie, especially in S. Crux neere vnto the sea side, in a barren place there called by the English men Halfe Hanneken; which place is appointed for Merchants to confer of their businesse, euen as the Exchange in London is: from which place my friend Mr. William Martin, a right expert Surgeon, did procure me the plants of them for my garden, by his seruant that he sent thither as Surgeon of a ship. Since which time I haue receiued plants of diuers others that haue trauelled into other of those parts and coasts: notwithstanding they haue not endured the cold of our extreme Winter.

¶ The Time.

They put forth their leaues in the Spring time, and wither away at the approach of Winter.

¶ The Names.

It is called both in Greeke and Latine *Euphorbium*: Pliny in one place putteth the herbe in the feminine gender, naming it *Euphorbia*: the iuyce is called also *Euphorbion*, and so it is likewise in shops: we are faine in English to vse the Latine word, and to call both the herbe and iuyce by the name of *Euphorbium*, for other name we haue none: it may be called in English, the Gum Thistle.

¶ The Temperature.

Euphorbium (that is to say, the congealed iuyce which we vse) is of a very hot, and, as Galen testifieth, causticke or burning facultie, and of thinne parts: it is also hot and dry in the fourth degree.

¶ The Vertues.

- A An emplaister made with the gumme *Euphorbium*, and twelue times so much oyle, and a little wax, is very singular against all aches of the ioynts, lamenesse, palsies, crampes, and shrinking of sinewes, as Galen, lib. 4. de medicamentis secundum genera, declareth at large, which to recite at this present would but trouble you ouermuch.
- B *Euphorbium* mingled with oyle of Bay and Beares grease cureth the scurfe and scalds of the head, and pildnesse, causing the haire to grow againe, and other bare places, being anointed therewith.
- C The same mingled with oyle, and applied to the temples of such are very sleepeie, and troubled with the lethargie, doth awaken and quicken their spirits againe.
- D If it be applied to the nuque or nape of the necke, it bringeth their speech againe that haue lost it by reason of the Apoplexie.
- E *Euphorbium* mingled with vinegar and applied taketh away all foule and ill fauoured spots, in what part of the body soeuer they be.
- F Being mixed with oyle of Wall-floures, as Mesues saith, and with any other oyle or ointments, it quickly heateth such parts as are ouer cold.
- G It is likewise a remedie against old paines in the huckle bones, called the Sciatica.
- H *Aetius*, *Paulus*, *Aetnarius*, and *Mesue* doe report, That if it be inwardly taken it purgeth by siege water and flegme; but withall it setteth on fire, scortcheth and fretteth, not onely the throat and mouth, but also the stomacke, liuer, and the rest of the intrals, and inflames the whole bodie.
- I For that cause it must not be beaten smal, and it is to be tempered with such things as allay the heate and sharpenesse thereof, and that make glib and slipperie; of which things there must be such a quantitie, as that it may be sufficient to couer all ouer the superficial or outward part thereof.
- K But it is a hard thing so to couer and fold it vp, or to mix it, as that it will not burne or scortch. For though it be tempered with neuer so much oyle, if it be outwardly applied it raiseth blisters, especially in them that haue soft and tender flesh, and therefore it is better not to take it inwardly.

It is

It is troublesome to beate it, vnlesse the nostrils of him that beats it be carefully stopped and defended; for if it happen that the hot sharpnesse thereof do enter into the nose, it presently causeth itching, and moueth neesing, and after that, by reason of the extremitie of the heate, it draweth out abouondance of flegme and filth, and last of all bloud, not without great quantity of teares.

But against the hot sharpnesse of *Euphorbium*, it is reported that the inhabitants are remedied by a certaine herbe, which of the effect and contrarie faculties is named *Anteuphorbium*. This plant likewise is full of iuyce, which is nothing at all hot and sharpe but coole and slimy, allaying the heate and sharpnesse of *Euphorbium*. We haue not yet learned that the old writers haue set downe any thing touching this herbe; notwithstanding it seemeth to be a kinde of Orpine, which is the antidote or counterpoyson against the poyson and venome of *Euphorbium*.

† CHAP. 493. Of soft Thistles, and Thistle gentle.

† **T** Here are certaine other plants by most writers referred to the Thistles; which being committed by our Author, I haue thought fit here to giue you.

† *Cirsium maximum Asphodeli radice.*
Great soft bulbed Thistle.

2 *Cirsium maius alterum.*
Great soft Thistle.

† The Description

† **T** He first and largest of these hath roots consisting of great longish bulbes like those of the Asphodill: from whence arise many large stalkes three or foure cubits high, crested and downy: the leaues are very long and large, iuycie, greenish, and cut about the edges, and set with soft prickles. At the tops of the stalkes and branches grow heads round and large; out whereof come floures consisting of abouondance of threds, of a purple colour, which flie away in downe. This growes wilde in the mountainous meowes and in some wet places of Austria. I haue seene it growing in the garden of Mr. Iohn Parkinson, and with Mr. Tuggey. It floures in Iuly. *Clusius* hath called it *Cirsium maximum mont. incano folio, bulbosa radice*. But he gaue no figure thereof, nor any else, vnlesse the *Acanthium peregrinum* in *Tabernamont*. (which our Author formerly

G g g g g

formerly, as I before noted, gave by the name of *Salsifialis lutea peregrina* were intended for this plant, as I verily thinke it was. I haue giuen you a figure which I drew some yeares agoe by the plant it selfe.

2 The root of this is long, yet sending forth of the sides creeping fibres, but not bulbous: the leaues are like those of the last mentioned, but lesse, and armed with sharpe prickles of a greenish colour, with the middle rib white: the heads sometimes stand vpright, and otherwhiles hang downe; they are very prickly, and send forth floures consisting of many elegant purple threds. The stalkes are thicke, crested and welted with the setting on of the leaues. This growes wilde vpon the sea coasts of Zeland, Flanders, and Holland: it floures in Iune and Iuly: it is the *Cirsium tertium* of *Dodoneus*; and *Cirsium minus* of *Lobel*.

3 This whose root is fibrous and liuing, sends forth lesser, narrower, and softer leaues than those of the former, not iagged or cut about their edges, nor hoary, yet set about with prickles: the stalkes are crested: the heads are smaller, and grow three or foure together, carrying such purple floures as the former. This is that which *Matthiolus*, *Gesner*, and others haue set forth for *Cirsium*: *Dodoneus*, for *Cirsium 2.* and *Clusius* hath it for his *Cirsium quartum*, or *Montanum secundum*.

‡ 3 *Cirsium folijs non hirsutis.*
Soft smooth leaued Thistle.

‡ 4 *Cirsium montanum capitulis parvis.*
Small Burre Thistle.

4 The leaues of this are somewhat like those of the last described, but larger, and welting the stalkes further at their setting on: they are also set with prickles about the edges: the stalkes are some two cubits high, diuided into sundry long slender branches: on whose tops grow little rough prickly heads, which after the floures come to perfection doe hang downewards, and at the length turne into downe: amongst which lies hid a smooth shining seed. This groweth wilde in diuers wooddy places of Hungarie and Austria. It is the *Cirsium* of *Dodoneus*; the *Cirsium 2.* or *Montanum 1.* of *Clusius*; and *Cirsium alterum* of *Lobel*. It floures in Iune: the root is about the thickness of ones little finger, fibrous also, and liuing.

5 This sends vp long narrow leaues, hairy, and set about the edges with slender prickles: out of the middest of these leaues grows vp a stalke sometimes a foot, otherwhiles a cubit high, slender, stiffe, and downy: vpon which grow leaues somewhat broad at their setting on, and there also a little nicked or cut in: this stalke sometimes hath no branches, otherwhiles two or three long slender ones, at the tops whereof grow out of scaly heads such floures as the common Knap-weed, which

‡ 5 *Cirsium montanum Anglicum.*
Single headed Thistle.

‡ *Cirsij Anglici alia Icon Penz.*
Penzance figure of the same.

‡ *Cirsij Anglici Icon Lobelij.*
Lobelius figure of the same.

‡ 6 *Carduus mollis folijs dissectis.*
Lagged leaved Thistle gentle.

which at length turne into downe; among which lies hid a small shining seed like the other plants of this kind. The root is made of diuers thicke fibres, which run in the ground, and here and there put vp new heads. This plant wants no setting forth; for *Clusius* giues vs the figure and historie thereof, first by the name of *Cirsium Pannonicum* 1. *pratense*; then he giues another historie thereof, with a worser figure, (which he receiued of Dr. *Thomas Penny* of London) by the name of *Cirsium Anglicum* 2. *Lobel* also described it, and set it forth with a figure expressing the floure alreadie faded, by the name of *Cirsium Anglicum*. *Bauhine* in his *Pinax*, deceived by these seuerall expressions, hath made three seuerall plants of this one; a fault frequent in many Writers of plants. *Clusius* found it growing in the mountainous meadowes alongst the side of the Danow in Austria: *Penny*, in the meadowes at the foot of Ingleborow hill in Yorke-shire: *Lobel*, in the meadowes at a place called Acton in Gloucester-shire. I found this onely once, and that was in a meadow on this side Highgate, hauing beene abroad with the Companie of Apothecaries, and returning that way home, in the companie of Mr. *James Walsall*, *William Broad*, and some others. I haue giuen you both the figures of *Clusius* his owne in the first place, and that of Dr. *Penny* in the second, but the former is the better: I haue also giuen you that of *Lobel*.

‡ 7 *Carduus mollis folijs Lapathi*.
Doeke leaued Thistle-gentle.

Stalke are lesser and narrower: out of whose bosomes towards the tops of the stalke grow out little branches which carry three, foure, or more little scaly heads like those of the Blew-Bottle, or Knapweed, whereout grow threddy blewish purple floures: the seed is wrapped in downe, and not vnlike that of Blew-Bottle: the root is blacke, hard, and liuing, sending forth shoots on the sides. It growes vpon the highest Austrian Alpes, and floures in Iuly. *Clusius* calls this *Carduus mollis Lapathi folio*.

¶ The Temperature and Vertues.

These plants seeme by their taste to be of a moderately heating and drying facultie, but none of them are vsed in medicine, nor haue their vertues set downe by any Author. ‡

6 These also *Clusius* (whom I herein follow) addeth to the kindes of Thistles. This ragged leaved one, which he calleth *Carduus mollior primus*, hath many leaues at the root, both spread vpon the ground, and also standing vpright; and they are couered with a white and soft downinesse, yet greene on the vpper side: they are also much diuided or cut in euen to the middle rib, like to the softer or tenderer leaues of the Starre Thistle: they haue no prickles at all vpon them: out of the middest of these leaues grow vp one or two stalkes, round, crested, purplish, hoarie, and some cubit or better high. The leaues that grow vpon the lower part of the stalke are diuided, those aboue not so; the tops of the stalkes sometimes, yet very seldome, are parted into branches, which cary scaly heads containing elegant floures made of many purple strings. The floure decaying, there succeeds a cornered seed: the root sometimes equals the thickenesse of ones finger, brownish, long, and somewhat fibrous. It floures in May, and growes vpon the hilly places of Hungarie.

7 The stalke of this is some foot or better high, thicke, crested, and somewhat hairy: the leaues about the root are somewhat large, and in shape like those of *Bonus Henricus*, (abusiuely called in English, Mercurie) somewhat sinuated about the edges, and set with harmelesse prickles, greene aboue, and verie hoarie vnderneath, like the leaues of the white Poplar: those that grow vpon the

CHAP. 494.

Of three leaved Grasse, or Meadow Trefoile.

¶ The Kindes.

There be diuers sorts of three leaved Grasses, some greater, others lesser; some beare floures of one colour, some of another: some of the water, and others of the land: some of a sweet smel, others stinking: and first of the common meadow Trefoiles, called in Irish *Shamrockes*.

1 *Trifolium pratense*.
Meadow Trefoile.

‡ 3 *Trifolium maius flore albo*.
Great white Trefoile.

¶ The Description.

1 **M**eadow Trefoile bringeth forth stalkes a cubit long, round, and something hairy, the greater part of which creepeth vpon the ground; whereon do grow leaues consisting of three ioyned together, one standing a little from another, of which those that are next the ground and roots are rounder, and they that grow on the vpper part longer, hauing for the most part in the midst a white spot like a halfe moon. The floures grow on the tops of the stalkes in a tuft or small Fox-taile eare, of a purple colour, and sweet of taste. The seed groweth in little huskes, round and blackish; the root is long, woody, and groweth deepe.

2 There is another of the field Trefoiles, differing from the precedent especially in the colour of the floures; for as those are of a bright purple, contrariwise these are very white, which maketh the difference. The leaues, floures, and all the whole plant is lesse than the former.

3. 4. There is also a Trefoile of this kinde which is sowne in fields of the Low-Countries, in Italy and diuers other places beyond the seas, that commeth vp ranker and higher than that which groweth in meadowes, and is an excellent food for cattell, both to fatten them, and cause them to giue great store of milke.

‡ Of this there is one more with white floures, which hath stalks some foot high, and narrow hairy leaues, with a root of the thickenesse of ones little finger. This is *Clusius* his *Trifolium maius primum*.

‡ 4 *Trifolium maius flo. purpureo.*
Great purple Trefoile.

‡ 6 *Trifolium luteum minimum.*
Little yellow Trefoile.

‡ 5 *Trifolium luteum Lupulinum.*
Hop Trefoile.

primum. The other hath stalkes some cubit high, with larger ioynts and leaues: the floure or head of floures is also larger, of an elegant red colour. This *Clusius* calls *Trifolium maius tertium*. ‡

5. 6. Likewise we haue in our fields a smaller Trefoile that bringeth forth yellow floures, a greater and a lesser, and diuers others also, differing from these in diuers notable points, the which to distinguish apart would greatly enlarge our volume, and yet to small purpose: therefore we leaue them to be distinguished by the curious, who may at the first view easily perceiue the difference, and also that they be of one stocke or kindred.

‡ The greater of these yellow Trefoiles hath pretty large yellow heads, which afterward become of a brownish colour, and somewhat resemble a Hop: whence *Thalins* called it *Lupulus syluaticus*, or *Trifolium luteum alterum lupulinum*: *Dodonæus* calls it *Trifolium agrarium*. The leaues are small, and lightly nickt about the edges. The lesser hath smaller and far lesser yellow heads, which are succeeded by many little crooked clustring seeds: the leaues of this are small, and also snipt about the edges: both this & the other haue two little leaues close by the fastning of the foot-stalkes of the leaues to the main stalks; wherefore I refer them to the Medicks, and vsually cal this later, *Medica sem. racemoso*. It is the *Trifol. luteum minimum* of *Pena* and *Lobel*; and *Trifolium arvense* of *Tabern*. ‡

¶ The

¶ The Place.

Common Meadow Trefoile groweth in medowes, fertile pastures, and waterish grounds. The others loue the like soile.

¶ The Time.

They floure from May to the end of Sommer.

¶ The Names.

Meadow Trefoile is called in Latine *Trifolium pratense*: in High Dutch, *Wissenklee*: in low Dutch, *Claueren*: in French, *Treffe* and *Trainiere*, and *Visumarus*, as *Marcellus* an old writer testifieth: in English, Common Trefoile, Three-leaved grasse: of some, Suckles, and Honi-suckles, Cocksheads; and in Irish, *Shamrocks*.

¶ The Temperature.

The leaues and floures of Meadow Trefoiles are cold and drie.

¶ The Vertues.

The decoction of three leaued Grasse made with honie, and vsed in a clyster, is good against the frettings and paines of the guts, and driueth forth tough and slimie humours that cleaue vnto the guts.

The leaues boiled with a little barrowes grease, and vsed as a pultis, take away hot swellings and inflammations.

Oxen and other cattell do feed of the herbe, and also calues and young lambs. The floures are acceptable to Bees.

Pliny writeth, and setteth it downe for certaine, that the leaues hereof do tremble, and stand right vp against the comming of a storme or tempest.

The meadow Trefoile (especially that with the blacke halfe Moon vpon the leafe) stamped with a little honie, takes away the pin and web in the eies, ceaseth the paine and inflammation thereof, if it be strained and dropped therein.

CHAP. 495. Of stinking Trefoile, or Treacle Clauer.

Trifolium bituminosum,
Treacle Clauer.

¶ The Description.

Treacle Clauer groweth vpright like a shrubbie plant, with stalkes of a cubit and a halfe high, whereupon do grow next the ground broad leaues; 3 ioined together, those vpon the stalkes are longer and narrower. The stalkes are couered ouer with a rough euill coloured hairinesse: the leaues are of a dark black Greene colour, and of a lothsome smell, like the pitch called *Bitumen Iudaicum*, whereof it took his name: the floures grow at the toppe of the stalkes, of a darke purplish colour tending vnto blewnesse, in shape like those of Scabious: the seed is broad, rough, long, and sharpe pointed: the root is small and tender, and cannot indure the coldnesse of our winter, but perisheth at the first approach thereof.

¶ The Place.

It groweth naturally, saith *Hippocrates Hippicatos*, not *Cous*, in rough places, as *Ruellius* translate it: in Germanie, France and England it neuer commeth vp of it selfe, but must be sown in gardens, as my selfe haue proued diuers times, and was constrained to sow it yearely, or else it would not come vp, neither of his owne sowing or otherwise.

¶ The Time.

It floureth not in my garden vntil the end of August.

¶ The Names.

Nicander calleth this Trefoile *τριφυλλον*: in Latine, *Trifolium acutum*, or sharpe pointed Trefoile: of Pliny, *Trifolium odoratum*, but not properly; of others, *Trifolium Asphaltum*, sive *Bituminosum*, or Stone Pitch Trefoile.

Anicen calleth it *Tarfilon*, and not *Handacocha*: Anicen doth comprehend Dioscorides his *Loti*, that is to say, *Lotus urbana sylvestris*, and *Aegyptia*, which Dioscorides confoundeth one with another in one chapter: in English it is called Clauer gentle, Pitch Trefoile, stinking Trefoile, & Treacle Clauer.

¶ The Temperature.

This Trefoile, called *Asphaltum*, as Galen saith, is hot and drie, as *Bitumen* is, and that in the third degree.

¶ The Vertues.

- A Being drunke, it taketh away the pain of the sides, which commeth by obstructions or stoppings, prouoketh vrine, and bringeth downe the desired sicknesse.
- B Hippocrates writeth, that it doth not onely bring them downe, but likewise the birth, not onely inwardly taken, but also outwardly applied. If a woman, saith he, be not well clenfed after her child bearing, giue her this Trefoile to drinke in white wine.
- C Dioscorides saith, that the seeds and leaues being drunke in water, are a remedie for the pleurisie, difficultie of making water, the falling sicknesse, the dropie when it first beginneth, and for those that are troubled with the mother: the quantity to be taken at once is three drams of the seeds, and foure of the leaues.
- D The leaues drunke in Oxymel, or a fyrrup of vineger made with honie, is good for those that are bitten with serpents.
- E Some affirme that the decoction of the whole plant, root and leaues, taketh away paine from those whom serpents haue bitten, if they be washed therewith; but if any other man hauing an vicer be washed with that water wherewith he was bathed that was bitten of the serpent, they say that he shall be troubled in the same manner that the stinged partie was.
- F Some also giue with wine three leaues, or a small quantitie of the seeds in tertian agues, and in quartaine foure, as a sure remedie against the fits.
- G The root also is put into antidotes or counterpoisons, saith Dioscorides: but other antient Physicians do not onely mix the root with them, but also the seed, as we may see in Galen, by a great many compositions in his 2. booke of Antidotes; that is to say, in the Treacles of Aelius Gallus, Zeno Laodiceus, Claudius Apollonius, Eudemus, Heraclides, Dorotheus, and Heras.
- H The herbe stamped and applied vpon any enuened wound, or made with poisoned weapon, it draweth the poison from the depth most apparantly. But if it be applied vpon a wound where there is no venomous matter to work vpon, it doth no lesse infect that part, than if it had been bitten with some serpent or venomous beast: which wonderfull effect it doth not performe in respect of any vitious qualitie that it hath in it selfe, but because it doth not finde that venomous matter to work vpon, which it naturally draweth (as the Load-stone doth iron) wherupon it is constrained through his attractive qualitie, to draw and gather together humours from far vnto the place, whereby the paine is greatly increased.

CHAP. 496. Of diuers other Trefoiles.

¶ The Description.

1 Three leaved grasse of America hath diuers crooked round stalks, leaning this way and that way, and diuided into diuers branches: whereon do grow leaues like those of the meadow Trefoile, of a black Greene colour, and of the smel of Pitch Trefoile, or Treacle Clauer: the floures grow at the top of the branches, made vp in a long spiked chaffie care, of a white colour: after which commeth the seed, somewhat flat, almost like to those of Tares: the roots are long strings of a wooddie substance.

2 This three leaved grasse (which Dodonæus in his last Edition calleth *Trifolium cochleatum primum*: and Lobel, *Fanum Burgundiacum*) hath diuers round vpright stalks, of a wooddie rough substance, yet not able of it selfe to stand without a prop or stay: which stalks are diuided into diuers small branches, whereupon do grow leaues ioined three together like the other Trefoiles, but of a darke swart Greene colour: the floures grow at the top of the stalks in shape like those of the codded Trefoile, but of a darke purple colour: the seede followeth, contained in small wrinkled huskes

1 *Trifolium Americum*.
Trefoile of America.

† 2 *Trifolium Burgundiacum*.
Burgundie Trefoile.

3 *Trifolium Salmanticum*. Portingale Trefoile.

huskes turned round, after the manner of a water snail: the root is thick, composed of diuers tough threddie strings, and lasteth long in my garden with great increase.

3 This three leaved grasse of Salmanca, a citie as I take it of Portingale, differeth not much from our field Trefoile: it hath many branches weake and tender, trailing vpon the ground, of two cubites and a halfe high: whereupon doe grow leaues set together by three vpon a stemme, from the bosome whereof thrust forth tender foot-stalkes, whereon doe stand most fine floures of a bright red tending vnto purple: after which come the seed wrapped in small skinned, of a red colour.

4 The Hart Trefoile hath very many flexible branches, set vpon a slender stalke, of the length of two or three foot, trailing hither and thither: whereupon doe grow leaues ioined together by three

4 *Trifolium cordatum.*
Heart Trefoile.

5 *Trifolium siliquosum minus.*
Small codded Trefoile.

† 6 *Coronopus ex Codice Casareo.*
Crow-foot Trefoile.

three on little slender foot-stalks, euery little leafe of the fashion of a heart, whereof it took his name: among which come forth scalie, or chaffie yellow floures: the root is thick and threddie. † I take the plant which our Author here figured and intended to describe vnto vs, to be of that *Medica* which *Camerarius* calls *Arabica*, which growes wilde in many places with vs, hauing the leaues a little dented in at the ends, so that they resemble the vulgar figure of a heart; and each leafe is marked with a blackish, or red spot: the floures be small and yellow: the seeds are contained in rough buttons, wound vp like the other *Spaile* Trefoiles, whereof it is a kinde. I haue given you the figure a little more exquisite, by the addition of the spots and cods. †

5 This kinde of three leaued grasse is a low herb, creeping vpon the ground: the leaues are like those of the common Trefoile, but lesser, and of a grayish Greene colour: the floures are faire and yellow, fashioned like those of broome, but lesser: after come three or foure cods, wherein is contained round seed: the root is long and reddish. † This is the *Trifolium corniculatum*, or *Melilotus Coronata* of *Lobel*: *Lotus pentaphyllos* of *Gesner*. †

This codded Trefoile is like vnto the last described in euery respect, sauing that this plant is altogether † larger, hauing stalks a cubit

bite and a halfe high: the leaues are also foure times as large, two roundish leaues growing by the stalke, and three longish ones growing vpon a short foot-stalke coming forth betweene the two roundish leaues: both the stalke and leaues haue a little soft downnesse or hairnesse on them: the floures grow clustering together on the tops of the stalks, in shape, bignesse, and colour like that of the last described, but commonly more in number: they are also succeeded by such cods as those of the former.

6 The figure which *Dodonæus* hath set forth out of an old Manuscript in the Emperors Library, being there figured for *Coronopus*, seemes to be of the last described, or some plant very like thereto, though the five leaues at each ioint be not put in such order as they should be, yet all the parts are well exprest, according to the drawing of those times, for you shall finde few antient expressions come so neere as this doth. ‡

7 There is a kinde of Clauer growing about Narbone in France, that hath many twiggie tough branches coming from a woody root, whereon are set leaues three together, after the manner of the other Trefoiles, somewhat long, hairy, and of a hoarie or ouerworne Greene colour. The floures are yellow, and grow at the tops of the branches like those of Broome.

7 *Lotus incana*, five *Oxytriphylon* *Scribonij* *Largi*.
Hoarie Clauer.

‡ 8 *Trifolium luteum siliqua cornuta*.
Yellow horned Trefoile.

‡ This sends vp many branches from one root, some cubit or more long, commonly lying along vpon the ground, round, flexible, and diuided into sundrie branches: the leaues stand together by threes, and are like those of the true *Medica*, or Burgundie Trefoile, but much lesse: the floures grow clustering together on the tops of the branches, like in shape to those of the former, of a yellow colour, and not without smell: they are succeeded by such, yet narrower crooked coddles, as the Burgundie Trefoile hath (but the Painter hath not wel expressed them:) in these cods are contained seeds like those also of that Trefoile, and such also is the root, which liues long, and much increases. It growes in Hungarie, Austria, and Morauia: it floures in Iune and Iuly: *Clusius* calls it *Medica flore flavo*: *Tabernaemontanus*, *Lens maior repens*: and *Tragus*, *Meliloti maioris species tertia*. *Bauhine* saith that about Nimes in Narbone it is found with floures either yellow white, Greene, blew, purple, blacke, or mixed of blew and Greene, and hee calleth it *Trifolium syluestre luteum siliqua cornuta*; or *Medica frutescens*. ‡

¶ The Place.

The severall titles of most of these plants set forth their naturall place of growing: the rest grow in most fertile fields of England.

¶ The Time.

They floure and flourish most of the sommer moneths.

¶ The Names.

There is not much to be said as touching their names, more than hath beene set downe.

¶ The Temperature and Vertues.

The temperature and faculties of these Trefoiles are referred vnto the common meadow Trefoile.

† The figure formerly put in the second place was of the lesser yellow Trefoile described in the last chapter see one.

CHAP. 497. Of the great Trefoiles, or winged Clauers.

¶ The Description.

† 1 The great Hares foot being a kinde of Trefoile, hath a hard and wooddie root, full of blacke threddie strings: from whence arise diuers tough and feeble branches, whereupon do grow leaues, set together by threes, making the whole plant to resemble those of the Meadow Trefoile: the floures grow at the top of the stalks, composed of a bunch of gray haire: among the which soft matter commeth forth small floures of a most bright purple colour, somewhat resembling the floures of the common meadow Trefoile, but far greater. Lobel calls this *Lagopus maximus folio, & facie Trifolij pratensis*. Dodonæus, *Lagopus maior folio Trifolij*.

† 1 *Lagopus maximus.*

The great Hares foot Trefoile.

† 2 *Lagopus maior spica longiore.*

Great large headed Hares foot.

† 2 This

‡ 2 This elegant plant (which *Tragus* hath set forth for *Cytisus*, *Lobel* by the name of *Lagopus altera folio pinnato*, and *Clusius* for his *Trifolij maioris* 3. *altera species*) hath stalkes some foot and better high, whereon grow leaues set together by threes, long, hoary and lightly snipt about the edges, with elegant nerues or veines, running from the middle rib to the sides of the leaues, which are most conspicuous in hot Countries, and chiefly then when the leafe begins to decay. At the tops of the branches, in long and large heads grow the floures, of an elegant sanguine colour. This floures in May and Iune, and growes wilde vpon some mountaines of Hungary and Austria; I haue seen them, both this and the former, growing in the gardens of some of our Florists.

3 This other great kinde of Hares-foot sends forth one slender, yet stiffe stalke, whereon grow leaues whose foot-stalkes are large at the setting on, encompassing the stalkes: the leaues themselves grow by threes, long, narrow, and sharpe pointed, of a grayish colour like those of the common Hares-foot; the spike at the top is soft and downy, with little reddish floures amongst the whitish hairinesse. This growes wilde in Spaine: *Clusius* calls it *Lagopus angustifolius Hispanicus maior*.

There is another sort of this described by *Lobel* and *Pena* in the *Aduers*, whose leaues are longer and narrower than this, the whole plant also is oft times lesser: they call it *Lagopus altera angustifolia*. ‡

‡ 3 *Lagopus angustifolius Hispanicus*.

Narrow leaved Spanish Hare-foot.

4 *Lagopodium, Pes leporis*.

Little Hares-foot Trefoile.

4 The small Hares-foot hath a round rough and hairy stalke, diuiding it selfe into diuers other branches; whereupon do grow small leaues, three joined together, like those of the small yellow Trefoile: the floures grow at the very point of the stalkes, consisting of a rough knap or bush of haire or downe, like that of *Alopecurus*, or Fox-taile, of a whitish colour tending to a light bluish, with little white floures amongst the downinesse: the root is small and hard.

¶ The Place.

The first groweth in the fields of France and Spaine, and is a stranger in England, yet it groweth in my garden.

The small Hare-foot groweth among corne, especially among Barly, and likewise in barren pastures almost euery where.

¶ The Time.

They floure and flourish in Iune, Iuly, and August.

H h h h h

¶ The

¶ The Names.

The great Hare-foot Trefoile is called of *Tragus*, *Cytisus*: of *Cordus*, *Trifolium magnum*: of *Lobelius*, *Lagopum maximum*, and *Lagopodium*: in Greeke, *λαγώπους*: in English, the great Hares-foot.

The last, being the smallest of these kindes of Trefoiles, is called *Lagopus*, and *Pes Leporis*: in Dutch, *Halen pootkens*: in high Dutch, *Halen fusz*: in French, *Pied de lieure*: in English Hare-foot.

¶ The Temperature and Vertues.

A The temperature and faculties are referred vnto the other Trefoiles, whereof these are kindes: notwithstanding *Dioscorides* saith, that the small Hares-foot doth binde and dry. It stoppeth, saith he, the laske, if it be drunke with red wine. But it must be giuen to such as are feuerish with water.

† Our Author in the first place formerly gaue the figure of *Tabern.* his *Lagopodium flore albo*, being only a variety of that plant: you shall hereafter finde it described by the name of *Anthylla leguminosa*; now he made the description somewhat in the leaues to agree with the figure, though nothing almost with the truth of that he intended to describe, for (as it is euident by the names) he intended to describe both the first and second (which are here now deseribed) in the first place, for he hath confounded them both together in the names.

CHAP. 498. Of Water Trefoile, or Bucks Beanes.

Trifolium paludosum.
Marsh Trefoile.

¶ The Description.

1 THE great Marsh Trefoile hath thicke fat stalkes, weake and tender, full of a spongius pith, very smooth, and of a cubit long: whereon do grow leaues like to those of the garden Beane, set vpon the stalkes three joined together like the other Trefoiles, smooth, shining, and of a deepe greene colour: among which toward the top of the stalkes standeth a bush of feather like floures of a white colour, dasht ouer slightly with a wash of light carnation: after which the seed followeth, contained in small buttons, or knobby huskes, of a browne yellowish colour like vnto Millet, and of a bitter taste: the roots creepe diuers waies in the middle marsh ground, being full of joints, white within, and full of pores, and spungie, bringing forth diuers by-shoots, stalkes, and leaues, by which meanes it is easily increased, and largely multiplied.

2 The second differeth not from the precedent, sauing it is altogether lesser, wherein consisteth the difference, if there be any: for doubtlesse I thinke it is the selfe same in each respect, and is made greater and lesser, according to his place of growing, clymate, and countrey.

¶ The Place.

These grow in marsh and Fenny places, and vpon boggie grounds almost euery where.

¶ The Time.

They floure and flourish from Iune to the end of August.

¶ The Names.

Marsh Trefoile is called in high Dutch, *Biberklee*, that is to say, *Castoris Trifolium*, or *Trifolium fibrinum*: in low Dutch, of the likenesse that the leaues haue with the garden Beanes, *Boczboomwi*, that is to say, *Fascilus Hircinus*, or *Boona Hircina*: the later Herbarists call it *Trifolium palustre*, and *Paludosum*: of some, *Isopyrum*: in English, marsh-Clauer, marsh-Trefoile, and Buckes-Beanes.

¶ The Temperature and Vertues.

A The seed of *Isopyrum*, saith *Dioscorides*, if it be taken with meade or honied water, is good against the cough and paine in the chest.

B It is also a remedy for those that haue weake Miers and spet bloud, for as *Galen* saith it clenseth and cutteth tough humours, hauing also adjoined with it an astringent or binding quality.

CHAP. 499 Of Sweet Trefoile, or garden Clauer.

Trifolium odoratum.
Sweet Trefoile.

¶ The Description.

Sweet Trefoile hath an vpright stalk, hollow, and of the height of two cubits, diuiding it selfe into diuers branches: whereon do grow leaues by three and three like to the other Trefoiles, sleightly and superficially nicked in the edges: from the bosom wherof come the floures, euery one standing on his owne single foot-stalk; consisting of little chaffe husks, of a light or pale blewish colour: after which come vp little heads or knops, in which lieth the seed, of a whitish yellow colour, and lesser than that of Fenu-greeke: the root hath diuers strings: the whole plant is not onely of a whitish green colour, but also of a sweet smell, and of a strong aromaticall or spicie sent, and more sweet when it is dried: which smell in the gathered and dried plant doth likewise continue long: and in moist and rainie weather, it smelleth more than in hot and drie weather: and also when it is yet fresh and Greene it loseth and recouereth againe his smell seuen times a day; whereupon the old wiues in Germanie do call it **Sieuen gezeiten kraut**, that is, the herbe that changeth seuen times a day.

¶ The Place.

It is sowne in gardens not onely beyond the seas, but in diuers gardens in England.

¶ The Time.

It is sowne in May, it floureth in Iune and Iuly, and perfecteth his seed in the end of August, the same yere it is sowne.

¶ The Names.

It is commonly called in Latine *Trifolium odoratum*: in high Dutch as we haue said **Sieuen gezeiten**: in low Dutch, **Seuenghetiscruist**, that is to say, an herb of seuen times: it is called in Spanish, **Trebol real**: in French, **Treffe oderiferant**: in English, Sweet Trefoile, and garden Clauer: it seemeth to be *Lotus Urbana*, or *satipa*, of which *Dioscorides* writeth in his fourth booke: neuerthelesse diuers Authors set downe Melilot, for *Lotus urbana*, and *Trifolium odoratum*, but not properly. ‡ The Gardiners and herbe women in Cheapside commonly call it, and know it by the name of Balsam, or garden Balsam. ‡

¶ The Temperature.

Galen saith, that sweet Trefoile doth in a meane concoct and drie, and is in a meane and temperate facultie betweene hot and cold: the which faculties vndoubtedly are plainly perceiued in this sweet Trefoile.

¶ The Vertues.

The iuice pressed forth, saith *Dioscorides*, with hony added thereto, clenseth the vlcers of the eyes, called in Latine *Argema*, and taketh away spots in the same, called *Albugines*, and remooueth such things as doe hinder the sight.

The oile wherein the floures are infused or steeped, doth perfectly cure Greene wounds in very short space; it appeaseth the paine of the gout, and all other aches, and is highly commended against ruptures, and burstings in young children.

The iuice given in white wine cureth those that haue fallen from some high place, auoideth congealed and clotted bloud, and also helpeth those that do pisse bloud, by meanes of some great bruise, as was proued lately vpon a boy in Fanchurch street, whom a cart went ouer, whereupon

H h h h h

upon he did not onely pisse bloud, but also it most wonderfully gushed forth, both at his nose and mouth.

D The dried herbe laied among garments keepeth them from Mothes and other vermine.

CHAP. 500. Of Fenugreeke.

¶ The Description.

Fenugreeke hath a long slender trailing stalke, Greene, hollow within, and diuided into diuers small branches: whereon do grow leaues like those of the meadow Trefoile, but rounder and lesser, Greene on the vpper side, on the lower side tending to an ash colour: among which come small white floures, after them likewise long slender narrow cods, in which do lie small vneuen seeds, of a yellowish colour: which being dried, haue a strong smell, yet not vnpleasant: the root is small, and perisheth when it hath perfected his seed.

1 *Fenumgracum.*
Fenugreeke.

2 *Fenumgracum sylvestre.*
Wilde Fenugreeke.

2 There is a wilde kinde hereof seruing to little vse, that hath small round branches, full of knees or ioints: from each ioint proceedeth a smal tender footstalk, whereon do grow three leaues and no more, somewhat snipt about the edges, like vnto those of Burgundie Haie: from the bosoms whereof come forth small yellow floures, which turne into little cods: the root is thicke, tough, and pliant.

¶ The Place.

Fenugreeke is sowne in fields beyond the seas: in England wee sow a small quantitie thereof in our gardens.

¶ The Time.

It hath two seasons of sowing, according to *Columella*, of which one is in September, at what time it is sowne that it may serue for fodder against winter; the other is in the end of Ianuarie, or the beginning of Februarie, notwithstanding we may not sow it vntill Aprill in England.

¶ The

¶ The Names.

It is called in Greeke *Carphos*, or as it is found in *Pliny* his copies *Carphos*: in Latine, *Fenum Graecum*: *Columella* saith that it is called *Siliqua*: in *Pliny* we read *Silicia*: in *Varro*, *Silicula*: in high Dutch, *Bockshorne*: in Italian, *Fiengreco*: in Spanish, *Alfornas*: in French, *Fenegrec*: and in English, *Fenegreeke*.

¶ The Temperature and Vertues.

It is thought according to *Galen* in his booke of the Faculties of nourishments, that it is one of those simples which do manifestly heat, and that men do vse it for food, as they do Lupines; for it is taken with pickle to keep the body soluble, and for this purpose it is more agreeable than Lupines, seeing it hath nothing in his owne proper substance, that may hinder the working.

The iuice of boiled Fenegreeke taken with honie is good to purge by the stoole all manner of corrupt humors that remaine in the guts, making soluble through his sliminesse, and mitigating paine through his warmnesse.

And because it hath in it a clensing or scouring facultie, it raiseth humors out of the chest: but there must be added vnto it no great quantitie of honie least the biting qualitie should abound.

In old diseases of the chest without a feuer, fat dates are to be boiled with it, but when you haue mixed the same iuice pressed out with a great quantitie of hony, and haue againe boiled it on a soft fire to a mean thicknesse, then must you vse it long before meat.

In his booke of the Faculties of simple medicines he saith, that Fenegreek is hot in the second degree, and dry in the first: therefore it doth kindle and make worse hot inflammations, but such as are lesse hot and more hard are thereby cured by being wasted and consumed away.

The meale of Fenegreeke, as *Dioscorides* saith, is of force to mollifie and waste away: being boiled with mead and applied it taketh away inflammations, as well inward as outward.

The same being tempered or kneaded with niter and vineger, doth soften and waste away the hardnesse of the milt.

It is good for women that haue either imposthume, vlcere, or stopping of the matrix, to bathe and sit in the decoction thereof.

The iuice of the decoction pressed forth doth clense the haire, taketh away dandriffe, scoureth running sores of the head, called of the Gracians *zypari*: being mingled with goose grease, and put vp in manner of a pessarie, or mother suppositorie, it doth open and mollifie all the parts, about the mother.

Greene Fenegreeke bruised and pounded with vineger, is a remedie for weak and feeble parts, and that are without skin, vlcerated and raw.

The decoction thereof is good against vlcers in the low gut, and foule stinking excrements of those that haue the bloody flux.

The oile which is pressed out thereof scoureth haire and scars in the priuie parts.

The decoction of Fenegreeke seed, made in wine, and drunke with a little vineger, expelleth all euill humors in the stomacke and guts.

The seed boiled in wine with dates and hony, vnto the form of a syrrop, doth mundifie and clense the breast, and easeth the paines thereof.

The meale of Fenegreek, boiled in mead or honied water, consumeth and dissolueth all cold hard imposthumes and swellings; and being mixed with the roots of Marsh Mallows and Linseed effecteth the same.

It is very good for women that haue any grieve or swelling in the matrix, or other lower parts, if they bathe those parts with the decoction thereof made in wine, or sit ouer it and sweat.

It is good to wash the head with the decoction of the seed, for it taketh away the scurfe, scales, Rits, and all other such like imperfections.

CHAP. 501. Of Horned Clauer, and blacke Clauer.

¶ The Description.

THe horned Clauer, or coddred Trefoile, groweth vp with many weake and slender stalks lying vpon the ground: about which are set white leaues, somewhat long, lesser, and narrower than any of the other Trefoiles: the floures grow at the tops, of the fashion of those of Pea-son, of a shining yellow colour: after which come certain straight cods, bigger than those of Fenegreek, but blunter at their ends, in which are contained little round seed; the root is hard and wooddie, and sendeth forth young springs euery yeare.

H h h h 3

2 This

1 *Lotus trifolia corniculata.*
Horned or coddled Clauer.

2 *Lotus quadrifolia.*
Foure leaved grasse.

2 This kinde of three leaved grasse, or rather foure leaved Tre foile, hath leaues like vn- to the common Trefoile; sauing that they bee lesser, and of a browne purplish colour, knowne by the name of Purple wort, or Purple-grasse; whose floures are in shapelike the meadow Trefoile, but of a dustie ouerworn colour tending to whiteneffe; the which doth oftentimes degenerate, sometime into three leaues, sometimes in fiae, and also into seuen, and yet the plant of his nature hath but foure leaues & no more. † I do not thinke this to be the purple leaved Trefoile with the white floure, which is commonly called Purple-grasse; for I could neuer obserue it to haue more leaues than three vpon a stalke. †

† 3 The root of this is smali and white, from which arise many weake hairie branches some cubit long: wheron grow soft hairy leaues three on one foot-stalke, with two little leaues at the root therof, & out of the bosoms of these vpon like footstalkes grow three lesser leaues, as also floures of the bignes and shape of those of a Vetch, but of a braue deep crimson veluet colour: after these are past come cods set with foure thinne welts or skins which make them seem foure square; whence *Camerarius* called it *Lotus pulcherrimatetragonolobus*: the seed is of an ash colour, somewhat lesse than a pease. It floures most of the Sommer moneths, and is for the prettinesse of the floure preserued in many Gardens by yearely sowing the seede, for it is an annuall plant. *Clusius* hath it by the name of *Lotus siliquosus rubello flore*: and hee saith the seeds were diuers times sent out of Italy by the name of *Sandalida*. It is also commonly called in Latine *Pisum quadratum*. †

¶ The Plate.

The first groweth wilde in barren ditch bankes, pastures, and drie Mountaines.

† 3 *Lotus siliqua quadrata.* Square crimson veluet pease.

The second groweth likewise in pastures and fields, but not so common as the other; and is planted in gardens.

¶ The Time.

They floure in Iuly and August.

¶ The Names.

The second is called *Lotus Trifolia*: in English, horned Clauer, or codded Trefoile.

The other is called *Lotus quadrifolia*, or foure leaved Grasse, or Purple-wort: of *Pena* and *Zobel*, *Quadrifolium phaeum fuscum hortorum*.

¶ The Temperature and Vertues.

Their faculties in working are referred vnto the meadow Trefoiles: notwithstanding it is reported, that the leaues of Purple-wort stamped, and the iuyce giuen to drinke, cureth young children of the disease called in English the Purples.

CHAP. 502. Of Medicke Fodder, or snaille Clauer.

¶ The Description.

THis kinde of Trefoile, called *Medica*, hath many small and slender ramping branches, crawling and creeping along vpon the ground, set full of broad leaues slightly indented about the edges: the floures are very small, and of a pale yellow colour, which turne into round wrinkled knobs, like the water Snaille, or the fish called Periwinkle: wherein is contained flat seed fashioned like a little kidney, in colour yellow, in taste like a Vetch or pease: the roo is small, and dieth when the seed is ripe: it growes in my garden, and is good to feed cattell fat.

1 *Trifolium Cochleatum*.
Medicke Fodder.

2 *Medica fructu cochleato spinoso*.
Prickly Snaille Trefoile.

¶ There are many varieties of these plants, and they chiefly consist in the fruit; for some are smooth and flat, as this first described: other some are rough and prickely, some with lesser, and other.

other some with bigger prickles; as also with them standing diuers wayes, some are onely rough, and of those some are as big as a small nut, other some no bigger than a pease. I giue you here the descriptions of three rough ones, (as I receiued them from M^r. Goodyer) whereof the last is of the sea, which, as you may see, our Author did but superficially describe.

Medica maioris Batice species prima, spinulis intortis.

This hath foure square reddish streaked hairy trailing branches, like the small English *Medica*, greater and longer, foure or five foot long: the leaues are also smooth, growing three together, neither sharpe pointed, nor yet so broad at the top as the said English *Medica*, but blunt topped, with a small blacke spot in the midst, not crooked: the floures are also yellow, three, foure, or five on a foot-stalke: after commeth a round writhed fruit fully as big as a hasell nut, with small prickles not standing fore-right, but lying flat on the fruit, finely wrapped, plaited, folded, or interlaced together, wherein lieth wrapped the seed in fashion of a kidney, very like a kidney beane, but foure times smaller, and flatter, of a shining blacke colour without, like polished leat; containing a white kernell within: the root is like the former, and perisheth also at Winter.

Medica maioris Batice spinosa species altera.

The branches also creepe on the ground, and are straked smooth foure square, reddish here and there, three or foure foot long: the leaues are smooth, finely notched about the edges, sharp pointed, without blacke spots, very like *Medica pericarpio plano*: the floures are small and yellow like the other: the fruit is round, writhed or twined in also, fully as big as a hasell nut, somewhat cottonie or woolly, with short sharpe prickles: wherein lyeth also wrapped a shining blacke kidney-like seed, so like the last described, that they are not to be discerned apart: the root is also alike, and perisheth at Winter.

Medica marina spinosa species.

The branches of this are the least and shortest of all the rest, little exceeding a foot or two in length, and are foure square, Greene, somewhat hairie, and trailing on the ground: the leaues are like to those of *Medica pericarpio plano*, not fully so sharpe pointed, without blacke spots, soft, hairy, three on a foot-stalke: the floures grow alongst the branches, on very small foot-stalkes, forth of the bosomes of the leaues, (not altogether on or neere the tops of the branches) and are very small and yellow, but one on a foot-stalke: after commeth small round writhed fruit, no bigger than a pease, with very short sharpe prickles, wherein is contained yellowish seed of the fashion of a kidney like the former, and is the hardest to be plucked forth of any of the rest: the root is also whitish like the roots of the other, and also perisheth at Winter. Aug. 2. 1621. Iohn Goodyer, †

3 *Trifolium Cochleatum marinum.*
Medick Fodder of the sea.

3 This kinde also of Trefoile, (called *Medica marina*: in English, sea Trefoile, growing naturally by the sea side about Westchester, and vpon the Mediterranean sea coast, and about Venice) hath leaues very like vnto the common meadow Trefoile, but thicker, and couered over with a flockie

flockie hoarinesse like *Gnaphalium*, after the manner of most of the sea herbes : the floures are yellow : the seeds wrinkled like the former, but in quantitie they be lesser.

¶ The Place.

The first is sowne in the fields of Germanie, Italy, and other countries, to feed their cartell, as we in England do Bucke-wheat : we haue a small quantitie thereof in our gardens, for pleasures sake

The third groweth neere vnto the sea side in diuers places.

¶ The Time.

Medica must be sowne in Aprill ; it floureth in Iune and Iuly : the fruit is ripe in the end of August.

¶ The Names.

Medick fodder is called of some *Trifolium Cochleatum*, and *Medica* : in French, *L'herbe à Limasson* : in Greeke, *Μυδική* : in Spanish, *Mielguas* : of the Valentians and Catalons, *Alfafa*, by a word either barbarous or Arabicke : for the chiefe of the Arabian writers, *Auicen*, doth call *Medica*, *Cot*, *Alaseleti*, and *Alfasafa*.

The other is called Sea Clauer, and Medick fodder of the sea.

¶ The Temperature and Vertues.

Medick fodder is of temperature cold, for which cause it is applied Greene to such inflammations and infirmities as haue need of cooling. A

CHAP. 503. Of Wood Sorrell, or Stubwort.

I *Oxys alba.*

White wood Sorrell.

¶ The Description.

I *Oxys Pliniana*, or *Trifolium acetosum*, being a kind of three leaved grasse, is a low and base herbe without stalk ; the leaues immediately rising from the root vpon short stems at their first comming forth folded together, but afterward they do spread abroad, and are of a faire light Greene colour, in number three, like the rest of the Trefoiles, but that each leafe, hath a deepe cleft or rift in the middle : amongst these leaues come vp small and weake tender stems, such as the leaues do grow vpon, which beare small star-like floures of a white colour, with some brightnes of carnation dasht ouer the same : the floure consisteth of five small leaues ; after which come little round knaps or huskes full of yellowish seed : the root is very threddy, and of a reddish colour : the whole herbe is in taste like Sorrell, but much sharper and quicker, and maketh better Greene sauce than any other herbe or Sorrell whatsoever.

† My oft mentioned friend M^r. George Bowles sent me some plants of this with very faire red floures, which he gathered in Aprill last, in a wood of Sir Thomas Walsinghams at Chiffelhurst in Kent, called Stockwell wood, and in a little round wood thereto adioyning. †

2 The second kinde of *Oxys* or wood Sorrell is very like the former, sauing that the floures are of

2. *Oxys lutea.*
Yellow wood Sorrell.

of a yellow colour, and yeeld for their seed vessels small and long horned cods; in other respects alike.

¶ *The Place.*

These plants grow in woods and vnder bushes, in sandie and shadowie places in euery countrie. ‡ I haue not as yet found any of the yellow growing with vs. ‡

¶ *The Time.*

They floure from the beginning of Aprill vnto the end of May and midst of Iune.

¶ *The Names.*

Wood Sorrell or Cuckow Sorrell is called in Latine *Trifolium acetosum*: the Apothecaries and Herbarists call it *Alleluia*, and *Panis Cuculi*, or Cuckowes meate, because either the Cuckow feedeth thereon, or by reason when it springeth forth and floureth the Cuckow singeth most, at which time also *Alleluia* was wont to be sung in Churches. *Hieronymus Fracastorius* nameth it *Lujula*. *Alexander Benedictus* saith that it is called *Alimonia*: in high-Dutch, **Saureklee**: in Low-Dutch, **Coeckcoerboot**: in French, *Pain de Cocu*: in English, wood Sorrell, wood Sower, Sower Trefoile, Stubwort, Alleluia, and Sorrell du Bois.

It is thought to be that which *Pliny*, lib. 27. cap. 12. calleth *Oxys*, writing thus: *Oxys* is three leaved, it is good for a feeble stomacke, and is also eaten of those that are bursten. But *Galen* in his fourth booke of Simples saith, that *Oxys* is the same which *Oxalis* or Sorrell is: and *Oxys* is found in *Pliny* to be also *Iunci species*, or a kinde of Rush.

¶ *The Nature.*

These herbes are cold and dry like Sorrell.

¶ *The Vertues.*

A Sorrell du Bois or wood Sorrell stamped and vsed for Greene fauce, is good for them that haue sicke and feeble stomackes; for it strengthneth the stomacke, procureth appetite, and of all Sorrell fauces is the best, not onely in vertue, but also in the pleasantnesse of his taste.

B It is a remedie against putrified and stinking vlcers of the mouth, it quenchem thirst, and cooleth mightily an hot pestilentiall feuer, especially being made in a syrrup with sugar.

CHAP. 504.

Of noble Liuer-wort, or golden Trefoile.

¶ *The Description.*

Noble Liuerwort hath many leaues spread vpon the ground, three cornered, resembling the three leaved grasse, of a perfect grasse Greene colour on the vpper side, but grayish vnderneath: among which rise vp diuers small tender foot-stalkes of three inches long; on the ends whereof stands one smal single blew floure, consisting of six little leaues, hauing in the middle a few white chiues: the seed is inclosed in little round knaps, of a whitish colour; which being ripe do start forth of themselves: the root is slender, composed of an infinite number of blacke strings.

2 The second is like vnto the precedent in leaues, roots, and seeds: the floures hereof are of a shining red colour, wherein consisteth the difference.

This strange three leaved Liuerwort differeth not from the former, saving that this brings forth double blew floures tending to purple, and the others not so.

There is another in my garden with white floures, which in stalks and euery other respect is like the others.

1 *Hepaticum trifolium*.
Noble Liuerwort.

2 *Hepatica trifoliarubra*.
Noble red Liuerwort.

3 *Hepatica multiflora* Lobelij.
Noble Liuerwort with double floures.

¶ The Place.

These pretty floures are found in most places of Germanie in shadowie woods among shrubs, and also by highwaies sides: in Italy likewise, and that not onely with the blew floures, but the same with double floures also, by the report of *Alphonſus Paucius* D^r. of Physicke in the Vniuersity of Ferrara, a man excellently well seen in the knowledge of Simples. They do all grow likewise in my garden, except that with double floures, which as yet is a stranger in England: ‡ it is now plentiful in many gardens. ‡

¶ The Time.

They floure in March and April, and perfect their seed in May.

¶ The Names.

Noble Liuerwort is called *Hepatica trifolia*, *Hepatica aurea*, *Trifolium aureum*: of *Baptista Sardus*, *Herba Trinitatis*: in high-Dutch, *Edel Leber kraut*: in low-Dutch, *Edel leuer cruist*: in French, *Hepatique*: in English, *Golden Trefoile*, three leaved Liuerwort, noble Liuerwort, and herbe Trinitie.

¶ The Temperature.

These herbes are cold and drie, with an astringent or binding qualitie.

¶ The

¶ The Vertues.

- A It is reported to be good against the weakenesse of the liuer which proceedeth of an hot cause, for it cooleth and strengthneth it not a little.
- B *Baptista Sardus* commendeth it, and writeth that the chiefe vertue is in the root, if a spoonfull of the poudre thereof be giuen certaine dayes together with wine, or with some kinde of broth, it profiteth much against the disease called *Enterocoele*.

CHAP. 505. Of Melilot, or plaister Clauer.

¶ The Description.

1 The first kinde of Melilot hath great plenty of small tough and twiggy branches, and stalkes full of ioynts or knees, in height two cubits, set full of leaues three together, like vnto Burgondie hay. The floures grow at the top of the stalke, of a pale yellow colour, standing thickly set and compact together, in order or rowes, very like the floures of *Securidaca altera*: which being vaded, there follow certaine crooked cods bending or turning vpward with a sharpe point, in fashion not much vnlike a Parrets bill, wherein is contained seed like Fenugreeke, but flatter and slenderer: the whole plant is of a reasonable good smell, much like vnto honey, and very full of iuyce: the root is very tough and pliant.

1 *Melilotus Syriaca odora.*
Assyrian Clauer.

2 *Melilotus Italica & Patavina.*
Italian Clauer.

2 The second kinde of Melilot hath small and tender vpright stalkes, a cubit high, and somewhat more, of a reddish colour, set full of round leaues three together, not snipt about the edges like the other Trefoiles; and they are of a very deepe Greene colour, thicke, fat, and full of iuyce. The floures grow alongst the tops of the stalkes, of a yellow colour, which turne into rough round seeds as big as a Tare, and of a pale colour. The whole plant hath also the fauour of honey, and perisheth when it hath borne his seed.

3 The third kind of Melilot hath round stalks and jagged leaues set round about, not much vnlike the leaues of Fenugreeke, alwaies three growing together like the Trefoiles, and oftentimes covered ouer with an hoarinesse, as though meale had been strewed vpon them. The floures be yellow and small, growing thicke together in a tuft, which turne into little cods, wherein the seed is contained: the root is small, tough, and pliant.

4 The fourth kinde of Melilot growes to the height of three cubits, set full of leaues like the common Melilot, and of the same sauour: the floures grow alongst the top of the stalks, of a white colour, which turne into small soft huskes, wherein is contained little blackish seed: the root is also tough and pliant.

3 *Melilotus Coronata.*
Kings Clauer.

4 *Melilotus Germanica.*
Germane Clauer.

‡ Although our Author intended this last description for our ordinarie Melilot, yet he made it of another which is three times larger, growing in some gardens (where it is onely sowne) about two yards high, with white floures and many branches: the whole shape thereof is like the common kinde, as far as I remember. The common Melilot hath weake cornered greene stalkes some two foot and better high, whereon grow longish leaues snipt and oftentimes eaten about the edges, of a fresh greene colour: out of the bosomes of the leaues come little stalkes some handfull long, set thicke on their tops with little yellow floures hanging downe and turning vp again, each floure being composed of two little yellow leaues, whereof the vppermost turnes vp again, and the vndermost seemes to be parted into three. The floures past, there succeed little cods wherein is the seed. ‡

¶ The Place.

These plants grow in my garden: the common English Melilot *Pena* setteth forth for *Melilotus Germanica*: but for certaintie no part of the world doth enioy so great part thereof as England; and especially Essex; for I haue seene betweene Sudbury in Suffolke, and Clare in Essex, and from Clare to Heningham, and from thence to Ouendon, Bulmare, and Pedmarsh, very many acres of earable pasture overgrowne with the same; insomuch that it doth not onely spoyle their land, but the corne also, as Cockle or Darnel, and as a weed that generally spreadeth ouer that corner of the Shire.

|||||

¶ The

¶ The Time.

These herbes do floure in Iuly and August.

¶ The Names.

Plaister Clauer is called by the generall name, *Melilotus*, of some, *Trifolium odoratum*; yet there is another sweet Tre foile, as hath been declared. Some call it *Trifolium Equinum*, and *Caballinum*, or Horse-Tre foile, by reason it is good fodder for horses, who do greedily feed thereon: likewise *Trifolium Vrsinum*, or Beares Trefoile: of *Fuchsius*, *Saxifraga lutea*, and *Serula Campana*: of *Cato*, *Serra Campana*, which most do name *Corona Regia*: in high Dutch, *Groote Steenclaueren*: of the Romanes and Hettrurians, *Tribolo*, as *Matthiolus* writeth: in English, Melilot, and Plaister-Clauer: in Yorkshire, Harts-Clauer.

¶ The Temperature.

Melilote, saith *Galen*, hath more plenty of hot substance than cold (that is to say, hot and dry in the first degree) it hath also a certaine binding qualitie, besides a waisting and ripening facultie. *Discorides* sheweth, that Melilote is of a binding and mollifying qualitie, but the mollifying qualitie is not proper vnto it, but in as much as it wasteth away, and digesteth humors gathered in hot swellings, or otherwise: for so far doth it mollifie or supple that thing which is hard, which is not properly called mollifying, but digesting and waisting away by vapors: which kinde of quality the Grecians call *diacopum*.

¶ The Vertues.

- A Melilote boiled in sweet wine vntill it be soft, if you adde thereto the yolke of a roasted egge, the meale of Fenegreeke and Linsfeed, the roots of Marsh Mallowses and hogs greace stamped together, and vsed as a pultis or cataplasma, plaisterwise, doth assuage and soften all manner of swellings, especially about the matrix, fundament and genitories, being applied vnto those places hot.
- B With the juice hereof, oile, wax, rosen and turpentine, is made a most soueraigne healing and drawing emplaister, called Melilote plaister, retaining both the colour and fauour of the herbe, being artificially made by a skilfull Surgion.
- C The herbe boiled in wine and drunke prouoketh vrine, breaketh the stone, and assuageth the paine of the kidnies, bladder and belly, and ripeneth flegme, and causeth it to be easily cast forth.
- D The juice thereof dropped into the eies cleareth the sight, consumeth, dissolueth, and cleane taketh away the web, pearle, and spot in the eies.
- E Melilote alone with water healeth *Recentes melicerides*, a kinde of wens or rather apostems conteyning matter like honey; and also the running vlcers of the head, if it be laid to with chalke, wine and galls.
- F It likewise mitigateth the paine of the eares, if the juice be dropped therein mixed with a little wine, and taketh away the paine of the head, which the Greekes call *κεφαλαλγία*, especially if the head be bathed therewith, and a little vineger and oile of Roses mixed amongst it.

† CHAP. 506. Of certaine other Trefoiles.

† These Trefoiles being omitted by our Author, I haue thought good to put into a chapter by themselues, though they haue little affinity with one another, the two last excepted.

¶ The Description.

1 The first of those in roots, stalkes, and manner of growing is like the Medicke or snail Trefoiles formerly described: the leaues are hairie, the floures yellow and small: after which follow crooked flat cods, of an indifferent bredth, wherein is contained seeds made after the fashion of little kidnies; this the Italians, according to *Lobel*, call *Lunaria radiata*; in the *Hist. Ludg.* it is called *Medica syl. altera lunata*.

2 The root of this is long and thicke, couered with a yellowish rinde, and hauing a white sweet pith in the inside, couered with a hairinesse on the top, and sending forth sundry fibres: from this rise vp many weake long foot-stalkes, whereon grow leaues set together by threes, long, narrow, smooth, lightly nickt on the edges: amongst these rises vp commonly one stalke (yet sometimes two) smooth and naked, three or foure inches long; on the top thereof grow spike fashion, 8. or ten pretty large light purple floures, each of them being set in a cup diuided into 5. parts. This growes vpon diuers parts of the Alpes: and *Pena* in his *Mons Baldus* set it forth by the name of *Trifolium angustifolium Alpinum*. *Bauhinus* saith, the root hereof tasteth like Liquorice, wherefore it may be called *Glycyrrhiza Astragaloides*, or *Astragalus dulcis*: and he receiued it out of Spaine by the name of *Glycyrrhiza*. He calls it in his *Prothromus*, *Trifolium Alpinum flore magno radice dulci*.

This

‡ 1 *Trifolium filiqua lunata.*

Moone Trefoile.

‡ 2 *Trifol. angustifol. Alpinum.*

Liquorice Trefoile.

‡ 3 *Trifolium spinosum Creticum.*

Prickly Trefoile.

3 This thornie Trefoile hath a long threddy root, from which arise many short branched stalkes some two handfulls high, cornered, and spred vpon the ground; the ioynts, which are many, are commonly red, and armed with foure sharpe prickles, and out of each of them, vpon short foot-stalkes grow two trifoile leaues, Greene, longish, and ending in a little prickle: out of these ioynts also grow little foot-stalkes, which carry single floures made of five little leaues, of the shape and colour of the little blew Bell-floure, with ten chiues in the middle tipt with yellow: after these follow five cornered sharpe pointed heads, containing a single flat red seed in each corner. *Clusius* set forth this by the name of *Trifolium spinosum Creticum*: the seed was sent out of Candy by the name of *spinosum*: he questions whether it may not be the true *Tribulus terrestris* of *Dioscorides*.

4 The roots, stalkes, and leaues of this pretty Trefoile do not much differ from the common

‡ 4 *Trifolium fragiferum*.
Straw-berry Trefoile.

white Trefoile, but there is some difference in the floures and seed; for the floures of this are small, grow thick together, & are of a whitish bluish colour: after which follow heads made of little bladders or thinne skins, after such a manner as they resemble a Strawberrie or Raspas, and they are of a grayish colour, here and there marked with red: the stalkes seldome grow aboue three inches high. It growes in most salt marishes, as in Dartford salt marish, in those below Purfleet, and such like: it floures in Iuly and August. *Clusius* hath set it forth by the name of *Trifolium fragiferum Friscum*: some had rather call it *Trifolium vesicarium*, Bladder Trefoile.

5 There are two other Trefoiles with which I thinke good to acquaint you, and those by the similitude of the cups, which containe the floures, and become the seed vessels, may be fitly called *stellata*; and thus *Bauhine* calls the first *Trifolium stellatum*; whereto for distinctions sake I adde *hirsutum*, calling it *Trifol. stellatum hirsutum*, Rough starrie headed Trefoile: it hath a smal long white root, from which arise stalkes some foot high, round, slender, hairie, and reddish, hauing few leaues or branches: the leaues stand three on a stalke, as in other Trefoiles, smooth on the vpper side, and hairy below: the floures are small and red, like in shape to those of the common red Trefoile, but lesser; and they stand each of them in a cup reddish and rough

below, and on the vpper part cut into five long sharpe leaues standing open as they commonly figure a starre: the floures fallen, these cups dilate themselues, and haue in the middle a longish transuerse whitish spot. I saw this flouering in May in the garden of M^r. *Tradescant*, who did first bring plants hereof from Fermentera a small Island in the Mediterranean sea.

6 This other (which for any thing that I know is not figured nor described by any) hath stalkes sometimes a foot, otherwhiles little aboue an inch high, hairy, and diuided but into few branches: the leaues, which stand by threes, are fastned to long foot-stalkes, and they themselues are somewhat longish, hauing two little sharpe pointed leaues growing at the setting on of the foot-stalkes to the stalkes: they are greene of colour, and not snipt about the edges. The heads that grow on the tops of the stalkes are round, short, and greene, with small purple or else whitish floures like those of the common Trefoile, but lesser, standing in cups diuided into five parts, which when the floures are fallen become somewhat bigger, harther, and more prickly, but open not themselues so much as those of the former: the seed is like that of Millet, but somewhat rounder. This floures in Iune, and the seed is ripe in Iuly. I first obserued it in Dartford salt marish, the tenth of Iune, 1633. I haue named this *Trifolium stellatum glabrum*, Smooth starrie headed Trefoile. ‡

¶ The Temperature and Vertues.

These, especially the three last, seeme to be of the same temper and vertue as the common Meadow Trefoiles, but none of them are at this day vsed in Physicke, or knowne, vnlesse to some few. ‡

CHAP. 597. Of Pulse.

¶ The Kindes.

There be diuers sorts of Pulse, as Beanes, Peason, Tares, Chiches, and such like, comprehended vnder this title Pulse: and first of the great Beane, or garden Beane.

¶ The

The Description.

THe great Beane riseth vp with a foure square stalke, smooth, hollow, without ioyns, long and vpright, which when it is thicke sowne hath no need of propping, but when it is sowne alone by it selfe it soone falleth downe to the ground: it bringeth forth long leaues one standing from another, consisting of many growing vpon one rib or stem, euerie one whereof is somewhat fat, set with veines, slipperie, more long than round. The floures are eared, in forme long, in colour either white with blacke spots, or of a blackish purple: after them come vp long cods, thicke, full of substance, slenderer below, frized on the inside with a certaine white wooll as it were, or soft flockes; which before they be ripe are greene, and afterwards being dry they are blacke and somewhat hard, as be also the cods of broome, yet they be longer than those, and greater: in which are contained three, foure, or fise Beanes, seldome more, long, broad, flat, like almost to a mans naile, great, and oftentimes to the weight of halfe a dram; for the most part white, now and then of a red purplish colour; which in their vpper part haue a long blacke nauell as it were, which is couered with a naile, the colour whereof is a light greene: the skin of the fruit or beane is closely compacted, the inner part being dry and hard and sound, and easily cleft in sunder, and it hath on the one side an euident beginning of sprouting, as haue also the lirtle pease, great Pease, Ciches, and many other Pulses. The roots hereof are long, and fastned with many strings.

1 *Faba maior hortensis.*
The great garden Beane.

2 *Faba sylvestris.*
The wilde Beane.

2 The second kinde of Beane (which *Pena* setteth forth vnder the title of *Sylvestris Gracorum* *Faba*, and *Dodonaus*, *Bona sylvestris*; which may be called in English Greeke Beanes) hath square hollow stalkes like the garden Beanes, but smaller. The leaues be also like the common Beane, fauing that the ends of the rib whereon those leaues do grow haue at the very end small tendrels or claspers, such as the pease leaues haue. The floures are in fashion like the former, but of a darke red colour: which being vaded, there succeed long cods which are blacke when they be ripe, within which is inclosed blacke seed as big as a Pease, of an vnpleasant taste and sauour.

‡ 3 The common Beane in stalkes, leaues, floures, and cods is like the former great garden Beane, but lesser in them all; yet the leaues are more, and grow thicker, and out of the bosomes of the leaues vpon little foot-stalkes grow the floures, commonly six in number, vpon one stalk, which are succeeded by so many cods, lesser and rounder than those of the former: the beans themselves are also lesse, and not so flat, but rounder, and somewhat longish: their colour are either whitish, yellowish, or else blacke. This is sowne in most places of this kingdome, in corne fields, and known both to man and beast. I much wonder our Author forgot to mention so common and vulgarly knowne a Pulse. It is the *Bana* or *Faselus minor* of *Dodonæus*; and the *Faba minor* of *Pena* and *Lobel.* ‡

¶ The Place.

The first Beane is sowne in fields and gardens euery where about London.

This blacke Beane is sowne in a few mens gardens who be delighted in varietie and study of herbes, whereof I haue great plenty in my garden.

¶ The Time.

They floure in Aprill and May, and that by parcels, and they be long in flouing: the fruit is ripe in Iuly and August.

¶ The Names.

The garden Beane is called in Latine *Faba*: in English, the garden Beane: the field Beane is of the same kinde and name, although the fertilitie of the soile hath amended and altered the fruit into a greater forme. ‡ The difference betweene the garden and field Beane is a specificke difference, and not an accidentall one caused by the soile, as euery one that knoweth them may well perceiue. ‡

The blacke Beane, whose figure we haue set forth in the second place, is called *Faba sylvestris*: of some thought to be the true physicke Beane of the Antients; whereupon they haue named it *Faba Veterum*, and also *Faba Græcorum*, or the Greeke Beane. Some would haue the garden Beane to be the true *Phaseolus*, or Kidney Bean; of which number *Dodonæus* is chiefe, who hath so wrangled and ruffled among his relatives, that all his antecedents must be cast out of dores: for his long and tedious tale of a tub we haue thought meet to commit to obliuion. It is called in Greeke *πυράνη*, whereupon the Athenians feast dayes dedicated to *Apollo* were named *πυράνη*, in which Beans and Pulses were sodden: in Latine it is also called *Faba fresa* or *fracta*, broken or bruised Beane.

‡ *Dodonæus* knew well what he did, as any that are either iudicious or learned may see, if they looke into the first chapter of the second booke of his fourth *Pemptas*. But our Authors words are too iniurious, especially being without cause, & against him, from whom he borrowed all that was good in this his booke, except the figures of *Tabernamontanus*. It may be Dr. *Priest* did not fit his translation in this place to our Authors capacitie; for *Dodonæus* did not affirme it to be the *Phaseolus*, but *Phaseolus*, distinguishing betweene them. ‡

¶ The Temperature and Vertues.

- A The Beane before it be ripe is cold and moist: being dry it hath power to bind and restraine, according to some Authors: further of the temperature and vertues out of *Galen*.
- B The Beane (as *Galen* saith in his booke of the Faculties of nourishments) is windie meate, although it be neuer so much sodden and dressed any way.
- C Beanes haue not a close and heauy substance, but a spongie and light, and this substance hath a scouring and clensing facultie; for it is plainly seene, that the meale of Beanes clenseth away the filth of the skin; by reason of which qualitie it passeth not slowly through the belly.
- C And seeing the meale of Beanes is windie, the Beanes themselves if they be boyled whole and eaten are yet much more windie.
- E If they be parched they lose their windinesse, but they are harder of digestion, and doe slowly descend, and yeeld vnto the body thicke or grosse nourishing iuyce; but if they be eaten green before they be ripe and dried, the same thing hapneth to them which is incident to all fruits that are eaten before they be fully ripe; that is to say, they giue vnto the body a moist kinde of nourishment, and therefore a nourishment more full of excrements, not onely in the inward parts, but also in the outward, and whole body thorow: therefore those kindes of Beans do lesse nourish, but they do more speedily passe thorow the belly, as the said Author in his booke of the Faculties of simple Medicines saith, that the Beane is moderately cold and dry.
- F The pulpe or meate thereof doth somewhat clense, the skin doth a little binde.
- G Therefore diuers Physitians haue giuen the whole Beane boyled with vineger and salt to those that were troubled with the bloody flux, with laskes and vomitings.
- H It raiseth flegme out of the chest and lungs: being outwardly applied it drieth without hurt the watery humors of the gout. We haue oftentimes vsed the same being boiled in water, and so mixed with swines grease.

We haue laid the meale therewith Oxymel, or fyrrup of vineger, both vpon bruised and wounded sinewes, and vpon the wounded parts of such as haue been bitten or stung, to take away the fierie heat. I

It also maketh a good plaister and pultis for mens stones and womens paps: for these parts when they are inflamed, haue need of moderate cooling, especially when the paps are inflamed through the cluttered and congealed milke contained in them. K

Also milke is dried vp with that pultis. L

The meale thereof (as *Dioscorides* further addeth) being tempered with the meale of Fenugreek and hony, doth take away blacke and blew spots, which come by drie beatings, and wasteth away kernels vnder the eares. M

With Rose leaues, Frankincense, and the white of an egge, it keepeth backe the watering of the eies; the pin and the web, and hard swellings. N

Being tempered with wine it healeth suffusions, and stripes of the eies.

The Beane being chewed without the skin, is applied to the forehead against rheumes and falling downe of humours. O

Being boiled in wine it taketh away the inflammation of the stones. P

The skins of Beans applied to the place where the hairs were first plucked vp, wil not suffer them to grow big, but rather consumeth their nourishment. Q

Being applied with Barly meale parched and old oile, they waste away the Kings euill. R

The decoction of them serueth to die woollen cloth withall. S

This Beane being diuided into two parts (the skin taken off) by which it was naturally ioined together, and applied, stancheth the bloud which doth too much issue forth after the biting of the horseleach, if the one halfe be laied vpon the place. T

The blacke Beane is not vsed with vs at all, seeing, as we haue said, it is rare, and sowne onely in a few mens gardens, who be delighted in varietie and studie of herbes. V

CHAP. 508. Of Kidney Beane.

¶ The Kindes.

THE stocke or kindred of the Kidney Bean are wonderfully many, the difference especially consisteth in the colour of the fruit: there be other differences, wherof to write particularly would greatly stufte our volume with superfluous matter, considering that the simplest is able to distinguish apart the white Kidney Beane from the blacke, the red from the purple, and likewise those of mixt colours from those that are onely of one colour: as also great ones from little ones. Wherefore it may please you to be content with the description of some few, and the figures of the rest, with their seuerall titles in Latine and English, referring their descriptions vnto a further consideration, which otherwise would be an endlesse labour, or at the least needlesse.

¶ The Description.

1 THE first kinde of *Phaseolus* or garden Smilax hath long and small branches growing very high, taking hold with his clasping tendrels vpon poles and stickes, and whatsoeuer standeth neere vnto him, as doth the hop or vine, which are so weake and tender, that without such props or supporters they are not able to sustaine themselves, but will run ramping on the ground fruitlesse: vpon the branches do grow broad leaues almost like Iuie, growing together by three, as in the common Trefoile or three leaved Grasse: among which come the floures, that do vary and differ in their colours, according to the soile where they grow, sometimes white, sometimes red, and oftentimes of a pale colour: afterwards there come out long cods, whereof some are crooked, and some are straight, and in those the fruit is contained, smaller than the common Beane, somewhat flat, and fashioned like a Kidney, which are of diuers colours, like vnto the floures: whereto for the most part these are like.

2 There is also another *Dolichus* or Kidney Beane, lesler, shorter, and with smaller cods, whose floures and fruit are like in forme to the former Kidney Beanes, but much lesler, and of a blacke colour.

3 There is likewise another strange Kidney Beane, which doth also winde it selfe about poles and props neere adioining, that hath likewise three leaues hanging vpon one stem, as haue the other Kidney Beans, but euery one is much narrower and also blacker: the cods be shorter, plainer, and flatter, and containe fewer seeds.

4 This

1 *Phaseolus albus.*

White Kidney Beane.

2 *Phaseolus niger.*

Blacke Kidney Beane.

3 *Smilax hortensis rubra.*

Red Kidney Beane.

4 *Smilax hortensis flava.*

‡ 5 *Phaseolus peregrinus fructu minore albo.*
Indian Kidney Beane with a small white fruit.

‡ 6 *Phaseolus peregrinus fructu minore frutescens.*
Indian Kidney Beane with a small red fruit.

‡ 7 *Phaseolus peregrinus angustifolius.*
Narrow leaved Kidney Beane.

4 This Kidney Bean differeth not from the others, but onely in the colour of the fruit, which are of a pale yellow colour, wherein consisteth the difference.

‡ Besides the varieties of these Kidney Beans mentioned by our Author, there are diuers other reckoned up by *Clusius*, which haue been brought out of the East and West Indies, and from some parts of Africa; I will only giue you the figures of two or three of them out of *Clusius*, with the colours of their floures and fruit.

5 The stalke of this is low and stiffe, the floures of a whitish yellow on the outside, and of a violet colour within: the fruit is snow white, with a blacke spot in the eye: This is *Phaseolus peregrinus* 4. of *Clusius*.

6 This hath leaues like the Marsh Trefoile, floures growing many together, in shape and magnitude like those of common Pease: the cods were narrow, and contained three or foure seeds, which were small, no bigger than the seeds of *Laburnum*; the Painter expressed two of them in the leafe next vnder the vppermost tuft of floures: this is *Clusius* his *Phaseolus peregrinus* 5.

7 This growes high, winding about poles or other supporters: the leaues are narrower than the former: the fruit lesser and flatter, of a reddish colour. This is the *Phaseolus peregrinus* 6. of *Clusius*.

8 This windes about poles, and growes to a great

Phaseoli parvi pallido albi ex America delati.

Phaseoli rubri.

Phaseoli rubri Indiani durissimi.

great height, with soft hairy leaves and large cods, wherein are contained seeds of diuers colours, sometimes they are red, otherwhiles of a whitish ash colour, sometimes wholly black, and otherwhiles spotted.

9 The Egyptian Beane is somewhat like the other Kidney Beanes in his growing: his fruit is of the bignesse of a small Hasell nut, blacke on one side, and of a golden yellow or Orange colour on the other.

Besides these you finde here figured, and diuers others described by *Clusius*, I think it not amisse to mention two more. The first of these, which was procured by *M^r. Tradescant*, and grows in our Gardens, is a large plant, not differing in manner of growth from the former Indian Kidney Beanes, but his floures are large, many, and of an elegant scarlet colour: whence it is vulgarly termed by our Flourists, the Scarlet Beane. The other I haue seene grow to a little height, but it would not indure; but the cods of it which were brought to vs were some three inches long, and couered with a hairie downe of a reddish colour, which put vpon the hands or skin in any part of the body would sting like a Nettle, and this was called the Stringing Beane: I thinke it came from some part of the East Indies. †

¶ The Place.

Kidney Beanes doe easily and soone spring vp, and grow into a very great length, being scwre neere to long poles fastned hard by them, or hard by arbors or banqueting places, otherwiser they lie flat on the ground, slowly come vp, hardly bring forth fruit, and become faultie and smitted, as *Theophrastus* writeth.

¶ The Time.

It is sowne in the Spring, especially in the midst of April, but not before: the fruit is ripe about the end of Sommer.

¶ The Names.

Hippocrates, *Diocles*, *Theophrastus*, and most of the other old Writers do call it *κίνας*: diuers of the bignesse of the seed do name it *κίνας* and *κίνας*: in Latine, *Silqua*: *Dioscorides* calleth it *Smilax*, because it climeth vp as *Smilax* doth, and taketh hold of props, staies, and shrubbes standing neere vnto it: others name it *φασέλιον*, a Diminitue deriued from *φάσιλος*: for *φάσιλος* and *φασέλιος* are not one and the selfe same pulse called by diuers names, as some suppose, but sundry fruits one differing from the other, as *Galen* in his first booke of the Faculties of Nourishments doth sufficiently declare, where he in-treateth of them both. For first he disputeth of *Phaselii* and *Ochri*, Beanes, and Pease; then afterward others comming betweene, he writeth of *Dolichus*, which also is named *Phaseolus*: and though hee may be thought to doubt what manner of pulse that is which *Theophrastus* calleth *Dolichus*; notwithstanding he gathereth and concludeth that it is a fruit of a garden plant in Italy, and in Caria, growing in the fields, which is in forme longer than the Cichlings, and was commonly called in his time *Faseolus*. Of his opinion is *Paulus Aegineta*, writing of *Phaselus*, which hee nameth *Dolichus*, in the 79. chap. of his first booke. Moreover, *Faselus* was in times past a common pulse in Italy and Rome, and *Dolichus* a strange pulse, for *Columella* and *Palladius*, writers of husbandry, haue made mention of the sowing of *Phaselus*: and *Virgil* calleth it *Vilis* in the first of his Georgicks: but concerning the sowing of *Dolichus* or Kidney Beane, none of the Latines haue written, by reason that the same was rare in Italy, and sowne onely in gardens, as *Galen* hath affirmed, naming it oftentimes a garden plant, and shewing that the same, as we haue said, is sowne in Caria; and likewise *Dioscorides* nameth it *σμίλαξ κηπουρά*, that is to say, *Smilax hortensis*, or garden *Smilax*, because it groweth in gardens: who also writing of this in another seuerall chapter, sheweth plainly, that *Smilax hortensis*, or *Dolichus* is another plant differing from *Faselus*, which he nameth *Phaseolus*.

For which causes it is not to be doubted, but that *Phaselus* with three syllables, differeth from *Faseolus* with foure syllables, no otherwise than *Cicer*, *Cicercula*, and *Cicera* differ, which notwithstanding be neere one to another in names: and it is not to be doubted but that they are deceiued, who thinke it to be one and the selfe same Pulse called by sundry names.

This plant is named in English, Kidney Beane, Sperage Beanes: of some, Fasselles, or long Peason, French Beanes, garden *Smilax*, and Romane Beanes: in French, *Fenes de Romme*: in Dutch, *Turckshoonen*.

¶ The Temperature.

Kidney Beanes, as *Dioscorides* teacheth, do more loose the belly than Peason; they are lesse windy, and nourish well, and no lesse than Peason, as *Diocles* saith: they be also without ingendring windiness at all: the Arabian Physitions say that they are hot and moist of nature.

¶ The Vertues.

A The fruit and cods of Kidney Beanes boiled together before they be ripe, and buttered, and so eaten with their cods, are exceeding delicate meat, and do not ingender winde as the other Pulses doe.

B They doe also gently loose the belly, prouoke vrine, and ingender good bloud reasonably well; but if you eat them when they be ripe, they are neither toothsome nor wholsome. Therefore they are to be taken whilest they are yet Greene and tender, which are first boiled vntill they be tender; then is the tib or sinew that doth run alongst the cod to be taken away; then must they be put into a stone pipkin, or some other vessell with butter, and set to the fire againe to stew, or boile gently: which meat is very wholsome, nourishing, and of a pleasant taste.

CHAP. 509. Of the flat Beane called Lupine.

¶ The Description.

THE tame or garden Lupine hath round hard stems, which of themselves do stand vp-right without any succour, help or stay: the leaues consist of fve, six, or seuen ioined together,

1 *Lupinus sativus.*
Garden Lupines.

2 *Lupinus flore luteo.*
Yellow Lupines.

3 *Lupinus flore caruleo.*
Blew Lupine.

4 *Lupinus maior flo. caruleo.*
The great blew Lupine.

gether, like those of the Chast tree, green on the vpper side, and on the nether side white and downy; and in the euening about the setting of the Sun they hang flagging downwards as though they were withered: among these there commeth vp a tuft of floures of a pale or light bluish colour, which turne into great rough cods, wherein is the fruit, which is flat and round like a cake, of a white colour, and bitter in taste: and where they cleaue vnto the cod, in that part they haue a certaine dent like a little nauell. This Lupine hath but one root, which is slender and wooddie, hauing hanging on it a few small threds like haire.

2 The yellow Lupine is like to the garden one in stalke and leaues, yet both of these lesser and shorter. It hath beautifull floures of an exceeding faire gold yellow colour, sweet of smell, made vp into an eare, of the colour of the yellow violet, and somewhat of the smell: the coddess are small, hard, somewhat hairy: the seeds be little, flat, round, in taste extreme bitter, of sundry colours, ill fauored, far lesser than the tame one.

3 The blew Lupines are longer than the yellow, and diuided into more wings and branches: the leaues be lesser and thinner: the floures small, and lesser than the yellow, of a blew colour: the seeds be also of diuers colours, bitter, and lesser than any of them all.

4 There is also another blew Lupine, whose leaues, stalks, floures, and cods are like, but larger than those of the first described: the floures are of colour blew, with some whiteneffe here and there intermixt.

¶ *The Place and Time.*

They require (saith *Theophrastus*) a sandy and bad soile: they hardly come vp in tilled places, being of their owne nature wilde: they grow in my garden, and in other mens gardens about London. They are planted in Aprill, and bring forth their fruit at two or three sundrie times, as though it did floure often, and bring forth many crops: the first in May, the second in Iuly, the last in September, but it seldome commeth to ripenesse.

¶ *The Names.*

This pulse is named in Greeke *σικυος λυπινος*: in Latine, *Lupinus*, and *Lupinus sativus*: in high Dutch, *Seigbonen*: in Italian, *Lupino domestico*: in Spanish, *Entramocos*: in the Brabanders language, *Ulrich boonen*, and *Lupinen*: in French, *Lupins*: in English, Garden Lupine, tame Lupine, and of some after the German name Fig-beane.

¶ *The Temperature and Vertues.*

A The seed of the garden Lupine is *σικυος λυπινος*, that is to say, much and often vsed, as *Galen* saith in his books of the Faculties of Nourishments: for the same being boiled and afterwards steeped in faire water, vntill such time as it doth altogether lose his naturall bitternes, and lastly being seasoned with a reasonable quantitie of salt, it is eaten with pickle. The Lupine is of an hard and earthy substance, wherefore it is necessarily of hard digestion, and containeth in it a thicke iuice, of which being not perfectly concocted in the veines, is ingendred a bloud or iuice which is properly called crude, or raw: but when it hath lost all his bitternes by preparing or dressing of it (as aforesaid) it is like *σικυος λυπινος*, that is to say, to such things as are without relish, which is perceiued by the taste; & being so prepared, it is, as *Galen* writeth in his books of the Faculties of simple medicines, one of the emplastricks or clammers.

B But whilest the naturall bitternesse doth as yet remaine, it hath power to clense and to consume or waste away; it killeth wormes in the belly, being both applied in manner of an ointment and giuen with hony to licke on, and also drunke with water and vineger.

C Moreouer, the decoction thereof inwardly taken, voideth the wormes; and likewise if it be sundry times outwardly vsed as a bath, it is a remedy against the morphew, sore heads, the small Pox, wilde scabs, gangrenes, venomous vlcers, partly by clensing, and partly by consuming and drying without biting; being taken with Rew and Pepper, that it may be the pleasanter, it scoureth the liuer and milt.

D It bringeth downe the menses, and expelleth the dead childe if it be layed to with myrrh and honie.

E Moreouer, the meale of Lupines doth waste or consume away without any biting qualitie, for it doth not onely take away blacke and blew spots that come of dry beatings, but also it cureth *Cheradas*, and *Phymata*: but then it is to be boiled either in vineger or oxymell, or else in water and vineger, and that according to the temperature of the griued parties, and the diuersities of the diseases, *Quod ex usu est eligendo*: and it also taketh away blew marks, and what thing soeuer else we haue said the decoction could do, all the same doth the meale likewise performe.

F These Lupines, as *Dioscorides* doth furthermore write, being boiled in raine water till they yeeld a certaine creame, are good to clense and beautifie the face.

G They cure the scabs in sheepe with the root of blacke Chameleon Thistle, if they be washed with the warme decoction.

The root boiled with water and drunke, prouoketh vrine.

The Lupines being made sweet and pleasant, mixed with vineger and drunk, take away the loth-
fomnesse of the stomacke, and cause a good appetite to meat.

Lupines boiled in that strong leigh which Barbarians do vse, and some Wormwood, Centorie, and
bay salt added thereto, stay the running and spreading of a *Gangrena*, and those parts that are de-
priued of their nourishment and begin to mortifie, and staieth the ambulative nature of running
and spreading vlcers, being applied thereto very hot, with stuphes of cloth or tow.

CHAP. 510. Of Peason.

¶ The Kindes.

There be diuers sorts of Peason, differing very notably in many respects, some of the garden, and
others of the field, and yet both counted tame: some with tough skinned or membranes in the
cods, and others haue none at all, whose cods are to be eaten with the Pease when they be young as
those of the young Kidney Beane: others carrying their fruit in the tops of the branches are este-
med and taken for Scottish Peason, which is not very common. There be diuers sorts growing wild,
as shall be declared.

1 *Pisum maius.*
Rownciuall Pease.

2 *Pisum minus.*
Garden and field Pease.

¶ The Description.

The great Pease hath long stalks, hollow, brickle, of a whitish green colour, branched, and
spread vpon the ground, vnlesse they be held vp with proppes set neere vnto them: the
leafe thereof is wide and long, made vp of many little leaues which be smooth, white,
growing vpon one little stalke or stem, and set one right against another: it hath also in the vpper
part long clasping tendrels, wherewith it foldeth it selfe vpon props and staies standing next vnto

3 *Pisum umbellatum.*
Tufted or Scottish Pease.

4 *Pisum excorticatum.*
Pease without skins in the cod.

5 *Pisum sylvestre.*
Wilde Pease.

6 *Pisum perenne sylvestre.*
Everlasting wilde Pease.

it: the floure is white and hath about the middle of it a purple spot: the cods be long, round *Cilindrica forma*: in which are contained seeds greater than *Ochri*, or little Peason, which being drie are cornered, and that vnequall, of colour sometimes white and sometimes gray: the roots are small.

2 The field Pease is so very well knowne to all, that it were a needlesse labour to spend time about the description.

3 Tufted Pease are like vnto those of the field, or of the garden in each respect, the difference consisteth onely in that, that this plant carrieth his floures and fruit in the tops of the branches in a round tuft or umbel, contrary to all other of his kinde, which bring forth their fruit in the midst, and alongst the stalks: the root is thicke and fibrous.

4 Pease without skins, in the cods differ not from the precedent, sauing that the cods hereof want that tough skinny membrane in the same, which the hogs cannot eat by reason of the toughness; whereas the other may be eaten cods and all the rest, euen as Kidney beanes are: which being so dressed are exceeding delicate meat.

5 The wilde Pease differeth not from the common field Pease in stalke and leaues, sauing that this wilde kinde is somewhat lesser: the floures are of a yellow colour, and the fruit is much lesser.

6 The Pease whose root neuer dies, differeth not from the wilde Pease, onely his continuing without sowing, being once sowne or planted, setteth forth the difference.

¶ The Place.

Pease are set and sown in gardens, as also in the fields in all places of England. The tufted Pease are in reasonable plenty in the West part of Kent, about Sennocke or Seuenock, in other places not so common.

The wilde Pease do grow in pastures and earable fields in diuers places, specially about the field belonging vnto Bishops Hatfield in Hartfordshire.

¶ The Time.

They be sowne in the Spring time, like as be also other pulses, which are ripe in Summer: they prosper best in warme weather, and easily take harme by cold, especially when they floure.

¶ The Names.

The great Pease is called in Latine *Pisum Romanum*, or *Pisum maius*: in English, Roman Pease, or the greater Pease, also garden Pease: of some, Branch Pease, French Pease, and Rounsuals. *Theophrastus* and other old Writers do call it in Greeke *πικύρα*: in Latine also *Pisum*: in low Dutch, *Roomsche erwiten*: in French, *des Pois*. The little Pease is called of the Apothecaries euery where *Pisum*, and *Pisum minus*: it is called in English, little Pease, or the common Pease.

¶ The Temperature and Vertues.

The Pease, as *Hippocrates* saith, is lesse windie than Beans, but it passeth sooner through the belly. *A Galen* writeth, that Peason are in their whole substance like vnto Beanes, and be eaten after the same manner that Beans are, notwithstanding they differ from them in these two things, both because they are not so windie as be the beanes, and also for that they haue not a clenising faculty, and therefore they do more slowly descend through the belly. They haue no effectuall qualitie manifest, and are in a meane between those things which are of good and bad iuice, that nourish much and little, that be windie and without winde, as *Galen* in his booke of the Faculties of Nourishments hath written of these and of beans.

CHAP. 511. Of the tame or Garden Ciche.

¶ The Description.

G Arden Ciche bringeth forth round stalks, branched and somewhat hairy, leaning on the one side: the leaues are made of many little ones growing vpon one stem or rib, and set one right against another: of which euery one is small, broad, and nicked on the edges, lesser than the leaues of wilde Germander: the floures be small, of colour either white, or of a reddish purple: after which come vp little short cods, puffed vp as it were with winde like little bladders, in which doe lie two or at the most three seeds cornered, small towards the end, with one sharp corner, not much vnlike to a Rams head, of colour either white, or of a reddish blacke purple, in which is plainly seen the place where they begin first to sprout. The root is slender, white and long: For as *Theophrastus* saith, the Ciche taketh deepest root of all the Pulses.

¶ The Place.

It is sowne in Italy, Spaine and France, euery where in the fields. It is sowne in our London gardens, but not common.

Cicer sativum.
Garden Ciche.

for yellow jaundice; but they are hurtfull vnto the bladder and Kidneies that haue vlcers in them.

CHAP. 512. Of wilde Ciches.

¶ The Kindes.

THe wilde Ciche is like to the tame (saith *Dioscorides*) but it differeth in seed: the later writers haue set downe two Kindes hereof, as shall be declared.

¶ The Description.

1 **T**He first wilde Cich bringeth forth a great number of stalks branched, lying flat on the ground: about which be the leaues, consisting of many vpon one rib as do those of the garden Ciche, but not nicked in the edges, more like to the leaues of Axcich: the floures come forth fastned on small stems, which grow close to the stalks, of a pale yellow colour, and like vnto eares: in their places come vp little cods, in forme and bignesse of the fruit of garden Ciches, black and something hairie, in which lieth the seed, that is smal, hard, flat, and glittering, in taste like that of Kidney Beane: the root groweth deepe, fastned with many strings.

2 There is another kinde of wilde Cich that hath also a great number of stalks lying vpon the ground, about which stand soft leaues, something hairy and white, consisting of three broad leaues standing vpon a middle rib, the least of which stand neere to the stem, and the greatest at the very top: the floures come forth at the bottome of the leaues many together, of colour yellow; after which grow small long huskes, soft and hairy, in euery one whereof is a little cod, in which lie two seeds like little Cichlings.

¶ The

¶ The Time.

It is sowne in Aprill, being first steeped in water a day before: the fruit is ripe in August.

¶ The Names.

It is called in Greeke *ἰσπινδοῦς*: in Latine, *Cicer arietinum*, or Rams Ciches, & of the blackish purple colour, *Cicer nigrum*, vel *rubrum*, blacke or red Ciche: and the other is named *Cand. dum* vel *album Cicer*: or white Ciche: in English, Common Cich, or Ciches, red Cich, of some, Sheepes Ciche Pease, or Sheepes Ciche Peason.

¶ The Temperature and Vertues.

The Ciche, as *Galen* writeth in his booke of the Faculties of nourishments, is no lesse windie than the true Bean, but it yeeldeth a stronger nourishment than that doth: it prouoketh lust, and it is thought to ingender seed.

Some giue the same to stallion horses. Moreover, Ciches do scoure more than do the true Beanes: insomuch as certaine of them do manifestly diminish or waste away the stones in the Kidneies: those be the blacke and little Ciches called *Arietina*, or Rams Ciches, but it is better to drinke the broth of them sodden in water.

Both the Rams Ciches, as *Dioscorides* saith, the white and the blacke prouoke vrine, if the decoction therof be made with Rosemary and giuen vnto those that haue either the Drop:

1 *Cicer sylvestre*.

The wilde Cich.

2 *Cicer sylvestre latifolium*.

Broad leaved wilde Cich.

¶ The Place.

These plants are sowne in the parts beyond the seas for to feed their cattell with in winter, as we do tares, vetches, and such other base pulse.

¶ The Time.

The time answereth the Vetch or tare.

¶ The Names.

The wild Cich hath no other name in Latine but *Cicer sylvestre*: the later writers haue not found any name at all.

¶ The Temperature and Vertues.

Their temperature and vertues are referred to the garden Cich, as *Theophrastus* affirmer; and *Galien* saith that the wilde Cich is in all things like vnto that of the garden, but in Physicks vse more effectuell, by reason it is more hotter and drier, and also more biting and bitter.

CHAP. 513. Of Lentils.

¶ The Description.

1 The first Lentil growes vp with slender stalks, and leaues which be somewhat hard, growing aslope from both sides of the rib or middle stalke, narrow and many in number like those of Tares, but narrower and lesser: the floures be small, tending somewhat towards a purple: the cods are little and broad: the seeds in these are in number three or foure, little, round, plaine, and flat: the roots are small and threddy.

2 The second kinde of Lentill hath small tender and pliant branches a cubit high, wheron do grow leaues diuided or consisting of sundry other small leaues, like the wilde Vetch, ending at the middle rib with some clasping tendrels, wherewith it taketh hold of such things as are neere vnto it: among these come forth little brownish floures mixed with white, which turne into small flat cods, containing little browne flat seed, and sometimes white.

¶ The

1 *Lens maior.*
Great Lentils.

2 *Lens minor.*
Little Lentils.

¶ *The Place.*

These Pulses do grow in my garden; and it is reported vnto me by those of good credit, that about Watford in Middlesex and other places of England the husbandmen do sow them for their cattell, euen as others do Tares.

¶ *The Time.*

They both floure and wax ripe in Iuly and August.

¶ *The Names.*

They are called in Greeke *quaris*, or *quana*: in Latine, *Lens*, and *Lenticula*: in high-Dutch, *Linsen*: in French, *Lentille*: in Italian, *Lentichia*: in Spanish, *Lenteia*: in English, Lentils.

¶ *The Temperature and Vertues.*

- A Lentils, as *Galen* saith, are in a meane betweene hot and cold, yet are they dry in the second degree: their skin is astringent or binding, and the meate or substance within is of a thicke and earthy iuyce, hauing a qualitie that is a little austere or something harsh, much more the skin thereof; but the iuyce of them is quite contrarie to the binding qualitie; wherefore if a man shal boile them in faire water, and afterwards season the water with salt and pickle, *aut cum ipsis oleo condiens*, and then take it, the same drinke doth loose the belly.
- B The first decoction of Lentils doth loose the belly; but if they be boyled againe, and the first decoction cast away, then doe they binde, and are good against the bloody fluxe or dangerous laskes.
- C They do their operation more effectually in stopping or binding, if all or any of these following be boyled therewith, that is to say, red Beets, Myrtles, pils of Pomegranats, dried Roses, Medlars, Seruice berries, vnripe Peares, Quinces, Plantaine leaues, Galls, or the berries of Sumach.
- D The meale of Lentils mixed with honey doth mundifie and cleanse corrupt vlcers and rotten sores, filling them with flesh againe; and is most singular to be put into the common digestiues vsed among our London Surgeons for greene wounds.
- E The Lentil hauing the skin or coat taken off, as it loseth that strong binding qualitie, and those accidents that depend on the same, so doth it more nourish than if it had the skin on.
- F It ingendreth thicke and naughty iuyce, and slowly passeth thorow the belly, yet doth it not stay the loofnesse as that doth which hath his coat on; and therefore they that vse to eat too much thereof

thereof do necessarily become Lepers, and are much subiect to cankers, for thicke and dry nourishments are apt to breed melancholy.

Therefore the Lentill is good food for them that through waterish humours be apt to fall into the dropie, and it is a most dangerous food for dry and withered bodies; for which cause it bringeth dimnesse of sight, though the sight be perfect, through his excessiue drinesse, whereby the spirits of the sight be wasted; but it is good for them that are of a quite contrarie constitution.

It is not good for those that want their termes, for it breedeth thicke bloud, and such as slowly passeth through the veines.

But it is singular good to stay the menses, as *Galen* in his booke of the faculties of nourishments affirmeth.

It causeth troublesome dreames (as *Dioscorides* doth moreouer write) it hurteth the head, sinewes, and lungs.

It is good to swallow downe thirty graines of Lentils shelled or taken from their husks, against the ouercasting of the stomacke.

Being boyled with parched barley meale and laid to, it asswageth the paine and ach of the gout.

With honey it filleth vp hollow sores, it breaketh aschaies, clenseth vlcers: being boyled in wine it wasteth away wens and hard swellings of the throat.

With a Quince, and Melilot, and oyle of Roses it helpeth the inflammation of the eyes and fundament, but in greater inflammations of the fundament, and great deep vlcers, it is boyled with the rinde of a pomegranat, dry Rose leaues, and honey.

And after the same maner against eating sores that are mortified, if sea water be added, it is also a remedie against pushes, the shingles, and the hot inflammation called S. Anthonies fire, and for kibes, in such manner as we haue written: being boyled in sea water and applied, it helps womens breasts in which the milke is cluttered, and cannot suffer too great abundance of milke.

CHAP. 514. Of Cich or true Orobus.

Orobus receptus Herbariorum.

The true Orobus.

¶ The Description.

THis Pulse, which of most Herbarists is taken for the true Orobus, and called of some, bitter Fitch, is one of the Pulses whose tender branches traile vpon the ground, as *Theophrastus* saith, and whose long tender branches spread far abroad, whereon doe grow leaues like those of the field Vetch: among which grow white floures; after which come long cods, that appeare bunched on the outside against the place where the seeds do lie, which are small, round, russet of colour, and of a bitter taste: the root is small and single.

¶ The Place.

It prospereth best in a leane soile, according to *Columella*: it groweth in woods and copses in sundry places of Spaine and Italy, but here only in gardens.

¶ The Time.

This is sowne early and late, but if it be sowne in the spring it easily commeth vp, and is pleasant, and vnpleasant if it be sowne in the fall of the lease.

¶ The Names.

This is called in Greeke *Oxylos*: the shops of Germanie haue kept the name *Orobus*: the Italians call it *Macho*: the Spaniards, *Terno*, and *Ternos*: in English it is called bitter Vetch, or bitter Fitch, and Orobus, after the Latine name. Of some Ers, after the French name.

The Temperature and Vertues.

- A** *Galen* in his first booke of the Faculties of nourishments saith, That men do altogether abstaine from the bitter Vetch, for it hath a very vnpleasant taste, and naughty iuyce; but Kine in Asia and in most other countries do eate thereof, being made sweet by steeping in water; notwithstanding men being compelled through necessitie of great famine, as *Hippocrates* also hath written, do oftentimes feed thereof; and we also dressing them after the manner of Lupines, vse the bitter Vetches with honey, as a medicine that purgeth thicke and grosse humors out of the chest and lungs.
- B** Moreouer, among the bitter Vetches the white are not so medicinable, but those which are neere to a yellow, or to the colour of Okar; and those that haue beene twice boyled, or sundrie times soked in water, lose their bitter and vnpleasant taste, and withall their clensing and cutting qualitie, so that there is onely left in them an earthy substance, which serues for nourishment, that drieth without any manifest bitternesse.
- C** And in his booke of the Faculties of simple medicines he saith, That bitter Vetch is dry in the later end of the second degree, and hot in the first: moreouer, by how much it is bitter, by so much it clenseth, cutteth, and remoueth stoppings: but if it be ouermuch vsed it bringeth forth bloud by vrine.
- D** *Dioscorides* writeth, that bitter Vetch causeth head-ache and heauy dulnesse, that it troubles the belly, and driueth forth bloud by vrine; notwithstanding being boyled it serueth to fatten Kine.
- E** There is made of the seed a meale fit to be vsed in medicine, after this maner: the full and white graines are chosen out, and being mixed together they are steeped in water, and suffered to lie till they be plumpe, and afterwards are parched till the skinne be broken; then are they ground, and searfed or shaken thorow a meale sieue, and the meale reserued.
- F** This looseth the belly, prouoketh vrine, maketh one well coloured: being ouermuch eaten or drunke it draweth bloud by the stooles, with gripings, and also by vrine.
- G** With honey it clenseth vlcers, taketh away freckles, sun-burnes, blacke spots in the skinne, and maketh the whole body faire and cleane.
- H** It stayeth running vlcers or hard swellings, and gangrens or mortified sores; it softeneth the hardnesse of womens breasts, it taketh away and breaketh eating vlcers, carbuncles, and sores of the head: being tempered with wine and applied it healeth the bitings of dogs, and also of venomous beasts.
- I** With vineger it is good against the strangurie, and mitigateth paine that commeth thereof.
- K** It is good for them that are not nourished after their meat, being parched and taken with hony in the quantitie of a nut.
- L** The decoction of the same helpeth the itch in the whole body, and taketh away kibes, if they be washed or bathed therewith.
- M** *Cicer* boyled in fountaine water with some *Orobis* doth assuage the swelling of the yard and priuie parts of man or woman, if they be washed or bathed in the decoction thereof; and the substance hereof may also be applied plaisterwise.
- N** It is also vsed for bathing and washing of vlcers and running sores, and is applied vnto the scurfe of the head with great profit.

CHAP. 515. Of the Vetch or Fetch.

The Description.

THE Vetch hath slender and foure squared stalkes almost three foot long: the leaues be long, with clasping tendrels at the end made vp of many little leaues growing vpon one rib or middle stem; euery one whereof is greater, broader, and thicker than that of the Lentil: the floures are like to the floures of the garden beane, but of a blacke purple colour: the cods be broad, small, and in euery one are contained fve or six graines, not round, but flat like those of the Lentil, of colour blacke, and of an vnpleasant taste.

There is another of this kinde which hath a creeping and liuing root, from which it sendeth forth crested stalkes some cubit and halfe high: the leaues are winged, commonly a dozen growing vpon one rib, which ends in a winding tendrel: each peculiar leafe is broader toward the bottoome, and sharper towards the top, which ends not flat, but somewhat round. Out of the bosomes of the leaues towards the tops of the stalkes, on short foot-stalkes grow two, three or more pretty large pease-fashioned blewish purple floures, which are succeeded by such cods as the former, but somewhat lesser, which when they grow ripe become blacke, and fly open of themselves, and

‡ 1 *Vicia*.
Tare, Vetch, or Fetch.

† 2 *Vicia maxima dumetorum*.
Bush Vetch.

‡ 3 *Vicia syl. flo. albo.*
White flowered Vetch.

4 *Vicia sylvestris, sine Cracca maior.*
Strangle Tare, Tine, or wilde Fetch.

and so scatter their seed. This growes in many places wilde among bushes, both here and in Germanie, as appeares by that name *Bauhine* thence giues it, calling it *Vicia maxima dumetorum*. *Tragus* makes it his *Vicia syl. altera*; and iudges it to be the *Aphace* of *Dioscorides*; and he saith the Latines call it *Os mundi*: the high-Dutch, *S. Cristoffels kraut*, and *Schwartzs Linsen*, *Tabern.* calls it *Cracca maior*.

‡ 5 *Vicia syl. sine Cracca minima.*
Small wilde Tare.

four or six vpon foot-stalkes; ending also in clasping tendrels: the floures grow vpon pretty long but very slender foot-stalkes, sometimes two or three, otherwhiles more, very small, and of a whitish colour inclining to blewnesse: which are succeeded by little short flat cods, containing commonly foure or fve little seeds of a blackish colour: this is the *Arachus*, *sine Cracca minima* of *Lobel*; but I question whether it be that which *Bauhine* in his *Pinax* hath made the same with it, calling it *Vicia segetum cum siliquis plurimis hirsutis*: for that which I haue described, and which exactly agrees with this figure of *Lobel* and that description in the *Aduers.* hath cods very smooth without any hairinesse at all. This floures most part of Sommer, and growes in most places both in corne fields and medowes. ‡

¶ The Place.

The Tare is sowne in any ground or soile whatsoeuer.

¶ The Time.

It floureth in May, and perfeð his seed toward September.

¶ The Names.

It is called in Latine *Vicia*, *à vinciendo*, of binding or wrapping, as *Varro* noteth, because, saith he, it hath likewise clasping tendrels such as the vine hath, by which it crawles vpon the stalks of the weeds which are next vnto it: of some, *Cracca*, and *Arachus*, and also *Aphaca*: it is called in high-Dutch, *Wicken*: in low-Dutch, *Witsen*: in French, *Vesce*: in most shops it is falsely termed *oerke*, and *Eruum*; for *Eruum* doth much differ from *Vicia*: it is called in English, *Vetch*, or *Fetch*. The countrey men lay vpon this Vetch with the seeds and whole plant, that it may be a fodder for their cattell.

¶ The Temperature and Vertues.

A Notwithstanding I haue knowne, saith *Galen*, some, who in time of famin haue fed hereof, especially in the spring, it being but Greene; yet is it hard of digestion, and bindeth the belly.

Therefore

Therefore seeing it is of this kinde of nature, it is manifest that the nourishment which comes thereof hath in it no good iuyce at all, but ingendreth a thicke blood, and apt to become melancholy.

† The figure of the common Fetch was formerly wanting, and in the stead thereof was put that of the other, described here in the second place.

CHAP. 516. Of Chicklings, Pease, and Tare everlasting.

¶ The Description.

† **T** Here is a Pulse growing in our high and thicke woods, hauing a very thicke tough and woody root; from which rise vp diuers long weake and feeble branches, consisting of a tough middle rib, edged on both sides with a thin skinny membrane, smooth, and of a grasse greene colour; whereon do grow at certaine distances small flat stems, vpon which stand two broad leaues ioyning together at the bottome: from betwixt those leaues come forth tough clasping tendrels which take hold of such things as grow next vnto them: from the bosome of the stem, whereon the leaues do grow, shooteth forth a naked smooth foot-stalke, on which doe grow most beautifull floures like those of the Pease, the middle part whereof is of a light red, tending to a red Purple in graine; the outward leaues are somewhat lighter, inclining to a blush colour: which being past, there succeed long round cods, wherein is contained seed of the bignesse of a Tare, but rounder, blackish without, and yellowish within, and of a bitter taste.

† 5 *Lathyrus maior latifolius.*
Pease everlasting.

† 2 *Lathyrus angustifolius flore albo.*
White floured Chichelings.

† 2 Of which kinde there is likewise another like vnto the precedent in each respect, sauing that the leaues hereof are narrower and longer, and therefore called of most which set forth the description, *Lathyrus angustifolia*: the floures of this are white, and such also is the colour of the fruit: the root is small, and not lasting like that of the former.

† 3 The stalks, leaues, and floures of this are like those of the precedent, but the floures are of a reddish purple colour: the cods are lesser than those of the former, and in them are contained

LI III

lesse

lesser, harder, and rounder seeds, of a darke or blackish colour. This growes not wildewith vs, but is sometimes sowne in gardens, where it floures in Iune and Iuly.

4 This Egyptian differs not in shape from the rest of his kinde, but the floures are of an elegant blew on the inside, but of an ash colour inclining to purple on the outside: the cods grow vpon long foot-stalkes, and are a little winged or welted, and containe but two or three little cornered seeds spotted with blacke spots. This floures in Iune and Iuly; and the seed thereof was sent to *Clusius* from Constantinople, hauing been brought thither out of Egypt.

‡ 3 *Lathyrus angustifol. flo. purp.*
Purple floured Chichelings.

‡ 4 *Lathyrus Aegyptiacus.*
Egyptian Chichelings.

5 The stalkes of this are some two or three foot long, winged, weake, and lying on the ground vnlesse they haue somewhat to support them. Vpon these at certaine distances grow winged leaues with two little eares at their setting on to the stalke: these leaues consist of six long and narrow Greene leaues like those of the other plants of this kinde; and these six leaues commonly stand vpright, by couples one against another; otherwhiles alternately: the footstalke whereon these stand ends in clasping tendrels: the floures are in shape like the former, but the outer leafe is of a faire red or crimson colour, and the inner leafe white: after the floures come the cods, containing some foure or five pretty large flat seeds, which swell out of the cods where they lie, which in the spaces between each seed are deprest, like that of *Orobus*. This is only a garden plant with vs, and floures in Iune and Iuly, the seed is ripe in August. I haue for this given you *Lobel's* figure of his *Lathyrus angustiore graminco folio*; which may serue, if you but make the leaues and cods to agree with this description. ‡

6 The yellow wilde Tare or Fetch hath diuers very small ramping stalkes, tough, and leaning this way and that way, not able to stand of it selfe without the helpe of props or things that stand by it: the leaues are very thin and sharpe pointed: the floures grow alongst the leaues in fashion of the pease floures, of a bright yellow colour: the roots are very small, long, tough, and in number infinite, insomuch that it is impossible to root it forth, being once gotten into the ground, vnlesse the earth be digged vp with the roots, and both cast into the riuer, or burned. Doubtlesse it is the most pernicious and hurtfull weed of all others, vnto all manner of Greene wholsome herbes or any wood whatsoeuer.

‡ 5 *Lathyrus annuus siliquis Orobi.*
Party coloured Cicheling.

‡ 6 *Lathyrus sylvestris flo. luteo.*
Tare euerlasting.

¶ The Place.

The first growes in shadowie woods, and among bushes: there groweth great store thereof in Swaincombe wood, a mile and a halfe from Greenhithe in Kent, as you go to a village thereby called Betsome, and in diuers other places.

The sixth groweth in most grassie pastures, borders of fields, and among graine almost euerie where.

¶ The Time.

The time answereth the other Pulses.

¶ The Names.

The first is called *Lathyrus*, to make a difference betweene it and *Lathyrus*, or Spurge: of *Matthi-olus*, *Clymenum*: of *Cordus*, *Eruum sativum*: of *Tragus*, *Pisum Gracorum*: in English, Pease euerlasting, great wilde Tare, and Cichling.

‡ The second is the *Eruum album sativum* of *Fuchsius*: *Lathyrus* or *Cicercula* of *Dodonaeus*: *Lathyrus angustiore gramineo folio* of *Lobel*.

The third is the *Aracus siue Cicera* of *Dodonaeus*: the *Lathyrus flore purpureo* of *Camerarius*.

The fourth by *Clusius* is called *Cicercula Egyptiaca*: by *Camerarius*, *Aracus Hispanicus*, siue *Lathyrus Egyptiacus*.

The fifth is not mentioned by any (that I remember) but *M^r. Parkinson*, in his garden of floures, and that by the name I giue you it.

The sixth is the *Lathyrus sylvestris flo. luteis* of *Thalins*: *Legumen terra glandibus simile* of *Dodonaeus*: *Vicia* of *Tabernamontanus*: and it may be, the *Aracus flore luteo* of the *Aduers*. However, I haue put *Lobels* figure of *Aracus* for it, which well enough agrees with it. I vse for some resemblance it hath to *Aphaca* to call it *Aphacoides*. ‡

¶ The Temperature and Vertues.

The remperature and vertues are referred to the manured Tare or Vetch; notwithstanding they are not vsed for meate or medicine.

CHAP. 517.

Of the oylie Pulse called Sefamum.

Sesamum, siue Sisamum.
The Oylie Graine.

¶ The Description.

† *Sesamum* hath a thicke and fat vpright stalke a cubit and a halfe high, garnished with leaues much like the Peach or Almond, but rougher, and cut in with somewhat deepe gashes on their sides: amongst these leaues come forth large white or else red floures, somewhat shaped like those of Foxgloves, which turne into round long crested cods, containing white flat oileous seed. *Theophrastus* affirmeth that there is a kinde thereof which is white, bearing only one root. No kinde of beast will eate this plant while it is Greene, because of his bitterneffe; but being withered and dried, the seed thereof becommeth sweet, and the cattell will feed on the whole plant.

¶ The Place.

It groweth both in Egypt and in India: *Sesama*, saith *Pliny*, came from the Indies; they make an oile of it. It is a stranger in England.

¶ The Time.

It is one of the Sommer grains, and is sowne before the rising of the seven starres, as *Pliny* writeth; yet *Columella* saith, that *Sesamum* must be sowne after the Autumne Æquinoctial, against the Ides of October: they require for the most part a rotten soile, which the husbandmen of Campania do call a blacke mold.

¶ The Names.

The Grecians cal this grain *ζευρα*; the Latines also *Sesamum*, and *Sisamum*, and often in the feminine gender *Sesama*: we are constrained for want of an English name to vse the Latine: it is vnknowne to the Apothecaries, especially the plant it selfe; but the seed and oyle thereof is to be found among them in other countries: we may call it Turkey Millet.

¶ The Temperature and Vertues.

- A According to some it is hot and dry in the first degree: the seed thereof, as *Galen* saith, is fat, and therefore being layd vp it commeth to be oylie very quickly; wherfore it speedily filleth and stuffeth vp those that feed thereof, and ouerthroweth the stomacke, and is slow of digestion, and yeeldeth to the body a fat nourishment: therefore it is manifest that it cannot strengthen the stomack, or any part thereof, as also no other kind of fat thing: and the iuice that commeth thereof is thick, and therefore it cannot speedily passe thorow the veines. Men do not greedily feed of it alone, but make cakes thereof with honey, which they call *ζευρα*: it is also mixed with bread, and is of an hot temperature, for which cause it procureth thirst: and in his booke of the faculties of simple Medicines he saith, that *Sesamum* is not a little clammy and fat, and therefore it is an emplasticke, and a softner, and is moderately hot: the oile which commeth thereof is of like temperature, and so is the decoction of the herbe also.
- B *Dioscorides* writeth, That *Sesamum* is an enemie to the stomacke, it causeth a stinking breath, if it remaine sticking betweene the teeth after it is chewed.
- C It wasteth away grossenes of the sinewes; it is a remedie against bruises of the eares, inflammations, burnings and scaldings, pains of the ioynts, and biting of the poysonfom horned serpent called *Ceraustes*. Being mixed with oile of Roses it takes away the head-ache which commeth of heate.
- D Of the same force is the herbe boyled in wine, but it is especially good for the heate and paine of the eyes.
- E Of the herb is made an oile vsed of the Egyptians, which as *Pliny* saith is good for the eares.
- F It is a remedie against the sounding and ringing of the eares.

CHAP. 518. Of Hatchet Fetch.

¶ The Description.

1 **T**He first kinde of Hatchet Fetch hath many small branches trailing here and there vpon the ground: vpon which grow small leaues spred abroad like the leaues of the wilde Fetch; among which come forth clusters of small yellow floures, which fade away, and turne into little flat thin and browne cods, wherein is contained small reddish seed of a bitter taste.

2 The second kinde of hatchet Fetch hath many round tough and flexible branches, trailing vpon the ground: whereupon do grow leaues like the former, but more like the leaues of Liquorice, and hauing the taste of the Liquorice root, which hath giuen occasion to some to deeme it a kinde of Liquorice: among these leaues come forth pale yellow floures, after which there succeed small crooked cods, turning their points inwardly, one answering another like little hornes, containing small flat seeds foure cornered, and fashioned like a little wedge: the root is tough, of a woody substance, and doth continue fruitfull a very long time.

† 1 *Hedysarum maius.*
Hatchet Fetch.

‡ 2 *Hedysarum Glycyrrhizatum.*
Liquorice hatchet Fetch.

3 There is another kind of *Securidaca* or hatchet Fetch, which hath branches, leaues, and roots like the last before remembred, and differeth in that, that the floures of this plant are mixed, and do vary into sundry colours, being on the vpper part of a flesh colour, and on the lower of a white or snowie colour, with a purple Storks bill in the middle: the leaues are in taste bitter: the cods are small like those of Birds foot, and not much vnlike the cods of *Orobis*.

4 There is likewise another kinde of *Securidaca* or hatchet Fetch, which is dedicated vnto *Carolus Clusius* by the aforementioned Dr. Penny, who found it in the North parts of England, hauing leaues, roots, and branches like vnto the former: but the floures of this are white, and mixed with some purple, and bitter also in taste: the cods are like the claw of a crab, or (as *Clusius* saith) like the knife which shoo-makers do vse in Flanders; in which cods are contained small reddish seed: this root also is of long continuance. ‡ *Clusius* doth not say that Dr. Penny found this in the North of England, but in the territorie of Geneua not far from Pontetremile, amongst the bushes, and nowhere else. ‡

‡ 3 *Hedysarum minus siliquis articulatis.*
Hatchet Fetch with ioynted cods.

‡ 5 *Securidaca minor lutea.*
Small yellow hatchet Fetch.

‡ 4 *Securidaca minor pallide carulea.*
Small blew floured hatchet Fetch.

‡ 6 *Securidaca siliquis planis dentatis.*
Indented hatchet Fetch.

† 5 This in the stalks, leaues, colour, and shape of the floures is like, yet lesse than the first described; the cods are also smaller, lesser, and more crooked: and herein onely consists the chiefe difference, it is an annuall plant, and grows onely in some gardens. *Matthiolus, Lobel, Dodonaeus*, and other, make this their *Hedysarum*, or *Securidaca minor*.

6 This hath many crested branches, whereon great winged leaues, that is, some twentie or more fastened to one rib: the floures are like those of the other plants of this kinde; but the cods are of an inch long, flat, or indented or toothed on their sides. But of what colour the floures and seeds are of it, is not exprest by *Clusius*, who onely set this forth by a picture, and some pieces of a dried plant thereof, which he receiued from *Cortusius*, by the name of *Scolopendria leguminosa*, or *Hedysarum peregrinum*: *Cortusius* had it from *Honorius Bellus*, who obserued it growing vpon the Rocks at *Seberico*, a citie of *Illyria*. †

7 There is also another sort of Hatcher Fetch, which hath very long and tough branches trailing vpon the ground, beset with leaues like the former, but much greater: the floures do grow at the top of the branches, of a pale colour, and turne into rough round and flat cods, fashioned like little bucklers: the root of this (as of the first) dieth at the first approach of winter, as soone as the seed is ripe: † The stalks of this are stiffe and crested, growing to the height of two cubits, with leaues as large as those of *Liquorice*: the floures are of a faire bright red colour: the cods are made as it were of many rough buckler-like seeds, or rather seed vessels wherein are contained smal brown seeds. †

† 7 *Hedysarum Clypeatum*.

French Honysuckle.

8 *Ferrum Equinum*.

Horse-shoo.

8 Horse-shoo hath many stalks slender and lying vpon the ground: the leaues be thinne, and lesser than those of *Axfeed*: the floures along the stalks are little: after which come vp long cods something broad, and a little bowing; which haue vpon the one side deepe round and indented cuts, like after a sort to an *Horse-shoo*: the root is somewhat long.

¶ The Place.

These plants do grow in my garden: the second kinde I found growing in *Suffolke*, in the highway on the right hand, as you goe from *Sudbury* to *Corner Church*, about an hundred paces from the end of the towne, as also in fundry other places of the same countrey; and in *Essex* about *Dun-*
mow;

mow, and in the townes called Clare and Henningham. ‡ Also it growes by Purfleet, about the foot of the hill whereon the Wind-mill stands; and in diuers parts of Kent. ‡

Horfe-shoee commeth vp in certaine vntilled and sunnie places of Italy and Languedocke: it groweth likewise in my garden.

¶ The Time.

These plants do floure in Iune, and their seed is ripe in August:

¶ The Names.

The Grecians name this, whether it be a pulse or an infirmitie among corne, *in Dorapoy*: the Latines, of the forme of the seed, *Securidaca*, and *Hedysarum*: in English, Axseed, Axwoort, Ax-fitch, and Hatchet Fitch: it is vnkowne to the Apothecaries.

‡ The second is the *Fanugracum sylvestre* of *Tragus* and *Dodonaus*: the *Glycyrrhiza sylvestris* of *Gesner*, and the *Glaux vulgaris* of *Lobel*. ‡

Horfe-shoee is commonly called in Italian *Sferro de cauallo*: you may name it in Latine *Ferrum equinum*: in English, Horfe-shoee.

¶ The Temperature.

The seeds of these plants are hot and drie of complexion.

¶ The Vertues.

- A Being drunke it is acceptable to the stomacke, and remoueth stoppings out of the intrailles, and of like vertue be the new leaues and tender crops of the whole plant.
- B *Dioscorides* sheweth that it is also good for the stomacke being taken in drink, and is mixed with counterpoisons.
- C And it is thought to hinder conception, if it be applied with honie before the act.
- D The seed of Axwoort openeth the stoppings of the liuer, the obstruction of the spleen, and of all the inward parts.
- E Horfe-shoee is bitter and like in nature to Axseed.

† The figure which formerly was in the first place, agreed with the third description: that which was in the second place was of the *Hedysarum minus*, of *Tabernaemontanus*, being a kinde of *Ferrum equinum*, which carries the cods many together on the tops of the branches, and growes in Germanie: whence *Bauhine* calls it *Ferrum equinum Germanicum siliquis in summitate*.

CHAP. 519. Of Pease Earth-Nut.

¶ The Description.

THE Pease Earth nut commeth vp with slender and weake stalkes: the leaues be thin, and little, growing vpon slender stems, with clasping tendrels at the ends, with which it imbraceth and taketh hold of such things as stand neere vnto it: the floures on the tops of the stalkes are like to those of Pease, but lesler, of a red purple colour, in smell not vnpleasant: in their places come vp long cods, in which are three or foure round seeds: the roots be thicke, long, like after a sort to acorns, but much greater, blacke without, gray within, in taste like to the Chesse-nut: out of which beneath doth hang a long slender string: there grow out of the same also other strings, hard to the setting on of the stalk, vnto which creeping a slope do grow other kernelled roots whilst the plant doth thus multiplie it selfe.

‡ 2 This with *Thalins* in his *Sylua Hircynia*, set forth by the name of *Astragalus sylvaticus*, was by our Author taken for, and confounded with the *Terraglandes*; and therefore I haue put it with it, that the difference might the better appeare, which is not a little to such as heedfully obserue it: But our Author in this is to be pardoned, seeing *D^r. Turner*, a man more exquisite in the knowledge of plants, and who had seene the true *Terraglandes* in Germany, mistooke this for it, as may appeare by that little Tract of his of the names of plants in Latine and English, set forth Anno, 1548; for there he saith, [I haue seene this herbe of late in Come parke more astringent than it of Germany:] and indeed this growes there, and is much more astringent and wooddie than that of Germany, and nowise fit to be eaten. The root consists of many blacke tuberous particles, here and there sending forth fibers: from hence arise cornered stalks some foot high, smal below, & somewhat larger aboue: the leaues grow forth of the stalks, consisting sometimes of two, & otherwhiles of 4. longish narrow leaues fastned to one foot stalk, which at the setting on hath two little leaues or eares: forth of the bosomes of these leaues grow stalks some two inches long, each of which vsually carry a couple of Pease-fashioned floures of a purple colour: which fading, vsually become blew: after these follow cods, straight, round and, blacke; and in each of them are commonly contained nine or ten white round

round seeds: it floures most part of Summer, and perfects the seed in Iuly and August. †

1 *Terraglandes.*
Pease Earth-nut.

‡ 2 *Astragalus sylvaticus.*
Wood Pease, or Heath Pease.

¶ The Place.

† 1 This groweth in corne fields, both with the corne it selfe, and also about the borders of fields among briers and brambles: it is found in diuers places of Germany, but not with vs that I can yet learne.

‡ This is found in the woods and pastures of England, especially in Hampstead wood neere London: it groweth in Richmond Heath, and in Come parke likewise.

¶ The Time.

It floureth in Iune and Iuly, the nuts after haruest be digged vp and gathered.

¶ The Names.

It is called in high Dutch, *Erdnussen*: in low Dutch, *Eerdnoten*, *Cerdeeckelen*, and *Muyser metsteerten*, that is to say, tailed Mife, of the similitude or likenesse of domesticall mife, which the blacke, round, and long nuts, with a piece of the slender string hanging out behind, do represent: the later writers do call it in Latine *Terraglandes* or *Terrestres glandes*: and in Greeke, *χαιμαλαγγοί*, *Chama balani*: in English, Pease Earth nut.

¶ The Temperature and Vertues.

The Nuts of this Pease being boiled and eaten, are hardlier digested than bee either Turneps or A Parsneps, yet do they nourish no lesse than the Parsneps: they are not so windie as they, they doe more slowly passe through the belly, by reason of their binding qualitie, and being eaten raw they be yet harder of digestion, and do hardlier and flowlier descend.

They be of temperature meanly hot, and somewhat drie, being withall not a little binding: wher- B upon also they do not onely stay the fluxes of the belly, but also all issues of bloud, especially from the mother or bladder.

The root of Pease Earth-nut stoppeth the belly, and the inordinate course of womens sicknesse. C

CHAP. 520. Of Milke Vetch.

¶ The Kindes.

There be diuers sorts of herbes contained vnder the title of *Astragalus*; whether I may, without breach of promise made in the beginning, insert them among the *Legumina*, pulses, or herbie plants, it is doubtfull: but seeing the matter is disputable, I think it not amisse to suffer them thus to passe, vntill some other shall finde a place more conuenient and agreeing vnto them in neighbourhood.

¶ The Description.

The first kinde of *Astragalus* hath reddish stalks, a cubit high, a finger thicke, somewhat crested or furrowed, and couered ouer with an hairy mossines; which diuide themselues into sundry smal branches, beset with leaues consisting of sundry little leaues set vpon a middle rib, like the wilde Vetch, placed on the small pliant branches like feathers, which are likewise couered ouer with a woollie hoarinesse; in taste astringent at the first, but afterwards burning hot: among these leaues come forth many small white floures, in fashion like the floures of Lupines, which before their opening seeme to be somewhat yellow: the root is marvellous great and large, considering the smalnesse of the plant; for sometimes it groweth to the bignesse of a mans arme, keeping the same bignesse for the space of a span in length, and after diuideth it selfe into two or more forks or branches, blacke without, and wrinckled, white within, hard and wooddie, and in taste vnpleasant, which being dried becommeth harder than an horne.

1 *Astragalus Lusitanicus Clusij.*
Portingale milke Vetch.

2 *Astragalus Syriacus.*
Assyrian milke Vetch.

2 The second kinde of *Astragalus* is a rare and gallant plant, and may well be termed *Planta Leguminosa*, by reason that it is accounted for a kinde of *Astragalus*, resembling the same in the similitude of his stalkes and leaues, as also in the thicknesse of his rootes, and the creeping and folding thereof

thereof; and is garnished with a most thicke and pleasant comlineffe of his delectable red floures, growing vp together in great tufts, which are very seemly to behold.

3 There hath been some controuersie about this third kinde, which I am not willing to prosecute or enter into: it may very well be *Astragalus* of *Matthiolus* his description, or else his *Polygala*, which doth exceeding well resemble the true *Astragalus*: his small stalkes grow a foot high, beset with leaues like *Cicer* or *Galega*, but that they are somewhat lesser: among which come forth small Pease like floures, of an Orange colour, very pleasant in sight: the root is tough and flexible, of a finger thicke.

‡ 3. *Astragalus Matthioli.*
Matthiolus his milke Vetch.

‡ 4. *Astragaloides.*
Bastard Milke Vetch.

4 The fourth is called of *Mattonus* and other learned Herbarists, *Astragaloides*, for that it resembleth the true *Astragalus*, which groweth a cubit high, and in shew resembleth Liquorice: the floures grow at the tops of the stalks, in shape like the Pease bloome, of a faire purple colour, which turne into small blacke cods when they be ripe: the root is tough and very long, creeping vpon the vpper part of the earth, and of a woody substance.

The Place.

They grow amongst stones, in open places, or as *Oribasius* writeth, in places subiect to winds, and couered with snow: *Dioscorides* copies do adde, in shadowie places: it groweth plentifully in Phe-nea a citie in Arcadia, as *Galen* and *Pliny* report: in *Dioscorides* his copies there is read, in Memphis a citie of Arcadia; but Memphis is a citie of Egypt, and in Arcadia there is none of that name: some of them grow in my garden, and in sundrie other places in England wilde; they grow in the medowes neere Cambridge, where the schollers vse to sport themselves: they grow also in sundrie places of Essex, as about Dunmow and Clare, and many other places of that countrey.

‡ I should be glad to know which or how many of these our Authour heere affirms to grow wilde in England; for as yet I haue not heard of, nor seene any of them wilde, nor in gardens with vs, except the last described, which growes in some few gardens. ‡

The Time.

They floure in Iune and Iuly, and their seed is ripe in September.

¶ The

¶ The Names.

Milke Vetch is called of *Matthiolus*, *Polygala*, but not properly : of most it is called *Astragalus*; in Spanish, *Garauancillos* : in the Portugales tongue, *Alphabeca* : in Dutch, *Cleyne Ciceren*.

A

¶ The Temperature and Vertues.

Astragalus, as *Galen* saith, hath astringent or binding roots, and therefore it is of the number of those simples that are not a little drying, for it glueth and healeth vp old vlcers, and staieth the flux of the belly, if they be boiled in wine and drunke : the same things also touching the vertues of *Astragalus Dioscorides* hath mentioned: the root, saith he, being drunke in wine staieth the laske, and prouoketh vrine, being dried and cast vpon old vlcers it cureth them : it likewise procureth great

B

store of milke in cattell that do eat thereof, whence it tooke his name.

It stoppeth bleeding, but it is with much ado beaten, by reason of his hardnesse.

CHAP. 521. Of Kidney Vetch.

¶ The Description.

Kidney Vetch hath a stalke of the height of a cubit, diuiding it selfe into other branches; whereon do grow long leaues, made of diuers leaues, like thole of the Lentill, couered as it were with a soft white downinesse : the floures on the tops of the stalks of a yellow colour, verie many ioined together, as it were in a spokie rundle: after which grow vp little cods, in which is contained small seed : the root is slender, and of a wooddie substance. ‡ This is sometimes found with white floures : whereupon *Tabernamontanus* gaue two figures, calling the one *Lagopodium flore luteo*, and the other *Lagopodium flo. albo*. Our Author vnfitly gaue this later mentioned figure in the chapter of *Lagopus*, by the name of *Lagopus maximum*. ‡

1 *Anthyllis Leguminosa*.
Kidney Vetch.

2 *Stella leguminosa*.
Starry Kidney Vetch.

2 The Starry Kidney Vetch, called *Stella leguminosa*, or according to *Cortusius*, *Arcturo* hath many

many small flexible tough branches, full of small knots or knees, from each of which springeth forth one long small winged leafe, like birds foot, but bigger: from the bosome of those leaues come forth little tender stems, on the ends whereof do grow small whitish yellow floures, which are very slender, and soone vaded, like vnto them of Birds-foot: these floures turne into small sharpe pointed cods, standing one distant from another, like the diuisions of a star, or as though it consisted of little hornes, wherein is contained small yellowish seeds: the root is tough, and deeply growing in the ground.

3 There is another sort of Kidney Vetch called Birds-foot, or *Ornithopodium*, which hath very many small and tender branches, trailing here and there close vpon the ground, set full of small and soft leaues, of a whitish Greene, in shape like the leaues of the wilde Vetch, but a great deale lesser, and finer, almost like small feathers: amongst which the floures doe grow, that are very small, yellowish, and sometimes whitish; which being vaded there come in place thereof little crooked cods, five or six growing together, which in shew and shape are like vnto a small birds foot, and each and euery cod resembling a claw; in which are inclosed small seed like that of Turneps.

‡ 3 *Ornithopodium maius*.
The great Birds-foot.

‡ 4 *Ornithopodium minus*.
Small Birds-foot.

‡ 5 *Scorpioides Leguminosa*.
Small Horned pulse.

4 There is also another kinde of *Ornithopodium*, or Birds-foot, called small Birds-foot, which is very like vnto the first, but that it is much smaller: the branches or sprigs grow not aboue a hand or halfe an hand in length, spreading themselues vpon the ground with his small leaues and branches, in maner of the lesser *Arachus*: the floures are like vnto those of the former, but very small, and of a red colour.

‡ 5 This small horned pulse may fitly here take place: The root thereof consists of many little fibres, from which arise two or three little slender straight stalkes some handfull and halfe or foot high: at the tops of these grow little sharpe pointed crooked hornes, rounder and slenderer than those of Fenugreeke, turning their ends inwards like the tales of Scorpions and so jointed; the floures are small and yellow; the leaues little, and winged like those of Birds-foot. *Pena* and *Lobel* found this amongst the corne in the fields in Narbon in France, and they set it forth by the name as I haue here giuen you it. ‡

¶ The Place.

1. 3. 4. These plants I found growing vpon Hampstead Heath neere London, right against the
M m m m m

the Beacon, vpon the right hand as you go from London, neere vnto a grauell pit: they grow also vpon blacke Heath, in the high way leading from Greenwich to Charleton, within halfe a mile of the towne.

¶ The Time.

They floure from Iune to the middle of September.

¶ The Names.

† This Gesner calls *Vulneraria rustica*: Dodonæus, Lobel, and Clusius, call it *Anthyllis*, and *Anthyllis leguminosa*. †

3. 4. I cannot finde any other name for these plants, but *Ornithopodium*: the first is called in English, great Birds-foot; the second small Birds-foot.

¶ The Nature and Vertues.

These herbes are not vsed either in meate or medicine, that I know of as yet; but they are very good food for cattel, and procure good store of milke, whereupon some haue taken them for kindes of *Polygala*.

CHAP. 522. Of Blacke milke Tare.

Glaux Dioscoridis.
Dioscorides his milke Tare.

¶ The Description.

THE true *Glaux* of *Dioscorides* hath very many tough and woody branches trailing vpon the ground, set full of small winged leaues, in shape like the common *Glaux*, but a great deale smaller, resembling the leaues of Tares, but rather like Birds-foot, of a very gray colour: amongst which come forth knobby and scaly, or chaffie heads, very like the Medow Trefoile, of a faire purple colour: the root is exceeding long and woody, which the figure doth not expresse and set forth.

¶ The Place.

The true *Glaux* groweth vpon Barton hill, foure miles from Lewton in Bedfordshire, vpon both the sides of the declination of the hill.

¶ The Time.

These plants do floure and flourish about Midsummer.

¶ The Names.

These plants haue in times past been called *Glaux*, i. *folia habens glauca, siue pallentia*; that is, hauing skie coloured, or pale leaues.

Sithens that in times past, some haue counted *Glaux* among the kindes of *Polygala*, or

Milkewoorts, we may therefore call this kinde of *Glaux*, blacke Milke-woort.

¶ The Nature.

These herbes are dry in the second degree.

¶ The Vertues.

A The seeds of the common *Glaux* are in vertue like the Lentils, but not so much astringent: they stop the flux of the belly, dry vp the moisture of the stomacke, and ingender store of milke.

† Our Author either not knowing, or forgetting what he had done, againe in this chapter, described the *Glaux Vulgaris*, whose history he gaue vs but foure chapters before, by the name of *Hedysarum glycyrrhizatum*; wherefore I haue omitted it here as not necessary.

CHAP. 523. Of red Fitchling, Medick Fitch, and Cockes-head.

¶ The Description.

1 The first kinde of *Onobrychis* hath many small and twiggie pliant branches, ramping and creeping through and about bushes, or whatsoever it groweth neere vnto: the leaues and all the rest of the pulse or plant is very like to the wilde Vetch or Tare: the floures grow at the top of small naked stalks, in shape like the pease bloome, but of a purple colour layed ouer with blew, which turne into small round prickly husks, that are nothing else but the seed.

1 *Onobrychis, sive Caput Gallinaceum.*
Medick Fitchling, or Cockes-head.

2 *Onobrychis flore purpureo.*
Purple Cockes-head.

2 The second kind of Fitchling or Cockes-head, of *Clusius* his description, hath very many stalks, especially when it is growne to an old plant, round, hard, and leaning to the ground like the other pulses; and leaues very like *Galega*, or the wilde Vetch, of a bitter taste and lothsome sauour: among which come forth small round stems, at the ends whereof do grow floures spike fashion, three inches long, in shape like those of the great *Lazopus*, or meadow Trefoile, but longer, of an excellent shining purple colour, but without smell: after which there follow small coddles, containing little hard and blacke seed, in taste like the Vetch. The root is great and long, hard, and of a woody substance, spreading it selfe far abroad, and growing very deep into the ground.

3 The third kinde of Fitchling or Cockes-head hath from a tough smal and wooddie root, many twiggie branches growing a cubit high, full of knots, ramping and creeping on the ground. The leaues are like the former, but smaller and shorter: among which come forth smal tender stemmes, whereupon do grow little floures like those of the Tare, but of a blew colour tending to purple: the floures being vaded, there come the small cods, which containe little blacke seed like a Kidney, of a blacke colour.

4 The fourth kinde of Fitchling hath firme green hard stalks a cubit and a halfe high, whereupon grow leaues like to the wilde Tare or *Galega*, but smaller and somewhat hairie, bitter and vnpleasant in taste, and in the end somewhat sharpe. At the top of the stalks come forth long spiked floures,

3 *Onobrychis* 2. *Clusij*.
Blew Medicke Fitch.

4 *Onobrychis* 3. *Clusij flore pallido*.
Pale coloured Medicke Fitch.

5 *Onobrychis montana* 4. *Clusij*.
Mountaine Medick Fitch.

floures, of a pale colour, and in shape like those of the second kinde; which being vaded, there follow small bottle cods, wherein is contained little blacke seed like the seed of Fenegreek, but smaller. The root is thicke and hard, and of a wooddie substance, and lasting very long.

5 The fifth kinde of *Onobrychis* hath many grosse and wooddie stalks, proceeding immediately from a thick, fat, and fleshie tough root: the vpper part of which are small, round, and pliant, garnished with little leaues like those of Lentils, or rather *Tragacantha*, somewhat soft, and couered ouer with a woollie hairinesse: amongst which come forth little long and naked stems, eight or nine inches long, whereon do grow many small floures of the fashion of the Vetch or Lentill, but of a blew colour tending to purple; and after them come smal cods, wherein the seed is contained.

¶ The Place.

The first and second grow vpon Barton hill, foure miles from Lewton in Bedfordshire, vpon both the sides of the hill: and likewise vpon the grassie balks between the lands of corn two miles from Cambridge, neere to a water mill towards London; & diuers other places by the way from London to Cambridge: the rest are strangers in England.

¶ The Time.

These plants do floure in Iuly, & their seed is ripe shortly after.

¶ The

¶ The Names.

It is *ἀνθύμνος*, or without a name among the later writers: the old and antient Physicians do call it *ανθυμνος*: for all those things that are found written in *Dioscorides* or *Pliny* concerning *Onobrychis*, doe especially agree hereunto. *Dioscorides* writeth thus; *Onobrychis* hath leaues like a Lentill, but longer; a stalk a span high; a crimson floure; a little root: it groweth in moist and vntilled places: and *Pliny* in like manner; *Onobrychis* hath the leaues of a Lentill, somewhat longer, a red floure, a small and slender root: it groweth about springs or fountaines of water.

All which things and euery particular are in this *ανθυμνος*, or namelesse herbe, as it is manifest: and therefore it is not to be doubted at all, but that the same is the *Onobrychis* of the old Writers: it may be called in English red Fetchling, or as some suppose Medick Fitch, or Cockes-head.

¶ The Temperature.

These herbs as *Galen* hath written in his books of the Faculties of simple Medicines, do rarifie or make thin and waste away.

¶ The Vertues.

Therefore the leaues thereof when it is Greene, being but as yet layed vpon hard swellings, wax-
en kernals, in manner of a salve, do waste and consume them away, but beeing dried and drunke in
wine they cure the strangurie; and laied on with oile it procureth sweat.

Which things also concerning *Onobrychis*, *Dioscorides* hath in these words set downe: the herbe
stamped and applied wasteth away hard swellings of the kernels; but beeing drunk with wine it
helpeth the strangurie, and rubbed on with oile it causeth sweatings.

CHAP. 524. Of Bastard Dittanie.

Fraxinella.

Bastard Dittanie.

¶ The Description.

Bastard Dittanie is a very rare and gallant plant, hauing many browne stalks, somewhat rough, diuided into sundry small branches, garnished with leaues like Liquorice, or rather like the leaues of the Ash tree, but blacker, thicker, and more full of iuice, of an vnpleasant sauer: among which grow floures, consisting of five whitish leaues striped with red, whereof one which groweth vndermost hangeth downe low; but the four which grow vppermost grow more stiffe and vpriht: out of the midst of this floure commeth forth a tassell, which is like a beard, hanging also downwards, and somewhat turning vp at the lower end: which beeing vaded, there come in place foure huskes ioined together, much like the husks or coddies of Columbines, somewhat rough without, slimie to handle, and of a lothsome sauer, almost like the smell of a goat: whereupon some Herbarists haue called it *Tragium*: in the cods are contained small black shining seeds like Peonie seeds in colour: the roots are white, a finger thicke, one twisting or knotting within another, in tast somewhat bitter.

There is another kinde hereof growing in my garden, not very much differing: the leaues of the one are greater, greener, harder, and sharper pointed: of the other blacker, not so hard, nor so sharpe pointed: the floures also hereof be something more bright coloured, and of the other a little redder.

¶ The Place.

Bastard Dittany groweth wilde in the monntaines of Italy and Germanie, and I haue it growing in my garden.

¶ The Time.

It floureth in Iune and Iuly: the seed is ripe in the end of August.

¶ The Names.

The later Herbarists name it *Fraxinella*: most, ~~as though they~~ as though they should say *Humilis Fraxinus* or a low Ash: in English, bastard, or false Dittanie: the shops call it *Dictamnium*, and *Diptamum*, but not truly, and vse oftentimes the roots hereof in stead of the right Dittanie. That it is not the right Dittanie it is better knowne than needfull at all to be confuted; and it is as euident that the same is not *Dioscorides* his *Pseudodictamnium*, or bastard Dittanie: but it is plaine to be a kinde of *Tragium* of the old Writers, wherewith it seemeth to agree in shew, but not in substance.

‡ The root of this is onely vsed in shops, and there knowne by the name of *Radix Diptamni*, or *Dictamni*. ‡

¶ The Temperature.

The root of bastard Dittanie is hot and dry in the second degree, it is of a wasting, attenuating, and opening facultie.

¶ The Vertues.

- A It bringeth downe the menses, it also bringeth away the birth and after birth; it helpeth cold diseases of the matrix: and it is reported to be good for those that haue ill stomackes and are short winded.
- B They also say, that it is profitable against the stings and birings of venomous serpents, against deadly poisons, against contagious and pestilent diseases, and that it is with good successe mixed with counterpoisons.
- C The seed of Bastard Dittanie taken in the quantitie of a dram is good against the strangury, prouoketh vrine, breaketh the stone in the bladder, and driueth it forth.
- D The like vertue hath the leaues and iuice taken after the same sort, and being applied outwardly, it draweth thornes and splinters out of the flesh.
- E The root taken with a little Rubarb killeth and driueth forth wormes.
- F *Dioscorides* reporteth, that the wilde Goats being stricken with darts or arrowes, will eat *Dictam*, and thereby cause them to fall out of their bodies, which is meant of the right *Dictam*, though *Dodonæus* reporteth that this plant will do the like (which I do not beleue) ‡ nor *Dodonæus* affirme. ‡

CHAP. 525. Of Land Caltrops.

Tribulus terrestris.
Land Caltrops.

¶ The Description.

Land Caltrops hath long branches full of ioints, spread abroad vpon the ground, garnished with many leaues set vpon a middle rib, after the manner of Ferches; amongst which grow little yellow branches, consisting of five smal leaues, like vnto the floures of Tormentill: I neuer saw the plant beare yellow, but white floures, agreeing with the description of *Dodonæus* in each respect, saue in the colour of the floures, which doe turne into small square fruit, rough, and full of prickles, wherein is a small kernell or seed: the root is white, and full of strings.

¶ The Place.

It groweth plentifully in Spain in the fields: it is hurtful to corne, but yet as *Pliny* saith, it is rather to be accounted among the diseases of corne, than among the plagues of the earth: it is also found in most places of Italy & France; I found it growing in a moist meadow adioyning to the wood or Park of Sir *Francis Carew*, neere Croidon, not far from London, and not elsewhere; from whence I brought plants for my garden.

¶ The

¶ The Time.

It floureth in Iune and Iuly: the fruit is ripe in August.

¶ The Names.

It is called in Greeke *τρίβυλος*: and in Latine *Tribulus*: and that it may differ from the other which groweth in the water, it is named *τρίβυλος γαροφύλος*, or *Tribulus terrestris*: it may be called in English, land Caltrops, of the likenesse which the fruit hath with Caltrops, that are instruments of Warre cast in the way to annoy the feet of the Enemies horses, as is before remembred in the Water Saligot.

¶ The Temperature and Vertues.

In this land Caltrop there is an earthy and cold qualitie abounding, which is also binding, as *A Galen* saith.

The fruit thereof being drunke wasteth away stones in the kidneyes, by reason that it is of thin parts. *B*

Land Caltrops, saith *Dioscorides*, being drunke to the quantitie of a French crowne weight, and so applied, cureth the bitings of the Viper. *C*

And if it be drunke in wine it is a remedie against poysons: the decoction thereof sprinckled about killeth fleas. *D*

¶ CHAP. 526. Of Spring or mountaine Pease or Vetches.

¶ 1 *Orobis Venetus.* Venice Pease.

¶ 2 *Orobis syluaticus vernus.* Spring Pease.

¶ The Description.

¶ 1 **T**His, which *Clusius* calls *Orobis Venetus*, hath many cornered stalkes some foot long, whereon grow winged leaues, foure or six fastned to one rib, standing by couples one against another, without any odde leafe at the end: these leaues are of an indifferent largenesse, and

and of a light Greene colour: the floures grow vpon long foot-stalks comming forth of the bosoms of the leaues, many together, hanging downe, small, yet shaped like those of other Pulses, and of a purple colour: after these follow cods almost like those of Fetches, but rounder, red when they be ripe, and containing in them a longish white seed: the root is hard and wooddy, running diuers wayes with many fibres, and liuing sundry yeares: this varies somtimes with yellower green leaues and white floures. It floures in May, and growes onely in some few gardens with vs.

2 The stalkes of this also are a foot or more high, stiffe, cornered, and green; on these do grow winged leaues six or eight on a rib, after the manner of those of the last described: each of these leaues hath three veines running alongst it: the floures in shape and manner of growing are like those of the former, but of a most elegant purple colour: which fading, they become blew. The floures are succeeded by such cods as the former, wherein are contained longish small variegated seed: which ripe, the cods fly open, and twine themselues round, as in most plants of this kinde: the root is blacke, hard, tuberous and wooddy, sending forth each yeare new shoots. This floures in April and May, and ripeneth the seed in Iune. This was found by *Clusius* in diuers mountainous wooddie places of Hungarie: he calls it *Orobis Pannonicus* 1.

† 3 *Orobis montanus flo. albo.*
White mountaine Pease.

† 4 *Orobis montanus angustifolius.*
Narrow leaved mountaine Pease.

3 This hath stalkes some cubit high, stiffe, straight, and crested; whereon by turnes are fastned winged leaues, consisting of foure sufficiently large and sharpe pointed leaues, whereto sometimes at the very end growes a fifth: the veines in these run from the middle rib towards their edges: their taste is first somewhat fourish, afterwards bitterish. The floures grow vpon short stalks comming forth of the bosomes of the leaues, five or six together, like those of the Fetch, but of colour white, with some little yellownesse on the two little leaues that turne vpwads. The cods are like those of the last described, and containe in them a brownish seed, larger than in any of the other kindes. This is an annuall plant, and perishes as soone as it hath perfected the seed. *Clusius* giues vs this by the name of *Orobis Pannonicus* 4. *Dodonaus* giues the same figure for his *Arachus latifolius*: and *Bauhine* affirms this to be the *Galega montana*, in the *Hist. Lugd.* pag. 1139. But these seeme to be of two seuerall plants; for *Dodonaus* affirms his to haue a liuing reot, and such seemes also that in the *Hist. Lugd.* to be: yet *Clusius* saith expressely that his is an annuall, and floureth in April

Aprill and May, and groweth in some wooddy mountainous places of the kingdom of Hungarie.

4 This fourth hath straight firme cornered stalkes some foot or more high, whereupon grow leaues vsually foure on a foot-stalke, standing two against two, vpright, being commonly almost three inches long, at first of a sourish taste, but afterwards bitter: it hath no clauicles, because the stalkes need no supporters: the floures grow vpon long foot-stalkes, spike-fashion like those of Pease, but lesse, and white of colour: after these follow long blackish cods, full of a blacke or else spotted seed: the roors are about the length of ones little finger, fashioned like those of the Asphodill or lesser female Peionie, but lesser, blacke without, and white within. *Clusius* found this on the mountainous places nigh the baths of Baden, and in the like places in Hungarie: he calls it *Orobus Pammonicus* 3.

¶ The Temperature and Vertues.

These are not knowne nor vsed in physicke; yet if the third be the *Galega montana* of the *Historia Lugd.* then it is there said to be effectuall against poyson, the wormes, the falling sicknesse, and the Plague. ‡

‡ CHAP. 527. Of some other Pulses.

‡ 1 *Ochrus, sine Ervilia.*
Birds Pease.

‡ 2 *Ervum sylvestre.*
Crimson grasse Fetch.

¶ The Description.

‡ 1 THE first of these hath cornered broad stalks like those of euerlasting Pease, and they are weake, and commonly lie vpon the ground, vnlesse they haue something to support them: the lower leaues are broad, and commonly welt the stalke at their setting on, and at the end of the first leafe do vsually grow out after an vnusuall manner, two, three, or more other prety large leaues more long than broad, and the middle rib of the first leafe runnes out beyond the setting on of the highest of the out-growing leaues, and then it ends in two or three clasping tendrels. Those leaues that grow the lowest vpon the stalkes haue commonly the fewest comming out of them.

them. The floures are like those of other Pulses, of colour white: the cods are some inch and halfe long, containing some halfe dozen darke yellow or blackish small Pease: these cods grow one at a ioynt, on short foot-stalkes comming forth of the bosomes of the leaues, and are welted on their broader side, which stands towards the maine stalke. This growes with vs only in gardens. *Dodonæus*, *Pena*, and *Lobel* call it *Ochrus sylvestris*, sine *Ervilia*.

2 The stalkes of this grow vp sometimes a cubit high, being very slender, diuided into branches, and set vnorderly with many grasse-like long narrow leaues: on the tops of the stalkes and branches, vpon pretty long foot-stalkes grow pretty pease-fashioned floures of a faire and pleasant crimson colour: which fallen, there follow cods, long, small, and round, wherein are nine, ten, or more round hard blacke shining graines: the root is small, with diuers fibres, but whether it die when the seed is perfected, or no, as yet I haue not obserued. This growes wilde in many places with vs, as in the pasture and meadow grounds about *Partridge Church*. *Lobel* and *Dodonæus* call this *Ervum sylvestre*; and they both partly iudge it to be the first *Catanance* of *Dioscorides*, and by that name it is vsually called. It floures in Iune and Iuly, and the seed is ripe in August.

3 This also, though it be not frequently found, is no stranger with vs; for I haue found it in the corne fields about *Dartford* in *Kent* and some other places. It hath long slender ioynted creeping stalkes, diuided into sundry branches, whereon stand pretty Greene three cornered leaues two at a ioynt, in shape and bignesse like those of the lesser *Binde-weed*. Out of the bosomes of these

leaues at each ioynt comes a clasping tendrel, and commonly together with it a foot-stalke some inch or more long, bearing a pretty little pease-fashioned yellow floure, which is succeeded by a short flattish cod containing six or seuen little seeds. This floures in Iune, Iuly, and August, and so ripens the seed. It is by *Lobel* and others thought to be the *Aphace* of *Dioscorides*, *Galen*, and *Pliny*: and the *Pitine* of *Theophrastus*, by *Anguillara*.

I finde mention in *Stowes Chronicle*, in *Anno 1555*, of a certaine Pulse or Pease, as they term it, wherewith the poore people at that time, there being a great dearth, were miraculously helped: he thus mentions it; In the moneth of August (saith he) in *Suffolke*, at a place by the sea side all of hard stone and pibble, called in those parts a shelve, lying betweene the townes of *Orford* and *Aldborough*, where neither grew grasse, nor any earth was euer seene; it chanced in this barren place suddenly to spring vp without any tillage or sowing, great abundance of Peason, whereof the poore gathered (as men iudged) aboue an hundred quarters, yet remained some ripe and some blossoming, as many as euer there were before: to the which place rode the Bishop of *Norwich* and the Lord *Willoughby*, with others in great number, who found nothing but hard rockie stone the space of three yards vnder the roots of these Peason: which roots were great and long, and very sweet.

Gesner also, de *Aquatilibus*, lib. 4. pag. 256. making mention, out of *D^r. Cajus* his letters, of the spotted English Whale, taken about that time at *Lin* in *Norfolke*, also thus mentions those

pease: *Pisa* (saith he) in littore nostro Britannico quod Orientem spectat, certo quodam in loco *Suffolciæ*, inter *Alburnum* & *Orfordium* oppida, saxis insidentia (mirabile dictu) nulla terra circumfusa, autumnali tempore Anno 1555, sponte nata sunt, adeo magna copia, vt sufficerent vel millibus hominum. These Pease, which by their great encrease did such good to the poore that yeare, without doubt grew there for many yeares before, but were not obserued till [Magister artis, ingenique largitor - Venter] — hunger made them take notice of them, and quickned their inuention, which commonly in our people is very dull, especially in finding out food of this nature,

† 2 *Aphaca*.
Small yellow Fetch.

My Worshipfull friend Dr. *Argent* hath told me, that many yeares ago he was in this place, and caused his man to pull away the beach with his hands, and follow the roots so long, vntill hee got some equall in length vnto his height, yet could come to no ends of them: hee brought these vp with him to London, and gaue them to Dr. *Lobel*, who was then liuing; and he caused them to be drawne, purposing to set them forth in that Worke which he intended to haue published, if God had spared him longer life. Now whether these Pease be truly so called, and be the same with the *Pisum sylvestre Perenne*, or different; or whether they be rather of the stocke of the *Lathyrus maior*, or of some other Pulse here formerly described, I can affirme nothing of certaintie, because I haue seene no part of them, nor could gather by any that had, any certaintie of their shape or figure: yet would I not passe them ouer in silence, for that I hope this may come to be read by some who liue thereabout, that may by sending me the things themselues, giue me certaine knowledge of them; that so I may be made able, as I am alwaies willing, to impart it to others.

¶ The Temperature and Vertues.

I haue not hitherto found any thing written of the faculties of the two first; but of *Aphace*, *Galen* A saith it hath an astringent facultie like as the Lentill, and also is vsed to be eaten like as it, yet it is harder of concoction, but it dries more powerfully, and heates moderately. The seeds (saith hee) haue an astringent facultie; wherefore parched, broken, and boyled, they stay fluxes of the belly. We know (saith *Dodonaeus*) by certaine experience, that the *Aphace* here described hath this astringent force and facultie. ‡

CHAP. 528. Of bastard Rubarb.

1 *Thalictrum, sine Thalictrum maius.*
Great bastard Rubarb.

2 *Thalictrum minus.*
Small bastard Rubarb.

¶ The Description.

1 THE great *Thalictrum* or bastard Rubarb hath large leaues parted or diuided into diuers other small leaues, somewhat snipt about the edges, of a blacke or darke green colour: the

the stalkes are crested or streaked, of a purple colour, growing to the height of two cubits: at the top whereof grow many small and hairy white floures, and after them come small narrow huskes like little cods, foure or fve growing together: the root is yellow, long, round, and knotty, dispersing it selfe far abroad on the vpper crust of the earth.

2 The small bastard Rubarb is very like vnto the precedent, but that it is altogether lesser: his stalkes are a span or a foot long: his leaues be thin and tender; the root fine and slender: the little floures grow together in small bundles or tufts, of a light yellow colour, almost white, and are of a grievous saour.

3 There is kept in some gardens a plant of this kinde growing vp with large stalkes to the height of three cubits: the leaues are very like those of Columbines: the floures are made of many white threds: it floures in Iune, and is called *Thalictrum minus Hispanicum*, Great Spanish Bastard Rubarb. ‡

¶ The Place.

These Plants doe grow alongst the Ditch sides leading from Kentish street vnto Saint Thomas a-Waterings (the place of Execution) on the right hand. They grow also vpon the bankes of the Thames, leading from Blacke-wall to Woolwich, neere London, and in sundry other places also.

¶ The Time.

The floure for the most part in Iuly and August.

¶ The Names.

Diuers of the later Herbarists do call it *Pigamum*, as though it were *thyrsus*, that is, Rue; whereupon most call it *Rutapalustris*, or Fen Rue: others, *Pseudo-Rhabarbarum*, and *Rhabarbarum Monachorum*, by reason of the yellow colour of the root. But neither of their iudgements is greatly to be esteemed of: they iudge better that would haue it to be *Thalictrum*, which *Dioscorides* describeth to haue leaues something flatter than those of Coriander; and the stalke like that of Rue, vpon which the leaues doe grow. *Pena* calleth it *Thalictrum*, *Thalictrum*, and *Rutapratensis*: in English, bastard Rubarb, or English Rubarb: which names are taken of the colour, and taste of the roots.

¶ The Temperature.

These herbes are hot and dry of complexion.

¶ The Vertues.

- A The leaues of bastard Rubarb with other pot-herbes do somewhat moue the belly.
- B The decoction of the root doth more effectually.
- C *Dioscorides* saith, that the leaues being stamped do perfectly cure old vlcers. *Galen* addeth, that they dry without biting.

CHAP. 529. Of Goats Rue.

¶ The Description.

Galega or Goats Rue hath round hard stalkes two cubits or more high, set full of leaues displayed or winged abroad; euerie leafe consisting of sundrie small leaues set vpon a slender rib, resembling the leaues of the field Vetch or Tare, but greater and longer. The floures grow at the top of the stalke, clustering together after the manner of the wilde Vetch, of a light skie colour, which turne into long cods small and round, wherein the seed is contained. The root is great, thicke, and of a white colour.

¶ The Place.

It groweth plentifully in Italy euery where in fat grounds and by riuers sides: it groweth likewise in my garden.

¶ The Time.

It floureth in Iuly and August.

¶ The Names.

The Italians call it *Galega*, and *Ruta Capraria*; diuers name it corruptly *Gralega*: *Hieronymus Fracastorius*

Galega.
Goats Rue.

Fracastorius calleth it *Herba Galleca* the *Hetruscians*, *Lauanese*; and it is also called by diuers other names in sundry places of Italy, as *Gesner* saith, as are *Castracane*, *Lauanna*, *Thorina*, or *Taurina*, *Martanica*, *Sarracena*, *Capragina*, *Herbamefa*, *Fœnum gracum syluestre*, and as *Brasauolus* witnesseth, *Giarga*. It is named in English, Italian *Fitch*, and *Goats Rue*.

Some iudge that the old *Physitions* were wont to call it *Onobrychis*: others, *Glauce*: diuers would haue it to be *Polemonium*, but not so much *Petr.* And *Matthiæus* in his commentaries, as euery one of the descriptions mentioned by *Dioscorides* do gainsay them; as also those, who thinke that *Galega*, is *Polygon*, & that the name of *Galega* came of *Polygon*, the very description also of *Polygon* is against them: for *Galega* is higher and greater than that it may be called a little shrub onely of an hand bredth high.

¶ *The Temperature.*

This plant is in a meane temperature betweene hot and cold.

¶ *The Vertues.*

Goats Rue is a singular herbe against all venome and poison, and against wormes, to kill and driue them forth, if the juice be giuen to little children to drinke.

It is of like vertue if it be fryed with *Lineseed oyle*, and bound vpon the childes nauell.

It is ministred vnto children which are possessed with the falling euill, a spoonefull euery morning in milke.

Being boiled in vineger, and drunke with a little Treacle, it is very good against the infection of the plague, especially if the medicine be taken within twelue houres.

The herbe it selfe is eaten, being boiled with flesh, as we vse to eate Cabbage and other woorts, and likewise in fallades, with oyle, vineger and pepper, as we doe eate boiled Spinage, and such like; Which is most excellent being so eaten, against all poison and pestilence, or any venomous infirmitie whatsoeuer, and procureth sweat.

It also helpeth the bitings and stingings of venomous beasts, if either the juice or the herbe stamped be laid vpon the wound.

Halfe an ounce of the juice inwardly taken is reported to helpe those that are troubled with convulsions, crampes, and all other the diseases aforesaid.

The seedes do feed pullen exceedingly, and cause them to yeeld greater store of eggs than ordinary.

† The juice of the leaues, or the leaues themselues bruised and applied to any part swollen by the sting of a bee or waspe, mitigate the paine, and are a present remedy, as *M^r. Cannon* a louer of Plants, and frind of mine, hath assured me he hath seen by frequent experience. †

CHAP. 530. Of Pliny his Leadwoot.

¶ *The Description.*

Dentaria or Dentillaria hath offended in the superlatiue degree, in that he hath hid himselfe like a runagate souldier, when the assault should haue been giuen to the plant *Lepidium*, whereof doubtlesse it is a kinde. But if the fault be mine, as without question it is, I craue pardon for the ouersight, and do intreate thee gentle reader to censure me with fauour, whereby I may more boldly insert it in this place, rather than to leaue it vntouched. The learned of Narbone (especially *Rondeletius*) haue not without good cause accounted this goodly plant for a kinde thereof,

Plumbago Plinij.
Leadwoort.

thereof, because the whole plant is of a biting taste, and a burning faculty, and that in such extremity, that it will raise blisters vpon a mans hand: for which cause some of the learned sort haue accounted it *Plinies Molybdana*, or *Agineta* his *Lepidium*: but the new Herbarists call it *Dentaria*, or *Dentillaria Rondeletij*, who made the like vse hereof, as he did of *Pyrethrum*, & such burning plants, to appease the immoderate pain of the tooth-ache and such like. This plant hath great thicke tough roots, of a woody substance, from whence spring vp long and tough stalkes two cubits high, confusedly garnished and beset with long leaues, in colour like Woad, of a sharpe and biting taste. The floures grow at the top of the stalkes of a purple colour; which being past, there succeed close glistening and hairy huskes, wherein is contained small blackish seed.

¶ *The Place.*

Pena reporteth that *Dentillaria* groweth about Rome, nigh the hedges and corne fields: it likewise groweth in my Garden in great plenty.

¶ *The Time.*

It floureth in Iuly and August.

¶ *The Names.*

Leadwoort is called *Molybdana*, *Plumbago Plinij*, & *Dentillaria Rondeletij*: in Italian, *Crepinella*, the Romanes, *Herba S. Antonij*: in Illyria, *Cucurida*: in English, Leadwoort.

¶ *The Temperature.*

Dentillaria is of a causticke quality.

¶ *The Vertues.*

A It helpeth the tooth-ache, and that as some say if it be holden in the hand some small while.

CHAP. 531. Of Rue, or herbe Grace.

¶ *The Description.*

1 **G**arden Rue or planted Rue, is a shrub full of branches, now and then a yard high, or higher: the stalkes whereof are couered with a whitish barke, the branches are more green: the leaues hereof consist of diuers parts, and be diuided into wings, about which are certaine little ones, of an odde number, something broad, more long than round, smooth and somewhat fat, of a gray colour, or greenish blew: the floures in the top of the branches are of a pale yellow, consisting of foure little leaues, something hollow: in the middle of which standeth vp a little head or button foure square, seldome fve square, containing as many little coffers as it hath corners, being compassed about with diuers little yellow threds: out of which hang pretie fine tips of one colour; the seed groweth in the little coffers: the root is woody, and fastned with many strings: this Rue hath a very strong and ranke smell, and a biting taste.

2 The second being the wilde or mountaine Rue, called *Ruta syluestris*, is very like to garden Rue, in stalkes, leaues, floures, seed, colour, taste, and sauour, sauing that euery little leafe hath smaller cuts, and is much narrower: the whole plant dieth at the approach of winter, being an annuall plant, and must either stand till it do sow himselfe, or else must be sowne of others. † This second is a variety of the garden Rue differing from the former onely in smallnesse. †

3 This plant is likewise a wilde kinde of Rue, and of all the rest the smallest, and yet more virulent, biting, and stinking than any of the rest: the whole plant is of a whitish pale Greene, agreeing with the last before mentioned in each respect, saue in greatnesse, and in that the venomous fumes or vapors that come from this small wilde Rue are more noisome and hurtfull than the former. † The leaues lie spread vpon the ground, & are very finely cut and diuided: the whole plant is of such

1 *Ruta hortensis.*
Garden Rue.

3 *Ruta sylvestris minima.*
The smallest wilde Rue.

4 *Ruta montana.*
Mountain Rue.

5 *Harmala.*
Wilde Rue with white flowers.

‡ 6 *Ruta Canina.*
Dogs Rue.

kish: this Rue in hot countries hath a marvellous strong smell, in cold Countries not so.

‡ 6 This, which *Matthioli* gaue for *Sideritis* 3. and *Lobel*, *Clusius*, and others for *Ruta canina*, hath many twiggy branches some cubit and halfe high; whereon grow leaues resembling those of the *Papauer Rhæas* or *Argemone*, lesser, thicker, and of a blackish Greene: the floures are of a whitish purple colour, fashioned somewhat like those of *Antirrhinum*: the seed is small, and contained in such vessels as those of Rue, or rather those of *Blattaria*. The whole plant is of a strong and vngratefull smell: it growes in the hot and dry places about Narbon in France, Rauenna and Rome in Italy. ‡

¶ The Place.

Garden Rue ioyeth in sunny and open places: it prospereth in rough and brickie ground, and among ashes: it cannot in no wise away with dung.

The wilde are found on mountaines in hot countries, as in Cappadocia, Galatia, and in diuers prouinces of Italy and Spaine, and on the hills of Lancashire and Yorke.

Pliny saith that there is such friendship betweene it and the fig tree, that it prospers no where so well as vnder the fig tree. The best for physicks vse is that which groweth vnder the fig tree, as *Dioscorides* saith: the cause is alledged by *Plutarch* in the first booke of his *Symposiacks* or Feasts, for he saith it becommeth more sweet and milde in taste, by reason it taketh as it were some part of the sweetnes of the fig tree, whereby the ouer rancke quality of the Rue is allayd; vnlesse it be that the fig tree whilest it draweth nourishment vnto it selfe, it likewise draweth away the rancknesse of the Rue.

¶ The Time.

They floure in these cold countries in Iuly and August; in other countries sooner.

¶ The Names.

The first, which is *Hortensis Ruta*, garden Rue: in high-Dutch, *Bauten*: in low-Dutch, *Rutite*: the Italians and Apothecaries keepe the Latine name: in Spanish, *Aruda*: in French, *Rue de lardin*: in English, Rue, and Herbe-Grace.

Wilde Rue is called in Greeke *Πήγανον*, *Peganon*: in Latine, *Ruta sylvestris*, or wilde Rue: in Galatia and Cappadocia, *Μαλν*: of diuers, *Harmala*: of the Arabians, *Harmel*: of the Syrians, *Besava*.

¶ The Temperature.

Rue is hot and dry in the later end of the third degree, and wild Rue in the fourth: it is of thin and

such acrimonie, that *Clusius* saith he hath oftner than once obserued it to pierce through three paire of gloues to the hand of the gatherer; and if any one rub his face with his hand that hath newly gathered it, forthwith it will mightily inflame his face. He tells a history of a Dutch Student of Mompelier that went with him a simpling, who putting some of it betweene his hat and his head to keepe him the cooler, had by that meanes all his face presently inflamed and blistred wherefoeuer the sweat ran downe. ‡

4 There is another wilde Rue growing vpon the mountaines of Sauoy and other places adioyning, hauing a great thicke root, from which do arise great shoots or stalkes; wheron do grow leaues very thicke and fat, parted into diuers longish sections, otherwise resembling the leaues of the first described, of a strong and stinking smell: the floures grow on the tops of the stalkes, consisting of foure small yellow leaues: the seeds are like the other.

5 *Harmel* is one of the wilde Rues: it bringeth forth immediatly from the root diuers little stalks of a cubit high; whereupon do grow Greene leaues diuersly cut into long pieces, longer and narrower than those of the wild strong smelling Rue: the floures be white, composed of fve white leaues: the fruit is three square, bigger than that of the planted Rue, in which the seed lieth: the root is thick, long, and bla-

and subtile parts: it waists and consumes winde, it cutteth and digesteth grosse and tough humors.

¶ *The Vertues.*

Rue or Herbe-Grace prouokes vrine, brings downe the sicknes, expels the dead child and after-
birth, being inwardly taken, or the decoction drunke; and is good for the mother, if but smelled to.

Plin. lib. 20. ca. 13. saith it opens the matrix, and brings it into the right place, if the belly all ouer
and the shere (the brest say the old false copies) be anointed therewith: mixed with hony it is a re-
medie against the inflammation and swelling of the stones, proceeding of long abstinence from ve-
nerie, called of our English Mountebanks the Colts euill, if it be boyled with Barrowes grease,
Bay leaues, and the pouders of Fenugreeke and Linseed be added thereto, and applied pultis wise.

It takes away crudity and rawnesse of humors, and also windines and old paines of the stomack.
Boiled with vineger it easeth paines, is good against the stitch of the side and chest, and shortnes
of breath vpon a cold cause, and also against the paine in the ioynts and huckle bones.

The oile of it serues for the purposes last recited: it takes away the collicke and pangs in the
guts, not only in a clister, but also anointed vpon the places affected. But if this oile be made of
the oile pressed out of Linseed it will be so much the better, and of singular force to take away
hard swellings of the spleene or milt.

It is vsed with good successe against the dropisie called in Greeke *νιτρισις*, being applied to the
belly in manner of a pultis.

The herb a little boiled or scalded, and kept in pickle as Sampier, and eaten, quickens the sight.

The same applied with honey and the iuyce of Fennell is a remedie against dim eyes.

The iuyce of Rue made hot in the rinde of a pomegranat and dropped into the eares, takes away
the paine thereof.

S. Anthonies fire is quenched therewith: it killeth the shingles, and running vlcers and sores in
the heads of yong children, if it be tempered with Ceruse or white Lead, vineger, and oile of roses,
and made into the forme of *Nutritum* or *Triapharmacum*.

Dioscorides saith, that Rue put vp in the nostrils stayeth bleeding.

Of whose opinion *Pliny* also is; when notwithstanding it is of power rather to procure bleeding
through the sharpe and biting qualitie that it hath.

The leaues of Rue beaten and drunke with wine, are an antidote against poisons, as *Pliny* saith.

Dioscorides writeth, that a twelue penny weight of the seed drunke in wine is a counterpoyson a-
gainst deadly medicines or the poyson of Wolfs-bane, *Ixia*, Mushrooms, or Tode stooles, the biting
of Serpents, stinging of Scorpions, spiders, bees, hornets, and wasps; and it is reported, that if a man
be anointed with the iuyce of Rue these will not hurt him; and that the Serpent is driuen away at
the smell thereof when it is burned, insomuch that when the Weefell is to fight with the Serpent,
she armeth her selfe by eating Rue against the might of the Serpent.

The leaues of Rue eaten with the kernels of wallnuts or figs stamped together and made into a
masse or paste, is good against all euill aires, the pestilence or plague, resists poyson and all venom.

Rue boiled with Dil, Fennell seed, and some Sugar, in a sufficient quantitie of wine, swageth the
torments and griping paines of the belly, the paines in the sides and breast, the difficulty of brea-
thing, the cough, and stopping of the lungs, and helpeth such as are declining to a dropisie.

The iuyce taken with Dill, as aforesaid, helpeth the cold fits of agues, and alters their course: it
helpeth the inflammation of the fundament, and paines of the gut called *Rectum intestinum*.

The iuyce of Rue drunke with wine purgeth women after their deliuerance, driuing forth the
secondine, the dead childe, and the vnnaturall birth.

Rue vsed very often either in meate or drinke, quencheth and drieth vp the naturall seed of ge-
neration, and the milke of those that giue sucke.

The oile wherein Rue hath beene boyled, and infused many dayes together in the Sun warmeth
and chafeth all cold members if they be anointed therewith: also it prouoketh vrine if the region
of the bladder be anointed therewith.

If it be ministred in clisters it expells windinesse, and the torsion or gnawing paines of the guts.

The leaues of garden Rue boiled in water and drunke, causeth one to make water, prouoketh the
termes, and stoppeth the laske.

Ruta sylvestris or wilde Rue is much more vehement both in smell and operation, and therefore
the more virulent or pernicious; for somtimes it fumeth out a vapor or aire so hurtfull that it scor-
cheth the face of him that looketh vpon it, raising vp blisters, wheales, and other accidents: it ve-
nometh their hands that touch it, and will infect the face also, if it be touched with them before
they be cleane washed; wherefore it is not to be admitted vnto meate or medicine.

The end of the second Booke.

THE THIRD BOOKE OF THE HISTORIE OF PLANTS.

Containing the Description, Place, Time, Names, Nature, and Vertues,
of Trees, Shrubs, Bushes, Fruit-bearing Plants, Rosins, Gums, Roses,
Heath, Mosses: some Indian Plants, and other rare Plants
not remembred in the Proeme to the first Booke. Also
Mushrooms, Corall, and their seue-
rall kindes, &c.

The Proeme.

HAuing finished the Treatise of Herbes and Plants in generall, vsed for meat, medicine, or
sweet smelling vse, onely some few omitted for want of perfect instruction, and also being
hindered by the slackenesse of the Cutters or Grauers of the those, which wants we intend
to supplie in this third and last part. The Tables as well generall as particular shall be set forth in
the end of this present Volume.

CHAP. I. Of Roses.

The Kindes.

THe Plant of Roses, though it be a shrub full of prickles, yet it had been more fit and
conuenient to haue placed it with the most glorious floures of the world, than to in-
sert the same here among base and thornie shrubs: for the Rose doth deserue the
chiefest and most principall place among all floures whatsoever, beeing not onely
esteemed for his beautie, vertues, and his fragrant and odoriferous smell, but also be-
cause it is the honour and ornament of our English Scepter, as by the coniunction
appeareth in the vniting of those two most royall houses of Lancaster and Yorke. Which pleasant
floures deserue the chiefest place in Crownes and garlands, as *Anacreon Thus* a most antient Greeke
Poet (whom *Henricus Stephanus* hath translated in a gallant Latine verse) affirms in those verses of a
Rose, beginning thus

Tò πόδι τῆς Ρηγίνας, &c.

*Rosa honos, decusq; florum,
Rosa, cura, amorq; Veris.
Rosa, calitum voluptas,
Roseis puer Cytheres.
Caput implicat Corollis,
Charitum Choras frequentans.*

The

The Rose is the honour and beautie of floures,
 The Rose is the care and loue of the Spring,
 The Rose is the pleasure of th'heauenly powres:
 The Boy of faire *Venus*, *Cytheras* darling,
 Doth wrap in his head round with garlands of Rose,
 When to the dances of the Graces he goes.

Augerius Busbeckius speaking of the estimation and honor of the Rose, reporteth that the Turks can by no meanes indure to see the leaues of Roses fall to the ground, because that some of them haue dreamed, that the first or most antient Rose did spring of the bloud of *Venus*; and others of the Mahumetans say, that it sprang of the sweat of *Mahumet*.

But there are many kindes of Roses differing either in the bignesse of the floures, or the plant it selfe, roughnesse or smoothnesse, or in the multitude of the floures, or in the fewnesse, or else in colour and smell: for diuers of them are high and tall, others short and low; some haue few leaues, others very many. *Theophrastus* telleth of a certaine Rose growing about Philippi, with an hundred leaues, which the inhabitants brought forth of Pangæum, and planted it in Campania, as *Pliny* saith; which wee hold to be the Holland Rose, that diuers call the Prouince Rose, but not properly.

Moreouer, some be red, others white, and most of them or all, sweetly smelling, especially those of the garden.

1 *Rosa alba.*
 The White Rose.

¶ The Description.

If the curious could so be content, one general description might serue to distinguish the whole stocke or kindred of the Roses, beeing things so well knowne: notwithstanding I thinke it not amisse to say something of them seuerally, in hope to satisfie all. The white Rose hath very long stalkes of a wooddie substance, set or armed with diuers sharpe prickles: the branches whereof are likewise full of prickles, whereon doe grow leaues consisting of five leaues for the most part, set vpon a middle rib by couples; the old leafe standing at the point of the same, and euery one of those small leaues somewhat snipt about the edges, somewhat rough, and of an ouerworne green colour: from the bosom wherof shoot forth long foot-stalks, whereon do grow very faire double floures, of a white colour, and very sweet smell, hauing in the middle a few yellow threds or chiues; which being past there succeedeth a long fruit, Greene at the first, but red when it is ripe, and stuffed with a downie choaking matter, wherein is contained seed as hard as stones. The root is long, tough, and of a wooddie substance.

2 The Red Rose groweth very low in respect of the former: the stalkes are shorter, smoother, and browner of colour: the leaues are like, yet of a worse dustie colour: the floures grow on the tops of the branches, consisting of many leaues, of a perfect red colour: the fruit is likewise red when it is ripe: the root also wooddie.

3 The common Damaske Rose in stature, prickley branches, and in other respects is like the white

2 *Rosa rubra.*
The red Rose.

3 *Rosa Provincialis, sive Damascena.*
The Prouince, or Damaske Rose.

5 *Rosa sine spinis.*
The Rose without prickles.

White Rose; the especiall difference consisteth in the colour and smell of the floures; for these are of a pale red colour, and of a more pleasant smell, and fitter for meate or medicine.

4 The *Rosa Provincialis minor*, or lesser Prouince Rose differeth not from the former; but is altogether lesser: the floures and fruit are like: the vse in physick also agreeth with the precedent.

5 The Rose without prickles hath many young shootes comming from the root, diuiding themselues into diuers branches, tough, and of a woody substance as are all the rest of the Roses, of the hight of two or three cubites, smooth and plaine without any roughnesse or prickles at all; whereon do grow leaues like those of the Holland Rose, of a shining deepe greene colour on the vpper side, vnderneath somewhat hoarie and hairy. The floures grow at the toppes of the branches, consisting of an infinite number of leaues, greater than those of the Damaske Rose, more double, and of a colour betweene the Red and Damaske Roses, of a most sweet smell. The fruit is round, red when it is ripe, and stuffed with the like flockes and seeds of those of the Damask Rose. The root is great, wooddie, and far spreading.

6 The

6 The Holland or Prouince Rose hath diuers shoots proceeding from a wooddie root, full of sharpe prickles, diuiding it selfe into diuers branches, whereon do grow leaues consisting of five leaues set vpon a rough middle rib, and those snipt about the edges: the floures grow on the tops of the branches, in shape and colour like the Damaske Rose, but greater and more double, insomuch that the yellow chiues in the middle are hard to be seene; of a reasonable good smell, but not ful so sweet as the common Damaske Rose: the fruit is like the other of his kinde.

6 *Rosa Hollandica, siue Batava.*

The great Holland Rose, commonly called the great Prouince Rose.

We haue in our London gardens one of the red Roses, whose floures are in quantitie and beauty equal with the former, but of greater estimation, of a perfect red colour, wherein especially it differeth from the Prouince Rose, in stalks, stature, and manner of growing it agreeth with our common red Rose.

¶ *The Place.*

All these sorts of Roses we haue in our London gardens, except that Rose without prikles, which as yet is a stranger in England. The double white Rose doth grow wilde in many hedges of Lancashire in great abundance, euen as Briers do with vs in these Southerly parts, especially in a place of the countrey called Leyland, and in a place called Roughford, not far from Latham. Moreouer, in the said Leyland fields doth grow our garden Rose wilde, in the plowed fields among the corne in such abundance, that there may be gathered daily, during the time, many bushels of Roses, equall with the best garden Rose in each respect: the thing that giueth great cause of wonder is, that in a field in the place aforesaid, called Glouers field, every yeare that the field is plowed for corne, that yeare the field will be spread ouer with Roses, and when it lyeth as they call it ley, and not plowed, then shall there be but few Roses to be gathered, by the relation of a curious Gentleman there dwelling, so often remembred in our Historie.

† I haue heard that the Roses which grow in such plenty in Glouers field, every yeare the field is plowed, are no other than corne Rose, that is, red Poppies, howeuer our Author was informed. †

¶ *The Time.*

These floure from the end of May to the end of August, and diuers times after, by reason the tops and superfluous branches are cut away in the end of their flourishing: & then do they sometimes floure euen vntill October, and after.

¶ *The*

¶ The Names.

The Rose is called in Latine *Rosa*: in Greeke *ῥόδον*: and the plant it selfe *ῥοζή*: (which in Latine keepeth the same name that the floure hath) and it is called *Rodon* (as *Plutarch* saith) because it sendeth forth plenty of smell.

The middle part of the Roses, that is, the yellow chiues, or seeds and tyss, is called *Anthos*, and *Flos Rosa*, the floure of the Rose: in shops, *Anthera*, or the blowing of the rose.

The white parts of the leaues of the floure it selfe, by which they are fastened to the cups, be named *Vngues* or nails. That is called *Calix*, or the cup, which containeth and holdeth in together the yellow part and leaues of the floure.

Alabastris, are those parts of the cup which are deeply cut, & that compasse the floure close about before it be opened, which be in number five, two haue beards and two haue none, and the fifth hath but halfe one: most do call them *Cortices Rosarum*, or the husks of the roses: the shoots of the plant of roses, *Strabo Gallus* in his little garden doth call *Viburna*.

The white Rose is called *Rosa alba*: in English, the white Rose: in high Dutch, *Weiß Roosen*: in low Dutch, *Witte Roosen*: in French, *Rose Blanche*: of *Plinie*, *Spinicola Rosa*, or *Rosa Campana*.

The red Rose is called in Latine, *Rosa rubra*: the Frenchmen, *Rose Franche*, *Rose de Prouins*, a towne in Campaigne: of *Plinie*, *Trachinia*, or *Prænestina*.

The Damaske Rose is called of the Italians *Rosa incarnata*: in high Dutch, *Leibfarbige Roosen*: in low Dutch, *Prouencie Roose*: of some, *Rosa Provincialis*, or Rose of Prouence: in French of some, *Melesia*: the Rose of Melaxo, a citie in Asia, from whence some haue thought it was first brought into those parts of Europe.

The great Rose, which is generally called the great Prouence rose, which the Dutch men cannot endure; for say they, it came first out of Holland, and therefore to be called the Holland Rose: but by all likelihood it came from the Damaske rose, as a kinde thereof, made better and fairer by art, which seemeth to agree with truth.

The rose without prickles is called in Latine, *Rosa sine spinis*, and may be called in English, the rose without thornes, or the rose of Austrich, because it was first brought from Vienna, the Metropolitan citie of Austrich, and giue nto that famous Herbarist *Carolus Clusius*.

¶ The Temperature.

The leaues of the floures of roses, because they doe consist of diuers parts, haue also diuers and fundry faculties: for there be in them certain that are earthy and binding, others moist and watery, and fundrie that are spirituall and airie parts, which notwithstanding are not all after one sort, for in one kinde these excell, in another those, all of them haue a predominant or ouerruling cold temperature, which is neere to a meane, that is to say, of such as are cold in the first degree, moist, airie, and spirituall parts are predominant in the White roses, Damaske and Muske.

¶ The Vertues.

The distilled water of roses is good for the strengthning of the heart, & refreshing of the spirits, A and likewise for all things that require a gentle cooling.

The same being put into iunketting dishes, cakes, sauces, and many other pleasant things, giueth B a fine and delectable taste.

It mitigateth the paine of the eies proceeding of a hot cause, bringeth sleep, which also the fresh C roses themselues prouoke through their sweet and pleasant smell.

The iuice of these roses, especially of Damask, doth moue to the stoole, and maketh the belly so- D luble; but most effectuallly that of the Musk roses: next to them is the iuice of the Damask, which is more commonly vsed.

The infusion of them doth the same, and also the syrrup made thereof, called in Latine *Drosatum*, E or *Serapium*: the Apothecaries call it Syrrup of roses solutiue, which must be made of the infusion in which a great number of the leaues of these fresh roses are diuers and fundry times steeped.

It is profitable to make the belly loose & soluble, when as either there is no need of other stron- F ger purgation, or that it is not fit and expedient to vse it: for besides those excrements which stick to the bowels, or that in the first and neereft veines remaine raw, flegmaticke, and now and then cholericke, it purgeth no other excrements, vnlesse it be mixed with certaine other stronger medicines.

This syrrup doth moisten and coole, and therefore it alayeth the extremitie of heat in hot bur- G ning feuers, mitigateth the inflammations of the intrails, and quencheth thirst: it is scarce good for a weake and moist stomacke, for it leaueth it more slacke and weake.

Of like vertue also are the leaues of these preserued in Sugar, especially if they be onely bruised H with the hands, and diligently tempered with Sugar, and so heat at the fire rather than boiled.

¶ The Temperature of Red Roses.

There is in the red Roses, which are common euery where, and in the other that be of a deep pur- I ple, called Prouence roses, a more earthie substance, also a drying and binding qualitie, yet not without

without certaine moisture ioined, being in them when they are as yet fresh, which they lose when they be dried: for this cause their iuice and infusion doth also make the bodie soluble, yet not so much as of the others aforesaid. These roses being dried and their moisture gone, do bind and dry; and likewise coole, but lesser than when they are fresh.

¶ *The Vertues.*

- I** They strengthen the heart, and helpe the trembling and beating thereof.
K They giue strength to the liuer, kidneies, and other weake intrails; they dry and comfort a weak stomacke that is flashe and moist; stay the whites and reds, stanch bleedings in any part of the body, stay sweatings, binde and loose, and moisten the body.
L And they are put into all manner of counterpoisons and other like medicines, whether they be to be outwardly applied or to be inwardly taken, to which they giue an effectuell binding, and certaine strengthening qualitie.
M Honie of Roses, or *Mel Rosarum*, called in Greeke *ροδομελις*, which is made of them, is most excellent good for wounds, vlcers, issues, and generally for such things as haue need to be clenfed and dried.
N The oile doth mitigate all kindes of heat, and will not suffer inflammations or hot swellings to rise, and being risen it doth at the first assuage them.

¶ *The Temperature and Vertues of the parts.*

- O** The floures or bloomings of Roses, that is to say, the yellow haire and tips, do in like maner dry and binde, and that more effectually than of the leaues of the roses themselves: the same temperature the cups and beards be of, but seeing none of these haue any sweet smell, they are not so profitable, nor so familiar or beneficiall to mans nature: notwithstanding in fluxes at the sea, it shall auaille the Chirurgion greatly, to carry store thereof with him, which doth there preuaile much more than at the land.
P The same yellow called *Anthera*, staieth not onely those laskes and bloody fluxes which do happen at the sea, but those at the land also, and likewise the white flux and red in women, if they be dried, beaten to powder, and two scruples thereof giuen in red wine, with a little powder of Ginger added thereto: and being at the sea, for want of red wine you may vse such liquour as you can get in such extremitie.
Q The little heads or buttons of the Roses, as *Pliny* writeth, do also stanch bleeding, and stoppe the laske.
R The nailes or white ends of the leaues of the floures are good for watering eies.
S The iuice, infusion, or decoction of Roses, are to be reckoned among those medicines which are soft, gentle, loosening, opening and purging gently the belly, which may be taken at all times and in all places, of every kinde or sex of people, both old and yong, without danger or perill.
T The syrrup made of the infusion of Roses, is a most singular & gentle loosening medicine, carrying downwards cholericke humors, opening the stoppings of the liuer, helping greatly the yellow iaudies, the trembling of the heart, & taking away the extreme heat in agues and burning feuers which is thus made:
V Take two pound of Roses, the white ends cut away, put them to steepe or infuse in six pintes of warme water in an open vessell for the space of twelue houres: then straine them out, and put thereto the like quantitie of Roses, and warme the water again, so let it stand the like time: do thus foure or fve times; in the end adde vnto that liquor or infusion, foure pound of fine sugar in powder; then boyle it vnto the forme of a syrrup, vpon a gentle fire, continually stirring it vntill it be cold; then straine it, and keepe it for your vse, whereof may be taken in white wine, or other liquour, from one ounce vnto two.
X Syrrup of the iuice of Roses is very profitable for the griefes aforesaid, made in this manner:
Y Take Roses, the white nailes cut away, what quantitie you please, stampe them, and straine out the iuice, the which you shall put to the fire, adding thereto sugar, according to the quantity of the iuice: boiling them on a gentle fire vnto a good consistence.
Z Vnto these syrrups you may adde a few drops of oyle of Vitriol, which giueth it a most beautiful colour, and also helpeth the force in cooling hot and burning feuers and agues: you likewise may adde thereto a small quantitie of the iuice of Limons, which doth the like.
A The conferue of Roses as well that which is crude and raw, as that which is made by ebullition or boiling, taken in the morning fasting, and last at night, strengthneth the heart, and taketh away the shaking and trembling thereof, strengthneth the liuer, kidneies, and other weake intrails, comforteth a weak stomacke that is moist and raw, staieth the whites and reds in women, and in a word is the most familiar thing to be vsed for the purposes aforesaid, and is thus made:
B Take the leaues of Roses, the nailes cut off, one pound, put them into a clean pan; then put thereto a pinte and a halfe of scalding water, stirring them together with a wooden slice, so let them stand

to macerate, close couered some two or three houres; then set them to the fire slowly to boyle, adding thereto three pounds of sugar in powder, letting them to simmer together according to discretion, some houre or more, then keepe it for your vse.

The same made another way, but better by many degrees: take Roses at your pleasure, put them C to boyle in faire water, hauing regard to the quantity; for if you haue many roses, you may take the more water; if fewer, the lesse water will serue: the which you shall boyle at the least three or foure houres, euen as you would boyle a piece of meat, vntill in the eating they be very tender, at which time the roses will lose their colour, that you would thinke your labour lost, and the thing spoyled. But proceed, for though the Roses haue lost their colour, the water hath gotten the tincture thereof; then shall you adde vnto one pound of Roses, foure pound of fine sugar in pure powder, and so according to the rest of the roses. Thus shall you let them boyle gently after the Sugar is put thereto, continually stirring it with a wooden Spatula vntill it be cold, whereof one pound weight is worth six pound of the crude or raw conserue, as well for the vertues and goodnesse in taste, as also for the beautifull colour.

The making of the crude or raw conserue is very well knowne, as also Sugar roset, and diuers D other pretty things made of roses and sugar, which are impertinent vnto our historie, because I intend neither to make thereof an Apothecaries shop, nor a Sugar bakers storehouse, leauing the rest for our cunning confectioners.

CHAP. 2. Of the Muske Roses.

¶ The Kindes.

T Here be diuers sorts of Roses planted in gardens, besides those written of in the former chapter, which are of most writers reckoned among the wilde roses, notwithstanding we thinke it conuenient to put them into a chapter betweene those of the garden and the brier roses, as indifferent whether to make them of the wilde roses, or of the tame, seeing we haue made them denizons in our gardens for diuers respects, and that worthily.

1 *Rosa Moschata simpliciflora.*
The single Muske rose.

2 *Rosa Moschata multiplex.*
The double Muske rose.

¶ The Description.

1 **T**he single Muske Rose hath diuers long shoots of a greenish colour and wooddie substance, armed with very sharpe prickles, diuiding it selfe into diuers branches: whereon do grow long leaues, smooth & shining, made of diuers leaues set vpon a middle rib, like the other roses: the floures grow on the tops of the branches, of a white colour, and pleasant sweet smell, like that of Muske, whereof it tooke his name; hauing certain yellow seeds in the middle, as the rest of the roses haue: the fruit is red when it is ripe, and filled with such chaffie flocks and seeds as those of the other roses: the root is tough and wooddie.

2 The double Muske rose differeth not from the precedent in leaues, stalks, and roots, nor in the colour of the floures, or sweetnesse thereof, but onely in the doublenesse of the floures, wherein consisteth the difference.

3 Of these roses we haue another in our London gardens, which of most is called the blush rose; it floureth when the Damaske rose doth: the floures hereof are very single, greater than the other Muske roses, and of a white colour, dasht ouer with a light wash of carnation, which maketh that colour which wee call a blush colour: the proportion of the whole plant, as also the smell of the floures, are like the precedent.

3 *Rosa Moschata species maior.*
The great Muske rose.

4 *Rosa Holosericea.*
The veluet rose.

4 The Veluet rose groweth alwaies very low, like vnto the red rose, hauing his branches covered with a certaine hairie or prickley matter, as fine as haire, yet not so sharpe or stiffe that it will harme the most tender skin that is: the leaues are like the leaues of the white rose: the floures grow at the top of the stalks, doubled with some yellow thrums in the midst, of a deepe and blacke red colour, resembling red crimson veluet, whereupon some haue called it the Veluet rose: when the floures be vaded, there follow red berries full of hard seeds, wrapped in a downe or woollinesse like the others.

5 The yellow rose which (as diuers do report) was by Art so coloured, and altered from his first estate, by grafting a wilde rose vpon a Broome stalke; whereby (say they) it doth not onely change his colour, but his smell and force. But for my part I hauing found the contrarie by mine owne experience, cannot be induced to beleue the report: for the roots and off-springs of this rose haue brought

brought forth yellow roses, such as the maine stocke or mother bringeth out, which euent is not to be seen in all other plants that haue been graffed. Moreouer, the seeds of yellow roses haue brought forth yellow roses, such as the floure was from whence they were taken; which they would not do by any coniecturall reason, if that of themselues they were not a naturall kind of rose. Lastly, it were contrary to that true principle,

Natura sequitur semina quodque sua: that is to say;

Euery seed and plant bringeth forth fruit like vnto it selfe, both in shape and nature: but leauing that error, I will proceed to the description: the yellow rose hath browne and prickly stalks or shoots, fise or six cubits high, garnished with many leaues, like vnto the Muske rose, of an excellent sweet smell, and more pleasant than the leaues of the Eglantine: the floures come forth among the leaues, and at the top of the branches of a faire gold yellow colour: the thrums in the middle, are also yellow: which being gone, there follow such knops or heads as the other roses do beare.

5 *Rosa lutea.*

The yellow rose.

‡ 6 *Rosa Lutea multiplex.*

The double yellow rose.

‡ 6 Of this kinde there is another more rare and set by, which in stalks, leaues, and other parts is not much different from the last described, onely the floure is very double, and it seldome fairly shewes it selfe about London, where it is kept in our chiefe gardens as a prime raritie. ‡

7 The Canell or Cinnamon rose, or the rose smelling like Cinnamon, hath shoots of a brown colour, foure cubits high, beset with thorny prickles, and leaues like vnto those of Eglantine, but smaller and greener, of the sauour or smell of Cinnamon, whereof it tooke his name, and not of the smell of his floures (as some haue deemed) which haue little or no sauour at all: the floures be exceeding double, and yellow in the middle, of a pale red colour, and sometimes of a carnation: the root is of a wooddie substance.

8 We haue in our London gardens another Cinnamon or Canell rose, not differing from the last described in any respect, but onely in the floures, for as the other hath very double floures, contrariwise these of this plant are verie single, wherein is the difference.

7 *Rosa Cinnamomea pleno flore.*
The double Cinnamon Rose.

8 *Rosa Cinnamomea flore simplici.*
The single Cinnamon Rose.

¶ The Place.

These Roses are planted in our London gardens, and elsewhere, but not found wilde in England.

¶ The Time.

The Muske Rose floureth in Autumne, or the fall of the leafe: the rest floure when the Damask and red Rose do.

¶ The Names.

The first is called *Rosa Moschata*, of the smell of Muske, as we haue said: in Italian, *Rosa Moschetta*: in French, *Roses Musques*, or *Muscadelles*: in Low Dutch, *Musket roosen*: in English, *Musk Rose*: the Latine and English titles may serue for the rest.

¶ The Temperature.

The Muske rose is cold in the first degree, wherein aerie and spiritual parts are predominant: the rest are referred to the Brier rose and Eglantine.

¶ The Vertues.

- A Conserue or syrrup made of the Muske rose, in manner as before told in the Damaske and red roses, doth purge very mightily waterish humors, yet safely, and without all danger, taken in the quantitie of an ounce in weight.
- B The leaues of the floures eaten in the morning, in manner of a fallad, with oile, vineger and pepper, or any other way according to the appetite and pleasure of them that shall eat it, purge very notably the belly of waterish and cholericke humors, and that mightily, yet without all perill or paine at all, insomuch as the simplest may vse the quantitie, according to their owne fancie; for if they do desire many stooles, or sieges, they are to eat the greater quantity of the leaues; if fewer, the lesse quantitie; as for example: the leaues of twelue or foureteene floures giue six or eight stooles, and so increasing or diminishing the quantitie, more or fewer, as my selfe haue often proued.
- C The white leaues stamped in a wooden dish with apeece of Allum and the iuice strained forth into some glased vessell, dried in the shadow, and kept, is the most fine and pleasant yellow colour that may be diuised, not only to limne or wash pictures and Imagerie in books, but also to colour meates and sauces, which notwithstanding the Allum is very wholsome.

There

There is not any thing extant of the others, but are thought to be equall with the white Muske Rose, whereof they are taken and holden to be kindes.

CHAP. 3. Of the wilde Roses.

¶ The Description.

THe sweet Brier doth oftentimes grow higher than all the kindes of Roses; the shoots of it are hard, thicke, and wooddie; the leaues are glittering, and of a beautifull Greene colour, of smell most pleasant: the Roses are little, five leaved, most commonly whitish, seldom tending to purple, of little or no smell at all: the fruit is long, of colour somewhat red, like a little oliue stone, and like the little heads or berries of the others, but lesler than those of the garden: in which is contained rough cotton, or hairie downe and seed, folded and wrapped vp in the same, which is small and hard: there be likewise found about the slender shoots hereof, round, soft, and hairie sponges, which we call Brier Balls, such as grow about the prickles of the Dog-rose.

1 *Rosa sylvestris odora*: The Eglantine, or sweet Brier.

2 We haue in our London gardens another sweet Brier, hauing greater leaues, and much sweeter: the floures likewise are greater, and somewhat doubled, exceeding sweet of smell, wherein it differeth from the former.

3 The Brier Bush or Hep tree, is also called *Rosa canina*, which is a plant so common and well knowne, that it were to small purpose to vse many words in the description thereof: for euen children with great delight eat the berries thereof when they be ripe, make chaines and other prettie gewgawes of the fruit: cookes and gentlewomen make Tarts and such like dishes for pleasure thereof, and therefore this shall suffice for the description.

4 The Pimpinell rose is likewise one of the wilde ones, whose stalks shoot forth of the ground in many places, of the height of one or two cubits, of a browne colour, and armed with sharpe prickles,

† 2 *Rosa syl. odora flore duplici.*
The double Eglantine.

3 *Rosa Canina inodora.*
The Brier Rose, or Hep tree.

4 *Rosa Pimpinella folio.*
The Pimpinell Rose.

kles, which diuide themselues toward the tops into diuers branches, whereon doe grow leaues consisting of diuers small ones, set vpon a middle rib like those of Burnet, which is called in Latine *Pimpinella*, whereupon it was called *Rosa Pimpinella*, the Burnet Rose. The floures grow at the tops of the branches, of a white colour, very single, and like vnto those of the Brier or Hep tree: after which come the fruit, blacke, contrarie to all the rest of the roses, round as an apple; whereupon some haue called it *Rosa Pomifera*, or the Rose bearing apples: wherein is contained seed, wrapped in chaffie or flockie matter, like that of the Brier: the root is tough and wooddie:

¶ *The Place.*

These wilde Roses do grow in the borders of fields and woods, in most parts of England. The last groweth very plentifully in a field as you go from a village in Essex, called Graies (vpon the brinke of the riuer Thames) vnto Horndon on the hill, insomuch that the field is full fraught therewith all ouer.

It groweth likewise in a pasture as you goe from a village hard by London called Knights bridge, vnto Fulham, a village thereby, and in many other places.

We haue them all except the Brier Bush in our London gardens, which we thinke vnworthy the place.

¶ *The*

¶ The Time.

They floure and flourish with the other Roses.

¶ The Names.

The Englantine Rose, which is *Cynorrhodi*, or *Canina Rosa species*, a kinde of Dogs Rose: and *Rosa sylvestris*, the wilde Rose: in low-Dutch, **Eglantier**: in French, *Esglentine*; and as *Ruellius* testifies, *Eglenterium*: who also suspects it to be *Cynosbaton*, or *Canirubus*: of which *Dioscorides* hath written in these words; *Cynosbatus*, or *Canirubus*, which some call *Oxyantha*, is a shrub growing like a tree, full of prickles, with a white floure, long fruit like an oliue stone, red when it is ripe, and downie within: in English we call it Englantine, or sweet Brier.

The spongie balls which are found vpon the branches are most aptly and properly called *Spongiola sylvestris Rosa*, the little sponges of the wilde Rose. The shops mistake it by the name of *Bedeguar*; for *Bedeguar* among the Arabians is a kinde of Thistle, which is called in Greeke *Ακνιδά Νεσσά*: that is to say, *Spina alba* the white Thistle, not the white Thorne, though the word doe import so much.

The Brier or Hep tree is called *Sylvestris Rosa*, the wilde Rose: in high-Dutch, **wilden Rosen**: in French, *Roses sauvages*: *Pliny lib. 8. cap. 25.* saith that it is *Rosa Canina*, Dogs Rose: of diuers, *Caninasensis*, or Dogs Thorne: in English, Brier bush, and Hep tree: the last hath been touched in the description.

¶ The Temperature and Vertues.

The faculties of these wilde Roses are referred to the manured Rose, but not vsed in physicke A where the other may be had: notwithstanding *Pliny* affirmeth, that the root of the Brier bush is a singular remedie found out by oracle, against the biting of a mad dog, which he sets downe in his eighth booke, chap. 41.

The same Author, *lib. 25. cap. 2.* affirmeth, that the little spongie Brier ball stamped with honey B and ashes causeth haire to grow which are fallen through the disease called *Alopecia*, or the Foxes euill, in plaine termes the French pocks.

Fuchsius affirmes, that the spongie excrescence or ball growing vpon the Brier are good against C the stone and strangurie, if they be beaten to powder and inwardly taken.

They are good not as they be diureticks or prouokers of vrine, or as they are wearers away of the D stone, but as certaine other binding medicines that strengthen the weake and feeble kidneyes, which do no more good to those that be subiect to the stone, than many of the diuretickes, especially of the stronger sort; for by too much vsing of diureticks or pissing medicines, it hapneth that the kidneyes are ouer-weakened, and often times too much heated, by which meanes not only the stones are not diminished, worne away, or driuen forth, but oftentimes are also increased and made more hard: for they separate and take away that which in the bloud is thin, waterie, and as it were wheyish; and the thicker part, the stronger sorts of diuretickes do draw together and make hard: and in like maner also others that are not so strong, by the ouermuch vsing of them, as *Galen lib. 5.* of the faculties of simple medicines reporteth.

The fruit when it is ripe maketh most pleasant meats and banqueting dishes, as tarts and such E like; the making whereof I commit to the cunning cooke, and teeth to eat them in the rich mans mouth.

CHAP. 4. Of the Bramble or black-Berry bush.

¶ The Description.

I T He common Bramble bringeth forth slender branches, long, tough, easily bowed, tam-
ping among hedges and whatsoeuer stands neere vnto it; armed with hard and sharpe prickles, whereon doe grow leaues consisting of many set vpon a rough middle rib, greene on the vpper side, and vnderneath somewhat white: on the tops of the stalks stand certaine floures, in shape like those of the Brier Rose, but lesser, of colour white, and sometimes washt ouer with a little purple: the fruit or berry is like that of the Mulberry, first red, blacke when it is ripe, in taste betweene sweet and soure, very soft, and full of grains: the root creepeth, and sendeth forth here and there yong springs.

† *Rubus repens fructu casio.*

† 2 This hath a round stalke set full of small crooked and very sharpe pricking thornes, and creepeth on hedges and low bushes of a great length, on the vpper side of a light red colour, and vnderneath greene, and taketh root with the tops of the trailing branches, whereby it doth mightily encrease.

encrease: the leaues grow without order, composed of three leaues, and sometimes of five, or else the two lower leaues are diuided into two parts, as Hop leaues are now and then, of a light Greene colour both aboue and vnderneath. The floures grow on the tops of the branches, *racematim*, many together, sometimes white, sometimes of a very light purple colour, euery floure containing five leaues, which are crompted or wrinkled, and do not grow plaine: the fruit followes, first green, and afterwards blew, euery berry composed of one or two graines, seldome oboue foure or five growing together, about the bignesse of corans; wherein is contained a stony hard kernell or seed, and a iuyce of the colour of Claret wine, contrarie to the common *Rubus* or Bramble, whose leaues are white vnderneath: the berries being ripe are of a shining blacke colour, and euery berry contains vsually aboue forty graines closely compacted and thrust together. The root is woody and lasting. This growes common enough in most places, and too common in ploughed fields. Sept. 6.

1619. *John Goodyer.* ‡

3 The Raspis or Framboise bush hath leaues and branches not much vnlike the common Bramble, but not so rough nor prickly, and sometimes without any prickles at all, hauing onely a rough hairinesse about the stalkes: the fruit in shape and proportion is like those of the Bramble, red when they be ripe, and couered ouer with a little downinesse; in taste not very pleasant. The root creepeth far abroad, whereby it greatly encreaseth. ‡ This growes either with prickles vpon the stalkes, or else without them: the fruit is vsually red, but sometimes white of colour. ‡

1 *Rubus.*

The Bramble bush.

2 *Rubus Ideus.*

The Raspis bush or Hinde-berry.

4 Stone Bramble seldome groweth aboue a foot high, hauing many small flexible branches without prickles, trailing vpon the ground, couered with a reddish barke, and somewhat hairy: the leaues grow three together, set vpon tender naked foot-stalkes somewhat snipt about the edges: the floures grow at the end of the branches, consisting of foure small white leaues like those of the Cherry tree: after which come small Grape-like fruit, consisting of one, two, or three large transparent berries, set together as those of the common Bramble, of a red colour when they be ripe, and of a pleasant taste, but somewhat astringent. The roots creepe along in the ground very farre abroad, whereby it greatly increaseth.

4 *Chamemorus* (called in the North part of England, where they especially doe grow, Knot-berries, and Knought-berries) is likewise one of the Brambles, though without prickles: it brings forth

forth small weake branches or tender stems of a foot high; whereon do grow at certaine distances rough leaues in shape like those of the Mallow, not vnlike to the leaues of the Gooseberrie bush: on the top of each branch standeth one floure and no more, consisting of five small leaues of a dark purple colour: which being fallen, the fruit succeedeth, like vnto that of the Mulberrie, whereof it was called *Chamamorus*, dwarfe Mulberry; at the first white and bitter, after red and somewhat pleasant: the root is long, something knotty; from which knots or ioynts thrust forth a few threddie strings. ‡ I take that plant to which our Author hereafter hath allotted a whole chapter, and called *Vaccinia nubes*, or Cloud-berries, to be the same with this, as I shall shew you more largely in that place. ‡

4 *Rubus Saxatilis*.

Stone blacke-Berry bush.

5 *Chamamorus*.

Knot berry bush.

¶ The Place.

The Bramble groweth for the most part in euery hedge and bush.

The Raspis is planted in gardens: it groweth not wilde that I know of, except in the field by a village in Lancashire called Harwood, not far from Blackburne.

I found it among the bushes of a causey, neere vnto a village called Wisterfon, where I went to schoole, two miles from the Nantwich in Cheshire.

The stone Bramble I haue found in diuers fields in the Isle of Thanet, hard by a village called Birchinton, neere Queakes house, sometimes Sir Henry Crispes dwelling place. ‡ I feare our Author mistooke that which is here added in the second place, for that which he figured and described in the third (now the fourth) which I know not yet to grow wilde with vs. ‡

Knot-berries do loue open snowie hills and mountaines; they grow plentifully vpon Ingleborough hils among the heath and ling, twelue miles from Lancashire, being thought to be the highest hill in England.

They grow vpon Stane-more betweene Yorkshire and Westmerland, and vpon other wet Fells and mountaines.

¶ The Time.

These floure in May and Iune with the Roses: their fruit is ripe in the end of August and September.

¶ The

¶ The Names.

The Bramble is called in Greeke *Batos*: in French, *Ronges*, *Loi Duyts Brelmers*: in Latine, *Rubus*, and *Sentis*, and *Vepres*, as *Ouid* writeth in his first booke of *Metamorphosis*.

Aut Lepori qui vepre latens hostilia cernit

Ora carum. —

Or to th' Hare, that vnder Bramble closely lying, spies

The hostile mouthes of Dogs. —

Of diuers it is called *Cynosbatus*, but not properly; for *Cynosbatus* is the wild Rose, as we haue written: in high-Dutch, *Bremen*: in low-Dutch, *Bzeemen*: in French, *Rouce*: in Italian, *Garza*: in English, Bramble bush, and Black-berry bush.

The fruit is named in Latine *Morum rubi*; and as *Fuchsius* thinketh, *Vacinium*, but not properly: in shops, *Mora Bati*: and in such shops as are more barbarous, *Mora Bassi*: in English, Blackberries.

The Raspis is called in Greeke *Batos idaze*: in Latine, *Rubus Idaeus*, of the mountaine Ida on which it groweth: in English, Raspis, Framboise, and Hinde-berry.

¶ The Temperature and Vertues.

- A The yong buds or tender tops of the Bramble bush, the floures, the leaues, and the vnripe fruit, do very much dry and binde withall: being chewed they take away the heate and inflammation of the mouth, and almonds of the throat: they stay the bloudy flux, and other fluxes, and all maner of bleedings: of the same force is their decoction, with a little honey added.
- B They heale the eyes that hang out, hard knots in the fundament, and stay the hemorrhoids, if the leaues be layd thereunto.
- C The iuyce which is pressed out of the stalks, leaues, and vnripe berries, and made hard in the Sun, is more effectuell for all those things.
- D The ripe fruit is sweet, and containeth in it much iuyce of a temperate heate, therefore it is not vnpleasant to be eaten.
- E It hath also a certaine kinde of astringion or binding qualitie.
- F It is likewise for that cause wholsome for the stomack, and if a man eat too largely therof, saith *Galen*, he shall haue the head-ache: but being dried whilest it is yet vnripe it bindeth and drieth more than the ripe fruit.
- G The root besides that it is binding containeth in it much thin substance, by reason whereof it wasteth away the stone in the kidnies, saith *Galen*.
- H *Pliny* writeth, that the berries and floures do prouoke vrine, and that the decoction of them in wine is a present remedie against the stone.
- I The leaues of the Bramble boiled in water, with honey, allum, and a little white wine added thereto, make a most excellent lotion or washing water to heale the sores in the mouth, the priuie parts of man or woman, and the same decoction fastneth the teeth.
- K The Raspis is thought to be like the Bramble in temperature and vertues, but not so much binding or drying. The Raspis, saith *Dioscorides*, performeth those things which the Bramble doth. The fruit is good to be giuen to those that haue weake and queasie stomacks.

CHAP. 5. Of Holly Roses, or Cistus.

¶ The Kindes.

Cistus hath been taken of diuers to be a kinde of Rose: the old Writers haue made two sorts thereof, male and female; and likewise a third sort, which is called *Ledum*: the later Herbarists haue discovered diuers more, as shall be declared.

¶ A generall Description, wherein all the sorts of *Cistus* are comprised.

Cistus and his kinds are wooddy shrubs full of branches, of the height of two or three cubits: some haue broad leaues, others rough, vneuen, wrinkled, somewhat downy, and most like the leaues of Sage; although some haue the leaues of Rosemary, others the forme of those of the Poplar tree: the floures grow on the tops of the branches, like vnto the wild Rose, yet such as very quickly fade, perish, and fall away: those of the male are most of a reddish blew or purple colour; and of the female white: in their places come vp little heads or knops somewhat round, in which is contained small seed: the roots of them all are wooddy.

There

There groweth vp sometimes vnder the shrub hard to the roots, a certaine excrecence or hypocist, which is thicke, fat, grosse, full of iuyce, without leaues, wholly consisting of many little cafes or boxes, as do those of Henbane or of the Pomegranat tree; of a yellowish red colour in one kinde, and in another white, and in certaine other Greene or grassie, as *Dioscorides* saith.

¶ The Description.

1 The first kinde of *Cistus* groweth vp like a small bush or shrub, of a woody substance, three or foure cubits high, garnished with many small and brittle branches, set full of crumpled or rugged leaues very like vnto Sage leaues: at the top of the branches come floures of a purple colour, in shape like vnto a single Brier Rose, hauing leaues somewhat wrinkled like a cloath new dried before it be smoothed, and in the midst a few yellow chiues or thrums: the floures for the most part do perish and fall away before noone, and neuer cease flourishing in such manner from the moneth of May vnto the beginning of September, at which time the seed is ripe, being of a reddish colour, and is contained in an hard hairie huske not much vnlike the husk of Henbane.

1 *Cistus mas angustifolius.*
The male Holly Rose.

2 *Cistus mas cum Hypocistide.*
The male Holly Rose with his excrecence.

2 The second sort of *Cistus*, being another kind of the male *Cistus*, which *Pena* calls *Cistus mas cum Hypocistide*, is like vnto the former, but that from the root of this kinde there commeth a certaine excrecence or out-growing, which is sometimes yellow, sometimes Greene, and sometimes white; from which is drawne by an artificiall extraction a certaine iuyce called in shops *Hypocistis*.

3 This kinde of *Cistus* hath many woody stalks diuided into diuers brittle branches of a russet colour; whereon do grow rough leaues somewhat cut or toothed on the edges, and of an ouerworne colour: the floures grow on the tops of the branches, in forme of a Muske Rose, but of an excellent bright purple colour: after which come round knops, wherein is contained smal reddish seed: the root is tough and woody,

4 This fourth sort of *Cistus* hath diuers woody branches, whereon are set, thicke thrust together, diuers smal leaues narrow like those of Winter Sauorie, but of an ouerworne russet colour: the root and floures are like the precedent.

3 *Cistus*

3 *Cistus mas dentatus*.
Toothed or snipt male Cistus.

4 *Cistus mas tenuifolius*.
Thin leaved Cistus.

5 *Cistus femina*.
The female Cistus.

7 *Cistus folio Halimi*.
Cistus with leaues like Sea Purslane.

5 The first of the females is like vnto the male Cistus in each respect, sauing that the floures hereof are of a white colour, with diuers yellow thrummes in the middle, and the others purple, wherein consisteth the difference.

6 The second female of *Matthiolum* description hath many hard and wooddie stalks, branched with diuers armes or wings: whereon are set by couples rough hoary and hairy leaues, of a darke russet colour: among which come forth small white floures like vnto those of the Iasmin: the root is tough and wooddy. ‡ This I iudge all one with the former, and therefore haue omitted the figure as impertinent, although our Authour followed it, making the floure so little in his description. ‡

† 7 The seuenth sort of Cistus groweth vp to the height of a small hedge bush, hauing diuers brittle branches full of pith: whereon are set leaues by couples, like those of sea Purslane, that is to say, soft, hoary, and as it were couered ouer with a kinde of mealesse: the floures are yellow, and lesse than those of the former.

8 *Cistus folio Lauandulae.*
Lauander leated Cistus.

9 *Cistus folio Thymi.*
Cistus with the leaues of Tyme.

8 The eighth Cistus hath likewise shrubbie stalks in maner of a hedge tree, whereon do grow at certaine distances diuers leaues close ioyned together at the stalke, like those of the former, but somewhat lower and narrower: the floures we haue not expressed in the figure, by reason we haue no certaine knowledge of them.

9 This ninth Cistus is likewise a wooddy shrub some foot high: the stalks are very brittle, as are all the rest of his kinde, whereon do grow very small leaues like those of Tyme: the floures are white, which maketh it one of the females.

10 The low or base Cistus with broad leaues, groweth like a small shrub, of a wooddy substance: the leaues are many, of a darke Greene colour: the floures are in forme like the other, but of a yellow colour: the roots are likewise wooddy.

11 This narrow leaved low Cistus hath diuers tough branches leaning to the ground, whereon do grow without order many small narrow leaues somewhat long, of a gummy taste at the first, afterwards bitter: the floures grow on the tops of the branches, of a yellow colour, consisting of five leaues, with certaine chiues in the middle; after which follow three square cods or seed-vessels: the root is tough and wooddy.

10 *Cistus humilis latifolius*.
Low Cistus with broad leaues.

11 *Cistus humilis angustifolius*.
Low Cistus with narrow leaues.

12 *Cistus humilis Austriaca Clusij*.
Low Cistus of Austria.

13 *Cistus humilis serpilli folio*.
Low Cistus with leaues like wilde Tyme.

12 The low or base Cistus of Austria groweth likewise leaning to the ground, having many woody branches very firme and tough, couered with a blackish barke; whereon do grow very many rough and hairy leaues in shape like those of the small myrtle, of a shining Greene on the vpper-side, and of an astringent taste: on euery branch standeth one floure, seldome two, in forme like the other, but consisting of one leafe deeply diuided into fve parts, and of a white colour tending to a flesh colour.

13 This low sort of Cistus hath many long tough branches trailing vpon the ground, of a reddish colour, whereon do grow small leaues like those of wilde Tyme, of a darke green colour, very thicke and fat, and somewhat hairy: the floures grow at the top of the branches, of a yellow gold colour, consisting of fve small leaues of a very sweet smell. The root is thicke, hard, and wooddie.

14 This strange and rare plant of *Lobels* obseruation I haue thought meet to be inserted amongst the kindes of Cistus, as a friend of theirs, if not one of the kinde: it hath leaues like vnto the male Cistus (the first in this chapter described) but more hairy, bearing at the top of his branches a small knop in shape like a rotten Strawberry, but not of the same substance; for it is compact of a scaly or chaffie matter such as is in the midst of the Camomill floures, and of a russet colour.

14 *Cistus exoticus Lobelij.*
Lobels strange Cistus.

16 *Myrtocistus Tho. Pennet Angli.*
Dr. Penny his Cistus.

15 This adulterine or counterfeit or forged Cistus growes to the height of a hedge bush: the branches are long or brittle, whereon do grow long leaues like those of the Willow, of an ouer-worne russet colour: the floures are small, consisting of fve little yellow leaues: the whole plant being well viewed seemeth to be a Willow, but at the first sight one of the Cistus; so that it is a plant participating of both: the root is wooddy. † *Bauhine* iudges this (which our Author out of *Tabern.* figured and named *Cistus adulterinus*) to be the Cistus set forth in the eighth place of the next chapter saue one: but I rather iudge it to be of the *Ledum Silesiacum* set forth in the eleuenth place of that chapter, and againe in the twelfth, where you may finde more thereof. †

16 This kinde of Cistus, which *Dr. Penny* (a famous Physitian of London deceased) did gather vpon the Islands of Majorica or Majorca, and called it by the name *Myrtocistus*, in Latine, *Myrtocistus Balearica*, is a shrub growing to the height of three cubits, having a very rough barke, beset round about with rough and scabbed warts; which bark wil of it selfe easily fall away from the old

old branches or boughes of the tree. The leaues of this tree are almost like them of *Myrtus*, very rough vnderneath like the branches aforesaid; but the leaues that grow higher, and toward the top of the branches, are smooth, growing about the branches very thicke together, as in the other kindes of *Cistus*. The floures are yellow, growing on the top of the twigs, consisting of five long leaues full of many very long chiues within. When the floures be vaded, there followeth a verie long and five square head or huske full of seed. The whole tree is very sweet, out of which issueth a gum or rosiné, or rather a thicke clammy and fat iuyce, such as commeth forth of the kindes of *Ledum*.

17 This annual *Cistus* groweth vp from seed with one vpright stalke to the height of a cubit; oft times diuided into other small branches; whereon grow rough leaues somewhat long, of a dark Greene colour. The floures grow at the top of the stalks, consisting of 5 small yellow leaues: which being past, there followeth a three square seed vessell full of small reddish seed. The root is small and woody, and perisheth when the seed is perfected.

17 *Cistus annuus*.
Cistus lasting one yeare.

18 *Cistus annuus longifolius* Lobelij.
Long leaved yearly Cistus.

18 This other *Cistus* that lasteth but one yeare hath long stalks diuided into other branches of the height of two cubits; whereon do grow long rough leaues, set three together at certain distances, the middlemost whereof is longer than the other two: the floures grow on the sides of the branches, like the female *Cistus*, of a white colour: the root is of a woody substance, as are all the rest of his kinde.

† 19 This growes some foot high, with a square rough greenish stalke, whereon by couples at certaine spaces stand little longish rough leaues, yet toward the top of the stalk they stand sometimes three together: vpon the top of the little branches grow floures like those of the other *Cistus*, of colour yellow, with a fine sanguine spot vpon each leafe of the floure. It groweth in some parts of France, as also on the Alps in Italy. *Clusius* describes it by the name of *Cistus annuus 2*. *Pona* in his *Mons Baldus* calls it *Cistus annuus flore guttato*.

20 This hath many slender branches whereon grow small roundish leaues, hoarie, and somewhat like those of *Marjerome*, somewhat lesse, with the middle rib standing out. The floures grow vpon the tops of the branches, and consist of five white leaues, with a darke purple spot in the middle of each leafe: the threds in the middle of the floure are of a yellow colour: their seed-vessels are

are of the bignesse of those of flax, but three square, containing a seed of the bignesse of that of Henbane. *Clusius* found this in diuers parts of Spaine, and sets it forth by the name of *Cistus folio Sampsuchi*. ‡

‡ 19 *Cistus annuus flore maculato*.
Spotted annuall Cistus.

‡ 20 *Cistus folio Sampsuchi*.
Marjerome leaued Cistus.

¶ The Place.

Holly Roses grow in Italy, Spaine, and Languedoc, and in the countries bordering vpon the riuer Padus, in all Hetruria and Massiles, and in many other of the hotter prouinces of Europe, in dry and stony places, varying infinitely according to the diuersitie of the regions where they doe grow; of which I haue two sorts in my garden, the first, and the *Cistus annuus*.

¶ The Time.

They floure from May to September.

¶ The Names.

The Holly Rose is called in Greeke *κίστος*, or *κιστός*; in Latine also *Cistus*, and *Rosa syluatica*: of diuers, *Rosa Canina*, as *Scribonius Largus* writeth, but not properly: in Spanish, *Estepa*: of the Portugals, *Rosella*: in English, Holly Rose, and *Cistus*, after the Greeke name. The fungous excrescence growing at the root of *Cistus*, is called in Greeke *κιστίτις*, because it groweth vnder the shrub *Cistus*: it is also called *Limodorum*: some call it *κιστός*: among whom is *Paulus Aegineta*, who also doth not call that *Hypocistus* which groweth vnder the shrub *Cistus*, but the iuyce hereof; whereupon might grow the word *Hypocistis*, by which name the Apothecaries call this iuyce when it is hardened: of some it is called *Erithanon*, *Citinus*, and *Hypoquistidos*.

¶ The Temperature.

Cistus, as *Galen* saith, doth greatly dry, neere hand in the second degree, and it is of that coldnesse, that it hath withall a temperate heate: the leaues and the first buds being beaten do only dry and binde, in such fort as they may close vp vlcers, and ioyne together Greene wounds.

¶ The Vertues.

The floures are of most force, which being drunke with wine are good against the bloudy flux, A weakenesse of the stomacke, fluxes, and ouerflowings of moist humors.

They cure putrified vlcers being applied in manner of a pultis: *Dioscorides* teacheth that they B are a remedie for eating vlcers, called in Greeke *κίστος*, being anointed therewith; and that they cure burnings, scaldings, and old vlcers.

- C *Hypocistis* is much more binding : it is a sure remedie for all infirmities that come of fluxes, as voiding of bloud, the whites, the laske, and the bloudy flux : but if it be requisite to strengthen that part which is ouerweakned with a superfluous moisture, it doth notably comfort and strengthen the same.
- D It is excellent to be mixed with fomentations that serue for the stomacke and liuer.
- E It is put into the Treacle of Vipers, to the end it should comfort and strengthen weake bodies, as *Galen* writeth.

CHAP. 6. Of other Plants reckoned for dwarfe kindes of Cistus.

1. 2. *Helianthemum Anglicum luteum vel album.*
English yellow or white dwarfe Cistus.

¶ The Description.

1 **T**he English dwarfe Cistus, called of *Lobel*, *Panax Chironium* (but there is another *Panax* of *Chiron*s description, which I hold to be the true and right *Panax*, notwithstanding he hath inserted it amongst the kindes of Cistus, as being indifferent to ioyne with vs and others for the insertion) is a low and base plant creeping vpon the ground, hauing many smal tough branches, of a browne colour; whereupon do grow little leaues set together by couples, thicke, fat, and ful of substance, and couered ouer with a soft downe: from the bosome whereof come forth other lesser leaues: the floures before they be open are small knops or buttons, of a browne colour mixed with yellow; and being open and spred abroad are like those of the wild Tansie, and of a yellow colour, with some yellower chiues in the middle: the root is thicke, and of a woody substance.

2 The second is very like vnto the precedent, sauing that the leaues are long, and doe not grow so thicke thrust together, and are more woolly: the floures are greater, and of a white colour, wherein the especiall difference consisteth. The root is like the former.

3 *Helianthemum luteum Germanicum.* The yellow dwarfe Cistus of Germanie.

3 There is found in Germanie, a certaine plant like to Cistus, and *Ledon*, but much lesser, creeping vpon the ground, vnlesse it be propped vp, hauing a multitude of twiggie branches, slender, and fine: whereupon do grow leaues lesser than those of *Ledon* or Cistus, very like to that of our English white dwarfe Cistus, of a full substance, sleightly haired, wherein is contained a tough iuice: the floures are small like little Roses, or the wilde Tanfie, of a yellow colour: the roots be slender, wooddie, and something red.

4 *Helianthemum album Germanicum.* The white dwarfe Cistus of Germanie.

5 *Helianthemum Sabaudicum.*
The dwarfe Cistus of Sauoy.

6 *Helianthemum angustifolium.*
Narrow leaved dwarfe Cistus.

4 This differeth not from the last described, sauing that the floures hereof are very white, and the others yellow, wherein they especially differ.

5 The

5 The Dwarf Cistus of Sauoy hath diuers tough branches, of a reddish colour, very tough and woody, diuided into diuers other branches: whereon are set small leaues, foure together, by certain spaces; the floures grow at the top of the branches like those of our yellow Dwarf Cistus, of a yellow colour: the root is very wooddie.

6 This dwarf Cistus with narrow leaues, hath very many small flexible branches, of a browne colour, very smooth, and ramping vpon the ground; whereon do grow small, long, narrow leaues, like those of Time of Candie, from the bosome whereof come forth diuers other smaller leaues: the floures grow on the tops of the branches, of a bleak yellow colour: the root is likewise wooddy.

‡ 7 To these I may fitly adde two more: the first of these hath creeping stalks, some foot or two long, blackish, and diuided into sundry smaller branches: the leaues grow thick and many together, set by couples (though the figure do not wel expresse so much:) these leaues are smal, of the bignes of those of Time, thick, green aboue, and whitish vnderneath, and of a bitter tast: at the ends of the branches grow two or foure floures neere together, very small, composed of fiew little leaues, of a kinde of flesh colour: to these succeed heads opening themselues when they come to ripenesse into fiew parts, and containing a very small seed: the root is hard and wooddie, sending out certaine fibres: also the branches here and there put forth some fibres. This plant dryed hath a pretty pleasing smell. This growes vpon the highest Austrian and Styrian alpes, and is set forth by *Clusius* by the name of *Chamacistus septimus*.

‡ 7 *Chamacistus serpillifolius*.
Tyme leaued dwarf Cistus.

‡ 8 *Chamacistus Friscus*.
Frisian Dwarf Cistus.

8 The same Author also in his *Cura posteriores* giues vs the historie of this, which he receiued with some other rare plants from *Iohn Dortman*, a famous and learned Apothecarie of Groeningen: This little plant is in leafe and root almost like and neere of the same bignesse with the Celticke Nard, yet the stalks are vnlike, which are small, set with a few longish leaues, and at the tops they carry fiew or six pretty floures like those of Crowfeet, consisting of six leaues apiece, of a yellow colour, yet with some few spots of another colour, and these set in a double ring about the middle; after these follow heads or seed vessels with forked tops, filled with a chaffie seed: the whole plant smells somewhat strong. It growes together with *Gramen Pernassi* in rotten moorish places about a village in the county of Drent. *Dortman* called this *Hirculus Friscus*: *Clusius* addes, *qui Chamacisti genus*. ‡

¶ The Place.

Their feuerall titles haue touched their naturall countries: they grow in rough, drie, and sunnie places, in plaine fields and vpon mountaines.

Those of our English growing, I haue found in very many places, especially in Kent, vpon the chalkie banks about Grauef-end, Southfleet, and for the most part all the way from thence vnto Canturburie and Douer.

¶ The Time.

They floure from Iuly to the end of August.

¶ The Names.

Tragus calleth dwarfe Cistus in the high Dutch tongue, *Heyden Blope*: in Latine, *Gratia Dei*, but there is another herbe called also of the later Herbarists *Gratia Dei*, which is *Gratiola*: *Valerius Cordus* nameth it *Helianthemum*, and *Solis flos*, or Sunne floure: of *Clusius*, *Chamaecistus*, or Dwarfe Cistus.

Pliny writeth, that *Helianthe* groweth in the champion countrey *Temisicyra* in Pontus, and in the mountaines of Cilicia neere to the sea: and he saith further, that the wise men of those countries, and the kings of Persia do annoint their bodies herewith, boiled with Lions fat, a little Saffron, and wine of Dates, that they may seeme faire and beautiful; and therefore haue they called it *Heliacaliden*, or the beautie of the Sun: *Matthiolus* saith, that *Helianthemum* is taken of some to be *Panaces Chironium*, or *Chirons* All-heale: but it is nothing likely, as we haue said.

¶ The Temperature and Vertues.

The faculties and temperature are referred to the kindes of Cistus, for it healeth wounds, stan-
cherh bloud, and stoppeth the spittings of bloud, the bloudie fluxe, and all other issues of bloud. A

The same boiled in wine healeth vlcers in the mouth and priuie parts, if they be washed there-
with: to be brieft, it ioineth together and strengthneth: which things doe plainely and euidently
shew, that it is not onely like to Cistus and Ledon in forme, but in vertues and faculties also, and
therefore it is manifest, that it is a certaine wilde kinde of Cistus and Ledon. B

CHAP. 7. Of Cistus Ledon, and Ladanum.

¶ The Kindes.

There be diuers sorts of Cistus, whereof that gummy matter is gathered, called in shops *Lada-*
num, and *Labdanum*, but vnproperly.

¶ The Description.

1 Cistus Ledon is a shrub, growing to the height of a man, and sometimes higher, hauing many hard wooddie branches, couered with a blackish bark: wherupon do grow leaues set together by couples, one right against another like vnto wings, of an inch broad, of a blacke swart Greene on the vpper sides, and whitish vnderneath: whercon is gathered a certain clam- mie transparent or through shining liquour, of a very hot sweet smell, which being gathered and hardned, is that which in shops is called *Labdanum*: the floures grow at the ends of the branches like little roses, consisting of fise white leaues, euery one decked or beautified toward the bottome with pretty darke purplish spots tending to blacknesse, hauing in the middle very many yellow chiues, such as are in the middle of the Rose: after come the knaps or seed vessels, full of most smal reddish seed; the whole plant being dried, groweth somewhat whitish, and of a pleasant smell, the which it retaineth many yeares.

2 The second groweth likewise to the height of an hedge bush, the branches are long, and very fragile or easie to breake, whercon do grow leaues greener than any other of his kinde, yet vnderneath of a hoarie colour, growing toward winter to be somewhat reddish, of a tower and binding taste: the floures are like the precedent: the forme whereof the Grauer hath omitted, in other respects like the former.

3 The third sort of Cistus Ledon groweth vp to the height of a small hedge bush, hauing many twiggie branches, whercon do grow leaues like those of the Poplar tree, sharpe at the point, couered ouer with that clammy dew that the others are: the floures grow at the tops of the branches, of a white colour like the precedent.

11 *Cistus Ledum Silesiacum*.
The Polonian *Cistus Ledon*.

10 *Cistus Ledon Myrtifolium*.
Cistus Ledon with leaues like Myrtle.

4 The fourth of *Clusius* description groweth likewise to the height of a shrubby bush, hauing many branches, flexible, hoarie, and hairie: the leaues are like the rest of his kind, but softer, more hairy, of a swart green colour, dasht ouer with that dewie fatnesse, not onely in the spring time, but in the heat of Sommer likewise: the floures are white, with yellow thrums in the middle: the rest answereth the last described.

5 The fift groweth vp like a hedge bush, with many tough branches; whereon are set long rough leaues, hoarie vnderneath, somewhat dasht ouer with that fattie dew or humour that the rest are possessed of: the floures are likewise of a white colour, with certaine yellow chiues in the middle: the root is wooddie.

† 6 The sixth hath diuers small branches couered with a blackish bark: the floures are set together at the tops of the branches by certaine spaces: they are yellow, and like the former in each respect.

7 The seuenth is a low shrub growing to the height of two cubits, hauing many branches couered with a barke of the colour of ashes; whereon are confusedly set diuers leaues at certaine distances, small, narrow, like those of winter Sauory, of an ouerworne russet colour, very thick, fat, and glutinous: the floures are white, & differ not, nor the seed from the rest.

8 The

8 The eighth groweth vp like a little hedge bush, hauing leaues like the common female Cistus, saying that those of this plant are sprinkled ouer with that clammy moisture, and the other not so: the floures and seed are also like: From the root of this plant commeth such like excrescence called *Limadron*, *Orobanche*, or *Hypocistis*, as there doth from the first male Cistus, wherein it differeth from all the rest vnder the name Ledon.

9 The ninth hath diuers brittle stalkes of an ash colour tending to a russet; whereon are set very many leaues like those of Thym, of an ouerworne colour: the floures are white, with certaine yellow chiuies in the middle, which the grauer hath omitted in the figure.

10 The tenth groweth vp like a small shrub, hauing brittle stalkes, couered with a blackish barke, and diuided into diuers branches; whereon are set vpon short truncheons or fat footstalkes, foure or fise like those the Myrtle tree, of a strong smell: the floures are likewise of a white colour.

11 *Cistus Ledum Rorismarini folio.*

Cistus Ledon with leaues like Rosemarie.

12 *Cistus Ledum Matthioli.*

Cistus Ledon of Matthiols description.

11. 12. The twelfth kinde of Cistus Ledon groweth vpright with a straight body or stocke, bringeth at the top many small twigs or rods of a cubit long, couered with a barke of the colour of ashes, which diuide themselues into other branches, of a purplish colour, beset with long and narrow leaues, not much vnlike to Rosemary, but longer; of a greene colour aboue, but vnderneath hauing as it were a long rib, made or compact of wooll or downe; of a sweet and pleasant smell, and somewhat sharpe in taste: on the tops of the branches grow knops or heads, compact as it were of many scales, of an iron or rustie colour: out of which commeth and proceedeth a certaine round and long mane, or hairy panickled tuft of floures, with many long, tender, greene, and somewhat woolly stalkes or twigs growing vnto them, of a sweet sent and smell: the floures consist of fise little white leaues, within which are contained ten white chiuies with a long stile or pointal in the midst of the floure: when the floures be vaded, there succeed long knops or heads which are fise cornered, in shape and bignesse like vnto the fruite and berries of *Cornus*; which being greene, are bespeckled with many siluer spots, but being ripe, are of a red colour; containing within them a long yellow seed, which is so small and slender, that it is like to the dust or powder that falleth out of worme holes. † This is the *Ledum Silesiacum* of *Clusius*; and the *Ledum Rorismarini folio* of *Tabernaemontanus*: it is also the *Rosmarium syluestre* of *Matthiols*; and *Chamaepeuce* of *Cordus*: and I am

deceived if the figure which *Tabernamontanus* and our Author out of him gaue by the name of *Cistus adulterinus*, were not of this. ‡

13 Among the shrubby bushes comprehended vnder the title of *Cistus Ledum*, *Matthiolus* hath set forth one, whereof to write at large were impossible, considering the Author is so brieue, and of our selues we haue not any acquaintance with the plant it selfe: *Dioscorides* to help what may be, saith, that it is a shrub growing like vnto the stocke or kindred of the *Cisti*: from whose leaues is gathered a clammy dew which maketh that gummie matter that is in shops called *Ladanum*: it groweth, saith he, in hot regions (but not with vs:) the Mauritians call the juice or clammy matter, *Leden*, and *Laden*: of some, *Ladano*, and *Odano*: in Spanish, *Xara*: and further saith, it groweth in Arabia, where the bush is called *Chafus*: thus much for the description: ‡ Our Author here seems to make *Dioscorides* to comment vpon *Matthiolus*, which shewes his learning, and how well he was exercised in reading or vnderstanding any thing written of Plants. But of this enough; The plant here figured which *Matthiolus* iudges to be the true *Ledon*, or *Cistus Ladanifera* of *Dioscorides*, hath large stalkes and branches, whereon grow very thicke leaues, broad also and long, with the nerues running alongst the leaues, the floure of this consists of five white leaues, and the seed is contained in a three cornered seed vessel. ‡

14 *Cistus Ledum Alpinum Clusij*.
The Mountaine Cistus.

‡ 15 *Cistus Ledon folijs Rosismarini*.
Rosemary leaued Cistus Ledon.

14 The foureteenth Cistus, being one of those that do grow vpon the Alpish mountaines, which *Lobel* setteth downe to be *Balsamum alpinum* of *Gesner*: notwithstanding I thinke it not amisse to insert it in this place, hauing for my warrant that famous Herbarist *Carolus Clusius*: this plant is one of beautifullest, differing in very notable points, and yet resembleth them in the woody branches and leaues: it riseth vp hauing many weake branches leaning to the ground, yet of a woody substance, couered ouer with an ash coloured barke: the leaues are broad, and very rough, of a shining Greene colour, and a binding taste: the floures grow at the tops of the branches like little bells, hanging downe their heads, diuided at the lips or brims into five diuisions, of a deepe red color on the out side, and dashed ouer here and there with some siluer spots; on the inside of a bright shining red colour, with certaine chiues in the middle, and of a very sweet smell, as is all the rest of the plant; after which come small heads or knaps, full of seed like dust, of a very strong smell, making the head of them to ake that smel thereto: the root is long, hard, and very woody: oftentimes there is found

found vpon the trunke or naked part of the stalks certaine excrescences, or out-growings in manner of galls, of a fungous substance, like those of Touchwood, white within, and red without, of an astringent or binding taste.

‡ 15 This growes some cubite and better high, and hath long narrow glutinous leaues like in shape to those of Rosemarie, set by couples, but not very thick: the branches whereon the floures do grow are slender, and the seed vessels are diuided into fise parts as in other plants of this kinde. This *Clusius* found in Spaine, and sets forth for his *Ledum nonum* ‡.

¶ The Place.

Cistus Ledon groweth in the Island of Candie, as *Bellonius* doth testifie, in vntilled places euery where: it is also found in Cyprus, as *Pliny* sheweth, and likewise in many places of Spaine that lie open to the Sun: moreouer both the forme and bignesse of the leaues, and also of the plants themselves, as well of those that bring forth *Ladanum*, as the other *Cistus*, do varie in this wonderful manner, according to the diuersitie of the places and countries where they grow: they are strangers in these Northerly parts, being very impatient of our cold clymate.

¶ The Time.

They floure for the most part from May to the end of August: the clammie matter which falleth vpon the leaues, which is a liquid kinde of Rosen of a sweet smell, is gathered in the Spring time as *Dioscorides* saith: but as *Petrus Bellonius* affirmeth (being an eye witnes of the gathering) in the midst of sommer, and in the extreme heat of the Dog-daies, the which in our time not without great care and diligence, and as great labour, is gathered from the whole plant (with certain instruments made in manner of tooth pickes, or eare pickes, which in their tongue they call *Ergastiri*) and not gathered from the beards of Goats, as it is reported in the old fables of the lying Monks themselves, called *Calohieros*, that is to say Greekish Monkes, who of very mockerie haue foisted that fable among others extant in their workes.

‡ I thinke it not amisse for the better explanation of the matter here treated of, as also to shew you after what manner our Author in diuers places gaue the testimonies of sundry Writers, and how well he vnderstood them, here to set downe in English the words of *Bellonius* concerning the gathering of *Ladanum*, which are these. [The Greekes (saith he) for the gathering of *Ladanum*, prouide a peculiar instrument which in their vulgar tongue they terme *Ergastiri*: This is an instrument like to a Rake without teeth, to this are fastened sundry thongs cut out of a raw and vtanned hide; they gently rub these vpon the *Ladanum* bearing shrubs, that so the liquid moisture concrete about the leaues may sticke to them, which afterwards with kniues they shaue off these thongs in the heat of the day. Wherefore the labour of gathering *Ladanum* is exceeding great, yea intollerable, seeing they must of necessitie stay in the mountaines all the day long in the greatest heat of the Dog-daies: neither vsually shall you finde any other who will take the paines to gather it, besides, the *Calohieroi*, that is the Greeke Monkes. It is gathered no where in the whole Island of Candy in greater plenty, than at the foot of the mountaine Ida at a village called Cogualino, and at Milopotamo. ‡]

¶ The Names.

The shrub it selfe is called in Greeke *λιδών*, or *λιδω*: the Latines keep the name *Ledon* or *Ladon*, and is a kinde of *Cistus* or Hollie Roses: the fat or clammie matter which is gathered from the leaues, is named *Ladanon* and *Ledanon*, according to the Greeke: the Apothecaries corruptly call it *Lapdanum*: *Dioscorides* counteth that to be the best which is sweet of smell, and somewhat greene, that easily waxeth soft, is fat, without sand, and is not easily broken, but very full of Rosine or Gumme.

¶ The Temperature.

Ladanum, saith *Galen*, is hot in the later end of the first degree, hauing also a little astringent or binding qualitie; it is likewise of a thin substance, and therefore it softeneth, and withall doth moderately digest, and also concoct.

¶ The Vertues.

Ladanum hath a peculiar property against the infirmities of the mother, it keepeth haïres from falling; for it wasteth away any settled or putrified humour that is at their roots.

Dioscorides saith, that *Ladanum* doth bind, heat, soule, & open, being tempered with wine, Myrrhe, B and oile of Myrtles; it keepeth haïres from falling, being annointed therewith; or laied on mixed with wine, it maketh the markes or scars of wounds faire and well coloured.

It taketh away the paine in the eares if it be powred or dropped therein, mixed with honied water, or with oile of Roses.

A fume made thereof draweth forth the afterbirth, and taketh away the hardnesse of the matrix.

- E It is with good successe mixed with mollifying plaisters that mitigate paine.
 F Being drunke with wine, it stoppeth the laske, and prouoketh vrine.
 G There is made hereof diuers sorts of Pomanders, chaines, and bracelets, with other sweets mixed therewith.

CHAP. 8. Of Rosemarie.

¶ The Description.

1 **R**osemarie is a wooddie shrub, growing oftentimes to the height of three or foure cubits, especially when it is set by a wall: it consisteth of slender brittle branches, whereon do grow verie many long leaues, narrow, somewhat hard, of a quicke spicy taste, whitish vnderneath, and of a full Greene colour aboue, or in the vpper side, with a pleasant sweet strong smell; among which come forth little floures of a whitish blew colour: the seed is blackish: the roots are tough and woody.

1 *Rosmarinum Coronarium.*
Garden Rosemarie.

2 *Rosmarinum sylvestre.*
Wilde Rosemarie.

2 The wilde Rosemarie *Clusius* hath referred vnto the kindes of *Cistus Ledon*, we haue as a poore kinsman thereof inserted it in the next place, in kinred or neighbourhood at the least. This wilde Rosemarie is a small wooddie shrub, growing seldome aboue a foot high, hauing hard branches of a reddish colour, diuiding themselues into other smaller branches of a whitish color: whereon are placed without order diuers long leaues, Greene aboue, and hoarie vnderneath, not vnlike to those of the dwarfe Willow, or the common Rosemarie, of a drie and astringent taste, of little smell or none at all: the floures stand on the tops of the branches, set vpon bare or naked footstalks, consisting of five small leaues of a reddish colour, somewhat shining; after which appeare little knaps full of small seed: the root is tough and wooddie.

3 This plant grows vp like an hedge shrub of a wooddie substance, to the height of two or three cubits;

3 *Casia Poetica, Lobelij.*

The Poets Rosemarie or Gardrobe.

cubits; hauing many twiggie branches of a green colour: wherupon do grow narrow leaues like vnto *Linaria* or Toad-flax, of a bitter taste; among which come forth small mossie floures, of a greenish yellow colour like those of the Cornell tree, and of the smell of Rosemarie: which hath moued me to place it with the Rosemaries as a kinde thereof, not finding any other plant so neere vnto it in kinde and neighbourhood: after the floures be past, there succeed fruit like those of the Myrtle tree, greene at the first, and of a shining red colour when they bee ripe, like Corall, or the berries of *Asparagus*, soft and sweet in taste, leauing a certaine acrimonie or sharpe taste in the end: the stone within is hard as is the nut, wherein is contained a small white kernel, sweet in tast: the root is of a wooddie substance: it floureth in the Sommer; the fruit is ripe in the end of October: the people of Granade, Montpelier, and of the kingdom of Valentia, doe vse it in their presses and Wardrobes, whereupon they call it *Guardalobo*. † This in *Clusius* his time when he liued about Montpelier was called *Osyris*; but afterwards they called it *Casia*, thinking it that mentioned by the Poet *Virgil*; the which it cannot be, for it hath no sweet smell. *Pena* and *Lobel* iudge it to be the *Casia* of *Theophrastus*, wherewith also it doth not well agree. †

¶ The Place.

Rosemarie groweth in France, Spaine, and in other hot countries; in woods, and in vntilled places: there is such plentie thereof in Languedocke, that the inhabitants burne scarce any other fuell: they make hedges of it in the gardens of Italy and England, being a great ornament vnto the same: it groweth neither in the fields nor gardens of the Easterne cold countries; but is carefully and curiously kept in pots, set into the stoues and sellers, against the iniuries of their cold Winters.

Wilde Rosemarie groweth in Lancashire in diuers places, especially in a field called Little Reed, amongst the Hurtleberries, neere vnto a small village called Maudsley, there found by a learned Gentleman often remembred in our historie (and that worthily) Mr. *Thomas Hesketh*.

¶ The Time.

Rosemarie floureth twice a yeare, in the Spring, and after in August.

The wilde Rosemarie floureth in Iune and Iuly.

¶ The Names.

Rosemarie is called in Greeke *λεβανός* or *λεβανός*; in Latine, *Rosmarinus Coronaria*: it is surnamed *Coronaria*, for difference sake betweene it and the other *Libanotides*, which are reckoned for kindes of Rosemarie, and also because women haue been accustomed to make crownes and garlands thereof: in Italian, *Rosmarino coronario*: in Spanish, *Romero*: in French and Dutch *Rosmarin*.

Wilde Rosemarie is called *Rosmarinus sylvestris*: of *Cordus*, *Chamaepence*.

¶ The Temperature.

Rosemarie is hot and drie in the second degree, and also of an astringent or binding quality, as being compounded of diuers parts, and taking more of the mixture of the earthy substance.

¶ The Vertues.

Rosemarie is giuen against all fluxes of bloud; it is also good, especially the floures thereof, for all infirmities of the head and braine, proceeding of a cold and moist cause, for they dry the brain, quicken the senses and memorie, and strengthen the sinewie parts.

Serapio witnesseth, that Rosemarie is a remedie against the stuffing of the head, that commeth through coldnesse of the braine, if a garland thereof be put about the head, whereof *Abin Mesuai* giueth testimonie.

Dioscorides teacheth that it cureth him that hath the yellow iaundice, if it be boiled in water and drunk before exercise, & that after the taking therof the patient must bathe himselfe & drink wine.

D The distilled water of the floures of Rosemarie being drunke at morning and evening first and last, taketh away the stench of the mouth and breath, and maketh it very sweet, if there be added thereto, to steep or infuse for certaine daies, a few Cloues, Mace, Cinnamon, and a little Annise seed.

E The Arabians and other Physitions succeeding, do write, that Rosemarie comforteth the brain the memorie, the inward senses, and restoreth speech vnto them that are possessed with the dumbe palsie, especially the conserue made of the floures and sugar, or any other way confectioned with sugar, being taken euery day fasting.

F The Arabians, as *Serapio* witnesseth, giue these properties to Rosemarie: it heateth, say they, is of subtile parts, is good for the cold rheume which falleth from the braine, driueth away windines, prouoketh vrine, and openeth the stoppings of the liuer and milt.

G *Tragus* writeth, that Rosemarie is spice in the Germane Kitchens, and other cold countries. Further, he saith, that the wine boiled with Rosemarie, and taken of women troubled with the mother, or the whites, helpeth them, the rather if they fast three or foure houres after.

H The floures made vp into plates with sugar after the manner of Sugar Roset and eaten, comfort the heart, and make it merry, quicken the spirits, and make them more liuely.

I The oile of Rosemarie chimically drawne, comforteth the cold, weake and feeble braine in most wonderfull maner.

K The people of Thuringia do vse the wilde Rosemarie to prouoke the desired sicknesse.

L Those of Marchia vse to put it into their drinke the sooner to make their clients drunke, and also do put it into chests and presses among clothes, to preserue them from mothes or other vermine.

† The vertues in the two last places properly belong to the *Rosmarinum sylvestre* of *Martholus*, which is the *Chamaepeuce* of *Cordus*, and is described in the 11. place of the foregoing Chapter, by the name of *Cistus Ledum Siliacum*.

CHAP. 9. Of Vpright Wood-binde.

1 *Periclymenum rectum Sabaudicum.*
Sauoy Honisuckles.

2 *Periclymenum rectum Germanicum.*
Germane Honisuckles.

The

¶ The Description.

1 **T**His strange kinde of Hony-suckle, found in the woods of Sauoy, represents vnto vs that shrub or hedge-bush called *Cornus fœmina*, the Dog-berry tree, or Pricke-timber tree, hauing leaues and branches like the common Wood-binde, sauing that this doth not clamber or clymbe as the others do, but contrariwise groweth vpright, without leaning to one side or other, like a small tree or hedge-bush: the floures grow vpon the tender sprays or twiggie branches, by couples, not vnlike in shape and colour to the common Wood-binde, but altogether lesser, and of a white colour, hauing within the same many hairy chiues like the other of his kinde: after which come red berries ioyned together by couples: the root is tough and woody.

2 The stalkes of the second be oftentimes of a meane thicknesse, the woody substance somewhat whitish and soft: the branches be round, and couered with a whitish barke, notwithstanding in the beginning when the sprays be yong they are somewhat reddish. The leaues be long, like those of the common Hony-suckle, soft, and of a white Greene: on the lower side they be whiter, and a little hairy: the floures be lesser than any of the Wood-bindes, but yet of the same fashion, and of a whitish colour, ioyned together by couples vpon seuerall slender foot-stalkes, like little wilde Cherries, of a red colour, the one lesser oftentimes than the other.

3 *Periclymenum rectum fructu caruleo.*
Vpright Wood-binde with blew berries.

4 *Periclymenum rectum fructu rubro.*
Cherry Wood-binde.

3 This strange kinde of Wood-binde, which *Carolus Clusius* hath set forth in his Pannonicke Obseruations, riseth vpon oftentimes to the height of a man, euen as the former doth; which diuides it selfe into many branches, couered with a rough blacke barke, that choppeth and gapeth in sundrie clefts as the barke of the Oke. The tender branches are of a whitish Greene colour, couered with a woolly hairinesse, or an ouerworne colour, whereupon do grow leaues set by couples one against the other, like vnto the common Wood-binde, of a drying bitter taste: the floures grow by couples likewise, of a whitish colour. The fruit succeedeth, growing like little Cherries, each one on his owne foot-stalke, of a bright and shining blew colour; which being bruised, doe die the hands of a reddish colour, and they are of a sharpe winie taste, and containe in them many small flat seeds. The root is woody, dispersing it selfe far abroad.

4 This

4 This kind of vpright Wood-bind groweth vp likewise to the height of a man, and oftentimes more high, like to the last described, but altogether greater. The berries hereof are very blacke, wherein especially is the difference. ‡ The leaues of this are as large as Bay leaues, sharpe pointed, Greene aboue, and whitish vnderneath, but not hairy, nor snipt about the edges: the floures grow by couples, of a whitish purple, or wholly purple: to these paires of floures there commonly succedeeds but one berry, larger than any of the former, of the bignesse of a little cherry, and of the same colour, hauing two marks vpon the top thereof, where the floures stood. ‡

Periclymeni 3. & 4. flores.
The floures of the third and fourth.

5 *Chamaepericlymenum.*
Dwarfe Hony-suckle.

5 To the kindes of Wood-bindes this plant may likewise be referred, whose picture with this description was sent vnto *Clusius* long since by that learned Doctor in physicke *Thomas Penny* (of our London colledge of famous memorie:) it riseth vp with a stalke of a foot high; whereupon are set by couples faire broad leaues one right against another, ribbed with certaine nerues like those of Plantaine, sharpe pointed, and somewhat hollowed in the middle like Spoon-wort: from the bosome of which leaues come forth small floures, not seene or described by the Author: after which commeth forth a cluster of red berries, thrust hard together as those of Aaron or priests pint. The root is tough and very slender, creeping far abroad vnder the vpper crust of the earth, whereby it occupieth much ground.

¶ *The Place.*

These plants are strangers in England: they grow in the woods and mountaines of Switzerland, Germany, Sauoy, and other those parts tending to the East, East North-East, and East and by South.

I haue a plant of the first kinde in my garden: the rest as yet I haue not seene, and therefore cannot write so liberally thereof as I could wish.

‡ The dwarfe Hony-suckle growes in the maritime parts of Norway and Sweden, & the countries thereabout. ‡

¶ *The Time.*

They floure for the most part when the others do, that is to say in May and Iune, and their fruit is ripe in September.

¶ *The*

¶ The Names.

Vpright Wood-binde or Hony-suckle is called *Periclymenum stans*, and *Periclymenum rectum*, or vpright Wood-binde: of *Dodoneus*, *Xylosteum*: in high-Dutch, *Honds kirschen*, that is to say, *Cannum Cerasa*, or Dog Cherries. The English names are expressed in their severall titles. It hath bin called *Chamacerasus*, but not truly.

¶ The Temperature and Vertues.

Touching the temperature and vertues of these vpright Wood-bindes, we haue no experience at all our selues, neither haue we learned any thing of others.

CHAP. 10. Of Sene.

Sena folijs obtusis.
Italian Sene.

¶ The Description.

Sene bringeth forth stalks a cubit high, set with diuers branches: the leaues are long, winged, consisting of many small leaues like those of Liquorice, or of bastard Sene: the floures come forth of the bottom of the wings, of colour yellow, standing vpon slender foot-stalks; from which after the floures be gone hang forked cods, the same bowing inward like a halfe-moone, plain and flat, in which are contained seeds like to the seeds or kernells of grapes, of a blackish colour. The root is slender, long, and vnprofitable, which perisheth when the leaues are gathered for medicine, and the seeds be ripe, and must be sowne againe the next yeare, euen as we do corne.

There is another kinde of Sene growing in Italy, like the other in each respect, sauing that it is greater, and hath not that force in purging that the other hath.

¶ The Place and Time.

This is planted in Syria and Egypt, also in Italy, in Prouince in France, in Languedoc. It hardly groweth in high and low Germany, neither in England: it prospereth in hot Regions, and cannot away with cold; for that cause it is in Italy sowne in May, and continueth no longer than Autumne: the best is brought from Alexandria and Egypt. The Arabians were the first that found it out.

¶ The Names.

The Persians call it *Abalzemer*, as *Mesue* his copy teacheth: the Apothecaries *Sena*, by which name it was knowne to *Aetnarius* the Grecian, and to the later Latines: it is called in English, Sene.

¶ The Temperature.

Sene is of a meane temperature, neither hot nor cold, yet inclining to heate, and dry almost in the third degree: it is of a purging facultie, and that by the stooles, in such sort as it is not much troublesome to mans nature, hauing withall a certaine binding qualitie, which it leaueth after the purging.

¶ The Vertues.

It voideth forth flegmaticke and cholericke humors, also grosse and melancholike, if it be helped with something tending to that end.

It is a singular purging medicine in many diseases, fit for all ages and kindes.

It purgeth without violence or hurt, especially if it be tempered with Anise seed or other like sweet smelling things added, or with gentle purgers or lenitiue medicines. It may be giuen in powder, but commonly the infusion thereof is vsed.

The

A
B
C

- D The quantitie of the poudre is a dram weight, and in the infusion, foure, five, or more. It may be mixed in any liquor.
- E It is in the decoction or in the infusion tempered with cold things in burning agues and other hot diseases: in cold and long infirmities it is boyled with hot opening simples and such like; or else it is steeped in wine, in which manner, as familiar to mans nature, it draweth forth gently by the stoole, almost without any kinde of paine, crude and raw humors.
- F Most of the Arabians commend the cods, but our Physitions the leaues rather; for vnlesse the cods be full ripe they ingender winde, and cause gripings in the belly. For they are oftentimes gathered before they be ripe, and otherwise easily fall away being shaken downe by the wind, by reason of their weake and slender stalks.
- G Some also thinke that Sene is hurtfull to the stomacke, and weakneth the same, for which cause they say that Ginger or some sweet kinde of spice is to be added, whereby the stomacke may be strengthned. Likewise *Mesue* noteth that it is slow in operation, and therefore Salgem is to be mixed with it. Moreouer, Sene purgeth not so speedily as stronger medicines do.
- H Notwithstanding it may be helped not only by Salgem, but also by other purging things mixed therewith, that is to say with simple medicines, as Rubarb, Agaricke, and others; and with compounds, as that which is called *Catholicon*, or the Electuarie *Diaphanicon*, or that which is made of the iuyce of Roses, or some other, according as the condition or qualitie of the disease and of the sicke man requireth.
- I The leaues of Sene are a familiar purger to all people, but they are windie, and do binde the bodie afterwards, very much disquieting the stomack with rumbling and belching: for the auoiding of which inconuenience there must be added Cinnamon, Ginger, Annise seed, and Fennell seed, Raisins of the Sun, and such like that do breake winde, which will the better help his purging qualitie.
- K Sene doth better purge when it is infused or steeped, than when it is boyled: for doubtlesse the more it is boiled the lesse it purgeth, and the more windie it becommeth.
- L Take Borage, Buglosse, Balme, Fumitorie, of each three drams, Sene of Alexandria very wel prepared and pouned, two ounces, strow the poudre vpon the herbes and distill them: the water that commeth thereof referue to your vse to purge those that liue delicately, being ministred in white wine, with sugar, in condited confections, and such dainty waies, wherein delicate and fine people do greatly delight: you may also (as was said before) adde hereunto according to the maladie, diuers purgers, as Agaricke, Mirobalans, &c.
- M The poudre of Sene after it is well prepared two ounces, of the poudre of the root of Mechoacan foure drams, poudre of Ginger, Anise seeds, of each a little, a spoonfull of Anise seeds, but a very little Ginger, and a modicum or small quantitie of *Salgemma*: this hath beene proued a verie fit and familiar medicine for all ages and sexes. The patient may take one spoonful or two thereof fasting, either in pottage, some supping in drink, or white wine. This is right profitable to draw both flegme and melancholy from the brest and other parts.
- N The leaues of Sene and Cammomil are put in baths to wash the head.
- O Sene opens the inward parts of the body which are stopped, and is profitable against all griefes of the principall members of the body.
- P Take Sene prepared according to art one ounce, Ginger halfe a quarter of an ounce, twelue cloues, Fenell seed two drams, or in stead thereof Cinnamon and Tartar, of each halfe a dram, poudre all these; which done, take thereof in white wine one dram before supper, which doth maruellously purge the head.
- Q Handle Sene in maner aboue specified, then take halfe an ounce thereof, which don, adde thereto sixty Raisins of the Sunne with the stones pickt out, one spoonfull of Anise seeds braied; boile these in a quart of ale till one halfe be wasted, and while it is boiling put in your Sene: let it stand so till the morning, then straine it, and put in a little Ginger: then take the one halfe of this potion and put thereunto two spoonfulls of syrrup of Roses: drinke this together, I meane the one halfe of the medicine at one time, and if the patient canot abide the next day to receiue the other halfe, then let it be deferred vntil the third day after.
- R Sene and Fumitorie (as *Rasis* affirmeth) do purge adust humors, and are excellent good against scabs, itch, and the ill affection of the body.
- S If Sene be infused in whey, and then boyled a little, it becommeth good physicke against melancholy, clenseth the braine and purgeth it, as also the heart, liuer, milt, and lungs, causeth a man to looke yong, ingendreth mirth, and taketh away sorrow: it cleareth the sight, strengthneth hearing, and is very good against old feuers and diseases arising of melancholy.

† There were formerly two figures in this chapter, which differed onely in that the first, which was the *Sena Orientalis*, had lesser, narrower, and sharper pointed leaues than the *Sena Italica*, which was the second.

CHAP. II. Of bastard Sene.

¶ The Description.

1 **C**olutea and Sene be so neere the one vnto the other in shape and shew, that the vnskilful Herbarists haue deemed *Colutea* to be the right Sene. This bastard Sene is a shrubby plant growing to the forme of a hedge bush or shrubby tree: his branches are straight, brittle, and woody; which being carelessly broken off, and as negligently prickt or sticke in the ground, will take root and prosper at what time of the yeare soeuer it be done; but sipt or cut, or planted in any curious sort whatsoeuer, among an hundred one will scarcely grow: these boughes or branches are beset with leaues like *Sena* or *Securidaca*, not much vnlike Liquorice: among which come forth faire broome-like yellow floures, which turne into small cods like the sownd of a fish or a little bladder, which will make a cracke being broken betweene the fingers: wherein are contained many blacke flat seeds of the bignesse of Tares, growing vpon a small rib or sinew within the cod: the root is hard, and of a woody substance.

1 *Colutea.*
Bastard Sene.

2 *Colutea Scorpioides.*
Bastard Sene with Scorpion cods.

2 Bastard Sene with Scorpion cods is a small woody shrub or bush, having leaues, branches, and floures like vnto the former bastard Sene, but lesse in each respect: when his small yellow floures are fallen there succeed little long crooked cods like the long cods or husks of *Matthiolus* his *Scorpioides*, whereof it tooke his name: the root is like the root of the Box tree, or rather resembling the roots of *Dalcamara* or Bitter-sweet, growing naturally in the shadowie woods of Valena in Narbone; whereof I haue a small plant in my garden, which may be called Scorpion Sene.

3 The low or dwarfe *Colutea* of *Clusius* description, hath a thicke woody root covered with a yellowish barke, with many fibres anexed thereto, which bringeth forth yearely new shoots, whereby it greatly encreaseth, of a cubit and a halfe high, smooth, and of a Greene colour; whereon doe grow leaues composed of six or seuen leaues, and sometimes nine, set vpon a middle rib like those of the common kinde, of a stipticke taste, with some sharpnesse or biting: the floures grow vpon slender

3 *Colutea scorpioides humilis.*
Dwarfe bastard Sene.

4 *Colutea scorpioides montana Clusij.*
Mountaine bastard Sene.

5 *Colutea minima, sine Coronilla.*
The smallest bastard Sene.

slender foot-stalkes, long and naked like those of the Pease, and of a yellow colour, of little or no smell at all, and yet that little nothing pleasant: after which come forth long cods, wherein is contained small seed like those of the Strangle Tare.

4 This mountaine bastard Sene hath stalks, leaues, and roots like the last described. The floures grow on the tops of the branches in manner of a crowne; whereupon some haue called it *Coronilla*: in shape like those of the pease, and of a yellow colour: the cods as yet we haue not seen, and therefore not expressed in the figure.

5 This small bastard Sene groweth like a small shrub creeping vpon the ground, halfe a cubit high, bringing forth many twiggie branches, in maner of those of the Spanish broome; wherupon do grow leaues like those of Lentils or the Strangle Tare, with many smal leaues set vpon a middle rib, somewhat fat or full of iuice, of the colour of the leaues of Rue or Herbage, of an astringent and vnpleasant taste: the floures grow at the tops of the branches, of a yellow colour, in shape like those of the smallest broome: after which come little crooked cods like the clawes or toes of a bird, wherein is contained seed somewhat long, blacke, and of an vn-sauorie taste: the root is long, hard, tough, and of a woody substance.

6 There

6 There is also found another sort hereof, not much differing from the former, saving that this plant is greater in each respect, wherein especially consisteth the difference.

¶ The Place.

Colutea or bastard Sene groweth in diuers gardens, and commeth vp of seed; it quickly cometh to perfection, insomuch that if a sticke thereof be broken off and thrust into the ground, it quickly taketh root, yea although it be done in the middle of summer, or at any other time, even as the sticks of Willow or Elder, as my selfe haue often prooued; the which bring forth floures and fruit the next yeere after.

The second with Scorpion cods groweth likewise in my garden: the last doth grow in diuers barren chalky grounds of Kent towards Sittinbourne, Canturbury, and about Southfleet; I haue not seene them elsewhere: the rest are strangers in England.

¶ The Time.

They floure from May till summer be well spent, in the meane season the cods bring forth ripe seed.

¶ The Names.

This shrub is called of *Theophrastus* in Greeke *καλυτεια* with the diphthong *eu* in the second syllable: in Latine, as *Gaza* expoundeth it, *Coloutea* or *Colutea*: in high Dutch, *Welsh linsen*: in French, *Baguenaudier*: they are deceiued that thinke it to be *Sena*, or any kinde thereof, although we haue followed others in giuing it to name Bastard Sene, which name is very vnproper to it: in low Dutch it is called *Sene boom*: and we may vse the same name Sene tree, in English.

This *Calutea*, or bastard Sene, doth differ from that plant *καλυτεια* with *u* in the second syllable, of which *Colytea*, *Theophrastus* writeth in his third booke. † The fifth is the *Polygala Valentina* of *Cusius*. ‡

¶ The Nature and Vertues.

Theophrastus, neither any other hath made mention of the temperature or faculties in working A of these plants, more than that they are good to fatten cattell, especially sheepe.

† There were formerly in the fifth and sixth places here two figures no waies different, but that which was in the sixth place was a little larger, and *Labels* title which he puts in his *Leontis*, after this was divided betweene them: for as you see, *Colutea minima*, sive *Coronilla*, was ouer in the fifth; and *Colutea*, sive *Polygala Valentina* (*Clusii*) was ouer the sixth.

CHAP. 12. Of Liquorice.

¶ The Description.

1 **T**He first kinde of Liquorice hath many woody branches, rising vp to the height of two or three cubits, beset with leaues of an ouerborne greene colour, consisting of many small leaues set vpon a middle rib, like the leaues of *Colutea*, or the Mastic tree, somewhat glutinous in handling: among which come small knops growing vpon short stems betwixt the leaues and the branches, clustering together, and making a round forme and shape: out of which grow small blew floures, of the colour of an English Hyacinth; after which succeed round, rough, prickly heads, consisting of diuers rough or scaly huskes closely and thicke compact together; in which is contained a flat seed: the root is straight, yellow within, and browne without: of a sweet and pleasant taste.

2 The common and vsuall Liquorice hath stalkes and leaues very like the former, saving that his leaues are greener and greater, and the floures of a light shining blew colour: but the floures of this are succeeded by longish cods that grow not so thicke clustring together in round heads as the former, but spike fashion, or rather like the wilde Vetch called *Onobrychu*, or *Galega*: the cods are small and flat like vnto the Tare: the roots are of a brownish colour without, and yellow within like Box, and sweeter in taste than the former.

¶ The Place.

These plants do grow in sundry places of Germany wilde, and in France and Spaine, but they are planted in gardens in England, whereof I haue plenty in my garden: the poore people of the North parts of England do manure it with great diligence, wherby they obtain great plenty thereof, replanting the same once in three or foure yeares.

¶ The Time.

Liquorice floureth in Iuly, and the seed is ripe in September.

Rrrrr

¶ The

1 *Glycyrrhiza Echinata* Dioscoridis.
Hedge-hogge Licorice.

2 *Glycyrrhiza vulgaris*.
Common Licorice.

¶ The Names.

The first is called in Greeke *γλυκύριζα*: in Latine, *Dulcis radix*, or sweet Root: this Licorice is not knowne either to the Apothecaries or to the vulgar people: we call it in English, *Dioscorides* his Licorice.

It is most evident that the other is *Glycyrrhiza*, or Licorice: the Apothecaries call it by a corrupt word, *Liquiritia*: the Italians, *Regalitia*: the Spaniards, *Regeliza* and *Regalitia*: in high Dutch, *Suszhotz*, *Suszwurtzel*: in French, *Rigolisse*, *Raigalisse*, and *Rezilisse*: in low Dutch, *Callistehout*, *Suethout*: in English, common Licorice: *Pliny* calleth it *Scythica herba*: it is named *Scythica* of the countrey *Scythia*, where it groweth.

¶ The Temperature.

The Nature of *Dioscorides* his Licorice, as *Galen* saith, is familiar to the temperature of our bodies, and seeing it hath a certaine binding quality adioined, the temperature thereof so much as is hot and binding, is specially of a warme buality, comming neereft of all to a meane temperature; besides, for that it is also sweet, it is likewise meanelly moist.

For as much as the root of the common Licorice is sweet, it is also temperately hot and moist; notwithstanding the barke thereof is something bitter and hot, but this must be scraped away; the fresh root when it is full of juice doth moisten more than the dry.

¶ The Vertues.

- A The root of Licorice is good against the rough harshnesse of the throat and brest; it openeth the pipes of the lungs when they be stuffed or stopped, and ripeneth the cough, and bringeth forth flegme.
- B The iuice of Licorice made according to Art, and hardned into a lumpe, which is called *Succus Liquiritia*, serueth well for the purposes aforesaid, being holden vnder the tongue, and there suffered to melt.
- C Moreouer, with the iuice of Licorice, Ginger, and other spices, there is made a certaine bread or cakes, called Ginger-bread, which is very good against the cough, and all the infirmities of the lungs and brest: which is cast into moulds, some of one fashion, and some of another.
- D The iuice of Licorice is profitable against the heate of the stomacke, and of the mouth.

The

The same is drunk with wine of Raifons against the infirmities of the liuer and chest, scabs or E
fores of the bladder, and diseases of the kidneyes.

Being melted vnder the tongue it quencheth thirst: it is good for greene wounds being layed F
thereupon, and for the stomacke if it be chewed.

The decoction of the fresh roots serueth for the same purposes. G

But the dried root most finely poudered is a singular remedie for a pin and a web in the eye, if it H
be strewed thereupon.

Dioscorides and *Pliny* also report, that Liquorice is good for the stomack and vlcers of the mouth, I
being cast vpon them.

It is good against hoarsenesse, difficultie of breathing, inflammation of the lungs, the pleurisie, K
spitting of blood or matter, consumption or rottenness of the lungs, all infirmities and ruggednes
of the chest.

It takes away inflammations, mitigateth and tempereth the sharpnesse and saltnes of humors, L
concocteth raw humors, and procureth easie spitting.

The decoction is good for the kidneyes and bladder that are exulcerated.

It cureth the strangurie, and generally all infirmities that proceed of sharpe, salt, and biting hu- M
mors.

These things concerning Liquorice hath also *Theophrastus*: viz. that with this and with cheese N
made of Mares milke the Scythians were reported to be able to liue eleuen or twelue dayes.

The Scythian root is good for shortnesse of breath, for a dry cough, and generally for all infir- O
mities of the chest.

Moreover, with honey it healeth vlcers, it also quencheth thirst if it be held in the mouth: for P
which cause they say that the Scythians do liue eleuen or twelue dayes with it and *Hippace*, which
is cheese made of Mares milke, as *Hippocrates* witnesseth.

Pliny in his twenty fifth booke, chap. 8. hath thought otherwise than truth, that *Hippace* is an Q
herbe so called.

† Both the figures formerly were of the first described.

CHAP. 13. Of Milke Trefoile or Shrub Trefoile.

¶ The Kindes.

There be diuers kindes or sorts of the shrubby Trefoile, the which might very well haue passed
among the three leaved Grasses, had it not bene for my promise in the proeme of our first
part, That in the last booke of our History the shrubbie or woody plants should be set forth, eue-
rie one as neere as might be in kindred and neighbourhood.

¶ The Description.

† 1 The first kinde of *Cytisus* or shrubby Trefoile growes to the forme of a small shrub
or woody bush two or three cubits high, branching into sundry small boughes
or armes, set full of leaues like the small Trefoile, darke greene, and not hairie,
three growing alwaies together: among these come forth smal yellow floures like them of French
Broome, which doe turne into long and flat cods, containing small seed of a blackish colour.

2 The second kinde of *Cytisus* is likewise a small shrub, in shape after the manner of the for-
mer, but that the whole plant is altogether smaller, and the leaues rounder, set together by cou-
ples, and the small cods hairy at the ends, which sets forth the difference. ‡ The leaues of this
are almost round, and grow three together close to the stalke: they are smooth, of a fresh greene,
and the middlemost leafe of the three is the largest, and ends in a sharpe point: the floures are of
the bignesse and colour of the *Trifolium corniculatum*: it floures in May. ‡

3 The root of this third kinde is single, from whence spring vp many smooth brittle stalks di-
uided into many wings and branches, whereon grow greene leaues smaller than those of meadow
Trefoile: the floures are yellow, lesser than Broome floures, otherwise very like, growing about
the tops of the twiggie branches, diuided into spoky tufts: which being vaded, there follow thinne
long narrow cods, lesser than those of the Broome, wherein is contained small blacke seed. The
root is long, deeply growing into the ground, and sometimes waxeth crooked in the earth. ‡ This
also hath smooth green leaues, and differs little (if any thing at all) from the first described, where-
fore I thought it needlesse to giue a figure. Our Author called it *Cytisus siliquosus*, Codded shrub
Trefoile, because one of the branches was fairely in the figure exprest with cods; I know no other
reason, for all the *Cytisi* are codded as well as this. ‡

Rrrrr 2

‡ The

1 *Cytisus*.
The first shrub Trefoile.

2 *Cytisus*.
The second shrub Trefoile.

4 *Cytisus hirsutus*.
Hairy shrub Trefoile.

5 *Cytisus incanus*.
Hoary shrub Trefoile.

4 The fourth kinde of *Cytisus* hath a great number of small branches and stalkes like the former, but it is a lower plant, and more woolly; whose stalks and branches grow not very high, but yet very plentifully spread about the sides of the plant: the leaues are greater than the former, but lesser than those of meadow Trefoile: the floures grow close together, as though they were bound vp or compact into one head or spokie tuft somewhat greater than the former: the cods are also greater, and more hairy: the root groweth very deepe into the ground, whereunto are adioyned a few fibres: it falleth out to be more hairy or woolly in one place than in another, and the more hairie and woolly that it is, the whiter it waxeth; for the roughnesse bringeth it a certain whitish colour. † The branches of this oft times lie along vpon the ground: the leaues are smooth and greene aboue, and hoarie vnderneath: the floures yellow, which fading sometimes become orange coloured: the cods are round, and seeds brownish. †

5 The fifth kinde of *Cytisus* groweth to the height of a cubit or more, hauing many slender twiggy branches like Broome, streaked and very hard: whereupon grow leaues very like Fenu-greeke, yet all hoary, three together: from the bosome of which, or betweene the leaues and the stalkes, come forth yellow floures very like Broome, *Spartum*, or Pease, but smaller: the cods be like vnto Broome cods, of an ash colour, but slenderer, rougher, and flatter; in the seueral cels or diuisions whereof are contained bright shining seeds like the blacke seeds of Broome: all the whole plant is hoarie like *Rhamnus* or *Halymus*.

6 *Cytisus Pinnatus*.
Winged shrub Trefoile.

7 *Cytisus 7. Cornutus*.
The Horned shrub Trefoile.

6 The sixth kinde of *Cytisus* or bush Trefoile groweth to the height of a tall man, with long stalkes couered ouer with a blackish barke, and a few boughes or branches, beset or garnished with leaues like the common Trefoile, but smaller, growing also three together, whereof the middlemost of the three leaues is twice as long as the two side leaues; the vpper side whereof is green, and the lower side somewhat reddish and hairie: the floures grow along the stalks almost from the bottom to the top, of a golden yellow colour, fashioned like the Broome floure, but greater than any of the rest of his kinde, and of a reasonable good saueur: the seed hath the pulsie taste of *Cicer*.

7 The seuenth kinde of *Cytisus* hath many tough and hairy branches rising from a wooddie root, foure or fve cubits high, which are diuided into sundry smaller branches beset with leaues like the meadow Trefoiles; among which come forth yellow floures like Broome, that turne into

crooked flat cods like a sickle; wherein is contained the seed tasting like *Cicer* or *Legumen*. The whole plant is hoarie like *Rhamnus*, and being broken or bruised smelleth like Rocket.

8 This eighth kinde of *Cytisus*, which *Pena* setteth forth, is doubtlesse another kinde of *Cytisus*, resembling the former in leaues, floures, and cods, sauing that the small leaues (which are alwaies three together) are a little snipt about the edges: the whole plant is slenderer, softer, and greener, rather resembling an herbe than a shrub: the root is small and single.

9 This bastard or mis-begotten shrub Trefoile, or bastard *Cytisus*, groweth vp like a shrub, but not of a wooddy substance, hauing tender stalks smooth and plaine: whereon do grow hairy leaues like the other, diuers set vpon one foot-stalke, contrarie to all the rest: the floures grow along the stems like those of the stocke Gillofloures, of a yellow colour: the root is tough and wooddy.

8 *Cytisus* 8.
The eighth shrub Trefoile.

9 *Cytisus adulterinus*, sine *Alysson fruticans*.
Bastard shrub Trefoile.

¶ The Place.

These plants were first brought into Italy and Greece from one of the Isles of *Cyclades*, called *Cyntho* or *Cynthus*, and since found in many places of France, as about *Montpelier*, *Veganium*, and other places: they are strangers in England, though they grow very plentifully in Scotland, as it is reported; whereof I haue two sorts in my garden, that is to say, *Cytisus Marantha*, or the horned *Cytisus*, and likewise one of the smallest, that is to say, the third in number. ‡ The second groweth in the garden of Mr. *Iohn Tradescant*. ‡

¶ The Time.

These plants floure for the most part in May, Iune, and Iuly, and some after: the seed is ripe in September.

¶ The Names.

The Grecians and Latines do call this shrub *κύνθος*, of *Cynthus* an Island before mentioned, in which place they are in great estimation for that they do so wonderfully feed cattell, and encrease milke in their dugs, nourish sheepe and goats, which bring yong ones good for store and increase. One Author doth call these plants in Greeke *κύνθος*, that is to say in Latine *Fecundum fenum*, fertile or fruitfull Hay, for that the kindes hereof cause milke to encrease, maketh good blood and iuice, augmenteth strength, and multiplieth the naturall seed of generation: they may be called in English, milke Trefoile, of the store of milke which they encrease.

¶ The

¶ The Temperature.

The leaues of milke Trefoile do coole, as *Dioscorides* writeth; they assuage swellings in the beginning, if they be stamped and laid vnto them with bread: the decoction thereof drunke prouoketh vrine: *Galen* teacheth, that the leaues of Milke Trefoile haue a digesting or wasting qualitie mixed with a waterie and temperate facultie, as haue those of the Mallow.

¶ The Vertues.

Women, saith *Columella*, if they want milke must steepe dry milke Trefoile in faire water, and when it is thoroughly soked, they must the next day mix a quart or thereabouts of the same pressed or strained forth with a little wine, and so let it be giuen vnto them to drinke, and by that meanes they themselves shall receiue strength, and their children comfort by abundance of milke.

Hippocrates reckoneth vp Milk-Trefoile among those things that encrease milke, in his booke of the Nature of women, and of womens diseases.

Also *Aristomachus* of Athens in *Pliny*, commandeth to giue with wine the dry plant, and the same likewise boiled in water, to nurses to drinke when their milke is gone.

Democritus and *Aristomachus* do promise that you shall want no Bees, if you haue milke Trefoile for them to feed on: for all writers with one consent do conclude (as *Galen* saith) that Bees doe gather of the floures of Milke Trefoile very great store of honie.

Columella teacheth, that Milke Trefoile is notable good for hennies, Bees, Goats, Kine, and all kinde of Cattell, which quickly grow fat by eating thereof, and that it yeeldeth very great store of milke.

The people of Betica and Valentia (where there is great store of *Cytisus*) doe vse it very much for the Silke Worms to hang their web vpon after they haue been well fed with the leaues of Mulberries.

Milke Trefoile is likewise a maruellous remedie against the Sciatica, and all other kindes of gouts.

† The description that formerly was in the first place belonged to that described and figured in the seuenth.

CHAP. 12. Of Bastard Milke-Trefoiles.

¶ The Description.

1 **T**His riseth vp with little stalks from the root, brittle, very many in number, parted into wings and branches, about which grow many leaues lesser than those of the meadow Trefoile, of colour Greene: the floures about the tops of the twigs be orderly placed in maner like ears, of colour yellow, lesser than those of broom, otherwise all alike: in their places grow vp slender cods long, narrow, and lesser than the cods of Broome: rough also and hairy; in which do lie little blackish seeds: the root is long, and groweth deepe, and oftentimes creepeth aslope.

2 The second kinde of bastard Milke-Trefoile is like vnto the former in plentifull stalkes and twigges, but that it is lower and more downie; neither doe the stalkes thereof stand vpright, but rather incline to the one side: the leaues also are somewhat greater, but yet lesser than those of the meadow Trefoile, wholly white, and they neuer open themselves out, but keep alwaies folded with the middle rib standing out: the floures likewise be closelier ioined together, and compacted as it were into a little head, and be also something greater: the cods in like manner are a little bigger and hairy, and of a blackish purple or murrey: the root groweth deepe in the ground, being diuided into a few sprigs; it oftentimes happeneth to grow in one place more hairie or downie than in another: the more hairie and downie it is, the more white and hoarie it is; for the hairinesse doth also bring with it a certaine whitish colour.

3 The third kinde of bastard Milke Trefoile bringeth forth a companie of young shoots that are somewhat writhed and crooked, long leaues of a faire Greene colour: the floures are closed together, long, white, or else galbaceous, sweetly smelling, that is to say, hauing the smel of honie: the shrub it selfe is alwaies Greene both Sommer and Winter. ‡ This growes some foot or better high, with slender hoarie branches, set with leaues three standing together vpon a very short stalke, and the middle leafe is as long againe as the other two; they are very white and hoarie, and the yellow floures grow out of the bosomes of the leaues all alongst the stalks. This is that mentioned in the vertues of the former chapter at F for the Silke wormes to worke vpon. ‡

4 The fourth shrub is likewise one of the wilde kinde, though in face and stature like the manured

1 *Pseudocytisus* 1.

The first bastard shrub Trefoile.

2 *Pseudocytisus* 2.

The 2. bastard shrub Trefoile.

3 *Cytisus semper-virens*.

The ever-greene shrub Trefoile.

4 *Pseudocytisus hirsutus*.

The hairie bastard tree Trefoile.

nured *Cytisus*: It groweth vp like a small shrub or hedge bush to the height of two or three yards; on whose branches do grow three rough or hairie leaues, set vpon a slender foot-stalke, of a grasse Greene colour aboue, with a reddish hairinesse below: the floures grow alongst the stalks from the middle to the toppe, of a bright shining yellow colour: the root is likewise wooddie.

¶ The Place.

These kindes of Milke Trefoiles are found in Morauia, so called in our age, which in times past was named *Marcomannorum provincia*, and in the vpper Pannonia, otherwise called Austria, neere to high waies, and in the borders of fields; for they seeme after a sort to ioy in the shade. ‡ These grow (according to *Clusius*) in sundry parts of Spaine. ‡

¶ The Time.

They floure especially in Iune and Iuly.

¶ The Names.

It is euident enough that they are bastard kindes of Milke Trefoiles, and therefore they may be called and plainly termed *Pseudocytisi*, or bastard Milke Trefoiles, or *Cytisi syluestres*, that is to say, wilde Milke Trefoiles.

¶ The Temperature and Vertues.

What temperature these shrubs are of, or what vertues they haue we know not, neither haue wee as yet found out by our owne experience any thing, and therefore they may be referred to the other Milke-Trefoiles.

CHAP. 15. Of the venomous Tree Trefoile.

† 1 *Dorycnium Monspelienſium.*

The venomous Trefoile of Montpelier.

2 *Dorycnium Hispanicum.*

The venomous Trefoile of Spain.

¶ The Description.

1 The venomous tree Trefoile of Montpelier hath many tough and pliant stalkes, two or three cubits high, diuided into sundry small twiggie braunches, beset with leaues three together

together, placed from ioint to ioint by spaces, somewhat hoarie, very like vnto the leaues of *Cytisus*, or Rue: among which come forth many small mossie white floures, tuft fashion, in small bundles like Nose-gaies, and very like the floures of the Oliue or Oke tree, which turne into small roundish bladders, as it were made of parchment: wherein is contained blacke seed like wilde *Lotus*, but in taste like the wilde tare: the whole plant is of an vnfaurie smell; the root is thicke, and of a wooddie substance.

2 The Spanish venomous Trefoile hath a wooddie stalke, rough and hoary, diuided into other small branches, whereon do grow leaues like the precedent: the floures grow on the tops of the branches, whereon do grow leaues like those of the Pease, and of a yellow, or rather greenish colour, wherein it differeth from the precedent.

¶ The Place.

These venomous Trefoiles grow in Narbone, on the barren and stonie craggie mountaines, at Frontignana, and about the sea coasts, and are strangers in England.

¶ The Time.

They flourish from May to the end of Iune.

¶ The Names.

Dorycnium, or Δορυχνιον, is that poisonous or venomous plant wherewith in times past they vsed to poison their arrow heads, or rather weapons, thereby to do the greater hurt vnto those whom they did assaile or pursue, whereupon it tooke his name: great controuersie hath been among Herbarists, what manner of plant *Dorycnium* should be; some saying one thing, and some another: which controuersies and sundry opinions are very well confuted by the true censure of *Rondeletius*, who hath for a definitiue sentence set downe the plant described for the true *Dorycnium*, and none other, which may be called in English, Venomous tree Trefoile. † These plants do not sufficiently answer to the description of *Dioscorides*, neither can any one say certainly, that they are poisonous. ‡

¶ The Temperature.

Dorycnium is very cold, without moistning.

¶ The Vertues.

A Venomous Trefoile hath not one good qualitie that I can reade of, but it is a pestilent venomous plant, as hath been said in the description.

† The figures were formerly transposed.

CHAP. 16. Of the shrub Trefoile called also Makebate.

Polemonium sive Trifolium fruticans.

Shrubby Trefoile, or yellow Iasmine.

¶ The Description.

THIS shrubby plant called *Polemonium*, hath many wooddie twigges, growing vnto the height of foure or fve cubits, hauing smal twiggie branches, of a darke green colour, garnished with small leaues of a deepe greene colour, alwaies three ioined together vpon little footstalks, like the *Cytisus* bush, or the field Trefoile, but smaller: the floures be yellow, and round, diuided into fve or six parts, not much vnlike the yellow Iasmine, which hath caused many to call it yellow Iasmine, euen vnto this day: when the floures be vaded, there succeed small round berries as big as a Pease, of a black purplish colour when they be ripe, which being broken will die or colour the fingers like Elder Berries: within these berries are contained a small flat seed, like vnto Lentils: the root is long and small, creeping hither and thither vnder the earth, putting forth new springs or shoots in sundry places, whereby it wonderfully increaseth.

¶ The Place.

It groweth plentifully in the countrey of Montpellier at New Castle vpon the drie hills, and hot banks of the Oliue fields, and in the stony fields and wood of Gramuntium: it growes in my garden, and in other Herbarists gardens in England.

¶ The

¶ The Time.

It floureth in Sommer: the seed is ripe in Autumne; the shrub it selfe is alwaies greene, and hath a lasting root.

¶ The Names.

Most do call it *Cytisus*, but we had rather name it *Trifolium fruticans*: for it doth not agree with *Cytisus* or Milk-Trefoile, as in the chapter before it is plaine enough by his description, vnlesse it be *Cytisus Marcelli*, or *Marcellus* his Milke-Trefoile, with which peradventure it might be thought to haue some likenesse, if the floures which are yellow were white, or *galbincous*, that is to say, blew.

There be diuers also that take this Trefoile to be *Polemonium*, forasmuch as the leaues hereof seeme to be somewhat like those of common Rue, but *Polemonium* hath not the leafe of common Rue, otherwise called Herb-grace, but of the other, that is to say, of S. Iohns Rue: it is called in English, shrubby Trefoile, or Make-bait.

¶ The Temperature.

Polemonium is of temperature dry in the second degree, with some Acrimonie or sharpnesse.

¶ The Vertues.

This shrubby plant hath so many singular and excellent vertues contained in it, that some haue **A** called it by the name *Chiliodunamis*, that is, hauing an hundred properties.

It is very effectuaft against the stinging of Scorpions, and (as some write) if a man hold it in his **B** hand, he cannot be hurt with the biting of any venomous beast.

Being taken in vineger it is very good for those that are spleneticke, and whose spleen or Milt is **C** affected with oppilations or stoppings.

If the root be taken in wine it helpeth against the bloody flux, it prouoketh vrine being drunke **D** with water, scoureth away grauell, and easeth the paine and ache called the Sciatica.

CHAP. 17. Of Broome, and Broome Rape.

1 *Genista*.
Broome.2 *Rapum Genista, sive Orobanche*.
Broome Rape, or Orobranch.

¶ The

‡ *Orobanche Monspeliaca flo. oblongis.*
Long flowered Broome Rape.

‡ *Orobanche flore maiore.*
Great flowered Broome Rape.

‡ *Orobancheraosa.*
Branched Broome Rape.

¶ The Description.

1 **B**roome is a bush or shrubby plant, it hath stalkes or rather wooddie branches : from which do spring slender twigs, cornered, Greene, tough, and that be easily bowed, many times diuised into small branches : about which do grow little leaues of an obscure green colour, and braue yellow floures, and at the length flat cods, which being ripe are blacke, as be those of the common Vetch, in which do lie flat seeds, hard, something brownish, and lesser than Lentils: the root is hard and wooddie, sending forth diuers times another plant of the colour of an Oken leafe, in shape like vnto the bastard Orchis, called Birds nest, hauing a root like a Turnep or Rape, whereupon it is called *Rapum Genista*, or Broom Rape.

2 This is a certaine bulbed plant growing vnto the roots of broome, big below, and smaller aboue, couered with blackish scales, and of a yellowish pulpe within : from which doth rise a stalke a span long, hauing whitish floures about the top, like almost to those of Dead Nettle: after which grow forth long, thicke, and round husks, in which are contained very many seeds, and good for nothing : the whole plant is of the colour of the Oken leafe.

‡ Of

3 *Genista Hispanica.*
Spanish Broome.

5 *Chamaenista Anglica.*
English Dwarf Broome.

6 *Chamaenista Pannonica.*
Dwarf broome of Hungarie.

¶ Of this *Orobanche* or Broome Rape there are some varieties obserued and set forth by *Lobel* and *Clusius*: the first of these varieties hath longer and smaller floures than the ordinarie. The second hath larger floures, and those of a blewish colour, and is sometimes found among corne. The third is parted towards the top into sundry branches; the floures of this are either blew, purplish, or else white, and it willingly growes among hempe. ‡

3 The Spanish Broome hath likewise woody stems, from whence grow vp slender pliant twigs, which be bare and naked without leaues, or at the least hauing but few small leaues, set here and there far distant one from another, with yellow floures not much vnlike the floures of common Broome, but greater, which turne into small long cods, wherein is contained browne and flat seed: the roote is tough and woody.

4 Small leaved or thin leaved Broome hath many tough pliant shoots rising out of the ground, which grow into hard and tough stalks, which are diuided into diuers twiggy branches whereon doe grow very small thin leaues, of a whitish colour, whereupon some haue called it *Genista alba*, white Broome: the floures grow at the top of the stalkes, in shape like those of the common Broom, but of a white colour, wherein it specially differeth from the other Broomes.

SSSSS

5 English

5 English Dwarf Broome hath many twiggy branches, very Greene, tough, somewhat at flaked or cornered, leaning toward the ground: whereon do grow leaves set without order, sometimes two together, and often three or foure growing fast together, like vnto the common Broome, Greene on the vpper side, hoary vnderneath, and of a bitter taste: among which leaves come forth yellow floures like those of common Broome, but lesser, of little or no smell at all: after which appeare small cods somewhat hairy, wherein is contained small seed: the root is tough and woody. † *Bauhine* iudges these two last described to be onely varieties of the common Broome, to whose opinion I do much incline, yet I haue let our Authrs description stand, together with the figure of this later, which seemingly expresse the greatest difference. †

6 The Dwarf Broome of Hungary hath stalkes and yellow floures like those of the last described: the leaues hercof are different, they are longer, and more in number: the whole plant is altogether greater, wherein especially consisteth the difference.

¶ The Place.

The common Broome groweth almost euery where in dry pastures and low woods.

The Broome Rape is not to be found but where Broome doth grow; it groweth in a Broome field at the foot of Shooters hill next to London; vpon Hampstead Heath, and in diuers other places.

Spanish Broome groweth in diuers kingdomes of Spaine and Italy; we haue it in our London gardens.

The White Broome groweth likewise in Spaine and other hot regions; it is a stranger in England; of this *Titus Calphurnius* makes mention in his second Eclog of his Bucolicks, writing thus:

*Cernis ut, ecce pater, quas tradidit Ornite vacca
Molle sub hirsuta latius explicuere genista.*

See father, how the Kine stretch out their tender side
Vnder the hairy broome, that growes in fields so wide.

¶ The Time.

Broome floureth in the end of Aprill or May, and then the young buds of the floures are to be gathered, and laid in pickle or salt, which afterwards being washed or boyled, are vsed for sallads, as Capers be, and be eaten with no lesse delight: the cods and seeds be ripe in August; the Rape appeareth and is seene especially in the moneth of Iune.

The Spanish Broome doth floure sooner, and is longer in flourishing.

¶ The Names.

This shrub is called in Latine, *Genista*, or as some would haue it *Genesta*: in Italian, *Genestra*: in Spanish likewise *Genestra*, or *Giestra*: in high Dutch, *Brimmen*: in low Dutch, *Brem*: in French, *Genest*: in English, Broome. † The Spanish Broome by most writers is iudged to be the *Spartium* of *Dioscorides*. †

¶ The Temperature and Vertues.

- A The twigs, floures, and seeds of Broome are hot and dry in the second degree: they are also of a thin essence, and are of force to cleanse and open, and especially the seed, which is dryer and not so full of superfluous moisture.
- B The decoction of the twigs and tops of Broome doth cleanse and open the liuer, milt, and kidneys.
- C It driueth away by the stoole watery humours, and therefore it is wholesome for them that haue the dropsie, especially being made with wine; but better for the other infirmities with water.
- D The seed also is commended for the same purposes.
- E There is also made of the ashes of the stalkes and branches dried and burnt, a lie with thin white wine, as Rhenish wine, which is highly commended of diuers for the Greene sicknesse and dropsie, and this doth mightily expell and driue forth thin and watery humors together with the vrine, and that by the bladder; but withall it doth by reason of his sharpe quality many times hurt and fret the intrails.
- F *Mesue* saith, that there is in the floures and branches a cutting moisture, but full of excrements, and therefore it causeth vomit: and that the plant doth in all his parts trouble, cut, attenuate, and violently purgeth by vomit and stoole, flegme and raw humours out of the ioints.
- G But these things are not written of Broome, but of *Spartum*, which purgeth by vomit, after the manner of Hellebor, as both *Dioscorides* and *Pliny* do testifie.
- H *Mesue* also addeth, that Broome doth breake the stone of the kidneys and bladder, and suffereth not the matter whereof the stone is made to lie long, or to become a stone.
- I The young buds or little floures preserued in pickle, and eaten as a sallad, stir vp an appetite to meate and open the stoppings of the liuer and milt.

The same being fully blowne, stamped and mixed with swines greafe, do ease the paine of the L gout.

And *Mesue* writeth, that this tempered with honie of Roses, or with an egge, doth consume a- M way the Kings-euill.

The Rape of the Broom or Broome Rape, being boyled in wine, is commended against the pains N of the kidnies and bladder, prouoketh vrine, breaketh the stone, and expelleth it.

The iuice pressed forth of Broom rape healeth green wounds, and clenseth old and filthy vlcers: O the later Physitions do affirme that it is also good for old venomous and malicious vlcers.

That worthy Prince of famous memorie *Henry 8.* King of England, was wont to drinke the di- P stilled water of Broome floures, against surfets and diseases thereof arising.

Sir *Thomas Fitzherbert* Knight, was wont to cure the blacke iaundice with this drinke onely. Q

Take as many handfuls (as you thinke good) of the dried leaues of Broom gathered and brayed R ro powder in the moneth of May, then take vnto each handfull of the dried leaues, one spoonful and a halfe of the seed of Broom braied into powder: mingle these together, and let the sicke drinke thereof each day a quantitie, first and last, vntill he finde some ease. The medicine must be conti- nued and so long vsed, vntill it be quite extinguished: for it is a disease not very suddenly cured, but must by little and little be dealt withall.

Orobanch or Broom rape sliced and put into oyle Oliue, to infuse or macerate in the same, as ye S do Roses for oile of Roses, scoureth and putteth away all spots, lentils, freckles, pimples, wheals and pushes from the face, or any part of the body, being annointed therewith.

Discorides writeth, that Orobanch may be eaten either raw or boiled, in manner as we vse to eat T the sprigs or young shoots of *Asparagus*.

The floures and seeds of Spanish Broome are good to be drunke with Mead or honied water in V the quantitie of a dram, to cause one to vomite with great force and violence, euen as white Helle- bor, or needling powder.

If it be taken alone, it looseth the belly, driueth forth great quantitie of waterie and filthie X humours.

CHAP. 18. Of base Broome or greening weed.

¶ The Description.

1 **T**His base kinde of Broom called Greene weed or Diers weed, hath many tough branches proceeding from a wooddie root: whereon do grow great store of leaues, of a deep green colour, somewhat long like those of Flax: the floures grow at the top of the branches not much vn- like the leaues of Broome, but smaller; of an exceeding faire yellow colour, which turne into small flat cods, wherein is contained a little flat seed.

2 *Carolus Clusius* setteth forth another kinde of Broome, which *Dodonaus* calleth *Genistatinctoria*, being another sort of Diers weed: it groweth like the Spanish Broome: vpon whose branches do grow long and small leaues like Flax, greene on the vpper side, and of an hoarie shining colour on the other. The floures grow at the top of the stalks, spike fashion, in forme and colour like the former: the roots are thicke and wooddie.

3 *Carolus Clusius* setteth forth two kindes of Broome. The first is a low and base plant, creeping and lying flat vpon the ground, whose long branches are nothing else, but as it were stalkes consi- sting of leaues thicke in the middest, and thinne about the edges, and as it were diuided with small nicks; at which place it beginneth to continue the same leafe to the end, and so from leafe to leafe, vntill it haue increased a great sort, all which doe as it were make one stalke; and hath none other leaues, sauing that in some of the nicks or diuisions there commeth forth a small leafe like a little eare. At the end of those flat and leaved stalks come forth the floures, much like the floures of the common Greening weed, but lesser, and of a yellow colour, which turne into small cods. The roots are very long, tough, and wooddie, ful of fibres, closing at the top of the root, from whence they pro- ceed as from one body.

4 This kinde of Greenweed called of some *Chamaespartium*, hath a thicke wooddie root: from which rise vp diuers long leaues, consisting as it were of many pieces set together like a paire of Beads (as may better be perceiued by the figure, than expressed by words) greene on the vpper side, and whitish vnderneath, very tough, and as it were of a rushie substance: among which rise vp very small naked rushie stalkes; on the top whereof groweth an eare or spike of a chaffie matter, hauing here and there in the said eare diuers yellow floures like Broome, but very small or little.

1 *Genistella tinctoria.*
Greenweed or Diers weed.

2 *Genistella infectoria.*
Wooddie Diers weed.

3 *Genistella pinnata.*
Winged Greenweed.

4 *Genistella globulata.*
Globe Greene weed.

5 The fift Greenweed hath a wooddie tough root, with certaine strings annexed thereto: from which rise vp diuers long, flat leaues, tough, & very hard, confisting as it were of many little leaues, fet one at the end of another, making of many one entire leafe, of a greene colour: amongst which come forth diuers naked hard stalks, very small and stiffe, on the tops whereof stand spikie eares of yellow floures, like those of Broome, in shape like that great three leaved grasse, called *Lagopus*, or like the Fox-taile grasse: after which come flat cods, wherein is inclosed small seed like to Tares both in taste and forme.

5 *Genistella Lagopoides maior.*
Hares foot Greenweed.

6 *Genistella Lagopoides minor.*
Small Greenweed with Hares foot floure.

6 This differeth not from the precedent in stalks, roots and leaues: the floures consist of a flockie soft matter, not vnlike to the grasse tuft of Foxtaile, resembling the floure of *Lagopus*, or Hares-foot, but hauing small yellow floures lesser than the former, wherein it chiefly differeth from the other of his kinde.

¶ The Place.

The first being our common Diers-weed, groweth in most fertile pastures and fields almost eue-ry where. The rest are strangers in England.

¶ The Time.

They floure from the beginning of Iuly to the end of August.

¶ The Names.

The first of these Greenweeds is named of most Herbarists *Flos Tinctorius*, but more rightly, *Genista Tinctoria*, of this *Pliny* hath made mention [The Greenweeds, saith he, do grow to dye cloths with] in his 18. booke 16. Chapter. It is called in high Dutch, *Ferblumen*, and *Ackerbsem*: in Italian, *Cerretta*, and *Cosaria*, as *Mathiolus* writeth in his chapter of *Lysimachia*, or Loose-strife: in English, Diers Greening weed, base Broome, and Woodwaxen.

The rest we refer to their seuerall titles.

¶ The Temperature and Vertues.

These plants are like vnto common Broome in bitternesse, and therefore are hot and drie in the second degree: they are likewise thought to be in vertues equall; notwithstanding their vse is not so well knowne, and therefore not vsed at all where the other may be had: we shall not need to speak of that vse that Diers make thereof, being a matter impertinent to our Historie.

CHAP. 19. Of Spanish base Broomes.

¶ The Description.

‡ I **T**his growes to the height of a cubit, and is covered with a crested and rough barke, and diuided into many longish branches crested & green, which at their first springing vp haue some leaues vpon them, which fall away as soon as the plant comes to floure: from the sides of the branches come forth long foot-stalks whereon hang some small yellow floures, which are succeeded by short round yellowish red cods which commonly containe but one seed, seldome two, and these hard and blacke, and like a little Kidney, which when it is ripe will rattle in the cod being shaken. ‡

I *Pseudospartum Hispanicum Aphyllum*:
Spanish Broome without leaues.

2 *Pseudospartum album Aphyllum*:
The white leafe-lesse Spanish broom.

2 This naked broome groweth vp to the height of a man: the stalk is rough, and void of leaues very greene and pliant, which diuideth it selfe into diuers twiggie branches, greene, and tough, like rushes: the floures grow all along the stalks like those of broome, but of a white colour, wherein it differeth from all the rest of his kinde.

¶ The Place.

These grow in the prouinces of Spaine, and are in one place higher and more bushie, and in another lower.

¶ The Time.

‡ The first floures in May, and the second in Februarie. ‡

¶ The Names.

These base Spanish broomes may be referred to the true, which is called in Greeke *σπάρτον*: the Latines vse the same name, calling it sometimes *Spartum*, and *Spartium*: in Spanish, *Retama*: in English, Spanish broome, and bastard Spanish broome.

¶ The Temperature and Vertues.

A Both the seeds and iuice of the branches of these base broomes, wherewith they in Spaine and other hot regions do tie their vines, do mightily draw, as Galen writeth.

Dioscorides

Dioscorides saith, that the seeds and floures being drunke in the quantitie of a dram, with Mede B
or honied water, doth cause one to vomit strongly, as the Hellebor or neefing powder doth, but yet
without ieopardie or danger of life: the seed purgeth by stoole.

The iuyce which is drawne from out of the branches steeped in water, being first bruised, is a re- C
medie for those that are tormented with the Sciatica, and for those that be troubled with the
Squincie, if a draught thereof be drunke in the morning; some vse to steepe the branches in sea
water, and to giue the same in a clister, which purgeth forth bloody and slimie excrements.

† In this chapter formerly in the first place was againe figured and described the true *Spartium* or Spanish Broome; which I haue now omitted, because it was
figured and described in the last chapter saue one before. In the second place was described that figured in the third: and in the third place was a description to no
purpose, which I therefore omitted, and as you see described anew and put in the first place that which formerly held the second.

CHAP. 20.

Of Furzes, Gorse, Whin, or prickley Broome.

¶ The Kindes.

There be diuers sorts of prickly Broome, called in our English tongue by sundry names, accor-
ding to the speech of the countrey people where they doe grow: in some places, Furzes; in
others, Whins, Gorse, and of some, Prickly Broome.

† *Genista spinosa vulgaris.*
Great Furze bush.

2 *Genista spinosa minor.*
The small Furze bush.

¶ The Description.

The Furze bush is a plant altogether a Thorne, fully armed with most sharpe prickles,
without any leaues at all except in the spring, and those very few and little, and quick-
ly falling away: it is a bushy shrub, often rising vp with many woody branches to
the height of foure or fife cubits, or higher, according to the nature and soile where they grow:
the greatest and highest that I did euer see do grow about Excester in the West parts of England,
where

where the great stalks are dearely bought for the better sort of people, and the small thorny sprais for the poorer sort. From these thorny branches grow little floures like those of Broome, and of a yellow colour, which in hot Regions vnder the extreme heate of the Sunne are of a very perfect red colour: in the colder countries of the East, as Danzicke, Brunswicke, and Poland, there is not any branch hereof growing, except some few plants and seeds which my selfe haue sent to Elbing, otherwise called Meluin, where they are most curiously kept in their fairest gardens, as also our common Broome, the which I haue sent thither likewise, being first desired by diuers earnest letters: the cods follow the floures, which the Grauer hath omitted, as a German who had neuer seen the plant it selfe, but framed the figure by heare-say: the root is strong, tough, and wooddy.

We haue in our barren grounds of the North parts of England another sort of Furze, bringing forth the like prickley thornes that the others haue: the onely difference consisteth in the colour of the floures; for the others bring forth yellow floures, and those of this plant are as white as snow.

† 2 To this may be ioyned another kinde of Furze which bringeth forth certaine branches that be some cubit high, stiffe, and set round about at the first with small winged Lentill-like leaues and little harmelesse prickles, which after they haue been a yeare old, and the leaues gon, be armed onely with most hard sharpe prickles, crooking or bending their points downwards. The floures hereof are of a pale yellow colour, lesser than those of Broome, yet of the same forme: the cods are small, in which do lie little round reddish seeds: the root is tough and wooddy.

† 3 *Genista Spinosa minor siliqua rotunda.*
Small round coddled Furze.

4 *Genistella aculeata.*
Needle Furze or petty Whin.

† Of this *Clusius* reckons vp three varieties: the first growing some cubit high, with deepe yellow floures: the second growes higher, and hath paler coloured floures: the third groweth to the height of the first, the floures also are yellow, the branches more prickly, and the leaues hairy; and the figure I giue you is of this third varietie.

3 This seldome exceeds a foot in height, and it is on euerie side armed with sharpe prickles, which grow not confusedly, as in the common sort, but keepe a certaine order, and still grow forth by couples: they are of a lighter Greene than those of the common Furze: on the tops of each of the branches grow two or three yellow floures like those of the former; which are succeeded by little round rough hairy cods of the bignesse of Tares. This floures in March, and groweth in the way between Burdeaux and Bayone in France, and vpon the Pyrenean mountaines. *Clusius* makes it his *Scorpius* 2. or second sort of Furze: *Lobel* calls it *Genista spartium spinosum alterum*. †

4 This

4 This small kinde of Furze (growing vpon Hampstead heath neere London, and in diuers other barren grounds, where in manner nothing else wil grow) hath many weake and flexible branches of a woody substance: whereon do grow little leaues like those of Tyme: among which are set in number infinite most sharpe prickles, hurting like needles, whereof it tooke his name. The floures grow on the tops of the branches like those of Broome, and of a pale yellow colour. The root is tough and woody.

† 5 This plant (saith *Clusius*) is wholly new and elegant, some span high, diuided into many branches, some spred vpon the ground, others standing vpright, hauing plentiful store of greene prickles: the floures in shape are like those of Broome, but lesse, and of a blewish purple colour, standing in rough hairy whitish cups, two or three floures commonly growing neere together: sometimes whilest it floures it sendeth forth little leaues, but not very often, and they are few, and like those of the second described, and quickly fall away, so that the whole plant seemes nothing but prickles, or like a hedge-hog when she folds vp her selfe: the root is woody, and large for the proportion of the plant. It growes in the kingdome of Valentia in Spaine, where the Spaniards call it *Erizo*, that is, the Hedge-hog; and thence *Clusius* also termed it *Erinacea*. It floureth in Aprill. †

5 *Genista spinosa humilis*.
Dwarfe or low Furze.

6 *Genista aculeata minor*, siue *Nepa* Theophr.
Scorpion Furzes.

6 The smallest of all the Furzes is that of the Antients called *Nepa*, or Scorpion Furze, as the word *Nepa* seemeth to import: it is a stranger in England: it hath beene touched of the Antients in name onely: which fault they haue beene all and euerie of them to be complained of, being so brieft that nothing can be gathered from their description: and therefore I refer what might hereof be said to a further consideration. † This hath a thicke woody blacke root some halfe foot long, from whence arise many slender branches some foot high, which are set with many stiffe and sharpe prickles, growing somewhat after the maner of the wilde prickly Sperage: the yong plants haue little leaues like those of Tragacanth, the old ones none: the floures are smal, and come forth at the bottome of the prickles, and they are succeeded by broad cods wherein the seed is contained. It growes in diuers places of France and Spaine, and is thought to be the *Scorpius* of Theophrastus, which *Gaza* translates *Nepa*. †

¶ The Place.

The common sort hereof are very well knowne to grow in pastures and fields in most places of England. The rest are likewise well knowne to those that curiously obserue the difference.

¶ The Time.

They floure from the beginning of May to the end of September.

¶ The Names.

Furze is commonly called *Genista spinosa*: in high-Dutch, *Gaspeldoren*: in English, Furze, Furzen bushes, Whinne, Gorse, and Thorne-Broome.

This thorny Broome is taken for Theophrastus his *Scorpius*, which *Gaza* nameth *Nepa*: the name *Scorpius* in Pliny is *πυρραῖος*, that is to say, signifying many things, and common to certaine Plants:

for

for besides this *Scorpius* of which he hath made mention, *lib. 25. cap. 5.* setting downe *Theophrastus* his words, where he maketh *Aconitum Thelyphonon* to be *Scorpius*, *lib. 23. cap. 10.* and likewise other plants vnder the same title, but vnproperly.

¶ *The Temperature and Vertues.*

A There is nothing written in *Theophrastus* concerning the faculties of *Scorpius spinosus*, or Furze: *Pliny* seemeth to attribute vnto it the same vertues that *Scorpioides* hath: notwithstanding the later Writers do agree that it is hot and dry of complexion: the seeds are vsed in medicines against the stone, and staying of the laske.

† This chapter hath vndergone a great alteration: as thus; the first, third, and fourth descriptions belonged to the third figure: the second and fifth description, to the fifth figure: and the first, second, and fourth figures had no descriptions belonging to them. The figure that was in the first place is now in the third: the second still holds his place: the third is in the first, belonging thereto of right: and for handfomnesse sake I haue made the fourth and fifth change places. This *Nepa* also in the sixth place was formerly mentioned by our Author (but now omitted) in the chapter of *Asparagus*.

CHAP. 21.

Of Cammocke Furze, Rest-Harrow, or Petty Whinne.

¶ *The Kindes.*

T Here be diuers sorts of Rest-Harrow, which some haue inserted among the smooth Broomes; others, among those with prickles, whereof some haue purple floures and likewise full of prickles; others, white floures, and sharpe thornes: some also purple floures, others white, and also yellow, and euery of them void of prickles.

1 *Anonis, siue Resta Bonis.*
Cammocke, or Rest-Harrow.

3 *Anonis non spinosa purpurea.*
Purple Rest-Harrow without prickles.

¶ *The Description.*

1 C Ammocke or ground Furze riseth vp with stalkes a cubit high, and often higher, set with diuers ioynted branches, tough, pliable, and full of hard sharpe thornes: among which do grow leaues in forme like those of *S. Johns wort*, or rather of the *Lentill*, of a deepe

deep green colour: from the bosome of which thorns and leaues come forth the floures, like those of Peason, of a purple colour: after which do come the cods, in which do lie flat seed: the root is long, and runneth far abroad, very tough, and hard to be torne in pieces with the plough, inso much that the oxen can hardly passe forward, but are constrained to stand still; whereupon it was called Rest-Plough, or Rest-Harrow.

4 *Anonis, siue Spinalutea.*
Yellow Rest-Yarrow.

2 We haue in our London pastures, and likewise in other places, one of the Rest-Harrowes, not differing from the precedent in stalkes, leaues, or prickles: the onely difference is, that this plant bringeth forth white floures, and the others not so: whence we may call it *Anonis flore albo*, Cammocke with white floures.

3 Rest-Harrow without thornes hath a tough hoary rough stalke, diuided into other rough branches, whereon are set without order, long leaues sharpe pointed, sleightly cut about the edges, of an hoary colour, and somewhat hairy: from the bosome whereof commeth forth purple Pease-like floures of a reasonable good smell: the root is verie tough, long, and wooddy.

4 The yellow floured Cammock is a stranger in these parts, it is only found in the cold Easterne countries, for ought that I can learne; it differs not from the last described, sauing that the floures hereof are of a darke yellow colour, wherein it differeth from all the other of his kinde.

¶ The Place.

These grow in earable grounds in fertile pastures, and in the borders of fields, in a fat, fruitful, and long lasting soile: it is sooner found than desired of husbandmen, because the tough and wooddie roots are combersome vnto them, for that they stay the plough, and make the oxen stand.

¶ The Time.

They send forth new shoots in May: they be full growne in Autumne, and then those that of nature are prickly be fullest of sharpe thornes: they floure in Iuly and August.

¶ The Names.

Cammocke is called in Greeke *Anonis*, or *Ononis*: and likewise in Latine *Anonis*, and *Ononis*: Of Herbarists commonly *Arestia Bonis*, and *Remora aratri*, because it maketh the Oxen whilest they be in plowing to rest or stand still: it is also called *Acutella*, of the stiffe and sharpe thornes which prick those that passe by: in French, *Areste beuf*, and *Boucrande*.

Cratenas nameth it *Agipyrus*: in high-Dutch, **Stalkkraut**: in low-Dutch, **Brangwoortele**: in Italian, *Bonaga*: in Spanish, *Gatillos*: in French, *Arreste beuf*, *Beuf & Bouverande*: in English, Cammocke, Rest-Harrow, Pettry Whinne, and ground Furze.

¶ The Temperature.

The root of Cammocke is hot in the third degree, as *Galen* saith: it cutteth also and maketh thinne.

¶ The Vertues.

The barke of the root drunke with Wine prouoketh vrine, breaketh the stone, and driueth it A forth.

The root boyled in water and vineger allayeth the paine of the teeth, if the mouth be often washed therewith hot.

Pliny reporteth, that being boyled in Oxymel (or the syrrop made with honey and vineger) till the one halfe be wasted, it is giuen to those that haue the falling sicknesse. *Matthiolus* reporteth, that he knew a man cured of a rupture, by taking of the powder of this root for many moneths together.

The tender sprigs or crops of this shrub before the thornes come forth, are preserued in pickle, and be very pleasant sauce to be eaten with meat as fallad, as a *Dioscorides* reacheth.

CHAP. 22.

Of Goose-berrie, or Fea-berrie Bush.

¶ The Kindes.

There be diuers sorts of the Goose-berries; some greater, others lesse: some round, others long, and some of a red colour: the figure of one shall serue for the rest.

† I will not much insist vpon diuersities of fruits, because my kinde friend M^r. *John Parkinson* hath sufficiently in his late Worke, discoursed vpon that subiect; onely because I iudge many will be desirous to know their names, and where to get them, I will briefly name the chiefe varieties our Kingdome affords; and such as are desirous of them may finde them with M^r. *John Millen* liuing in Old-street.

The sorts of Goose-berries are these: the long Greene, the great yellowish, the blew, the great round red, the long red, and the prickly Goose-berrie.

Vua Crispa.

Goose-berries.

¶ The Description.

The Goose-berrie bush is a shrub of three or foure cubits high, set thicke with most sharpe prickles: it is likewise full of branches, slender, woody, and prickly: whereon doe grow round leaues cut with deepe gashes into diuers parts like those of the Vine, of a very Greene colour: the floures be very smal, of a whitish Greene, with some little purple dashed here and there: the fruit is round, growing scatteringly vpon the branches, Greene at the first, but waxing a little yellow through maturitie, full of a winie iuyce somewhat sweet in taste when they be ripe; in which is contained hard seed of a whitish colour: the root is woody, and not without strings annexed thereto.

There is another whose fruit is almost as big as a small Chery, and very round in forme: as also another of the like bignesse, of an inch in length, in taste and substance agreeing with the common sort.

We haue also in our London gardens another sort altogether without prickles: whose fruit is very smal, lesser by much than the common kinde, but of a perfect red colour, wherein it differeth from the rest of his kinde.

¶ The Place.

These plants do grow in our London gardens and elsewhere in great abundance.

¶ The Time.

The leaues come forth in the beginning of Aprill or sooner: the fruit is ripe in Iune and Iuly.

¶ The Names.

This shrub had no name among the old Writers, who as we deeme knew it not, or else esteemed it not: the later writers call it in Latine *Crossularia*: and oftentimes of the berries, *Vua Crispa*, *Vua spina*, *Vua spinella*, and *Vua Crispina*: in high-Dutch, *Kruselbeer*: in low-Dutch, *Stekelbessen*: in Spanish, *Vua Crispa*, or *Espina*: in Italian, *Vua spina*: in French, *Groiselles*: in English, Goose-berrie, Goose-berrie bush, and Fea-berrie bush in Cheshire, my natiue country.

¶ The Temperature.

The berries of this bush before they be ripe are cold and dry, and that in the later end of the second degree, and also binding.

¶ The Vertues.

The fruit is vsed in diuers fauces for meate, as those that are skilfull in cookerie can better tel than my selfe.

They

They are vsed in broths in stead of Veriuiice, which maketh the broth not onely pleasant to the taste, but is greatly profitable to such as are troubled with a hot burning ague. B

They are diuersly eaten, but howsoeuer they be eaten they alwaies ingender raw and cold bloud: they nourish nothing or very little: they also stay the belly, and stench bleedings. C

They stop the menses, or monethly sickenes, except they happen to be taken into a cold stomack, then do they not helpe, but rather clog or trouble the same by some manner of flix. D

The ripe berries, as they are sweeter, so doe they also little or nothing binde, and are something hot, and yeeld a little more nourishment than those that be not ripe, and the same not crude or raw; but these are seldome eaten or vsed as sauce. E

The iuice of the Greene Gooseberries cooleth all inflammations, *Erysipelas*, and Saint Anthonyes fire. F

They prouoke appetite, and coole the vehement heate of the stomacke and liuer. G

The young and tender leaues eaten raw in a fallad, prouoke vrine, and driue forth the stone and grauell. H

CHAP. 23. Of Barberries.

¶ The Kindes.

There be diuers sorts of Barberries, some greater, others lesser, and some without stones.

Spina acida, siue Oxycantha.

The Barberry bush.

¶ The Description.

THE Barberry plant is an high shrub or bush, hauing many young straight shootes and branches, very full of white and prickly thornes; the rinde whereof is smooth and thin, the wood it selfe yellow: the leaues are long, very Greene, slightly nicked about the edges, and of a sowre taste: the floures be yellow, standing in clusters vpon long stemmes: in their places come vp long berries, slender, red when they be ripe, with a little hard kernell or stone within; of a sowre and sharpe taste: the root is yellow, disperfeth it selfe farre abroad, and is of a woody substance.

Wee haue in our London gardens another sort, whose fruite is like in forme and substance, but one berry is as big as three of the common kinde, wherein consisteth the difference.

We haue likewise another without any stone, the fruite is like the rest of the Barberries, both in substance and taste.

¶ The Place.

The Barberrie bush groweth of it selfe in vn-toiled places and desert grounds, in woods, and the borders of fields, especially about a Gentlemans house called Mr. Monke, dwelling in a village called Iuer, two miles from Colebrooke, where most of the hedges are nothing else but Barberry bushes.

They are planed in gardens in most places of England.

¶ The Time.

The leaues spring forth in Aprill: the floures and fruite in September.

¶ The Names.

Galen calleth this thorne in Greeke, *ἰξάνθρον*, who maketh it to differ from *ἰξάνθρον*, in his booke of the Faculties of simple medicines: but more plainly in his booke of the Faculties of Nourishments, where he reckoneth vp the tender springs of Barberries among the tender shootes that are

to be eaten, such as *Oxyacanthus* or the Hawthorne bringeth not forth, wherein he plainly made a difference, *Oxyacantha* the Barbery bush, and *Oxyacanthus* the Hawthorne tree.

Dioscorides hath not made mention of this Thorne; for that which he calleth *Oxyacantha* in the Foeminine gender, is *Galen's Oxyacanthus* in the Masculine gender.

Auicenna seemeth to containe both these shrubs vnder the name of *Amyrberis*, but we know they are neither of affinitie or neighbourhood, although they be both prickly.

The shrub it selfe is called in shops Barbaries, of the corrupted name *Amyrberis*, of the later writers *Crespinus*: in Italian, *Crespino*. in Spanish, *Espino de maiuelas*: in high Dutch, *Datfelbeer*: in low Dutch, *Sauseboom*: in French, *Espine vinette*: and thereupon by a Latine name, *Spiniuina*, *Spina acida*, and *Oxyacantha Galeni*. † In English, a Barbery bush, or Piprige Tree, according to Dr. Turner. †

¶ The Temperature.

The leaues and berries of this thorne are cold and dry in the second degree: and as *Galen* also affirmeth, they are of thin parts, and haue a certaine cutting qualitie.

¶ The Vertues.

- A The leaues are vsed of diuers to season meate with, and in stead of a sallad, as be those of Sorrell.
- B The decoction thereof is good against hot burnings and cholericke agues: it allaieth the heate of the bloud, and tempereth the ouermuch heate of the liuer.
- C The fruite or berries are good for the same things, and be also profitable for hot laskes, and for the bloody fixe, and they stay all manner of superfluous bleedings.
- D The greene leaues of the Barbery bush stamped, and made into sawce, as that made of Sorrell, called greene sawce, doth coole hot stomackes, and those that are vexed with hot burning agues, and procureth appetite.
- E The conserue made of the fruite and sugar performeth all those things before remembred, but with better force and successe.
- F The roots of the tree steeped for certaine daies together in strong lie, made with ashes of the ash-tree, and the haire often moistned therewith, maketh it yellow.
- G † The barke of the roots is also vsed in medicines for the iaundise, and that with good successe. †

CHAP. 24. Of the white Thorne, or Hawthorne Tree.

¶ The Kindes.

There be two sorts of the white Thorn Trees described of the later writers, one very common in most parts of England: there is another very rare, and not found in Europe, except in some few rare gardens of Germanie; which differeth not from our common Hawthorne, sauing that the fruit here of is as yellow as Saffron: we haue in the West of England one growing at a place called Glastenburie, which bringeth forth his floures about Christmas, by the report of diuers of good credit, who haue seen the same; but my selfe haue not seen it; and therefore leaue it to be better examined.

¶ The Description.

1 The white Thorne is a great shrub growing oftentimes to the height of the Peare-tree the trunke or body is great: the boughes and branches hard and wooddy, set full of long sharpe thornes: the leaues be broad, cut with deepe gasches into diuers sections, smooth, and of a glistering greene colour: the floures grow vpon spokie rundles, of a pleasant sweet smell, sometimes white, and often dasht ouer with a light wash of purple; which hath moued some to thinke some difference in the plants: after which come the fruit, being round berries, green at the first, and red when they be ripe; wherein is found a soft sweet pulpe, and certaine whitish seed: the root groweth deepe in the ground, of a hard wooddy substance.

2 The second and third haue been touched in the first title, notwithstanding I haue thought it not vnfit to insert in this place a plant participating with the Hawthorne in floures and fruit, and with the Seruice tree in leaues, and not vnlike in fruit also.

Theophrastus hath set forth this tree vnder the name of *Aria*, which groweth vnto the forme of a small tree, delighting to grow in our shadowie woods of Cumberland and Westmerland, and many other places of the North country, where it is to be found in great quantitie: but seldome in Spaine,

Spaine, Italy, or any hot Region. This tree is garnished with many large branches beset with leaues like the Peare tree, or rather like the Aller leafe, of a darke Greene colour aboue, and of a white colour vnderneath: among these leaues come forth tufts of white floures, very like vnto the Hawthorne floures, but bigger: after which succeed small red berries, like the berries of the Hawthorne, and in taste like the Neapolitan Medlar: the temperature and faculties whereof are not yet knowne.

1 *Oxyacanthus*.
The Haw-thorne tree.

2 *Aria Theophrasti*.
Cumberland Haw-thorne.

¶ The Place.

The Haw-thorne groweth in woods and in hedges neere vnto high-waies almost euery where. The second is a stranger in England. The last groweth at Glastenbury Abbey, as it is credibly reported vnto me. † The *Aria* groweth vpon Hampsted heath, and in many places of the West of England. †

¶ The Time.

The first and second floure in May; whereupon many do call the tree it selfe the May-bush, as a chiefe token of the comming in of May: the leaues come forth a little sooner: the fruit is ripe in the beginning of September, and is a food for birds in Winter.

¶ The Names.

Dioscorides describeth this shrub, and nameth it *οξυανθος*, in the feminine gender: and *Galen* in his booke of the Faculties of simple medicines, *οξυανθος*, in the masculine gender: *Oxyacanthus*, saith he, is a tree, and is like to the wilde Peare tree in forme, and the vertues not vnlike, &c. Of *Oxyacantha*, *Dioscorides* writeth thus: It is a tree like to the wild Peare tree, very full of thorns, &c. *Serapio* calleth it *Amyrberis*: and some, saith *Dioscorides*, would haue it called *nupina*, but the name *Pyrina* seemeth to belong to the yellow Haw-thorne: it is called in high-Dutch, *Haogdozen*: in low-Dutch, *Hagedozen*: in Italian, *Bagaia*: in Spanish, *Pirlitero*: in French, *Aub-espine*: in English, White-thorne, Haw-thorne tree; and of some Londoners, May-bush. † This is not the *Oxyacantha* of the Greekes, but that which is called *Pyracantha*, as shall be shewed hereafter.

The second is thought to be the *Aria* of *Theophrastus*, and so *Lobel* and *Tabernamontanus* call it. Some, as *Bellonius*, *Gesner*, and *Clasius*, refer it to the *Sorbus*, and that not vnfitly: in some places of this kingdome they call it a white Beame tree. †

¶ The Temperature.

The fruit of the Haw-thorne tree is very astringent.

¶ The Vertues.

A The Hawes or berries of the Haw-thorne tree, as *Dioscorides* writeth, do both stay the laske, the menses, and all other fluxes of bloud: some Authors write, that the stones beaten to poulder, and giuen to drinke are good against the stone.

CHAP. 25. Of Goats Thorne.

¶ The Description.

1 The first *Tragacantha* or Goats-thorne hath many branchie boughes and twigs, slender and pliant, so spread abroad vpon euerie side, that one plant doth sometimes occupie a great space or roome in compasse: the leaues are small, and in shape like Lentill leaues, whitish, and somewhat mossie or hairy, set in rowes one opposite against another: the floure is like the blof- some of the Lentill, but much lesser, and of a whitish colour, and sometimes marked with purple lines or streaks: the seed is inclosed in small cods or husks, almost like vnto the wilde *Lotus* or horned Trefoile: the whole plant on euery side is set full of sharpe prickely thornes, hard, white, and strong: the roots run vnder the ground like Liquorice roots, yellow within, and blacke without, tough, limmer, and hard to breake; which being wounded in sundry places with some iron toole, and laid in the Sun at the highest and hottest time of Sommer, issueth forth a certain liquor, which being hardned by the Sun, is that gum which is called in shops *Tragacantha*: and of some, though barbarously *Dragagant*.

1 *Tragacantha, siue spina Hirci.*
Goats Thorne.

2 *Spina Hirci minor.*
Small Goats Thorne.

2 The second kinde of *Tragacantha* is a low and thicke shrub, hauing many shoots growing from one turfe: of a white or grayish colour, about a cubit high, stiffe and wooddy: the leaues are like the former, and garded with most stiffe pricks not very safely to be touched: among the thorne- leaues come forth many floures in small tufts like *Genistella*, but that they are white: the cods are

are many, straight and thorny like *Genistella*, wherein are many small white and three cornered seeds as big as mustard seed. † This differs from the former in that it is smaller, and loseth the leaues euery Winter, when as the former keeps on the leaues vntill new ones come in the Spring. The middle rib of the winged leaues ends in a pricke, which by the falling of the leaues becommeth a long and naked thorne. I haue giuen you a more accurate figure hereof out of *Clusius*, wherein the leaues, floures, cods, and seeds are all expresse apart. †

3 The Grecians haue called this plant *Neveida*, because it is good for the sinewes: it should seeme it tooke the name *Poterion*, of *Potrix*, because it loueth a watty or fenny soile: it hath small branches, and leaues of *Tragacantha*, growing naturally in the tract of Piedmont in Italy: it spreadeth abroad like a shrub: the barke or rinde is blackish, and dry without great moisture, very much writhed or wrinkled in and out as that of *Nepa* or *Corruda*: the sharpe pricks stand not in order as *Tragacantha*, but confusedly, and are finer and three times lesser than those of *Tragacantha*, growing much after the manner of *Astragalus*: but the particular leaues are Greene aboue, and white below, shaped somewhat like Burnet: the seed is small and red, like vnto Sumach, but lesser.

† *Tragacantha minoris icon accuratior.*
A better figure of the Goats-thorne.

† 3 *Poterion Lob. sine Pimpinella spinosa Camer.*
Burnet Goats-thorne.

¶ The Place.

Petrus Bellonius in his first booke of Singularities reports, that there is great plenty hereof growing in Candy vpon the tops of the mountaines. *Theophrastus* saith that it was thought to grow nowhere but in Candy; but now it is certaine that it is found in Achaia, Peloponessus, and in Asia: it doth also grow in Arcadia, which is thought not to be inferiour to that of Candy. It is thought by *Lobel* to grow in Languedock in France, whereof *Theophr.* hath written in his ninth booke, that the liquor or gum issueth out of it selfe, and that it is not needfull to haue the root broken or cut. The best is that, saith *Dioscorides*, which is through-shining, thin, smooth, vnmixt, and sweet of smel and taste.

¶ The Time.

They floure and flourish in the Sommer moneth: I haue sowne the seed of *Poterion* in Aprill, which I receiued from *Ioachimus Camerarius* of Noremberg, that grew in my garden two yeares together, and after perished by some mischance.

Ttttt 3

¶ The

¶ The Names.

Goats-thorne is called in Greeke *Tragacantha*: of most Herbarists likewise *Tragacantha*: we may call it in Latine *Spina Hirci*: in French, *Barbe Renard*: and in English for want of a better name, Goats-Thorne: the liquor or gum that issueth forth of the roots beareth the name also of *Tragacantha*: it is called in shops *Gummi Tragacantha*; and in a barbarous manner *Gummi Tragacanthi*: in English, Gum Dragagant.

¶ The Temperature.

This plant in each part thereof is of a drying facultie without biting. It doth consolidate or glew together sinewes that be cut: but the roots haue that facultie especially, which are boyled in wine, and the decoction giuen vnto those that haue any grieve or hurt in the sinewes.

Gum Dragagant hath an emplasticke qualitie, by reason whereof it dulleth or allayeth the sharpnesse of humors, and doth also somthing dry.

¶ The Vertues.

A The Gumme is singular good to be licked in with honey against the cough, roughnesse of the throat, hoarsenesse, and all sharpe and thin rheumes or distillations: being laid vnder the tongue it taketh away the roughnesse thereof.

B Being drunke with Cute or the decoction of Liquorice it taketh away and allayeth the heat of the vrine: it is also vsed in medicines for the eyes.

C The greatest part of those artificiall beades, sweet chaines, bracelets, and such like pretty sweet things of pleasure are made hard and fit to be worne by mixing the gum hereof with other sweets, being first steeped in Rosewater till it be soft.

† The figure which was in the third place was of the plant described in the second which *Matthiolus* and *Tabern.* made their *Poterium*, but it agreed not with the description which was taken out of the *Aduers.*

CHAP. 26. Of the Egyptian Thorne.

† 1 *Acacia Dioecoris.*
The Egyptian Thorne.

† 2 *Acacia altera trifolia.*
Thorny Trefoile.

¶ The

¶ The Description.

1 **D**ioscorides maketh mention of *Acacia*, whereof the first is the true and right *Acacia*, which is a shrub or hedge tree, but not growing right or straight vp as other small trees do: his branches are wooddie, beset with many hard and long Thorns; about which grow the leaues, compact of many small leaues clustering about one side, as in the Lentill: the floures are whitish, the husks or cods be plaine and flat, yea very broad like vnto Lupines, especially on that side where the seed growes, which is contained sometimes in one part, and sometimes in two parts of the husk, growing together in a narrow necke: the seed is smooth and glistering. There is a blacke iuice taken out of these huskes, if they be dried in the shadow when they be ripe; but if when they are not ripe, then it is somewhat red: some do wring out a iuice out of the leaues and fruit: there floweth also a gum out of this tree, which is the gum of Arabia, called Gum Arabicke.

2 *Dioscorides* hauing described *Spina Acacia*, setteth downe a second kinde thereof, calling it *Acacia altera*, which hath the three leaues of Rue or *Cytisus*, and coddles like those of *Genistella*, but somewhat more blunt at the end, and thicke at the backe like a Rasor, and still groweth forward narrower and narrower, vntill it come to haue a sharpe edge: in these cods are contained three or foure flat seeds like *Genistella*, which before they wax ripe are yellow, but afterwards blacke: the whole plant groweth to the height of *Genista spinosa*, or Gorse, both in shape, height, and resemblance, and not to the height of a tree, as *Matthiolus* would persuaide vs, but full of sharpe Thornes like the former.

¶ The Place.

The true *Acacia* groweth in Egypt, Palestina, Lombardie, and Syria, as *Dioscorides* writeth: among the shrubs and trees that remaine alwaies greene, *Acacia* is noted for one by *Petrus Belloninus*, in his first booke of Singularities, chap. 44.

The other *Acacia* groweth in Cappadocia and Pontus, as *Dioscorides* writeth: it is also found in Corsica, and on diuers mountaines of Italy, and likewise vpon all the coast of Liguria and Lombardie, and vpon the Narbone coast of the Mediterranean sea.

¶ The Time.

These floure in May, and their fruit is ripe in the end of August.

¶ The Names.

The tree *Acacia* is named of the Græcians *ακία*, yea euen in our time, and likewise of the Latins *Acacia*: it is also called *Egyptia spina*: this strange thorne hath no English name that I can learn, and therefore it may keep still the Latine name *Acacia*, yet I haue named it the Egyptian thorne: the iuice is called also *Acacia* after the name of the plant: the Apothecaries of Germanie do vse in stead hereof, the iuice that is pressed forth of sloes or snags, which they therefore call *Acacia Germanica*: *Matthiolus* pictureth for *Acacia* the tree which the later Herbarists do call *Arbor Iuda*, to which he hath vnruly added Thorns, that he might belie *Acacia*, and yet he hath not made it agree with *Dioscorides* his description.

They call this *ακία αλterna*: in Latine *Acacia altera*, or the other *Acacia*, and *Pontica Acacia*, or Ponticke *Acacia*.

¶ The Nature.

The iuice of *Acacia*, as *Galen* saith, consisteth not of one only substance, but is of substance both cold and earthie, to which also is coupled a certaine waterie essence, and it likewise hath thin and hot parts disperfed in it selfe: therefore it is dry in the third degree, and cold in the first if it be not washed, and in the second, if it be washed: for by washing it loseth his sharpe and biting quality and the hot parts.

¶ The Vertues.

The iuice of *Acacia* stoppeth the laske, the inordinate course of womens termes, and mans inuoluntarie issue called *Gonorrhæa*, if it be drunke in red wine.

It healeth the blastings and inflammations of the eies, and maketh the skin and palmes of the hands smooth after the healing of the *Serpigo*: it healeth the blisters and extreme heat in the mouth, and maketh the haire blacke that are washed therewith.

It is good, saith *Dioscorides*, against S. Anthonies fire, the shingles, Chimetla, Pterygia, and whitelowes.

The gum doth binde and somewhat coole: it hath also ioined vnto it an emplastrick quality, by which it dulleth or alayeth the sharpnesse of the medicines wherewith it is mixed. Being applied with the white and yolk of an egge, it suffereth not blisters to rise in burned or scalded parts. *Diosc.*

The iuice of the other, saith *Dioscorides*, doth also binde, but it is not so effectuell nor so good in eie medicines.

† Our Author gaue but formerly one figure, which was that in the second place, and he would haue persuaided vs, that it was of the right *Acacia*, yet in his description he tells vs otherwaies.

CHAP. 27. Of box Thorne, and the iuice thereof called *Lycium*.

¶ The Description.

1 *B*ox Thorne is a rare plant, in shape not vnlike the Box tree, whereof it hath beene reckoned for a wilde kinde, hauing many great branches set full of round and thicke leaues, very like that of the common Box tree: amongst which grow forth most sharpe pricking thornes: the floures grow among the leaues, which yeeld forth small blacke berries of a bitter tast, as big as a pepper corne: the iuice whereof is somewhat oilie, and of a reddish colour, which bitter iuice being set on fire, doth burne with a maruellous cracking and sparkling; the ashes thereof are of a red colour: it hath many wooddie roots growing aslope.

1 *Lycium, sive Pyxacantha.*
Box Thorne.

2 *Lycium Hispanicum.*
Spanish Box Thorne.

2 The other kinde of *Pyxacantha* or *Lycium*, groweth like vnto the common Priuet, hauing such like leaues, but somewhat narrower: the tops of the slender sprigs are furnished with prickles: the root is tough, and of a wooddie substance.

¶ The Place.

They grow in Cappadocia and Lycia, and in many other countries: it prospereth in rough places, it hath likewise been found in Languedoc, and Prouence in France: *Belonius* writeth that hee found it in Palestina.

Matthiolus pictureth for Box Thorne, a plant with box leaues, with very many boughes, and certaine thornes standing among them: but the notable Herbarist *Anguillara* and others, hold opinion, that it is not the right, with whom we also do agree.

There is drawne out of the leaues and branches of box Thorn, or as *Pliny* saith, out of the boughs and roots being thoroughly boiled, a iuice, which is named *Lycium*.

Dioscorides saith, that the leaues and branches must be braied, and the infusion made many daies in

in the decoction thereof, after which the feces or wooddie stuffe must be cast away, and that which remaineth boiled againe till it become as thicke as honie: *Pliny* saith, that the roots and branches are very bitter, and for three daies together they must be boiled in a copper vessell, and the wood and sticks often taken out till the decoction be boiled to the thicknesse of honie.

¶ The Time.

They floure in Februarie and March, and their fruit is ripe in September.

¶ The Names.

It is named in Greeke *πυλαγανθον*, which a man may call in Latine *Buxa spina*: and in English, Box Thorne: of some, Asses Box Tree, and prickley Boxe: it is also named *Eycium*, of the iuice which is boyled out of it: the iuice is properly called *λυκιον*, and retaineth in Latine the same name *Lycium*: it is termed in English Thorne box. But it seemeth to me, that the originall name *Lycium* is fitter, being a strange thing, and knowne to very few: the Apothecaries know it not, who in stead thereof do vse amisse the iuice of the fruit of Woodbinde, and that not without great error, as we haue already written. ‡ It is vnkowne in our shops, neither is there any thing vsed for it, it being wholly out of vse, wherefore our Author might here well haue spared *Dodonaeus* his words. ‡

Dioscorides teacheth to make a *χρησμος* of Sumach which is good for those things that *Lycium* is, and is vsed when *Lycium* is not to be had, and it is fit to be put in all medicines in stead thereof.

¶ The Temperature.

Lycium, or the iuice of Box Thorne, is as *Galen* teacheth, of a drying qualitie, and compounded of diuers kindes of substances, one of thinne parts digesting and hot, another earthie and cold, by which it enioyeth his binding facultie: it is hot in a meane, and therefore it is vsed for seuerall purposes.

¶ The Vertues.

Lycium cleareth the sight, saith *Dioscorides*, it healeth the scurvie festred sores of the eye lids, the itch, and old fluxes, or distillations of humors; it is a remedie for the running of the eares; for vlcers in the gummies, and almonds of the throat, and against the chappes or gallings of the lips and fundament.

† The figure which was in the 2. place, was of the *Lycium Italicum* of *Martialis* and others; but the description and title better fitted this *Lycium Hispanicum* of *Lucretius*, which therefore I put thereto. The figure also of the *Lycium Italicum* of *Martialis* our Author gaue againe in the next chapter saue two.

CHAP. 28. Of Ramme or Harts Thorne.

¶ The Kindes.

After the opinion of *Dioscorides* there be three sorts of *Rhamnus*, one with long, flat & soft leaues; the other with white leaues; and the third with round leaues, which are somewhat blackish; *Theophrastus* and *Pliny* affirme that there are but two, the one white, and the other black, both which do beare Thornes: but by the labour and industry of the new and late writers there are found sundry sorts moe, all which and euery one of them are plants of a wooddie substance, hauing also many straight twiggie and pliant branches, set with most sharpe pricking thornes.

¶ The Description.

1 This is a shrubbe growing in the hedges, and bringing forth straight branches and hard thornes, like to those of the Hawthorne, with little leaues, long, something fat and soft: and this hath that notable learned man *Clusius* described more diligently in these words: the Ram is a shrub fit to make hedges of, with straight branches, parting it selfe into many twigs, white, and set with stiffe and strong thornes, hauing leaues, which for the most part grow by foures or fives at the root of euery Thorne, long, something fat, like to those of the Oliue tree, somewhat white, but tender and full of iuice; which in Autumne doe sometimes fall off, leauing new growing in their places: the floures in Autumne are something long, whitish, diuided at the brims into fve parts: in their places is left a seed, in shew as in *Gelsemine*: notwithstanding it was neuer my chance to see the fruit: the root is thicke and diuersly parted.

‡ I obserued another (saith the same Author) almost like to the former, but lower, and diuided into more branches, with lesser leaues, more thick and salt of taste, and whiter also than the former: the floures are like, in all things but their colour, those of the former, which in this are purple.

2 This hath more flexible stalks and branches, and these also set with thornes: the leaues are narrow, and not so thicke or fleshie as those of the former, yet remaine alwaies greene like as they do: the floures are small and mossie, of a greenish colour, growing thicke about the branches, and they are succeeded by a round fruit, yellowish when it is ripe, and remaining on the shrubbe all the

Winter,

† 1 *Rhamnus 1. Clusij flo. albo.*
White floured Ram-thorne.

† *Rhamnus alter Clus. flore purpureo.*
Purple floured Ram-thorne.

† 2 *Rhamnus 2. Clusij.*
Sallow-Thorne.

† 3 *Rhamnus tertius Clusij.*
Ram or Harts-Thorne.

Winter: The whole shrubbe lookes as if it were sprinkled ouer with dust.

3 To these may be added another growing with many branches to the height of the Sloe-tree or blacke Thorne, and these are couered with a blackish barke, and armed with long prickles: the leaues, as in the first, grow forth of certaine knots many together, long, narrow, fleshie, greene, and continuing all the yeare: their taste is astringent, somewhat like that of Rhabarb: the floures shew themselves at the beginning of the Spring, of a greenish colour, growing thicke together, and neere the setting on of the leaues; in Summer it carries a blacke fruit almost like a Sloe, round, and harsh of taste.

¶ The Place.

The first of these growes in sundry places of Spaine, Portugall, and Prouince: the other varietie thereof *Clusius* saith he found but onely in one place, and that was neere the citie Horivela, called by the Antients *Orcellis*, by the riuier Segura, vpon the borders of the kingdome of Valentia: the second growes in many maritime places of Flanders and Holland, and in some vallies by riuers sides. The third growes in the vtilld places of the kingdome of Granado and Murcia. ‡

¶ The Time.

This Ram is euer greene together with his leaues: the fruit or berries remaine on the shrub, yea euen in Winter.

¶ The Names.

The Grecians call this thorne *ῥαμνός*: the Latines also *Rhamnus*: and of diuers it is also named *ῥαμνός*, *ἰσχυρὸς*, *ἀνδροειδής*, that is *Spina alba*, or white Thorne, *Spina Cerialis*, or Harts-thorne, as we finde written among the bastard words. *Marcellus* nameth it *Spina salutaris*, and *Herba salutaris*; which hath, saith he, as it were a grape. It is called in Italian *Marruca* and *Rhamno*: in Spanish, *Scambrones*: in English, Ram, or Harts Thorne.

¶ The Temperature.

The Ram, saith *Galen*, doth drie and digest in the second degree, it cooleth in the later end of the first degree, and in the beginning of the second.

¶ The Vertues.

The leaues, saith *Dioscorides*, are layed pultis wise vpon hot cholericke inflammations, and Saint **A** Anthonies fire, but we must vse them whilest they be yet but tender, as *Galen* addeth.

‡ The leaues and buds or young shoots of the first, are eaten as fallads with oile, vineger, and **B** salt, at Salamanca and other places of Castile, for they haue a certaine acrimonie and aciditie which are gratefull to the taste. A decoction of the fruit of the third is good to foment relaxed and weake or paralyticke members, and to ease the paine of the gout, as the Inhabitants of Granada told *Clusius*. ‡

† Our Author in this chapter gaue onely the figure of the third, and the description of the first, and the place of the second, with the names and faculties in generall.

CHAP. 29. Of Christs Thorne.

¶ The Description.

CHRISTs Thorn or Ram of Lybia, is a very tough and hard shrubby bush, growing vp sometimes vnto the height of a little tree, hauing very long and sharpe pricklie branches: but the thornes that grow about the leaues are lesfer, and not so prickly as the former. The leaues are small, broad, and almost round, somewhat sharpe pointed; first of a darke greene colour, and then somewhat reddish. The floures grow in clusters at the top of the stalks, of a yellow colour: the husks wherein the seeds be contained, are flat and broad, very like vnto small bucklers as hard as wood, wherein are contained three or foure thin and flat seeds, like the seed of Line or Flax.

¶ The Place.

This Thorne groweth in Lybia; it is better esteemed of in the countrey of Cyrene than is their Lote tree, as *Pliny* affirmeth. Of this shrub *Diphilus Siphnius* in *Athenaus* in his foureteenth booke maketh mention, saying, that hee did verie often eat of the same in Alexandria that beautifull Citie.

Petrus Bellonius who trauelled ouer the Holly Land, saith, that this shrubbe thorne *Paliurus* was the

Paliurus.
Christs Thorne.

the thorne wherewith they crowned our Saviour Christ: his reason for the prooffe hereof is this, that in Iudæa there was not any thorne so common, so pliant, or so fit for to make a crown or garland of, nor any so full of cruell sharpe prickles. It groweth throughout the whole countrey in such abundance, that it is their common fuell to burne; yea so common with them there, as our Gorse, Brakes, and broome is here with vs. *Iosephus* in his first booke of Antiquities, and 11. chap. saith, that this Thorne hath the most sharpe prickles of any other, and therefore that Christ might be the more tormented, the Iewes rather tooke this than any other. Of which I haue a small tree growing in my garden, that I haue brought forth by sowing of the seed.

The Time.

The leaues fall away and continue not alwaies green, as do those of the Rams: it buddeth forth in the Spring, as *Pliny* testifieth.

The Names.

This Thornie shrubbe is called in Greeke *αλκυρα*: the Latines and Italians retaine the same name *Paliurus*: for want of an English name, it may be termed Ramme of Lybia, or Christs Thorne: *Pliny* reporteth, that the seed is called *Zura*.

The Temperature.

The leaues and root of Christs Thorne doe evidently binde and cut.

The Vertues.

- A** By vertue of this cutting quality the seed doth weare away the stone, and cause tough and slimy humors to remoue out of the chest and lungs, as *Galen* saith.
- B** The decoction of the leaues and root of Christs Thistle, as *Dioscorides* writeth, stoppeth the belly, prouoketh vrine, and is a remedy against poisons, and the bitings of serpents.
- C** The root doth waste and consume away *Phymata*, and *Oedemata* if it be stamped and applied.
- D** The seed is good for the cough, and weareth away the stone in the bladder.

CHAP. 30. Of Buck-Thorne, or laxative Rcm.

The Description.

Buck-thorne groweth in manner of a shrub or hedge tree; his trunk or body is often as big as a mans thigh; his wood or timber is yellow within, and his barke is of the colour of a Chestnut, almost like the bark of a Cherry tree. The branches are beset with leaues that are somewhat round, and finely snipt about the edges like the leaues of the Crab or Wilding tree: among which come forth Thornes which are hard and prickly: the floures are white and small, which being vaded there succeed little round berries, Greene at the first, but afterwards black, whereof that excellent Greene colour is made, which the Painters and Limners do call Sap-Greene; but these berries before they be ripe do make a faire yellow colour, being steeped in vinegar.

† 2 Besides the common kinde, *Clusius* mentions two other: the first of which hath branches some two cubits long, subdiuided into diuers others, couered with a smooth barke like that of the former, which, the vpper rinde being taken off, is of a yellowish Greene colour, and bitterish taste: the branches haue some few prickles vpon them, and commonly end in them: the leaues are almost like those of the common kinde, but smaller, narrower, and somewhat resembling those of the blacke Thorn, hauing somewhat a drying taste: the floure consists of foure leaues of a yellowish Greene

† 1 *Rhamnus solutivus*.
Buck-thorne.

† 2 *Rhamnus solutivus minor*.
Middle Buck-thorne.

† 3 *Rhamnus solutivus pumilus*.
Dwarfe Buck-thorne.

greene colour: the root is wooddie as in other shrubs: *Clusius* found this growing in the mountainous places of Austria, and calls it *Spina infectoria pumila*.

3 This other hath branches some cubite long, and of the thicknesse of ones little finger, or lesser, couered with a blacke and shruelled barke: and towards the top diuided into little boughs, which are couered with a thin & smoother barke, and commonly end in a sharp thorn: the leaues much resemble those of the Slo-tree yet are they shorter and lesser, greene also, and snipt about the edges; first of an astringent, and afterwards of somewhat a bitterish taste; the floures which grow amongst the leaues are of an herby colour, and consist of foure leaues: the fruit is not much vnlike that of the former, but distinguished with two, & sometimes with three crests or dents, first green, and then black when it is ripe: the root is thicke, wooddie and hard. *Clusius* found this on the hill about the Bathes of Baden, hee calls it *Spina infectoria pumila* 2. This *Matthiolus* and others call *Lycium Italicum*: and our Author formerly gaue the figure of *Matthiolus* and *Tabernamontanus*, by the name of *Lycium Hispanicum*, and here againe another for his *Rhamnus solutivus*, which made mee to keepe it in this chapter, and omit it in the former, it being described in neither. †

Vuuuu

¶ The

¶ The Place.

Buck-thorne groweth neere the borders of fields, in hedges, woods, and in other vntoiled places: it delighteth to grow in riuers and in water ditches: it groweth in Kent in sundry places, as at Farningham vpon the cony burrowes belonging sometime to Mr. *Sibil*, as also vpon cony burrowes in Southfleet, especially in a small and narrow lane leading from the house of Mr. *William Swan* vnto Longfield downes, also in the hedge vpon the right hand at Dartford townes end towards London, and in many places more vpon the chalkie bankes and hedges.

¶ The Time.

It floureth in May, the berries be ripe in the fall of the leafe.

¶ The Names.

The later Herbarists call it in Latine *Rhamnus solutivus*, because it is set with thornes, like as the Ram, and beareth purging berries. *Matthiolus* nameth it *Spina insectoria*; *Valerius Cordus*, *Spina Cerui*, and diuers call it *Bargissina*. It is termed in high Dutch, *Crenkbeer weghdoorn*: in Italian, *Spino Merlo*, *Spino Zerlino*, *Spino Ceruino*: in English, Laxatiue Ram, Way-thorne, and Buck-thorne: in low Dutch they call the fruit or berries *Rhinbesien*, that is, as though you should say in Latine, *Bacca Rhenana*: in English, Rheinberries: in French, *Nerprun*.

¶ The Temperature.

The berries of this Thorne, as they be in taste bitter and binding, so be they also hot and dry in the second degree.

¶ The Vertues.

- A The same do purge and void by the stoole thicke flegme, and also cholericke humors: they are giuen being beaten into poudre from one dram to a dram and a halfe: diuers do number the berries, who giue to strong bodies from fifteene to twenty or moe; but it is better to breake them and boile them in fat flesh broth without salt, and to giue the broth to drinke: for so they purge with lesser trouble and fewer gripings.
- B There is pressed forth of the ripe berries a iuice, which being boyled with a little Allum is vsed of painters for a deep Greene, which they do call Sap Greene.
- C The berries which be as yet vnripe, being dried and infused or steeped in water, do make a faire yellow colour, but if they be ripe they make a Greene.

CHAP. 31. Of the Holme, Holly, or Huluer tree.

Agri-folium.

The Holly tree.

¶ The Description.

THE Holly is a shrubbie plant, notwithstanding it oftentimes growes to a tree of a reasonable bignesse: the boughes whereof are tough and flexible, couered with a smooth and green bark. The substance of the wood is hard and sound, and blackish or yellowish within, which doth also sinke in the water, as doth the Indian wood which is called *Guaiacum*: the leaues are of a beautifull green colour, smooth and glib, like almost the bay leaues, but lesser, and cornered in the edges with sharp prickles, which notwithstanding they want or haue few when the tree is old: the floures be white, and sweet of smell: the berries are round, of the bignesse of a little Pease, or not much greater, of colour red, of tast vnpleasant, with a white stone in the midst, which do not easily fall away, but hang on the boughes a long time: the root is wooddie.

There is made of the smooth barke of this tree or shrub, Birdlime, which the birders and country men do vse to take birds with: they pul off the barke, and make a ditch in the ground, specially in moist, boggy, or foggy earth, wherinto they put this bark, couering the ditch with boughes of trees, letting it remaine there till it be rotten and putrified, which will be done in the

the space of twelue daies or thereabout : which done, they take it forth, and beat in morters vntill it be come to the thicknesse and clamminesse of Lime: lastly, that they may cleare it from pieces of barke and other filthinesse, they do wash it very often : after which they adde vnto it a little oyle of nuts, and after that do put it vp in earthen vessells.

¶ *The Place.*

The Holly tree groweth plentifully in all countries. It groweth green both winter and sommer; the berries are ripe in September, and they do hang vpon the tree a long time after.

¶ *The Names.*

This tree or shrub is called in Latine *Agrifolium* : in Italian, *Agrifoglio*, and *Aguifoglio* : in Spanish, *Azebo* : in high Dutch, *Walddistell*, and of diuers *Stecpalmen* : in low Dutch, *Hult* : in French, *Hous* and *Housson* : in English, Holly, Huluer, and Holme.

¶ *The Temperature.*

The berries of Holly are hot and drie, and of thin parts, and waste away winde.

¶ *The Vertues.*

They are good against the collicke : for ten or twelue being inwardly taken bring away by the A stoole thicke flegmaticke humors, as we haue learned of them who oftentimes made triall thereof.

The Birdlime which is made of the barke hereof is no lesse hurtfull than that of Miffeltoe, for it B is marvellous clammy; it glueth vp all the intrails, it shutteth and draweth together the guts and passages of the excrements, and by this meanes it bringeth destruction to man, not by any qualitie, but by his glewing substance.

Holly beaten to poudre and drunke, is an experimented medicine against all the fluxes of the C belly, as the dysenterie and such like.

CHAP. 32. Of the Oke.

¶ *Quercus vulgaris cum glande & musco suo.*

The Oke Tree with his Acornes and Mosse.

¶ *The Description.*

I THe common Oke groweth to a great tree; the trunke or body whereof is couered ouer with a thicke rough barke full of chops or rifts : the armes or boughs are likewise great, dispersing themselues farre abroad : the leaues are bluntly indented about the edges, smooth, and of a shining Greene colour, whereon is often found a most sweet dew and somewhat clammy, and also a fungous excrecence, which we call Oke Apples. The fruit is long, couered with a browne hard and tough pilling, set in a rough scaly cup or husk: there is often found vpon the body of the tree, and also vpon the branches, a certaine kind of long white mosse hanging downe from the same : and sometimes another wooddie plant, which we call Miffeltoe, being either an excrecence or outgrowing from the tree it selfe, or of the doung (as it is reported) of a bird that hath eaten a certaine berrie. † Besides these there are about the roots of old Okes within the earth certaine other excrecences, which Bauhine and others haue called *Fua quercina*, because they commonly grow in clusters together, after the manner of Grapes and about their bignes, being sometimes round, & otherwhiles cornered, of a woody substance, hollow within; and sometimes of a purple, otherwhiles of a whitish colour on the outside : their taste is astringent, and vse singular in all Dysente-

ries and fluxes of bloud, as *Encelius* affirmes, *Cap. 51. de Lapid. & Gen.* ‡

3 *Carolus Clusius* reporteth that hee found this base or low Oke not far from Lisbone, of the height of a cubite, which notwithstanding did also beare an acorne like that of our Oke-tree, sauing that the cup is smoother, and the Acorne much bitterer, wherein it differeth from the rest of his kinde.

2 *Quercus vulgaris cum excrementis fungosis:*

The common Oke with his Apple or Greene Gall.

3 *Quercus humilis.*

The dwarfe Oke.

There is a wilde Oke which riseth vpon oftentimes to a maruellous height, and reacheth very far with his armes and boughes, the body wherof is now and then of a mighty thicknesse, in compasse two or three fathoms: it sendeth forth great spreading armes, diuided into a multitude of boughs. The leaues are smooth, something hard, broad, long, gashed in the edges, greene on the vpper side: the Acornes are long, but shorter than those of the tamer Oke; euery one fastened in his owne cup, which is rough without: they are couered with a thin rinde or shell: the substance or kernell within is diuided into two parts, as are Beans, Pease, and Almonds: the bark of the yong Okes is smooth, glib, and good to thicken skins and hides with, but that of the old Okes is rugged, thicke, hard, and full of chops: the inner substance or heart of the wood is something yellow, hard and sound, and the older the harder: the white and outward part next to the barke doth easily rot, being subiect to the worme, especially if the tree be not felled in due time: some of the roots grow deepe into the earth, and other some far abroad, by which it stiffely standeth.

¶ *The Place.*

The Oke doth scarcely refuse any ground, for it groweth in a drie and barren soile, yet doth it prosper better in a fruitfull ground: it groweth vpon hills and mountaines, and likewise in vallies: it cometh vpon euery where in all parts of England, but is not so common in other of the South and hot regions.

¶ *The Time.*

The Oke doth cast his leaues for the most part about the end of Autumne: some keepe their leaues on, but dry all winter long, vntill they be thrust off by the new spring.

¶ *The Names.*

The Oke is called in Greeke *σκύρος*: in Latine, *Quercus*: of some, *Placida*, as *Gaza* translateth it. It may be called *Satua*, *Vrbana*, or *Culta*, some also, *Emeros mudion*, and *Robur*: the Macedonians *ινυδρος*,

as though you should say *Veriquercus*, as *Gaza* expoundeth it, or *Vere Quercus*, the true Oke. We may name it in English, the tamer Oke-tree: in French, *Chesne*: in Dutch, *Eyken boom*.

The fruit is named in Greeke *Βελανος*: in Latine, *Glans*: in high Dutch, *Eichel*: in low Dutch, *Eekel*: in Spanish, *Bellotus*: in Italian, *Chiande*: in English, Acorne and Mast.

The cup wherein the Acorne standeth is named in Greeke *κυσσος*, as *Paulus Aegineta* in his third booke, 42 chapter testifieth, saying, *Omphacis* is the hollow thing out of which the Acorne groweth: in Latine, *Calix glandis*: in shops, *Cupula glandis*: in English, the Acorne cup.

¶ *The Temperature and Vertues.*

The leaues, barke, Acorne cups, and the Acornes themselves, doe mightily binde and drie in the third degree, being somewhat cold withall.

The best of them, saith *Galen*, is the thin skin which is vnder the barke of the tree, and that next, which lieth neereft to the pulpe, or inner substance of the Acorne, all these stay the whites, the reds, spitting of bloud and laskes: the decoction of these is giuen, or the powder of them dried, for the purposes aforesaid.

Acornes if they be eaten are hardly concocted, they yeeld no nourishment to mans body, but that which is grosse, raw, and cold.

Swine are fatted herewith, and by feeding hereon haue their flesh hard and sound.

The Acorns prouoke vrine, and are good against all venome and poison, but they are not of such a stopping and binding facultie as the leaues and barke.

The Oke apples are good against all fluxes of bloud and lasks, in what manner soeuer they be taken, but the best way is to boile them in red wine, and being so prepared, they are good also against the excessiue moisture and swelling of the iawes and almonds or kernels of the throat.

The decoction of Oke apples staieth womens diseases, and causeth the mother that is false downe to returne againe to the naturall place, if they doe sit ouer the said decoction being very hot.

The same steeped in strong white wine vineger, with a little powder of Brimstone, and the root of *Ireos* mingled together, and set in the Sun by the space of a moneth, maketh the haire blacke, consumeth proud and superfluous flesh, taketh away sun-burning, freckles, spots the morpew, withall deformities of the face, being washed therewith.

The Oke Apples being broken in sunder about the time of their withering, do foreshew the sequell of the yeare, as the expert Kentish husbandmen haue obserued by the liuing things found in them: as if they finde an Ant, they foretell plenty of graine to insue: if a white worme like a Gentill or Magot, then they prognosticate murren of beasts and cartell; if a spider, then (say they) wee shall haue a pestilence or some such like sicknesse to follow amongst men: these things the learned also haue obserued and noted; for *Matthiolus* writing vpon *Dioscorides* saith, that before they haue an hole through them, they containe in them either a flie, a spider, or a worme; if a flie, then war insueth, if a creeping worme, than scarcitie of victuals; if a running spider, then followeth great sicknesse or mortalitie.

CHAP. 33. Of the Scarlet Oke.

¶ *The Kindes.*

Although *Theophrastus* hath made mention but of one of these Holmeor Holly Okes onely, yet hath the later age set downe two kinds thereof, one bearing the scarlet grain, and the other onely the Acorn: which thing is not contrary to *Dioscorides* his opinion, for he intreateth of that which beareth the Acorne, in his first booke, among *αρκυρια* or the Okes; and the other hee describeth in his fourth booke, vnder the title *κόκκινος βαφικόν* Or *Coccus Baphice*.

¶ *The Description.*

The Oke which beareth the scarlet graine is a small tree, in manner of a hedge tree, of a meane bignesse, hauing many faire branches or boughes spread abroad: whereon are set leaues, green aboue, white vnderneath, snipt about the edges, and at euery corner one sharpe prickle, in manner of the smoother Holly: among which commeth sometimes, but not often, small Acornes, standing in little cups or husks, armed with prickles as sharpe as thornes, and of a bitter taste. Besides the Acornes, there is found cleauing vnto the wooddie branches, a certaine kinde of berries, or rather an excrescence, of the substance of the Oke Apple, and of the bignesse of a Pease, at the first white, and of the colour of ashes when they be ripe, in which are ingendred little Maggots, which seeme

Ilex Coccigera.
The Scarlet Oke.

to be without life vntill they feele the heat of the sun, and then they creep, and seeke to flie away. But the people of the countrey (which make a gaine of them) doe watch the time of their flying, euen as we doe Bees, which they then take and put into a linnen bag, wherein they shake and boulte them vp and downe vntill they be dead, which they make vp into great lumpes oftentimes, and likewise sell them to diuers apart, euen as they were taken forth of the bag, whereof is made the most perfect Scarlet.

¶ *The Place.*

This Oke groweth in Languedocke, and in the countries thereabout, and also in Spain: but it beareth not the scarlet graine in all places, but in those especially, which lie towards the Midland sea, and which be subiect to the scorching heat of the Sun, as *Carolus Clusius* witnesseth; & not there alwaies, for when the tree waxeth old it growes to be barren. Then do the people cut and lop it downe, that after the young shoots haue attained to two or three yeares growth, it may become fruitfull againe.

Petrus Bellonius in his books of Singularities sheweth, that *Coccus Baphicus* or the Scarlet graine doth grow in the Holy land, and neere to the lake which is called the Sea of *Tiberias*, and that vpon little trees, whereby the inhabitants get great store of wealth, who seperat the husks from the pulpe or Magots, and sell this being made vp into balls or lumpes, much dearer than the emptie shels or husks.

Of this graine also *Pausanias* hath made mention in his tenth booke, and sheweth, that the tree which bringeth forth this graine is not great, and also groweth in Phocis, which is a countrey in Macedonia neere to the Boetians, not far from the mountain *Parnassus*.

Theophrastus writeth, that *μαύρος* or the Scarlet Oke, is a great tree, and riseth vp to the height of the common Oke: amongst which writers there are some contrarietie. *Petrus Bellonius* reporteth it is a little tree, and *Theophrastus* a great one, which may chance according to the soyle and climate; for that vpon the stonie mountaines cannot grow to that greatnesse as those in the fertill grounds.

¶ *The Time.*

The little graines or berries which grow about the boughes begin to appeare especially in the Spring, when the Southwest windes do blow: the floures fall and are ripe in Iune, together with the Maggots growing in them, which receiuing life by the heat of the Sun, do forthwith flie away (in manner of a Moth or Butterflie) vnlesse by the care and diligence of the keepers, they be killed by much and often shaking them together, as aforesaid.

The tree or shrub hath his leaues alwaies greene: the Acornes be very late before they be ripe, seldome before new come vp in their place.

¶ *The Names.*

The Scarlet Oke is called in Greeke *μαύρος*: in Latine *Ilex*: the later writers, *Ilex Coccigera*, or *Coccolifera*; in Spanish, *Coscoia*: for want of a fit English name, we haue thought good to call it by the name of Scarlet Oke, or Scarlet Holme Oke: for *Ilex* is named of some in English, Holme, which signifieth Holly or Huluer. But this *Ilex*, as well as those that follow, might be called Holm Oke, Huluer Oke, or Holly Oke, for difference from the shrub or hedge tree *Agrifolium*, which is simply called Holme, Holly, and Huluer.

The graine or berrie that serueth to die with is properly called in Greeke *μαύρος σάπινος*: in Latine, *Coccus infectoria*, or *Coccum infectorium*: *Pliny* also nameth it *Cusculium*: or as most men doe reade it, *Quisquilium*: the same Author saith, that it is likewise named *Scolecion*, or Maggot berrie.

The Arabians and the Apothecaries doe know it by the name of *Chesmes*, *Chermes*, and *Kermes*: They are deceiued who thinke that *Chesmes* doth differ from *Infectorium Coccum*: it is called in Italian, *Grano detintori*: in Spanish, *Grana detintareros*: in high Dutch, *Scharlachbeer*: in French, *Vermillon*,

Vermillon, and *Graine d'escarlate*: in English, after the Dutch, Scarlet Berry, or Scarlet graine, and after the Apothecaries word, *Coccus Baphicus*: the maggot within is that which is named Cutcho-nele, as most do deeme.

Theophrastus saith the Acorne or fruit hereof is called of diuers, *ἄκων, Acylum*.

¶ *The Temperature and Vertues.*

This graine is astringent and somewhat bitter, and also dry without sharpnesse and biting, there-fore, saith *Galen*, it is good for great wounds and sinewes that be hurt, if it be layd thereon: some temper it with Vineger; others with Oxymel or fyrrup of vineger.

It is commended and giuen by the later Physitians to stay the Menses: it is also counted among those Simple which be cordials, and good to strengthen the heart. Of this graine that noble and famous confection *Alkermes*, made by the Arabians, hath taken his name, which many doe highly commend against the infirmities of the heart: notwithstanding it was chiefly deuised in the begin-ning for purging of melancholy; which thing is plainly perceiued by the great quantitie of *Lapis Lazulus* added thereto: and therefore seeing that this stone hath in it a venomous quality, and like-wise a property to purge melancholy, it canot of it selfe be good for the heart, but the other things be good, which be therefore added, that they might defend the heart from the hurts of this stone, and correct the malice thereof.

This composition is commended against the trembling and shaking of the heart, and for swoon-ings and melancholy passions, and sorrow proceeding of no euident cause: it is reported to recre-ate the minde, and to make a man merry and ioyfull.

It is therefore good against melancholy diseases, vaine imaginations, sighings, grieve and sor-row without manifest cause, for that it purgeth away melancholy humors: after this maner it may becomfutable for the heart, and delightfull to the minde, in taking away the materiall cause of sorrow: neither can it otherwise strengthen a weake and feeble heart, vnlesse this stone called *Lapis Cyaneus* be quite left out.

Therefore he that is purposed to vse this composition against beatings and throbbings of the heart, and swoonings, and that not as a purging medicine, shall do well and wisely by leauing out the stone *Cyaneus*; for this being taken in a little weight or small quantitie, cannot purge at all, but may in the meane season trouble and torment the stomacke, and withall thorow his sharpe and ve-nomous qualitie (if it be oftentimes taken) be very offensive to the guts and intrailles, and by this meanes bring more harme than good.

Moreover, it is not necessarie, no nor expedient, that the bristle died with *Cochenele*, called *Chesmes*, as the Apothecaries terme it, should be added to this composition, for this bristle is not died without *Auripigmentum*, called also Orpiment, and other pernicious things ioyned therewith, whose poysonsome qualities are added to the iuyces together with the colour, if either the bristle or died silke be boyled in them.

The berries of the *Cochenele* must be taken by themselues, which alone are sufficient to dy the iuices, and to impart vnto them their vertue: neither is it likewise needfull to boile the raw silke together with the graines, as most Physitians thinke: this may be left out, for it maketh nothing at all for the strengthening of the heart.

CHAP. 34. *Of the great Skarlet Oke.*

¶ *The Description.*

THE great Skarlet Oke, or the great Holme Oke, groweth many times to the full height of a tree, sometimes as big as the Peare tree, with boughes far spreading like the Acorne or com-mon Mast trees: the timber is firme and sound: the leaues are set with prickles round about the edges, like those of the former Skarlet Oke: the leaues when the tree waxeth old haue on them no prickles at all, but are somewhat bluntly cut or indented about the edges, greene on the vpper side, and gray vnderneath: the Acorne standeth in a prickly cup like our common Oke Acorne, which when it is ripe becommeth of a browne colour, with a white kernel within of taste not vnpleasant. There is found vpon the branches of this tree a certaine kinde of long hairy mosse of the colour of ashes, not vnlike to that of our English Oke. ¶ This tree is euer greene, and at the tops of the branches about the end of May, here in England, carrieth diuers long catkins of mossie yellow floures, which fall away, and are not succeeded by the acornes, for they grow out vpon other stalks. *Clusius* in the year 1581 obserued two trees; the one in a garden aboue the Bridge, and the other in the priuat garden at White-Hall, hauing lesser leaues than the former. The later of these is yet standing, and euery yeare beares small Acornes, which I could neuer obserue to come to any ma-turitie. ¶

¶ *The*

Ilex maior Glandifera.
The great Skarlet Oke.

‡ *Ilicis ramus floridus.*
The floures of the great Skarlet Oke.

¶ *The Place.*

In diuers places there are great woods of these trees, hills also and vallies are beautified therewith: they grow plentifully in many countries of Spaine, and in Languedocke and Prouence in great plenty. It is likewise found in Italy. It beareth an Acorne greater, and of a larger size than doth the tame Oke; in some countries lesser and shorter: they are strangers in England, notwithstanding there is here and there a tree thereof, that hath been procured from beyond the seas: one groweth in her Maiesties Priuy Garden at White-Hall, neere to the gate that leadeth into the street, and in some other places here and there one.

¶ *The Time.*

It is greene at all times of the yeare: it is late before the Acorne be ripe. *Clusius* reporteth, that he saw the floures growing in clusters of a yellow colour in May.

¶ *The Names.*

This Oke is named in Greeke *ωϊναι*: in Latine, *Ilex*: in Spanish, *Enzina*: in Italian, *Elize*: in French, *Chefnuerd*: in English, Barren Skarlet Oke, or Holme Oke, and also of some, French or Spanish Oke.

The Spaniards call the fruit or Acorne *Bellota*, or *Abillota*. *Theophrastus* seemeth to call this tree not *Prinos*, but *Smilax*; for he maketh mention but of one *Ilex* onely, and that is of Skarlet Oke; and he sheweth that the Arcadians do not call the other *Ilex*, but *Smilax*: for the name *Smilax* is of many significations: there is *Smilax* among the Pulses, which is also called *Dolichus*, and *Phaseolus*; and *Smilax aspera*, and *Lenis*, amongst the Binde-weeds: likewise *Smilax* is taken of *Dioscorides* to be *Taxus*, the Yew tree. Of *Smilax*, *Theophrastus* writeth thus in his third booke: the inhabitants of Arcadia do call a certaine tree *Smilax*, being like vnto the Skarlet Oke: the leaues thereof be not set with such sharpe prickles, but tenderer and softer.

Of this *Smilax* *Pliny* also writeth, in his sixteenth booke, chap. 6. There be of *Ilex*, saith he, two kindes, *Ex ijs in Italia folio non multum ab oleis distant*, called of certain Grecians *Smilaces*, in the prouinces *Aquisolia*: in which words, in stead of Oliue trees may perchance be more truly placed *Suberis*, or the Corke tree; for this kinde of *Ilex* or *Smilax* is not reported of any of the old writers

to haue the leafe of the Oliue tree: but *Suber* in Greeke, called *Phellos*, or the Corke tree, hath a little leafe.

¶ *The Temperature and Vertues.*

The leaues of this Oke haue force to coole and repell or keepe backe, as haue the leaues of the Acornes or Mast trees: being stamped or beaten, and applied, they are good for soft swellings, and strengthen weake members.

The barke of the root boiled in water vntill it be dissolued, and layd on all night, maketh the haire blacke, being first scoured with *Cimolia*, as *Dioscorides* saith.

Clusius reporteth, that the Acorne is esteemed of, eaten, and brought into the market to be sold, in the city of Salamanca in Spaine, and in many other places of that countrey; and of this Acorne *Pliny* also hath peradventure written, *lib. 16. cap. 5.* in these words: Moreouer, at this day in Spain the Acorne is serued for a second course.

CHAP. 35. Of the great Holme-Oke.

1 *Cerris maiore Glande.*

The Holme Oke with great Acornes.

2 *Cerris minore Glande.*

The Holme Oke with lesser Acorns.

¶ *The Description.*

1 Among the wilder Okes this is not the least, for his comely proportion, although vnprofitable for timber, to make coles, carts, Wainscot, houses, or ships of: the fruit is not fit for any man or beast to eate, neither any propertie knowne for the vse of physicke or surgerie: it groweth vp to the height of a faire tree, the trunke or body is great, and verie faire to looke vpon: the wood or timber soft and spongie, scarce good to be burned: from which shooteth forth very comely branches dispersing themselues faire abroad, whereon are set for the most part by couples very faire leaues, Greene aboue, and of an ouerworne russet colour vnderneath, cut or snipt about the edges very deepe: the Acorne groweth fast vnto the boughes, without any foot-stalke at all, being very like vnto our common Acorne, set in a rough and prickly cup like an Hedge-hog or the Chesnut huske, of a harsh taste, and hollow within: this tree beareth or bringeth

‡ *Cerri minoris ramulus cum flore.*

A branch of the smaller Holme Oke with floures.

bringeth forth oft times a certain smooth kinde of Gall not altogether vnprofitable. This Oke likewise bringeth forth another kinde of excrescence, which the Grauer hath omitted in the figure, which is called in Greeke *φάσμα*: *Gaza* nameth it *Penis*. This *Penis* or pricke is hollow, mossie, hanging downe halfe a yard long, like a long rag of linnen cloath.

2 The second is altogether like the first, sauing that this beareth smaller Acornes, and the whole tree is altogether lesse, wherein consisteth the difference.

‡ Both this & the former cary floures clustering vpon long stalkes, like as in the common Oke; but the fruit doth not succeed them, but grow forth in other places. ‡

¶ *The Place.*

This Oke groweth in vntoiled places, it is seldome times found, and that but in Woods onely: it is for the most part vknowne in Italy, as *Pliny* reporteth.

¶ *The Time.*

They bring forth their fruit or Acornes in the fall of the leafe.

¶ *The Names.*

This Oke is called in Greeke *ἄρζις*: in Latine, *Cerrus*: yet doth *Pliny* make mention both of *Agilops*, and also of *Cerrus*: *ἄρζις* is likewise one of the diseases of

corne, called in Latine *Festuca*: in English, wilde Otes, and far differing from the tree *Agilops*.

That which hangeth from the boughs, *Pliny*, lib. 16. cap. 8. calleth *Pannus* onely: that acorne tree named *Agilops* bringeth forth *Pannos arentes*, withered prickles, couered with white mossie iags hanging downe, not only in the barke, but also from the boughes, halfe a yard in bignesse, bearing a sweet smell, as we haue said, among ointments.

¶ *The Temperature and Vertues.*

We finde nothing written of the faculties of this tree among the old Writers, neither of our owne experience.

CHAP. 36. Of the Corke Oke.

¶ *The Description.*

1 **T**He Corke tree is of a middle bignesse like vnto *Ilex*, or the barren skarlet Oke, but with a thicker body, and fewer boughes: the leaues be for the most part greater, broader, rounder, and more nicked in the edges: the barke of the tree is thicke, very rugged, and full of chinkes or crannies that cleaueth and diuideth it selfe into pieces, which vnlesse they be taken away in due time do giue place to another barke growing vnderneath, which when the old is remoued is maruellous red, as though it were painted with some colour: the Acorne standeth in a cup, which is great, bristled, rough, and full of prickles: this Acorne is also astringent or binding, more vnpleasant than the Holme Acorne, greater in one place, and lesse in another.

2 The Corke tree with narrow leaues groweth likewise to the height and bignesse of a great tree; the trunke or body whereof is couered with a rough and scabbed barke of an ouerworn blackish colour, which likewise cleaueth and casteth his coat when the inner barke groweth somewhat thicke: the branches are long, tough, and flexible, easie to be bowed any way, like those of the Ozier;

Oziar, whereupon do grow leaues like those of the precedent, but longer, and little or nothing indented about the edges: the fruit groweth in small cups as the Acornes doe: they are lesser than those of the other kinde, as is the rest of the tree, wherein is the chiefest difference. † This varies in the leafe, (as you may see in the figure) which in some is snipt about the edge, in other some not at all.

1. 2. *Suber latifolium & angustifolium.*
The Corke tree with broad and narrow leaues.

¶ The Place.

It groweth in the countrey of Aquitania, neere to the mountaines called Pyrenæi: it also groweth plentifully in the kingdomes of Spaine, differing somewhat from that of Aquitania, as *Clusius* declareth: it is likewise found in Italy, and that in the territorie of Pisa, with a longer leafe, and sharper pointed; and about Rome with a broader, and cut in the edges like a saw, and rougher, as *Matthiolus* testifieth.

¶ The Time.

The leaues of the first are alwaies greene in Spaine and Italy, about the Pyrenæan mountaines they fall away in Winter.

¶ The Names.

This tree is called in Greeke *κέρκισ*: in Latine *Suber*: in French, *Liege*: in Italian, *Sugaro*: the same names do also belong to the barke: the Spaniards call the tree *Alcornoque*: the Englishmen, Corke tree; and the barke, *Corcha de Alcornoque*; whereupon the Low-countrey men and Englishmen also do call it Corke; and yet it is called in low-Dutch also *Ulothout*.

¶ The Temperature and Vertues.

This barke doth manifestly dry, with a binding facultie.

Being beaten to powder and taken in water it stancheth bleeding in any part of the body. The Corke which is taken out of wine vessels, saith *Paulus*, being burnt, maketh ashes which do mightily dry, and are mixed in compositions diuised against the bloudy flux.

Corke is also profitable for many things: it is vsed (saith *Pliny*) about the anchors of ships, Fishers nets, and to stop vessels with; and in Winter for womens shooes, which vse remains with vs euen to this day: fishermen hang this barke vpon the wings of their nets for feare of sinking: and shoo-makers put it in shooes and pantofoles for warmnesse sake.

CHAP.

CHAP. 37. Of the Gall tree.

¶ The Kindes.

OF trees that bring forth Galls there be diuers sorts, as may appeare by the diuers formes and sorts of Galls set forth in this present chapter, which may serue for their seuerall distinctions, whereof some bring forth Acornes likewise, and some nothing but Galls: the figures of some few of the trees shall giue you sufficient knowledge of the rest: for all the Acorne or Mast trees bring forth Galls, but those trees whose figures we haue set forth do beare those Galls fit for medicine, and to thicken skins with.

Dioscorides and *Galen* make but two sorts of Galls; the one little, yellow, full of holes, and more spongie in the inner part, both of them round, hauing the forme of a little ball, and the other smooth and even on the out side: since, the later writers haue found moe, some hauing certain little knobs sticking forth, like in forme to the Gall, which doth also cleaue and grow without stalke to the leafe. There is also found a certaine excrescence of a light Greene colour, spongie and waterie, in the middle whereof now and then is found a little flie or worme: which soft ball in hot countries doth oftentimes become hard, like the little smooth Gall, as *Theophrastus* saith.

1 *Galla, siue Robur maius.*
The great Gall tree.

‡ 2 *Robur, siue Galla maior altera.*
Another great Gall tree.

¶ The Description.

1 **T**HE Gall tree growes vp to a sufficient height, hauing a very faire trunk or body, whereon are placed long twiggy branches bringing forth very faire leaues, broad, and nicked in the edges like the teeth of a saw: among which come forth acornes, although the figure expresse not the same, like those of the Oke, and likewise a woody excrescence, which we name the Gall, hauing certaine small eminences or bunches on the out side, growing for the most part vpon the slender branches without stalks, and somtimes they grow at the ends thereof; which by the heate of the Sun are harder, greater, and more sollid in one countrey than another, according to the soile and clymat.

‡ 2 This

3 *Galla minor.*
The little Gall tree.

† 2 This growes to the height of a tall man, hauing leaues deeply diuided on the edges like the Oke, and they are green aboue, but hairy and hoary below: it carries a great Gall of the bignesse of a little Apple, and that in great plenty, & without any order. This groweth in diuers parts of old Castile in Spain, and in all the mountainous woods about Vienna in Austria.†

3 The lesser Gall tree differeth not from the former, sauing that it is altogether lesser: the fruit and Gall is likewise lesser, wherein especially consisteth the difference.

¶ The Place.

The Galls are found in Italy, Spaine, and Bohemia, and most of the hot regions.

¶ The Time.

The Gall, saith *Pliny*, appeareth or commeth forth when the Sun commeth out of the signe *Gemini*, and that generally in one night.

¶ The Names.

The Gall tree is called *Quercus*, *Robur*, and *Galla arbor*: the Gall is called in Greeke *καλλι*: the Apothecaries and Italians keepe the name *Galla* for the fruit: in high-Dutch, *Galopffel*: in low-Dutch, *Galnoten*: in Spanish, *agatha*

Galha, and *Bugalha*: in French, *Noix de Galle*: in English, *Gaules*, and *Galls*.

¶ The Temperature and Vertues.

The Gall called *Omphacitis*, as *Galen* writeth, is dry in the third degree, and cold in the second: A it is a very harsh medicine, it fastneth and draweth together faint and slacke parts, as the ouergrowings in the flesh: it repelleth and keepeth backe rheumes and such like fluxes, and doth effectually dry vp the same, especially when they haue a descent into the gums, almonds of the throat, and other places of the mouth.

The other Gall doth dry and also binde; but so much lesser, by how much the harsh or choking B qualitie is diminished: being boyled, beaten, and also applied in manner of a plaister is laid with good successe vpon the inflammations of the fundament, and falling downe thereof: it is boiled in water if there be need of a little astringion; and in wine, especially in austere wine, if more need require.

Galls are very profitable against the Dysenterie and the Coeliacke passion, being drunk in wine, C or the powder thereof strewed vpon meats.

Galls are vsed in dying and colouring of sundry things, and in making of inke. D

Last of all, burnt Galls doe receiue a further facultie, namely to stanch bloud, and are of thin E parts, and of a greater vertue to dry than be those that are not burnt: they must be layd vpon hot burning coles vntill they come to be thorow white, and then they are to be quenched in Vineger and wine.

Moreouer, Galls are good for those that are troubled with the bloody flix and common laskes, F being taken in wine or water, and also applied or vsed in meats: finally, these are to be vsed as oft as need requireth to dry and binde.

Oke Apples are much of the nature of Galls, yet are they far inferiour to them, and of lesser G force.

† Our Author out of *Tabernaemontanus* gaue the figures of foureene varieties of Galls; some being large, others small; some round, others longish, and other sorts diuersly cornered.

CHAP. 38.

Of Miffeltoe or Mifteltoe.

1 *Viscum*.
Miffeltoe.

¶ The Description.

1 **V**iscum or Miffeltoe hath many slender branches spread ouerthwart one another, and wrapped and interlaced one within another: the bark whereof is of a light green or Popinjay colour: the leaues of this branching excrescence be of a browne Greene colour: the floures be smal and yellow: which being past, there appeare small clusters of white translucent berries, which are so cleare that a man may see through them, and are full of clammy or viscous moisture, whereof the best Bird-lime is made, far exceeding that which is made of Holme or Holly barke: and within this berry is a small blacke kernell or seed: this excrescence hath not any root, neither doth encrease himselfe of his seed, as some haue supposed; but it rather commeth of a certaine moisture and substance gathered together vpon the boughes and ioints of the trees, through the barke whereof this vaporious moisture proceeding, bringeth forth the Miffeltoe. Many haue diuersly spoken hereof: some of the Learned haue set downe that it comes of the dung of the bird called a Thrush, who hauing fed of the seeds thereof, as eating his owne bane, hath voided and left his dung vpon the tree, whereof was ingendred this berry, a most fit matter to make lime of to intrap and catch birds withall.

2 Indian Miffeltoe groweth likewise vpon the branches of trees, running alongst the same in manner of Polypodie: the strings of the roots are like those of Couch-grasse, from which rise vp diuers stalks smooth and euen, set with ioints and knees at certain distances: toward the top comes forth one leafe ribbed like the Plantain leafe, whereon are marked certaine round eyes such as are in the haft of a knife; from the bosome whereof cometh forth a chaffie branch, set with small leaues which continue Greene winter and Sommer.

2 *Viscum Indicum* Lobelij.
Indian Miffeltoe.3 *Viscum Peruvianum* Lobelij.
Miffeltoe of Peru.

3 There is found also another plant growing vpon the boughes or branches of trees, in maner as our Miffeltoe doth, and may very well be reckoned as a kinde thereof: the plant cleaueth vnto the branches, being fet thereto as it were with the pillings of the sea onion, of the bredth of a mans hand toward the bottome, and somewhat hollow: the tops whereof are very small and rushy, hollow likewise, and of a purple colour: among which comes forth a branch like that of *Hastula Regia*, or the Kings Speare, resembling the bush of Otes, couered with a white filke, such as is to be found in *Asclepias*, of a salt and nitrous taste, and very vnpleasant.

¶ The Place.

The first kinde of Miffeltoe groweth vpon Okes and diuers other trees almost euery where; as for the other two they are strangers in England.

¶ The Time.

Miffeltoe is alwaies Greene as well in Winter as in Sommer: the berries are ripe in Autumne; they remaine all Winter thorow, and are a food for diuers birds, as Thrushes, Blacke-birds, and Ring-doues.

¶ The Names.

Miffeltoe is called in Greeke *ῥῖζα*, and *ῥῖζα*: in Latine, *Viscum*: in high-Dutch, *Miffell*: in Low-Dutch, *Marentacken*: in Italian, *Vischio*: in Spanish, *Liga*: in the Portugall language, *Visgo*: in English, Miffel, and Miffeltoe.

The glue which is made of the berries of Miffel is likewise called *Viscum* and *Ixia* in English, Bird-lime. *Ixia* is also called *Chamaleon albus*, by reason of the glue which is oftentimes found about the root thereof. This word is also ascribed to *Chamaleon niger*, as we reade among the standard names. *Ixia* is likewise reckoned vp by *Dioscorides*, lib. 6. and by *Paulus Aegineta*, lib. 5. among the poysons: but what this poyson some and venomous *Ixia* is it is hard and doubtfull to declare: many would haue it to be *Chamaleon niger*: others, the glue or clammy substance which is made of the berries of Miffel-toe; who do truly thinke that *Ixia* differeth from *Chamaleon niger*: for *Paulus Aegineta*, lib. 5. cap. 20. in reckoning vp of simple poysons hath first made mention of *Chamaleon niger*, then a little after of *Ixia*: and whilest he doth particularly discourse of euery one, he intreateth of *Chamaleon niger*, cap. 32. and of *Ixia* (which hee also nameth *Vlophonon*) cap. 47. and telleth of the dangerous and far differing accidents of them both. And *Dioscorides* himselfe, lib. 6. where he setteth downe his iudgement of simple poysons, intreateth first of *Chamaleon niger*, and then a little after of *Ixia*. These things declare that *Chamaleon niger* doth differ from *Ixia*, which is reckoned among the poysons. Moreouer, it can no where be read that *Chamaleon niger* beareth Bird-lime, or hath so glutinous and clammy a substance as that it ought to be called *Ixia*: therefore *Ixia*, as it is one of the poysons, is the glue that is made of the berries of Miffeltoe, which because it is sharpe and biting, inflameth and setteth the tongue on fire, and with his slimie and clammy substance doth so draw together, shut, and glue vp the guts, as that there is no passage for the excrements, which things are mentioned among the mischiefes that *Ixia* bringeth.

† I can by no meanes approue of, or yeeld to this opinion here deliuered out of *Dodonaeus* by our Author; which is, That the Bird-lime made of the berries of Miffeltoe is poyson; or that *Ixia* fet forth by *Dioscorides* and *Nicander* for a poyson is meant of this: for this is manifestly treated of in *Dioscorides*, lib. 3. cap. 103. by the name of *ῥῖζα*: when as the other is mentioned, lib. 6. cap. 21. by the name of *ῥῖζα*. Also dayly experience shewes this plant to haue no maligne nor poisonous, but rather a contrarie facultie, being frequently vsed in medicines against the Epilepsie. Such as would see more concerning *Ixia* or *Ixias*, let them haue recourse to the first chapter of the first part of *Fabius Columna*, de *Stirpib. min. cognitib. & rarioribus*, where they shall finde it largely treated of. †

¶ The Temperature and Vertues.

The leaues and berries of Miffeltoe are hot and dry, and of subtile parts: the Bird-lime is hot and biting, and consists of an airy and waterie substance, with some earthy qualitie; for according to the iudgement of *Galen*, his acrimony ouercommeth his bitternesse; for if it be vsed in outward applications it draweth humors from the deepest or most secret parts of the body, spreading and dispersing them abroad, and digesting them.

It ripeneth swellings in the groine, hard swellings behinde the eares, and other impostumes, being tempered with rosin and a little quantitie of wax.

With Frankincense it mollifieth old vlcers and malicious impostumes, being boyled with vnslaked lime, or with *Gagate lapide*, or *Asio*, and applied, it wasteth away the hardnes of the spleene.

With Orpment or *Sandaraca* it taketh away foule ill fauoured nailes, being mixed with vnslaked lime and wine lees it receiueth greater force.

It hath been most credibly reported vnto me, that a few of the berries of Miffeltoe bruised and strained into Oyle, and drunken, hath presently and forthwith rid a grieuous and sore stitch.

CHAP. 39. Of the Cedar tree.

¶ The Kindes.

There be two Cedars, one great bearing Cones, the other small bearing berries like those of Juniper.

Cedrus Libani.

The great Cedar tree of Libanus.

¶ The Description.

The great Cedar is a very big and high tree, not onely exceeding all other resinous trees, and those which beare fruit like vnto it, but in his tallnesse and largenesse farre surmounting all other trees: the body or trunke thereof is commonly of a mighty bignesse, insomuch as foure men are not able to fathome it, as *Theophrastus* writeth: the barke of the lower part, which proceedeth out of the earth, to the first yong branches or shoots, is rough and harsh; the rest which is among the boughes is smooth and glib: the boughes grow forth almost from the bottome, and not farre from the ground, euen to the very top, waxing by degrees lesser and shorter still as they grow higher, the tree bearing the forme or shape of a Pyramide or sharpe pointed steeple: these compasse the body round about in manner of a circle, and are so orderly placed by degrees, as that a man may clymbe vp by them to the very top as by a ladder: the leaues be small and round like those of the Pine tree, but shorter, and not so sharp pointed; all the cones or clogs are far shorter and thicker than those of the Firre tree, compact of soft, not hard scales, which hang not downewards, but stand vpriight vpon the boughes, whereunto also they are so strongly fastned, as they can hardly be plucked off

without breaking of some part of the branches, as *Bellonius* writeth: the timber is extreme hard, and rotteth not, nor waxeth old: there is no wormes nor rottennesse can hurt or take the hard matter or heart of this wood, which is very odoriferous, and somewhat red: *Solomon* King of the Iewes did therefore build Gods Temple in Ierusalem of Cedarwood: the Gentiles were wont to make their Diuels or Images of this kinde of wood, that they might last the longer.

¶ The Place.

The Cedar trees grow vpon the snowie mountaines, as in Syria vpon mount Libanus, on which there remaine some euen to this day, saith *Bellonius*, planted as is thought by *Solomon* himselfe: they are likewise found on the mountaines Taurus and Amanus, in cold and stony places: the merchants of the factorie at Tripolis told me, that the Cedar tree groweth vpon the declining of the mountaine Libanus, neere vnto the Hermitage by the city Tripolis in Syria: they that dwel in Syria vse to make boats thereof for want of the Pine tree.

¶ The Time.

The Cedar tree remaineth alwaies greene, as other trees which beare such manner of fruit: the timber of the Cedar tree, and the images and other workes made thereof, seeme to sweat and send forth moisture in moist and rainy weather, as do likewise all that haue an oylie iuyce, as *Theophrastus* witnesseth.

¶ The Names.

This huge and mighty tree is called in Greeke *κεδρος*: in Latine likewise *Cedrus*: in English, Cedar, and Cedar tree. *Pliny*, lib. 24. cap. 5. nameth it *Cedrelate*, as though he should say, *Cedrus abies*, or *Cedrina abies*, Cedar Firre; both that it may differ from the little Cedar, and also because it is very like to the Firre tree.

The Rosin hath no proper name, but it may be surnamed *Cedrina*, or Cedar Rosin.

The pitch which is drawne out of this is properly called *Κεδρινα*: yet *Pliny* writeth, that also the liquor of the Torch Pine is named *Cedrium*. The best, saith *Dioscorides*, is fat, thorow shining, and of a strong smell; which being poured out in drops vniteth it selfe together, and doth not remaine feuered.

¶ The Temperature and Vertues.

Cedar is of temperature hot and dry, with such an exquisite tenuitie and subtiltie of parts, that it seemeth to be hot and dry in the fourth degree, especially the Pitch or Rosin thereof. A

There issueth out of this tree a Rosin like vnto that which issueth out of the Fir tree, very sweet in smell, of a clammy or cleauing substance, the which if you chew in your teeth it will hardly be gotten forth againe, it cleaueth so fast: at the first it is liquid and white, but being dried in the sun it waxeth hard: if it be boiled in the fire an excellent pitch is made thereof, called Cedar Pitch. B

The Egyptians were wont to coffin and embalne their dead in Cedar, and with Cedar pitch, although they vsed also other meanes, as *Herodotus* recordeth. C

The condited or embalmed body they call in shops *Mumia*, but very vnfitly; for *Mumia* among the Arabians is that which the Grecians call *Pissasphaltum*, as appeareth by *Auicenna*, cap. 474. and out of *Serapio*, cap. 393. D

He that interpreted and translated *Serapio* was the cause of this error, who translated and interpreted *Mumia* according to his owne fancie, and not after the sence and meaning of his Author *Serapio*, saying that this *Mumia* is a composition made of Aloes and Myrrh mingled together with the moisture of mans body. E

The gum of Cedar is good to be put in medicines for the eyes, for being anointed therewith it cleareth the sight, and clenseth them from the Haw and from stripes. F

Cedar infused in vinegar and put into the eares killeth the wormes therein, and being mingled with the decoction of Hyssop, appeaseth the sounding, ringing, and hissing of the eares. G

If it be washed or infused in vinegar, and applied vnto the teeth, it easeth the tooth-ache. H

If it be put into the hollownesse of the teeth it breaketh them, and appeaseth the extreme grieve thereof. I

It preuaileth against *Angina's*, and the inflammation of the Tonfils, if a Gargarisme be made thereof. K

It is good to kill nits and lice and such like vermine: it cureth the biting of the serpent *Ceraustes*, being layd on with salt. L

It is a remedie against the poyson of the sea Hare, if it be drunke with sweet wine. M

It is good also for Lepers: being put vp vnderneath it killeth all manner of worms, and draweth forth the birth, as *Dioscorides* writeth. N

CHAP. 40. Of the Pitch tree.

¶ The Description.

1. *Picea*, the tree that droppeth Pitch, called Pitch tree, groweth vp to be a tall, faire, and big tree, remaining alwaies greene like the Pine tree: the timber of it is more red than that of the Pine or Firre: it is set full of boughes not onely about the top, but much lower, and also beneath the middle part of the body, which many times hang downe, bending toward the ground: the leaues be narrow, not like those of the Pine tree, but shorter and narrower, and sharpe pointed like them, yet are they blacker, and withall couer the yong and tender twigs in manner of a circle, like those of the Firre tree; but being many, and thicke set, grow forth on all sides, and not onely one right against another, as in the Yew tree: the fruit is scaly, and like vnto the Pine apple, but smaller: the barke of the tree is somewhat blacke, tough and flexible, not brittle, as is the bark of the Firre tree: vnder which next to the wood is gathered a Rosin, which many times issueth forth, and is like to that of the Larch tree.

2. Of this sort (saith *Clusius*) there is found another that neuer growes high, but remaineth dwarfish, and it carries certaine little nugaments or catkins of the bignesse of a small nut, composed of scales lying one vpon another, but ending in a prickly leafe, which in time opening shew certaine emptie cauities or cels: from the tops of these sometimes grow forth branches set with many short and pricking little leaues: all the shrub hath shorter and paler coloured leaues than the former: I obserued neither fruit nor floure on this, neither know I whether it carry any. *Dalechampsius* seemes to haue knowne this, and to haue called it *Piceus Tubulus* or *Tibulus*. ‡

1 *Picea maior.*
The Pitch tree.

2 *Picea pumila.*
The dwarfe Pitch tree.

¶ The Place.

The Pitch tree groweth in Greece, Italy, France, Germanie, and all the cold regions euen vnto Russia.

¶ The Time.

The fruit of the Pitch tree is ripe in the end of September.

¶ The Names.

The Grecians call this Cone tree *μιρος*: the Latines, *Picea*, and not *Pinus*; for *Pinus* or the Pine tree, is the Grecians *πινος*, as shall be declared: that *μιρος* is named in Latine *Picea*, *Scribonius Largus* testifieth, in his 201 Composition, writing after this manner; *Resina Petuina, id est, ex Picea arbore*, which signifies in English, of the Rosin of the tree *Pitys*, that is to say, of the Pitch tree. With him doth *Pliny* agree, *lib. 16. cap. 10.* where he translating *Theophrastus* his words concerning *Peuce* and *Pitys*, doth translate *Pitys*, *Picea*, although for *Peuce* he hath written *Larix*, as shall be declared. *Pliny* writeth thus; *Larix vltis radicibus non repullulat*: and the Larch tree doth not spring vp againe when the roots are burnt: the Pitch tree springeth vp againe, as it hapned in Lesbos, when the wood *Pyriheus* was set on fire. Moreouer, the wormes *Pityocampa* are scarce found in any tree but onely in the Pitch tree, as *Bellonius* testifieth: so that they are not rashly called *Pityocampa*, or the wormes of the Pitch tree, although most Translators name them *Pinorum eruca*, or the wormes of the Pine trees: and therefore *Pitys* is firnamed by *Theophrastus*, *αδυσμιτος*, because wormes and magots are bred in it. But forso much as the name *Pitys* is common both to the tame Pine, and also to the Pitch tree, diuers of the late writers do for this cause suppose, that the Pitch tree is named by *Theophrastus*, *μιρος αγρια*, or the wilde Pine tree. This *Picea* is named in high-Dutch, **Schwartz Tannebaum**, and **Rot Tannebaum**, and oftentimes also **Torenholtz**; which name notwithstanding doth also agree with other plants: in English, Pitch tree: in low-Dutch, **Deck boom**.

¶ The Temperature and Vertues.

The leaues, barke, and fruit of the Pitch tree, are all of one nature, vertue, and operation, and of the same facultie with the Pine trees.

CHAP. 41. Of the Pine Tree:

¶ The Kindes.

THe Pine Tree is of two sorts, according to *Theophrastus*; the one *ῥαπὴς*, that is to say, tame, or of the garden; the other *ῥυτίς*, or wilde: he saith that the Macedonians do adde a third, which is *ῥαπὴς* or barren, or without fruit, that vnto vs is vnkowne: the later writers haue found moe as shall be declared.

Pinus sativa, five domestica.

The tame or manured Pine tree.

¶ The Description.

THe Pine tree groweth high, and great in the trunk or bodie, which below is naked, but aboue it is clad with a multitude of boughes, which diuide themselves into diuers branches, whereon are set small leaues, verie straight, narrow, somewhat hard and sharp pointed: the wood or timber is hard, heavy, about the heart or middle ful of an oileous liquor, & of a reddish colour: the fruit or clogs are hard, great, and consist of many sound woody scales, vnder which are included certaine knobs, without shape, couered with a wooden shell, like small nuts, wherein are white kernels, long, very sweet, and couered with a thin skin or membrane, that easily is rubbed off with the fingers, which kernell is vsed in medicine.

¶ The Place.

This tree groweth of it selfe in many places of Italie, and especially in the territorie of Rauenna, and in Languedock, about Marfiles, in Spain, & in other regions, as in the East countries: it is also cherished in the gardens of pleasure, as well in the Low-countries as England.

¶ The Time.

The Pine tree groweth greene both winter and Sommer: the fruit it commonly two yeres before it be ripe: wherefore it is not to be found without ripe fruit, and also others as yet verie small, and not come to ripeness.

¶ The Names.

It is called in Latine, *Pinus*, and *Pinus sativa*, *urbana*, or rather *mansueta*: in English, tame and garden Pine: of the Macedonians and other Gracians, *ῥαπὴς* *ῥαπὴς*; but the Arcadians name it *ῥαπὴς*; for that which the Macedonians call *ῥαπὴς*, the Arcadians name *ῥαπὴς*, as *Theophrastus* saith, and so doth the tame Pine in Arcadia, and about Elia change her name: and by this alteration of them it happens that the fruit or Nuts of the Pine tree found in the Cones or Apples, be named in Greeke by *Dioscorides*, *Galen*, *Paulus*, and others, *ῥαπὴς*, as though they should terme it *ῥαπὴς* *ῥαπὴς*, or the fruit of the Pine tree.

There is also another *ῥαπὴς*: in Latine *Picea*, or the Pitch tree, which differeth much from the Pine tree: but *Pytis* of Arcadia differeth nothing from the Pine tree, as we haue said.

The fruit or apples of these be called in Greeke *ῥαπὴς*, and in Latine *Coni*: notwithstanding *Conos* is a common name to all the fruits of these kind of trees: they also be named in Latine, *Nuces pinea*: by *Mnesitheus* in Greeke *ῥαπὴς*, by *Diocles Carystius*, *ῥαπὴς*, which be notwithstanding the fruit or clogges of the tree that *Theophrastus* nameth *ῥαπὴς*, or the wilde Pine tree, as *Athenaus* saith. It is thought that the whole fruit is called by *Galen* in his 4. Commentarie vpon *Hipocrates* Bookes of Diet in sharpe diseases, *Strobilos*: yet in his 2. booke of the Faculties of Nourishments hee doth not call *Conos* or the apple by the name of *Strobilos*, but the nuts contained in it. And in like manner in his seuenth book of the Faculties of Simple medicines, the Pine Apple fruit, saith he, which they

they call *Coccalus*, and *Strobilus*, as we have said before, that these are named in Greeke *πινος*. This apple is called in high Dutch, *Zyzel*: in low Dutch, *Pin appel*: in English, Pine apple, Clogge, and Cone.

¶ The Temperature and Vertues.

- A The kernels of these nuts do concoct and moderately heate, being in a meane betweene cold and hot: it maketh the rough parts smooth, it is a remedy against an old cough, and long infirmities of the chest, being taken by it selfe or with hony, or else with some other licking thing.
- B It cureth the Ptisicke, and those that pine and consume away through the rottenesse of their lungs: it recouereth strength, it nourisheth and is restorative to the bodie.
It yeeldeth a thicke and good iuice, and nourisheth much, yet is it not altogether easie of digestion, and therefore it is mixed with preserues, or boyled with sugar.
- C The same is good for the stone in the Kidneies, and against frettings of the bladder, and scalding of the vrine, for it alayeth the sharpnesse, mitigateth paine, and gently prouoketh vrine: moreouer, it increaseth milke and seed, and therefore it also prouoketh fleshly lust.
- D The whole Cone or Apple being boyled with fresh Horehound, saith *Galen*, and afterwards boiled againe with a little hony til the decoction be come to the thicknesse of hony, maketh an excellent medicine for the clenfing of the chest and lungs.
- E The like thing hath *Dioscorides*, the whole Cones, saith hee, which are newly gathered from the trees, broken and boiled in sweet wine are good for an old cough, and consumption of the lungs, if a good draught of that liquour be drunke every day.
- F The scales of the Pine apple, with the barke of the tree, do stoppe the laske and the bloudy fluxe, they prouoke vrine, and the decoction of the same hath the like propertie.

CHAP. 42. Of the Wilde Pine tree.

1 *Pinus sylvestris*.

The wilde Pine tree.

2 *Pinus sylvestris mugo*.

The low wilde Pine tree.

¶ The Description.

1 The first kinde of wilde Pine tree groweth very great, but not so high as the former, bearing the tame or manured Pine tree; the barke thereof is glib: the branches are spread abroad, beset with long sharpe pointed leaues: the fruit is somewhat like the tame Pine tree, with some Rosine therein, and sweet of smell, which doth easily open it selfe, and quickly falleth from the tree.

2 The second kinde of wilde Pine tree groweth not so high as the former, neither is the stem growing straight vp, but yet it bringeth forth many branches, long, slender, and so easie to be bent or bowed, that hereof they make Hoops for wine Hogs-heads and Tuns: the fruit of this pine is greater than the fruit of any of the other wilde Pines.

3 The third kinde of wilde Pine tree groweth straight vpright, and waxeth great and high, yet not so high as the other wilde kinds: the branches do grow like the pitch tree: the fruit is long and big, almost like the fruit of the said Pitch tree, wherein are contained smal triangled nuts, like the nuts of the Pine Apple tree, but smaller, & more brittle, in which is contained a kernell of a good taste, like the kernell of the tame Pine apple: the wood is beautiful, and sweet of smell, good to make tables and other workes of.

4 There is another wilde Pine of the mountaine, not differing from the precedent but in stature, growing for the most part like a hedge tree, wherein is the difference.

3 *Pinus sylvestris montana.*

The mountaine wilde Pine tree.

4 *Pinus montana minor.*

The smaller wilde Pine tree.

5 This kinde of Pine, called the sea Pine tree, groweth not above the height of two men, having leaues like the tame Pine tree, but shorter: the fruit is of the same forme, but longer somewhat fashioned like a Turnep: this tree yeeldeth very much Rosine. ‡ Bauhine iudges this all one with the third. ‡

6 The sixth kinde of wilde Pine being one of the Sea Pines, groweth like an hedge tree or shrub feldome exceeding the height of a man; with little leaues like those of the Larch tree, but alwaies continuing with a very little cone, and fine small kernell.

7 The bastard wilde Pine tree groweth vp to a meane height; the trunke or bodie, as also the branches

5 *Pinus maritima maior.*
The great Sea Pine tree.

6 *Pinus sylvestris minor.*
The little Sea Pine Tree.

7 *Teda sive pseudopinus.*
The bastard wilde Pine.

8 *Pinaster Austriacus.*
Dwarfe Pine with vpright Cones.

‡ 9 *Pinaster maritimus minor*:
Dwarfe Sea Pine.

are little and slender, the kernell small, blackish, and winged as the rest. *Clusius* found this onely in some few places of the kingdome of Murcia in Spaine, wherefore he calls it, *Pinaster 3. Hispanicus*. *Dodonæus* calls it *Pinus maritima minor*. ‡

¶ The Place.

These wilde Pines doe grow vpon the cold mountaines of Liuania, Polonia, Noruegia, and Russia, especially vpon the Island called Holland within the Sownd, beyond Denmarke, and in the woods by Narua, vpon the Liefeland shore, and all the tract of the way, being a thousand Wersts, (each Werst containing three quarters of an English mile) from Narua vnto Moscouia, where I haue seene them grow in infinite numbers.

¶ The Time.

The fruit of these Pine trees is ripe in the end of September: out of all these issueth forth a white and sweet smelling Rosine: they are also changed into *Teda*, and out of these is boiled through the force of the fire, a blacke Pitch: the Pitch tree and the Larch tree be also sometimes changed into *Teda*; yet very seldome, for *Teda* is a proper and peculiar infirmitie of the wilde Pine tree. A tree is said to be changed into *Teda*, when not onely the heart of it, but also the rest of the substance is turned into fatnesse.

¶ The Names.

All these are called in Greeke *μικρὴν ἐλάτην*: and in Latine *Sylvestres Pini*: of *Pliny*, *Pinastri*: *Pinaster*, saith he in his 16. booke. 10 chapter, is nothing else but *Pinus sylvestris*, or the wild Pine tree, of a lesser height, and full of boughes from the middle, as the tame Pine tree in the top, (most of the copies haue falsely) of a maruellous height: they are far deceiued who thinke that the Pine tree is called in Greeke *ἐλάτην*, besides the tame Pine which notwithstanding is so called not of all men, but onely of the Arcadians (as we haue said before) *ἐλάτην*, all men do name the wilde *μικρὴν ἐλάτην*, and therefore *Teda*, or the Torch Pine, hereof is said to be in Latine not *Picea*, but *Pinea*, that is, not the Pitch-tree, but the Pine tree, as *Ouid* doth planly testifie in his Heroicall Epistles;

ches & leaues are like vnto those of the matured Pine tree: the onely difference is, that some yeares it resembleth the Pine it selfe; and the other yeares as a wilde hedge tree, varying often, as nature listeth to play and sport her selfe amongst her delights, with other plants of lesse moment: the timber is soft, and not fit for building, but is of the substance of our Birch tree: the fruit is like those of the other wilde Pines, whereof this is a kinde.

‡ 8 This dwarfe Austrian Pine exceeds not the height of a man, but immediately from the root is diuided and spread abroad into tough, bending, pretty thicke branches, couered ouer with a rough barke: the leaues, as in the former, come two out of one hose, thicker, shorter, blunter pointed, and more Greene than the former: the cones or clogs are but small, yet round, and compact, and hang not dowewards, but stand vpright: the foot is tough and wooddie like other plants of this kinde: It growes on the Austrian and Styrian Alpes. *Clusius* sets it forth by the name of *Pinaster 4. Austriacus*.

9 This other Dwarfe is of the same height with the former, with such tough and bending branches, which are neither so thick nor clad with so rough a barke, nor so much spread. The leaues also are smaller, and not vnlike those of the *Larix* tree, but not so soft, nor falling euery yeare as they do. The cones

*Vt vidi, vt perij, nec notis ignibus arsi,
Ardet vt ad magnos Pineae Teda deos.*

Also in *Fastorum* 4.

*Illic accendit geminas pro lampade Pinus:
Hinc Cereris sacris nunc quoque Teda datur.*

The same doth *Virgill* also signifie in the seuenth of his *Aeneid*.

*Ipsa inter medias, flagrantem feruida Pinum
Sustinet.*

Where in stead of *Flagrantem Pinum*, *Servius* admonisheth vs to vnderstand *Teda Pineae*. *Catullus* also consenteth with them in the marriage song of *Julia* and *Mallius*.

Manu
Pineam quate tedam.

And *Prudentius* in *Hymno Cerei Paschalis*.

Seu Pinus piceam fert alimoniam.

Moreouer, the herbe *Peucedanos*, or *Horestrong*, so named of the likenesse of *πυκνόν*, is called also in Latine *Pinastellum*, of *Pinus* the Pine tree: all which things do evidently declare that *πικνόν* is called in Latine not *Picea*, but *Pinus*.

The first of these wilde kinds may be *Idaea Theophrasti*, or *Theophrastus* his Pine tree, growing on mount *Ida*, if the apple which is shorter were longer: for he nameth two kinds of wilde Pines, the one of mount *Ida*, and the other the Sea Pine with the round fruit: but we hold the contrarie, for the fruit or apple of the wilde mountaine Pine is shorter, and that of the Sea Pine longer. This may more truly be *Macedonum mas*, or the Macedonians male Pine, for they make two sorts of wilde Pines, the male and the female, and the male more writhed and harder to be wrought vpon, and the female more easie; but the wood of this is more writhed, and not so much in request for workes, as the other, and therefore it seemeth to be the male. This wilde Pine tree is called in high Dutch, *Hartzbaum*, and *wilder Hartzbaum*: in Gallia Celtica, *Elvo Aleuo*: and in Spanish, *Pino Carax*.

The second wild Pine tree is named commonly of the Italians *Tridentinis*, and *Ananienfibus*, *Cembro*, and *Cirmolo*; it seemeth to differ nothing at all from the Macedonians wilde female Pine, for the wood is easie to be wrought on, and serueth for diuers and sundry workes.

The third they call *Mugo*: this may be named not without cause *κακόν*, that is to say, *Humilis Pinus*, or Dwarf Pine: yet doth it differ from *Chamaepeuce* the Herbe called in English, Ground Pine.

The fourth wilde Pine is named in Greeke *καλαμίσκος*: in Latine, *Maritima*, and *Marina Pinus*: in English, Sea Pine.

That which the Latines call *Teda*, is named in Greeke *τέδα*, and *τάδα*: in high Dutch, *Kynholtz*: it may be termed in English, Torch-pine.

Pliny is deceived, in that he supposeth the Torch Pine to bee a tree by it selfe, and maketh it the sixth kinde of Cone-tree; as likewise he erreth in taking *Larix*, the Larch tree, for *πικνόν*, the Pine Tree. And as *Dioscorides* maketh so little difference as scarce any, betweene *πικνόν* and *μύρος*, and supposeth them to be both of one kinde, so likewise he setteth downe faculties common to them both.

¶ The Temperature and Vertues.

- A The barke of them both, saith he, doth binde; being beaten and applied it cureth Merigals, and also shallow vlcers and burnings if it be layed on with Litharge and fine Frankincense.
- B With the Cerote of Myrtles it healeth vlcers in tender bodies: being beaten with Copperas it staieth tetters, and creeping vlcers: it draweth away the birth and after birth, if it be taken vnder in a fume: being drunke it stoppeth the belly, and prouoketh vrine.
- C *Galen* hath almost the same things, but he saith, that the barke of the Pine tree is more temperate than that of the Pitch tree; the leaues stamped take away hot swellings and sores that come thereof.
- D Being stamped and boyled in vineger, they assuage the paine of the teeth, if they be washed with this decoction hot: the same be also good for those that haue bad liuers, being drunke with water or mead.
- E Of the same operation is likewise the barke of the pine nuts; but *Galen* affirmeth that the Cone

or

or apple, although it seeme to be like these is notwithstanding of lesser force, inſomuch as it cannot effectually performe any of the aforeſaid vertues, but hath in it a certaine biting qualitie, which hurteth.

The Torch Pine cut into ſmall pieces and boiled in vinegar, is a remedy likewiſe againſt the tooth-ache if the teeth be waſhed with the decoction. F

Of this there is made a profitable ſpather or ſlice to be uſed in making of compound plaſters and peſſaries that eaſe paine. G

Of the ſmoke of this is made a blacke which ſerueth to make inke of, and for eating ſores in the corners of eies, and againſt the falling away of the haire of the eie lids, and for watering and bleere eies, as *Dioſcorides* teacheth. H

Of Roſins.

¶ The Kindes.

OVt of the Pine trees, eſpecially of the wilde kinds, there iſſueth forth a liquid, whitish, and ſweet ſmelling Roſin, and that many times by it ſelfe; but more plentifully either out of the cut and broken boughes, or forth of the body when the tree commeth to be a Torch Pine.

2 there iſſueth alſo forth of the crackes and chinkes of the barke, or out of the cut boughes, a certaine dry Roſin, and that forth of the Pine Tree or Firre Tree.

There is likewiſe found a certaine congealed Roſin vpon the cones or apples.

It is called in Latine, *Refina*: in Greeke, *ῥηνίνη*: in high Dutch, *Hartz*: in low Dutch, *Herſt*: in Italian, *Ragia*: in Spaniſh, *Refina*: in Engliſh, Roſin.

The firſt is named in Latine, *Liquida Refina*: in Greeke, *ῥηνίνη ὕγια*, and of diuers, *ἀποπύρρος*, that it to ſay, iſſueth out of it ſelfe: of the Lacedemonians, *πρωτοπύρρος*, or *Primiſſua*, the firſt flowing Roſin: and in Cicilia, *καμμίον*, as *Galen* writeth in his third booke of medicines according to the kinds: in ſhops *Refina Pini*, or Roſin of the Pine tree, and common Roſin. It hapneth oftentimes through the negligent and careleſſe gathering thereof, that certaine ſmall pieces of wood, and little ſtones be found mixed with it: this kinde of Roſin *Galen* ſurnameth *συγκυμμίον*, as though he ſhould ſay, confuſed, which being melted and clenſed from the drotte becommeth hard and brittle.

The like hapneth alſo to another liquid Roſin, which after it is melted, boiled, and cooled againe, is hard and brittle, and may likewiſe be beaten, ground, and ſearced; and this Roſin is named in Greeke *φρυκτῆ*: in Latine, *Friſta*, and many times *Colophonia*, in Greeke, *κολοφώνια*: which name is uſed among the Apothecaries, and may ſtand for an Engliſh name; for *Galen* in his third booke of Medicines according to their kinds ſaith, that it is called *Friſta*, and of ſome *Colophonia*: that, ſaith he, is the drieſt Roſin of all, which ſome call *Friſta*, others *Colophonia*: becauſe in times paſt, as *Dioſcorides* writeth, it was fetched from *Colophon*, this being yellow or blacke in compariſon of the reſt, is whitewhen it is beaten: *Pliny* in his 14. booke, 20. chapter.

The ſecond Roſin is named in Greeke *ῥηνίνη ἁγία*, ſpecially that of the Pitch tree without fatneſſe, and that ſoone waxeth dry, which *Galen* in his 6. booke of Medicines according to the kinds, calleth properly *φύσκη μαύρος*: that which in Aſia is made of the Pitch tree being very white, is called *Spagas*, as *Pliny* teſtifieth.

The third is called in Greeke *ῥηνίνη ῥεβελίνη*, the ſame is alſo named *φύσκη ῥεβελίνη*: this is vnkowne in ſhops. Yet there is to be ſould a certaine dry Roſin, but the ſame is compounded of the Roſins of the Pine tree, of the cones or clogs, and of the Firre tree mixed altogether, which they call *Gari-pot*: this is uſed in perfumes in ſtead of Frankincenſe, from which notwithstanding it farre differeth.

¶ The Temperature and Vertues.

All the Roſins are hot and dry, but not all after one manner: for there is a difference among them: they which be ſharper and more biting, are hotter, as that which commeth of the cones, being of Roſins the hotteſt, becauſe it is alſo the ſharpeſt: the Roſin of the Pitch Tree is not ſo much biting, and therefore not ſo hot: the Roſin of the Firre tree is in a meane between them both; the liquid Roſin of the Pine is moiſter, comming neere to the qualitie and facultie of the Larch Roſin. A

The Roſins which are burnt or dried, as *Dioſcorides* teſtifieth, are profitable in plaſters, and compositions that eaſe wearifomenefſe; for they do not onely ſupple or mollifie, but alſo by reaſon of the thinneſſe of their parts and dryneſſe, they digeſt: therefore they both mollifie and waſt away ſwellings, and through the ſame facultie they cure wearifomenefſe, being uſed in compound medicines for that purpoſe. B

The liquid Roſins are very fitly mixed in ointments, commended for the healing vp of greene wounds, for they both bring to ſuppuratiſon, and do alſo glue and vnite them together. C

Y y y y

Moreouer,

D Moreover, there is gathered out from the Rosins as from Frankincense, a congealed smoke, called in Latine *Fuligo*; in Greeke *μύκη* and in English, Blacke, which serueth for medicines that beautifie the eie lids, and cure the fretting sores of the corners of the eies, and also watering eies, for it drieth without biting.

E There is made hereof saith *Dioscorides*, writing inke, but in our age not that which we write withall, but the same which serueth for Printers to print their bookes with, that is to say, of this blacke, or congealed smoke, and other things added.

Of Pitch and Tar.

The manner of drawing forth of Pitch.

Out of the fattest wood of the Pine tree changed into the Torch Pine, is drawne Pitch by force of fire. A place must be paved with stone, or some other hard matter, a little higher in the middle, about which there must also be made gutters, into which the liquor shall fall; then out from them other gutters are to be drawne, by which it may be receiued; being receiued, it is put into barrels. The place being thus prepared, the clouen wood of the Torch Pine must be set vpright; then must it be couered with a great number of Fir and Pitch boughes, and on euery part all about with much lome and earth: and great heed must be taken, least there be any cleft or chinke remaining, onely a whole left in the top of the furnace, thorow which the fire may be put in, and the flame and smoke may passe out: when the fire burneth the Pitch runneth forth, first the thin, and then the thicker.

This liquor is called in Greeke *μύκη*: in Latine, *Pix*: in English, Pitch, and the moisture, euen the same that first runneth is named of *Plinie* in his 16. booke, 11. chapter, *Cedria*. There is boyled in Europe, saith he, from the Torch Pine a liquid Pitch vsed about ships, and seruing for many other purposes; the wood being clouen is burned with fire, and set round about the furnaces on euery side, after the manner of making Charcoles: the first liquor runneth thorow the gutter like water: (this in Syria is called *Cedrium*, which is of so great vertue, as in Ægypt the bodies of dead men are preserued, being all couered ouer with it) the liquor following being now thicker, is made Pitch. But *Dioscorides* writeth, that *Cedria* is gathered of the great Cedar tree, and nameth the liquor drawne out of the Torch tree by force of fire, *μύκη*: this is, that which the Latines call *Pix liquida*: the Italians, *Peceliquida*: in high Dutch, *weich bach*: in low Dutch, *Teer*: in French, *Poix foudire*: in Spanish, *Pex liquida*: certaine Apothecaries, *Kitran*: and we in English, Tar.

And of this when it is boiled is made a harder Pitch: this is named in Greeke *εὐμύκη*: in Latine, *Arida*, or *sicca Pix*: of diuers, *παλινμύκη*: as though they should say, *Iterata Pix*, or Pitch iterated: because it is boiled the second time. A certaine kinde hereof being made clammie or glewing is named *Βουξίς*: in shops, *Pix naualis*, or Ship Pitch: in high Dutch, *Bach*: in low Dutch, *Steenpeck*: in Italian, *Pese secca*: in French, *Poix seche*: in Spanish, *Peç seca*: in English, Stone Pitch.

The Temperature and Vertues.

A Pitch is hot and dry, Tarre is hotter, and stone pitch more drying, as *Galen* writeth. Tar is good against inflammations of the almonds of the throte, and the uvula, and likewise the Squincie, being outwardly applied.

B It is a remedie for mattering eares with oile of Roses: it healeth the bitings of Serpents, if it be beaten with salt and applied.

C With an equall portion of wax it taketh away foule ilfavoured nailes, it wasteth away swellings of the kernels, and hard swellings of the mother and fundament.

D With barley meale and a boies vrine it consumeth *χρυσόδακ*, or the Kings euill: it staieth eating vlcers, if it be laid vnto them with brimstone, and the barke of the Pitch Tree, or with branne.

E If it be mixed with fine Frankincense, and a cerote made thereof, it healeth chops of the fundament and feet.

F Stone Pitch doth mollifie and soften hard swellings: it ripens and maketh matter, and wasteth away hard swellings and inflammations of kernels: it filleth vp hollow vlcers, and is fitly mixed with wound medicines.

G What vertue Tarre hath when it is inwardly taken we may reade in *Dioscorides* and *Galen*, but we set downe nothing thereof, for that no man in our age will easily vouchsafe the taking.

H There is also made of Pitch a congealed smoke or blacke, which serueth for the same purposes, as that of the Rosins doth.

CHAP. 43. Of the Firre or Deale Tree.

¶ The Description.

THe Firre tree groweth very high and great, hauing his leaues euer greene, his trunke or body smooth, euen and straight, without ioints or knots, vntill it hath gotten branches; which are many and very faire, beset with leaues, not much vnlike the leaues of the Ewe tree, but smaller: among which come forth floures vpon the taller trees, growing at the bottomes of the leaues like little catkins, as you may see them exprest in a branch apart by themselves: the fruit is like vnto the Pine Apple, but smaller and narrower, hanging downe as the Pine Apple: the timber hereof excelleth all other timber for the masting of ships, posts, rails, deale boords, and sundry other purposes.

¶ *Abies.*

The Firre tree.

¶ 2 *Abies mas.*

The male Firre tree.

2 There is another kinde of Firre tree, which is likewise a very high and tall tree, and higher than the Pine: the body of it is straight without knots below, waxing smaller and smaller euen to the very top: about which it sendeth forth boughes, foure together out of one and the selfe same part of the body, placed one against another, in manner of a crosse, growing forth of the foure sides of the body, and obseruing the same order euen to the very top: out of these boughes grow others also, but by two and two, one placed right against another, out of the sides, which bend downwards when the other beare vpwards: the leaues compassse the boughes round about, and the branches thereof: they be long, round, and blunt pointed, narrower, and much whiter than those of the Pitch tree, that is to say, of a light greene, and in a manner of a white colour: the cones or clogs be long, and longer than any others of the cone trees, they consist of a multitude of soft scales, they hang downe from the end of the twigs, and doe not easily fall downe, but remaine on the tree a very long time: the kernels in these are small, not greater than the kernels of the Cherrie stone, with a thinne skin growing on the one side, very like almost to the wings of Bees, or great Flies: the timber or substance of the wood is white, and clad with many coats, like the head of an Onion.

Y y y y 2

¶ The

‡ *Abietis ramus cum julis.*

A branch with Catkins or floures.

¶ The Place.

The Firre trees grow vpon high mountains, in many woods of Germany and Bohemia, in which it continueth alwaies greene; it is found also on hills in Italy, France, & other countries; it commeth downe oftentimes into the vallies: they are found likewise in Pruse, Pomerania, Liefeland, Russia, & especially in Norway, where I haue seene the goodliest trees in the world of this kinde, growing vpon the rockie and craggie mountaines, almost without any earth about them, or any other thing, sauing a little mosse about the roots, which thrust them selues here and there into the chinkes and crannies of the rockes, and therefore are easily cast downe with any extreme gale of winde. I haue seen these trees growing in Cheshire, Staffordshire, and Lancashire, where they grew in great plenty, as is reported, before *Noahs* flood: but then being ouerturned and ouerwhelmed haue lien since in the mosses and waterie moorish grounds very fresh and sound vntill this day, & so full of a resinous substance, that they burne like a Torch or Linke, and the inhabitants of those countries do call it Fir-wood, and Fire-wood vnto this day: out of this tree issueth the rosin called *Thus*, in English, Frankinsence: but from the young Fir trees proceedeth an excellent cleare and liquid Rosin, in taste like to the peelings or outward rinde of the Pomecitron,

¶ The Time.

The time of the Fir tree agreeth with the Pine trees.

¶ The Names.

The tree is called in Latine *Abies*: in Greeke, *ἄβις*: amongst the Græcians of our time the same name remaineth whole and vncorrupt: it is called in high Dutch *weiss Channen*, and *weiss Channen baum*: in Low Dutch, *witte Dennen boom*, or *Abel-boom*, and *Mast-boom*: in Italian, *Abete*: in Spanish, *Abeto*: in English, Firre-tree, Mast-tree, and Deale-tree. The first is called in French, *du Sap*, or *Sapin*: the other is *Suisse*.

The liquid rosin which is taken forth of the barke of the young Firre-trees, is called in Greeke *δακρυον τῆς ἄβιτος*: in Latine, *Lachryma abietis*, and *Lachryma abiegna*: in the shops of Germany, as also of England, *Terebintina Veneta*, or Venice Turpentine: in Italian, *Lagrime*: diuers do thinke that *Dioscorides* calleth it *ἰλακιδις resin*, *Oleasa Resina*, or oile Rosin; but oile Rosin is the same that *Pix liquida*, or Tar is.

Arida Abietum Resina, or drie Rosin of the Fir trees, is rightly called in Greeke *ρῆμα ἄβιτος*, and in Latine, *Abiegna Resina*: it hath a sweet smell, and is oftentimes vsed among other perfumes in stead of Frankincense.

¶ The Temperature.

The barke, fruit, and gums of the Fir tree, are of the nature of the Pitch tree and his gums.

¶ The Vertues.

- A The liquid Rosin of the Fir tree called Turpentine, looseth the belly, driueth forth hot cholerick humours, clenseth and mundifieth the kidnies, prouoketh vrine, and driueth forth the stone and grauell.
- B The same taken with Sugar and the pouder of Nutmegs, cureth the strangurie, staieth the Gonorrhoea or the inuoluntary issue of mans nature, called the running of the rains, and the white flux in women.
- C It is very profitable for all green and fresh wounds, especially the wounds of the head: for it healeth and clenseth mightily, especially if it be washed in Plantaine water, and afterward in Rose water, the yolke of an egge put thereto, with the pouders of *Olibanum* and Masticke finely searced, adding thereto a little Saffron.

CHAP.

CHAP. 44. Of the Larch Tree.

¶ The Description.

THe Larch is a tree of no small height, with a body growing straight vp: the bark whether in the nether part beneath the boughes is thicke, rugged, and full of chinks, which being cut in sunder is red within, and in the other part above smooth, slipperie, something whitewithout: it bringeth forth many boughes diuided into other lesser branches, which be tough and pliable. The leaues are small, and cut into many iags, growing in clusters thicke together like tassels, which fall away at the approach of Winter: the floures or rather the first shewes of the cones or fruit be round, and grow out of the tenderest boughes, being at the length of a braue red purple colour: the cones be small, and like almost in bignesse to those of the Cypresse tree, but longer, and made vp of a multitude of thin scales like leaues: vnder which lie small seeds, hauing a thin velme growing on them very like to the wings of Bees and wasps: the substance of the wood is very hard, of colour, especially that in the midst, somewhat red, and very profitable for workes of long continuance.

1 *Laricis ramulus.*

A branch of the Larch tree.

2 *Larix cum Agarico suo.*

The Larch tree with his Agarick.

It is not true that the wood of the Larch tree cannot be set on fire, as *Vitruvius* reporteth of the castle made of Larch wood, which *Cesar* besieged, for it burneth in chimneies, and is turned into coles, which are very profitable for Smithes, as *Matthiolus* writeth.

There is also gathered of the Larch tree a liquid Rosin, very like in colour and substance to the whiter hony, as that of Athens or of Spaine, which notwithstanding issueth not forth of it selfe, but runneth out of the stocke of the tree, when it hath been bored euen to the heart with a great and long auger and wimble.

Galen writeth, that there be after a sort two kindes hereof, in his 4. booke of Medicines, according to the kinds, one like vnto Turpentine, the other more sharper than this, hotter, more liquid

of a stronger smell, and in taste bitterer and hotter : but the later is thought not to be the Rosine of the Larch, but of the Fir-tree, which *Galen* because it is after a sort like in substance, might have taken for that of the Larch tree.

There groweth also vpon the Larch tree a kinde of Mushrum or excrescence, not such as is vpon other trees, but whiter, softer, more loose and spungie than any other of the Mushrooms, and good for medicine, which beareth the name of *Agaricus*, or *Agaricke* : I find that *Pliny* supposeth all the Masticke trees, and those that beare Galls, do bring forth this *Agaricum* : wherein he was somewhat deceiued, and especially in that he took *Glandifera* for *Conifera*, that is, those trees which beare mast or Acornes, for the Pine apple trees : but among all the trees that beare *Agaricus*, the Larch is the chiefe, and bringeth most plenty of *Agarick*.

¶ The Place.

The Larch tree groweth not in Greece, or in Macedon, but chiefly vpon the Alpes of Italy, not far from Trent, hard by the riuers *Benacus* and *Padus* ; and also in other places of the same mountaines : it is likewise found on hils in Morauia, which in times past was called the countrey of the Marcomans : *Fuchsius* writeth, that it groweth also in Silesia : others, in Lusatia, in the borders of Poland : it also groweth plentifully in the woods of Gallia Cesalpina.

Pliny hath said somewhat hereof, contradicting the writings of others, in his 16 book, 8 chapter, where he saith, that specially the Acorne trees of France do beare *Agaricke*, and not only the acorn trees, but the Cone trees also, among which, saith he, the Larch tree is the chiefe that bringeth forth *Agaricke*, and that not onely in Gallia, which now is called France, but rather in Lumbardy and Piemont in Italy, where there be whole woods of Larch trees, although they be found in some smal quantitie in other countries.

The best *Agarick* is that which is whitest, very loose and spungie, which may easily be broken, and is light, and in the first taste sweet, hard, and well compact : that which is heauy, blackish, and containing in it little threds as it were of sinewes, is counted pernicious and deadly.

¶ The Time.

Of all the Cone trees onely the Larch tree is found to be without leaues in the Winter : in the Spring grow fresh leaues out of the same knobs, from which the former did fall. The cones are to be gathered before winter, so soone as the leaues are gone : but after the scales are loosed and opened, the seeds drop away : the Rosine must be gathered in the Sommer moneths.

¶ The Names.

This tree is called in Greeke *ἀρίξ* : in Latine also *Larix*, in Italian and Spanish, *Larice* : in high Dutch, *Lerchenbaum* : in low Dutch *Lozkenboom* : in French, *Melese* : in English, Larch tree, and of some *Larix* tree.

The liquid Rosin is named by *Galen* also *ἀρίξ* : the Latines call it *Resina Larigna*, or *Resina Laricea*, Larch Rosin : the Italians, *Larga* : the Apothecaries, *Terebinthina*, or Turpentine, and it is sold and also mixed in medicines in stead thereof : neither is that a thing newly done, for *Galen* likewise in his time reporteth, that the Druggers sold the Larch Rosine in stead of Turpentine : and this may be done without error, for *Galen* himselfe in one place vseth Larch Rosin for Turpentine, and in another, Turpentine for Larch Rosine, in his booke of medicines according to the kinds.

The *Agaricke* is also called in Greeke *ἀγάριον* and *ἀγάρινος* : in Latine, *Agaricum* and *Agaricus*, and so likewise in shops : the Italians, Spaniards, and other nations do imitate the Greeke word, and in English we call it *Agaricke*.

¶ The Temperature and Vertues.

- A The leaues, barke, fruit and kernell, are of temperature like vnto the Pine, but not so strong.
- B The Larch Rosin is of a moister temperature than all the rest of the Rosines, and is withall without sharpnesse or biting, much like to the right Turpentine, and is fitly mixed with medicines which perfectly cure vlcers and greene wounds.
- C All Rosins, saith *Galen*, that haue this kinde of moisture and clamminesse ioined with them, do as it were binde together and vnite dry medicines, and because they haue no euident biting qualitie, they doe moisten the vlcers nothing at all : therefore diuers haue very well mixed with such compound medicines either Turpentine Rosin, or Larch Rosin : thus far *Galen*. Moreouer, Larch Rosin performeth all such things that the Turpentine Rosin doth, vnto which, as we haue said, it is much like in temperature, which thing likewise *Galen* himselfe affirmeth.
- D *Agaricke* is hot in the first degree and dry in the second, according to the old writers. It cutteth, maketh thin, clenseth, taketh away obstructions or stoppings of the intrailles, and purgeth also by stool.
- E *Agaricke* cureth the yellow iaudice proceeding of obstructions, and is a sure remedie for cold shakings, which are caused of thicke and cold humors.
- F The same being inwardly taken and outwardly applied, is good for those that are bit of venomous beasts which hurt with their cold poison.

It

It prouoketh vrine, and bringeth downe the menses: it maketh the body well coloured, driueth forth wormes, cureth agues, especially quotidian and wandring feuers, and others that are of long continuance, if it be mixed with fit things that serue for the disease: and these things it performes by drawing forth and purging away grosse, cold, and flegmaticke humors, which cause the diseases.

From a dram weight, or a dram and a halfe, to two, it is giuen at once in substance or in powder: the weight of it in an infusion or decoction is from two drams to five.

But it purgeth slowly, and doth somewhat trouble the stomacke; and therefore it is appointed that Ginger should be mixed with it, or wilde Carrot seed, or Louage seed, or Sal gem, in Latine, *Sal fossilis*.

Galen, as Mesue reporteth, gaue it with wine wherein Ginger was infused: some vse to giue it with Oxymel, otherwise called syrrop of vineger, which is the safest way of all.

Agaricke is good against the paines and swimming in the head, or the falling Euill, being taken with syrrop of vineger.

It is good against the shortnesse of breath, called *Asthma*, the inueterate cough of the lungs, the pty sicke, consumption, and those that spet blood: it comforteth the weake and feeble stomacke, causeth good digestion, and is good against wormes.

CHAP. 45. Of the Cypresse tree.

Cupressus satina & syluestris.

The Garden and wild Cypresse tree.

The Description.

The tame or manured Cypresse tree hath a long thicke and straight body; whereupon many slender branches do grow, which do not spred abroad like the branches of other trees, but grow vp alongst the body, yet not touching the top: they grow after the fashion of a steeple, broad below, and narrow toward the top: the substance of the wood is hard, sound, well compact, sweet of smell, and somewhat yellow, almost like the yellow Saunders, but not altogether so yellow, neither

ther doth it rot nor wax old, nor cleaueth or choppeth it self. The leaues are long, round like those of Tamariske, but fuller of substance. The fruit or nuts do hang vpon the boughes, being in manner like to those of the Larch tree, but yet thicker and more closely compact: which being ripe do of themselves part in sunder, and then falleth the seed, which is shaken out with the winde: the same is small, flat, very thin, of a swart ill fauoured colour, which is pleasant to Ants or Pismires, and serueth them for food.

Of this diuers make two kindes, the female and the male; the female barren, and the male fruitfull. *Theophrastus* reporteth, that diuers affirme the male to come of the female. The Cypresse yeelds forth a certaine liquid Rosin, like in substance to that of the Larch tree, but in taste marvellous sharpe and biting.

The wilde Cypresse, as *Theophrastus* writeth, is an high tree, and alwaies greene, so like to the other Cypresse, as it seemeth to be the same both in boughes, body, leaues, and fruit, rather than a certaine wilde Cypresse: the matter or substance of the wood is sound, of a sweet smell, like that of the Cedar tree, which rotteth not: there is nothing so crisped as the root, and therefore they vse to make precious and costly workes thereof.

‡ I know no difference betweene the wilde and tame Cypresse of our Author, but in the handfomnesse of their growth, which is helped somewhat by art. ‡

¶ The Place.

The tame and manured Cypresse groweth in hot countries, as in Candy, Lycia, Rhodes, and also in the territorie of Cyrene: it is reported to be likewise found on the hills belonging to Mount Ida, and on the hills called *Leuci*, that is to say white, the tops whereof be alwaies couered with snow. *Bellonius* denieth it to be found vpon the tops of these hills, but in the bottoms on the rough parts and ridges of the hills: it groweth likewise in diuers places of England where it hath beene planted, as at Sion a place neere London, sometime a house of Nunnes: it groweth also at Greenwich, and at other places, and likewise at Hampsted in the garden of Mr. *Wade*, one of the Clerkes of her Maiesties priuy Councell.

The wilde kinde of Cypresse tree groweth hard by *Ammons* Temple, and in other parts of the countrey of Cyrene vpon the tops of mountaines, and in extreme cold countries. *Bellonius* affirmeth, that there is found a certaine wilde Cypresse also in Candy, which is not so high as other Cypresse trees; nor groweth sharpe toward the top, but is lower, and hath his boughes spred flat, round about in compasse: he saith the body thereof is also thicke: but whether this be *Thya*, of which *Theophrastus* and *Pliny* make mention, we leaue it to consideration.

¶ The Time.

The tame Cypres tree is alwaies greene; the fruit may be gathered thrice a yeare, in Ianuarie, May, and September, and therefore it is syrnamed *Trifera*.

The wilde Cypres tree is late, and very long before it buddeth.

¶ The Names.

The tame Cypres is called in Greeke, *Κυπάρισσος*, or *Κυπάρις*: in Latine, *Cupressus*: in shops, *Cypressus*: in Italian, *Cypressso*: in French and Spanish, *Cipres*: in high-Dutch, *Cipressenbaum*: in low-Dutch, *Cypresse boom*: in English, Cypres, and Cypres tree.

The fruit is named in Greeke, *Σπείρις τῆς κυπάρις*: in Latine, *Pilule Cupressi*, *Nuces Cupressi*, and *Galluli*: in shops, *Nuces Cypressi*: in English, Cypres nuts or clogs. This tree in times past was dedicated to *Pluto*, and was said to be deadly; whereupon it is thought that the shadow thereof is vnfortunate.

The wilde Cypres tree is called in Greeke, *Θύα* or *Θύων*, and *Θύον*: from this doth differ *Θύα*, being a name not of a plant, but of a mortar in which dry things are beaten: *Thya*, as *Pliny* writeth, lib. 13. cap. 16. was well knowne to *Homer*: he sheweth that this is burned among the sweet smells, which *Circe* was much delighted withall, whom he would haue to be taken for a goddesse, to their blame that call sweet and odoriferous smells, euen all of them, by that name; because he doth especially make mention withall in one verse, of *Cedrus* and *Thya*: the copies haue falsly *Larix*, or Larch tree, in which it is manifest that he spake onely of trees: the verse is extant in the fift booke of *Odysses*, where he mentioneth, that *Mercurie* by *Iupiters* commandement went to *Calypsus* den, and that he did smell the burnt trees *Thya* and *Cedrus* a great way off.

Theophrastus attributeth great honor to this tree, shewing that the roofs of old Temples became famous by reason of that wood, and that the timber thereof, of which the rafters are made is everlasting, and it is not hurt there by rotting, cobweb, nor any other infirmitie or corruption.

¶ The Temperature.

The fruit and leaues of the Cypres are dry in the third degree, and astringent.

¶ The Vertues.

A The Cypres nuts being stamped and drunken in wine, as *Dioscorides* writeth, stoppeth the laske and bloody flux; it is good against the spitting of blood and all other issues of blood.

They

They glue and heale vp great vlcers in hard bodies : they safely and without harme soke vp and B
consume the hid and secret moisture lying deepe and in the bottome of weake and moist infir-
mities.

The leaues and nuts are good to cure the rupture, to take away the *Polypus*, being an excrescence C
growing in the nose.

Some do vse the same against carbuncles and eating sores, mixing them with parched Barley D
meale.

The leaues of Cypres boyled in sweet wine or Mede, helps the strangurie and difficulty of ma- E
king water.

It is reported, that the smoke of the leaues doth driue away gnats, and that the clogs do so like- F
wife.

The shauings of the wood laid among garments preferueth them from the moths : the rosin kil- G
leth Moths, little wormes, and magots.

† Our Author in this chapter hath put together two chapters of *Dodonæus*; the one of *Cypresse*, the other of *Thya*, out of *Theophrastus* and others. Vid. *Pempt.* 6.
lib. 5. cap. 7 & 8.

CHAP. 46. Of the Tree of Life.

Arbor Vita.

The Tree of Life.

¶ The Description.

THE tree Tree of Life groweth to the height of a
small tree, the barke being of a darke reddish
colour : the timber very hard, the branches sprea-
ding themselves abroad, hanging down toward the
ground by reason of the weaknesse of the twiggie
branches surcharged with very oileous and ponde-
rous leaues, casting, and spreading themselves like
the feathers of a wing, resembling those of the Sa-
uine tree, but thicker, broader, and more full of gum-
mie or oileous substance : which being rubbed in
the hands do yeeld an aromattick, spicie, or gummie
sauer, very pleasant and comfortable : amongst the
leaues come forth small yellowish floures, which in
my garden fall away without any fruit : but as it
hath beene reported by those that haue seene the
same, there followeth a fruit in hot regions, much
like vnto the fruit of the Cypres tree, but smaller,
compact of little and thinne scales closely pact one
vpon another, which my selfe haue not yet seene.
The branches of this tree laid downe in the earth
wil very easily take root, euen like the Woodbinde
or some such plant, which I haue often proued, and
thereby haue greatly multiplied these trees.

¶ The Place.

This tree groweth not wilde in England, but it groweth in my garden very plentifully.

¶ The Time.

It endureth the cold of our Northerne clymat, yet doth it lose his gallant greenes in the winter
moneths : it floureth in my garden about May.

¶ The Names.

Theophrastus and *Pliny*, as some thinke, haue called this sweet and aromattick tree *Thuia*, or *Thya* :
some call it *Cedrus Lycia* : the new writers do terme it *Arbor vita* : in English, the tree of life, I doe
not meane that whereof mention is made, *Gen.* 3. 22.

¶ The Temperature.

Both the leaues and boughes be hot and dry.

¶ The Vertues.

Among the plants of the New-found land, this Tree, which *Theophrastus* calls *Thuia*, or *Thud.*

is the most principal, and best agreeing vnto the nature of man, as an excellent cordial, and of a very pleasant smell.

CHAP. 47. Of the Yew tree.

Taxus.

The Yew tree.

¶ The Description.

‡ IN stead of the description and place mentioned by our Author (which were not amisse) giue me leaue to present you with one much more accurate, sent me by Mr. *John Goodyer*.

Taxus glandifera baccifera.
The Yew bearing Acornes and berries.

THE Yew tree that beareth Acornes and berries is a great high tree remaining alwaies greene, and hath vsually an huge trunke or body as big as the Oke, couered ouer with a scabbed or scaly barke, often pilling or falling off, and a yong smooth barke appearing vnderneath; the timber hereof is somewhat red, neere as hard as Box, vniuersally couered next the barke with a thick white sap like that of the Oke, and hath many big limmes diuided into many smal spreading branches: the leaues be about an inch long, narrow like the leaues of Rosemary, but smooth, and of a darker greene colour, growing all alongst the little twigs or branches close together, seldome one opposite against another, often hauing at the ends of the twigs little branches composed of many leaues like the former, but shorter and broader, closely compact or ioyned together: amongst the leaues are to be seene at all times of the yeare, small slender buds somewhat long, but neuer any floures, which at the very beginning of the

Spring grow bigger and bigger, till they are of the fashion of little Acornes, with a white kernell within: after they are of this forme, then groweth vp from the bottomes of the Acornes a reddish matter, making beautiful reddish berries more long than round, smooth on the out side, very clammy within, and of a sweet taste, couering all the Acorne, onely leauing a little hole at the top, where the top of the Acorne is to be seene: these fallen, or deuoured by birds, leaue behinde them a little whitish huske made of a few scales, appearing like a little floure, which peraduenture may deceiue some, taking it to be so indeed: it seemes this tree, if it were not hindred by cold weather, would alwaies haue Acornes and berries on him, for he hath alwaies little buds, which so soone as the Spring yeelds but a reasonable heate, they grow into the forme of Acornes: about the beginning of August, seldome before, you shall finde them turned into ripe berries, and from that time till Christmasse, or a little after, you may see on him both Acornes and red berries.

Taxus tantum florens.

The Yew which only floures.

The Yew which onely beareth floures and no berries, is like the other in trunke, timber, barke, and leaues; but at the beginning of Nouember, or before, this tree doth beginne to be very thicke set or fraught on the lower side or part of the twigs or little branches, with small round buds, verie neere as big, and of the colour of Radish seed, and do so continue all the Winter, till about the beginning or middle of Februarie, when they open at the top, sending forth one small sharpe point, little longer than the huske, diuided into many parts, or garnished towards the top with many small

small dusty things like floures, of the colour of the husks; and if you shall beate or throw stones into this tree about the end of Februarie, or a good space after, there will proceed and fly from these floures an abundance of dustie smoke. These dusty floures continue on the trees till about haruest, and then some and some fall away, and shortly after the round buds come vp as afore-said.

¶ *The Place.*

These trees are both very common in England: in Hampshire there is good plentie of them growing wilde on the chalkie hills, and in Church-yards where they haue been planted.

¶ *The Time.*

The time is expressed in their descriptions. Dec. 19. 1621. *John Goodyer.* ‡

¶ *The Names.*

This tree is named by *Dioscorides*, *ῥῖναι*: by *Theophrastus*, *ῥῖνος*: but *Nicander* in his book of Counterpoisons, *ῥῖναι*: *Galen* doth also call it *ῥῖναι*: it is named in Latine *Taxus*: in high-Dutch, *Eybenbaum*: in low-Dutch, *Ibenboom*: in Italian, *Tasso*: in Spanish, *Toxo*, and *Taxo*: in French, *Yf*: in English, Ewe, or Yew tree: in the vnlearned shops of Germany, if any of them remaine, it is called *Tamariscus*; where in times past they were wont not without great error, to mix the bark hereof in compound medicines, in stead of the Tamariske barke.

¶ *The Temperature.*

The Yew tree, as *Galen* reporteth, is of a venomous qualitie, and against mans nature. *Dioscorides* writeth, and generally all that heretofore haue dealt in the facultie of Herbarisme, that the Yew tree is very venomous to be taken inwardly, and that if any doe sleepe vnder the shadow thereof it causeth sicknesse and oftentimes death. Moreouer, they say that the fruit thereof being eaten is not onely dangerous and deadly vnto man, but if birds do eat thereof, it causeth them to cast their feathers, and many times to die. All which I dare boldly affirme is altogether vntue: for when I was yong and went to schoole, diuers of my schoole-fellowes and likewise my selfe did eat our filis of the berries of this tree, and haue not only slept vnder the shadow thereof, but among the branches also, without any hurt at all, and that not one time, but many times. *Theophrastus* saith, That *ῥῖναι*, *animalia*, *Gaza* translates them *Iumenta*, or labouring beasts, do die, if they do eat of the leaues; but such cattell as chew their cud receiue no hurt at all thereby.

Nicander in his book of Counterpoisons doth reckon the Yew tree among the venomous plants, setting downe also a remedie, and that in these words, as *Gorræus* hath translated them.

*Parce venenata Taxo, quæ surgit in Oeta
Abietibus similis, lethoquæ absomit acerbo
Nè præter morem pleno cratere meraca
Fundere vina pares, cum primum sentiet ager
Arctari obstructas fauces animaque canalem.*

‡ Shun th' poysonous Yew, the which on Oeta growes,
Like to the Firre, it causes bitter death,
Vnlesse besides thy vse pure wine that flowes
From empty'd cups, thou drinke, when as thy breath
Begins to faile, and passage of thy life
Growes strait.

Pena and *Lobel* also obserued that which our Author here affirms, and dayly experience shewes it to be true, that the Yew tree in England is not poysonous: yet diuers affirme, that in Prouince in France, and in most hot countries, it hath such a maligne qualitie, that it is not safe to sleepe or long to rest vnder the shadow thereof. ‡

CHAP. 48. Of the Juniper tree.

¶ *The Kindes.*

Among the Juniper trees one is lesser, another greater, being a strange and forreine tree: one of these bringeth forth a floure and no fruit; the other fruit and no floures.

¶ *The Description.*

The common Juniper tree groweth in some parts of Kent vnto the stature and bignes of a faire great tree, but most commonly it growes very low like vnto ground Furres: this

tree

1 *Iuniperus*.
The Iuniper tree.

2 *Iuniperus maxima*.
The great Iuniper tree.

3 *Iuniperus Alpina minor*.
Small Iuniper of the Alps.

tree hath a thin bark or rinde, which in hot regions will chop and rend it self into many cranies or pieces : out of which rifts issueth a certaine gum or liquour much like vnto Frankincense : the leaues are very small, narrow, and hard, and somewhat prickly, growing euer green along the branches, thicke together : amongst which come forth round and small berries, greene at the first, but afterward blacke declining to blewnesse, of a good sauer, and sweet in taste, which do wax somewhat bitter after they be dry and withered.

2 The great Iuniper tree comes now and then to the height of the Cypres tree, with a greater and harder leafe, and also with a fruit as big as Oliue berries, as *Bellonius* writeth, of an exceeding faire blew colour, and of an excellent sweet sauer.

3 This exceeds not the height of a cubit, but growes low, and as it were creeps vpon the ground, and consists of sundry thicker and shorter branches than the common kind, tough also, writhen, and hard to breake ; 3 leaues alwaies growing at equall distances, as in the common, but yet broader, shorter, and thicker, neither lesse prickling than they, of a whitish greene colour on the inside, and green without, incompasse the tender branches. *Clusius*, who giues vs this figure and historie, obserued not the floure, but the fruit is like that of the ordinarie,

nary, but yet somewhat longer; It growes vpon the Austrian Alpes, and ripens the fruite in August and September. †

¶ The Place.

The common Iuniper tree is found in very many places, especially in the South parts of England.

Bellonius reporteth, that the greater groweth vpon mount Taurus: *Aloisius Anguillara* writeth, that it is found on the sea shores of the *Ligurian* and *Adriaticke* sea and in *Illyricum*, bringing forth great berries: and others say that it growes in *Prouence* of France: it commeth vp for the most part in rough places and neere to the sea, as *Dioscorides* noteth.

¶ The Time.

The Iuniper tree floureth in May; the floure whereof is nothing else but as it were a little yellowish dust or powder strowed vpon the boughes. The fruit is ripe in September, and is seldome found either winter or Sommer without ripe and vnripe berries, and all at one time.

¶ The Names.

The Iuniper tree is called in Greeke *ἰουνίπτερος*: the Apothecaries keepe the Latine name *Iuniperus*: the Arabians call it *Archonas* and *Archencas*: the Italians, *Ginepro*: in high Dutche, *Weckholter*: in Spanish, *Enebro*, *Ginebro*, and *Zimbro*: the French men and base Almaines *Geneue*: in English, Iuniper tree.

The lesser is named in Greeke *ἰουνίπτερος*: in Latine, *Iuniperus*. The great Iuniper Tree is called as some thinke in Greeke *ἰουνίπτερος*: in Latine (by *Lobel*) *Iuniperus maximus Illyricus caralea bacca*, by reason of the colour of the berries, and may be called in English, blew Iuniper.

The berries are called *Grana Iuniperi*: in Greeke, *ἰουνίπτερος*, although the Tree it selfe also is oftentimes called by the same name *ἰουνίπτερος*: it is termed in high Dutche, *Krametbeer*, *Weckholterbeer*: in low Dutche, *Genebrebesten*: in Spanish, *Neurinas*: in English, Iuniper berries.

The gum of the Iuniper tree is vsually called of the Apothecaries *Vernix*: in Latine, *Lachryma Iuniperi*: *Serapio* nameth it *Sandarax* and *Sandaracha*; but there is another *Sandaracha* among the Grecians, being a kinde of Orpment, which growes in the same minerals wherein Orpment doth, and this doth farre differ from *Vernix*, or the Iuniper gum. *Pliny* in his 11. booke, 7. chapter maketh mention also of another *Sandaracha*, which is called *Erithree* and *Cerimthus*: this is the meate of Bees whilest they be about their worke.

¶ The Temperature.

Iuniper is hot and dry, and that in the third degree, as *Galen* teacheth; the berries are also hot, but not altogether so drie: the gum is hot and dry in the first degree, as the Arabians write.

¶ The Vertues.

The fruite of the Iuniper tree doth cleanse the liuer and kidnies, as *Galen* testifieth: it also maketh thin clammie and grosse humors: it is vsed in counterpoysons and other wholesome medicines: being ouer largely taken it causeth gripings and gnawings in the stomacke, and maketh the head hot: it neither bindeth nor looseth the belly: it prouoketh vrine. A

Dioscorides reporteth, that this being drunke is a remedy against the infirmitie of the chest, coughes, windines, gripings and poisons, and that the same is good for those that be troubled with cramps, burstings, and with the disease called the mother. B

It is most certaine that the decoction of these berries is singular good against an old cough, and against that with which children are now and then extremely troubled, called the Chin cough, in which they vse to rise vp raw, tough and clammy humors, that haue many times bloud mixed with them. C

Diuers in Bohemia do take in stead of other drinke, the water wherein those berries haue been steeped, who liue in wonderfull good health. D

This is also drunke against poisons and pestilent feuers, and it is not vnpleasant in the drinking: when the first water is almost spent, the vessell is againe filled vp with fresh. E

The smoke of the leaues and wood driueth away serpents, and all infection and corruption of the aire, which bring the plague, or such like contagious diseases: the iuice of the leaues is laid on with wine, and also drunke against the bitings of the viper. F

The ashes of the burned barke, being applied with water, take away scurfie and filth of the skinne. G

The powder of the wood being inwardly taken, is pernicious and deadly, as *Dioscorides* vulgar copies do affirme; but the true copies vtterly deny it, neither do any of the old writers affirme it. H

The fume and smoke of the gum doth stay flegmaticke humors that distill out of the head, and stoppeth the rheume: the gum doth stay raw and flegmaticke humors that sticke in the stomacke and guts, if it be inwardly taken, and also drunke. I

It killeth all maner of wormes in the belly, it staieth the menfes, and hemorrhodes: it is commended also against spitting of bloud; it dryeth hollow vlcers, and filleth them with flesh, if it be cast thereon: being mixed with oile of Roses, it healeth chops in the hands and feet, K

Z z z z z

There

L There is made of this and of oile of Linefeed, mixed together, a liquor called Vernish, which is vsed to beautifie pictures and painted tables with, and to make iron glister, and to defend it from the rust.

CHAP. 49. Of the prickly Cedar, or Cedar Iuniper.

¶ The Kindes.

THe prickly Cedar tree is like to Iuniper, and is called the small or little Cedar, for difference from the great and tall Cedar, which bringeth Cones; and of this there are two kinds, as *Theophrastus* and *Pliny* do testifie, that is to say, one of *Lycia*, and another crimson.

¶ The Description.

1 **T**He Crimson or prickly Cedar seemeth to be very like to the Iuniper tree in body and boughes, which are writhed, knotty, and parted into very many wings: the substance of the wood is red, and sweet of smell like that of the Cypresse; the tree is couered ouer with a rugged barke: the leaues be narrow and sharpe pointed, harder than those of Iuniper, sharper and more pricking, and standing thinner vpon the branches: the fruite or berry is sometimes as big as a hasell nut, or, as *Theophrastus* saith, of the bignesse of Myrtle berries, and being ripe it is of a reddish yellow, or crimson colour, sweet of smell, and so pleasant in taste, as euen the countrey-men now and than do eate of the same with bread.

1 *Oxycedrus Phœnicia.*
Crimson prickly Cedar.

3 *Oxycedrus Lycia.*
Rough Lycian Cedar.

2 The other low Cedar which growes in *Lycia* is not so high as the former, hauing likewise a writhed body as big as a mans arme, full of boughes; the barke is rough, yellowish without, and red within: the leaues stand thicker, like at the first to those of Iuniper, but yet somewhat shorter, and in the third or fourth yeere thicker, long and round withall, comming neere to the leaues

of

‡ 3 *Cedrus Lycia altera*.
The other Lycian Cedar.

of the Cypres tree, or of the second Sauine, that is, blunt, and not pricking at all, which being bruised betweene the fingers do yeeld a very pleasant smell: so doth one and the selfe same plant bring forth below sharpe and prickly leaues, and aboue thick and blunt ones, as that notable learned Herbarist *Clusius* hath most diligently obserued: the fruit or berry is round like that of Iuniper, of colour yellow when it is ripe, inclining to a red, in taste somewhat bitter, but sweet of smell.

‡ 3 This also hath Cypresse-like leaues, not vnlike those of the last described, yet somewhat thicker and broader: the fruit is also much larger, being as big as Hasell nuts, and of a red or skarlet colour; whence *Lobel* calleth it *Cedrus Phœnicia altera*. ‡

¶ The Place.

The prickly Cedar with the crimson colour commeth vp higher and greater in certaine places of Italy, Spaine, and Asia, and in other Countries; for that which grows on mount Garganus in Apulia is much higher and broader than those that grow elsewhere, and bringeth forth greater berries, of the bignesse of an hasell nut, and sweeter, as that most diligent writer *Bellonius* reporteth. *Carolus Clusius* sheweth, that the prickly Cedar and the Iuniper tree be of so great a growth in diuers places of Spaine, as he hath obserued, as that the body of them is as thicke as a man.

The Lycian Cedar is found in Prouence of France, not far from Massilia, and groweth in a great part of Greece, in Illyricum and Epirum.

¶ The Time.

Both of them are alwaies greene, and in Winter also full of fruit, by reason that they continually bring forth berries, as when the old do fall new come in their places: in the spring grow vp new buds and beginnings of berries: in Autumne they wax ripe the second yeare, as doe the berries of Iuniper.

¶ The Names.

They are called in Latine, *Minores*, and *Humiles Cedri*, little and low Cedars, for difference from the tall and great Cedar which beareth Cones.

The former is named in Greeke, *ὄξυκέδρος*, and *κίςδος ποικίλη*: in Latine, *Oxycedrus*, and *Cedrus Punica*: in English, Prickly Cedar, and Crimson Cedar: *Pliny* synnameth it *Phœnicea*, of the crimson colour of the fruit: the Spaniards call this also *Enebro*, as *Clusius* testifieth, euen by the same name which they giue to the Iuniper: wherein likewise they are thought to imitate diuers of the old Writers, who haue not by names distinguished the Iuniper from the Cedar, but haue, as *Theophrastus* noteth, called them *Cedros*, Cedar trees; yet with an addition, *ὄξυκέδρος*, or prickly Cedar.

The other with the blunt leafe is named by *Theophrastus*, *ἀνία κίςδος*: of *Pliny* also, *Lycia Cedrus*: in Prouince of France, *Morueine*: diuers name this *Sabina*, and vse it in stead of Sauine, which they want; as the Apothecaries of *Epidaurus*, and in diuers cities of Greece, and also in Illyricum and Epirum, as *Bellonius* testifieth. Some would haue it to be *Thya*; but *Thya*, according to *Theophrastus*, is like, not onely in body, leaues, and boughes, but in fruit also, to the Cypresse tree, but the fruit of this is nothing like to the Cypresse Cones.

The fruit of this Cedar is named by *Theophrastus*, *κίςδος*, *Cedris*: notwithstanding *Cedrus*, as hee himselfe doth also testifie (*Gaza* nameth it *Credula*) is a certaine little shrub which neuer groweth to a tree.

The gum or liquor which issueth forth of the prickly Cedar is also called *Vernix*, and is sold in stead thereof.

¶ The Temperature and Vertues.

The little Cedar, as *Galen* writeth, is hot and dry in a manner in the third degree: the matter or substance thereof is sweet of smell, like that of Iuniper, and is vsed for perfumes and odoriferous smells together with the leaues.

- B The berries or fruit of the low Cedar haue the faculties not so strong, as the same Author testi-
fieth, inso much as that they may also be eaten, yet if they be taken too plentifully, they cause
head-ache, and breed heate and gnawings in the stomacke. Yet there is a difference between these
two Cedar berries; for the crimson ones are not so hot and dry, by reason they are sweeter and plea-
sant to the taste, and therefore they are better to be eaten, and do also yeeld vnto the body a kind
of nourishment: but the berries of that of *Lycia* are biting, hotter and drier also than those of Iuni-
per, from which they differ especially in the biting qualitie; they bring no nourishment at all, and
though a man eate neuer so few of them he shall feelee gnawings in his stomacke, and paine in his
head.
- C The Peasants do feed thereon rather to satisfie their hunger, than for any delight they haue in
the taste, or the physicall vertues thereof; albeit they be good against the strangurie, and prouoke
vrine.

CHAP. 50. Of Sauin.

¶ The Kindes.

There be two kinds of Sauin; one like in leafe to Tamariske, the other to the Cypresse tree;
whereof the one beareth berries, the other is barren.

1 *Sabina sterilis*.
Barren Sauin.

2 *Sabina baccifera*.
Sauin bearing berries.

¶ The Description.

1 The first Sauin, which is the common kind, and best of all knowne in this country, grow-
eth in manner of a low shrub or tree: the stem or trunk whereof is sometimes as big as a
mans arme, diuiding it selfe into many branches set full of small leaues like vnto Cypres, or Tama-
riske, but thicker, and more sharpe or prickely, remaining greene Winter and Sommer, in smell
ranke or very strong, barren both of floures and fruit.

2 The

‡ 3 *Sabina baccata altera.*
The lesser berry-bearing Sauin.

2 The other Sauin is an high tree, as *Bellonius* saith, as tall as the Almond tree, and much like to the tame Cypresse tree: the bodie is writhed, thicke, and sometimes of so great a compasse as that it cannot be fathomed; the substance of the wood is red within, as is that of the Iuniper, and of the prickely Cedar: the barke is not very thicke, and it is of a yellowish red: the leaues are of a maruellous gallant greene colour, like to those of the Cypres tree, yet thicker or more in number; in taste bitter, of a spicie smell, and like Rosin: the boughes are broader, and thicke set as it were with wings, like those of the Pitch tree and of the Yew tree: on which grow a great number of berries, very round like those of the little Cedars, which at the first are green, but when they be ripe they are of a blackish blew. Out of the root hereof issueth oftentimes a rosin, which being hard is like to that of the Iuniper tree, and doth also crumble in the chewing.

‡ 3 There is another, which differs from the last described onely in that the leaues are smaller and lesse pricking than those of the former, as also the branches lesser: *Lobel* calls this *Sauina baccata altera*. ‡

¶ The Place.

Both of them grow vpon hills in woods, and in other like vntoiled places, as in Candy, Myfia, and elsewhere. *P. Bellonius* reporteth that he found them both vpon the tops of the mountaines Taurus, Amanus, and Olympus.

The first is planted in our English gardens almost euery where: the second is planted both by the seed and by the slip: the slips must be set in a ground that is meanly moist and shadowie, till they haue taken root: the shrubs which grow of these decline toward the one side, retaining still the nature of the bough: but that Sauin which is planted by the seed groweth more vpright; this in continuance of time bringeth forth seeds, and the other for the most part remaines barren: both these grow in my garden.

¶ The Time.

They both continue alwaies greene: the one is found to be loden with ripe fruit commonly in Winter, but it hath fruit at all times; for before the old berries fall, new are come vp.

¶ The Names.

Sauine is called in Greeke *Bpādu*, or *Bpādu*: in Latine, *Sabina*.

The first is commonly called in the Apothecaries shops by the name *Sauina*: of diuers, *Sauimera*: the Italians and Spaniards keepe the Latine name: it is called in high-Dutch, *Siben baum*: in low-Dutch, *Sauel boom*: in French, *Sauenier*: in English, common Sauine, or garden Sauine.

Some name the other *Cupressus Cretica*, or Cypres of Candy, as *Pliny* saith, lib. 12. cap. 17. making mention of a tree called *Bruta*: some there are that take this to be *altera Sabina*, or the second Sauin, and to be read *Bruta* for *Bpādu*, *Brathu*, by altering of the vowels. For it is described by *Plin. li. 12. cap. 17.* to be like the Cypresse tree, in these words; They seeke in the mountaine *Elimæi* the tree *Bruta*, being like to the broad Cypres tree, hauing white boughes, yeelding a sweet smell when it is set on fire; whereof mention is made with a miracle, in the stories of *Claudius Caesar*. It is reported that the Parthians do vse the leaues in drinks; that the smell is very like to that of the Cypres tree, and that the smoke thereof is a remedie against other woods. It groweth beyond *Pasitigris*, neere vnto the towne *Sittaca*, on mount *Zagrus*. Thus far *Pliny*.

The mountaines *Elimæi* are described by *Strabo* in the countrey of the Assyrians, next after the mountaine *Sagrus* about the Babylonians; by *Ptolomeus* not far from the Persian gulfe: therefore it is hard to say that *Bruta* is *Sabina altera*, or the second Sauine, seeing that so great a distance of the place may vndoubtedly cause a difference, and that it is not largely but briefly described. It seemeth that *Thya* mentioned by *Theophrastus* is more like vnto Sauine: but yet forasmuch as *Thya* is like in fruit to the Cypres tree, and not to the fruit or berries of the little Cedars, it is also verie

manifest, that the second Sauine is not *Thya*, neither *Vita arbor*, so called of the later Herbarists: it is likewise named by *Lobel*, *Sabina genuina baccifera*, *atrocarulea*, that is, the true Sauine that beareth berries of a blackish blew colour.

¶ *The Temperature.*

The leaues of Sauine, which are most vsed in medicine, are hot and dry in the third degree, and of subtile parts, as *Galen* saith.

¶ *The Vertues.*

- A The leaues of Sauin boyled in Wine and drunke prouoke vrine, bring downe the menses with force, draw away the after-birth, expell the dead childe, and kill the quick: it hath the like vertue receiued vnder in a perfume.
- B The leaues stamped with honey and applied, cure vlcers, stay spreading and creeping vlcers, scoure and take away all spots and freckles from the face or body of man or woman.
- C The leaues boyled in oyle Oliue, and kept therein, kill the wormes in children, if you anoint their bellies therewith: and the leaues poudered and giuen in milke or Muscadell do the same.
- D The leaues dried and beate into fine pouder, and strewed vpon those kindes of excrescences *sub praputio*, called Caroles, and such like, gotten by dealing with vncleane women, take them away perfectly, curing and healing them: but if they be inueterate and old, and haue been much tampered withall, it shall be necessarie to adde vnto the same a small quantitie of *Auripigmentum* in fine pouder, and vse it with discretion, because the force of the medicine is greatly increased thereby and made more corrosiue.

CHAP. 51. Of *Tamariske*.

1 *Tamariscus Narbonensis*.
French *Tamariske*.

2 *Tamariscus Germanica*.
Germane *Tamariske*.

¶ *The*

¶ The Description.

1 **T**He first kinde of Tamariske groweth like a small hedge tree, couered with a reddish barke, hauing many branches set and bedeckt with leaues, much like vnto Heath: among which come forth small mossie white floures declining to purple, which turne into a pappous or downie seed, that flieth away with the winde, as that of Willow doth: the root is wooddie as the roots of other shrubs be, and groweth diuers waies.

2 The Germane Tamariske hath many wooddie branches or shoots rising from the root, with a white bark, hauing his leaues thicker and grosser than the former, and not so finely iagged or cut: The floures are reddish, and larger than the former, growing not vpon foot-stalkes, many thick clustering together, as those of the former, but each a pretty distance from another on the tops of the branches spike fashion, and begin to floure below: which do turne into seed, that is likewise carried away with the winde.

¶ The Place.

Tamariske groweth by running streames, and many times by riuers that breake forth, and not seldome about fenny grounds, commonly in a grauelly soile, for it best prospereth in moist and stony places: it is found in Germany, Vindelicia, Italy, Spaine, and also in Greece.

The Tamarisks do also grow in Egypt and Syria, as *Dioscorides* writeth, and likewise in Tylus an Island in Arabia, as *Theophrastus* noteth: the wood wherof, saith he, is not weak as with vs in Greece, but strong like *aspinion*, or timber, or any other strong thing: this Tamariske *Dioscorides* doth call *ῥαίρος*, that is to say, tame, or planted, and saith that it bringeth forth fruit very like to Galls, in taste rough and binding.

Petrus Bellonius in his second booke of singularities reporteth, that hee saw in Egypt very high Tamarisks and great like other trees, and that sometimes in moist places by riuers sides, and many times also in dry and grauelly grounds where no other trees did grow, which now and then did beare hanging on the boughes such a multitude of Galls, that the inhabitants call *Chermasel*, as being ouer loden, they were ready to breake. Both these grow and prosper well in gardens with vs here in England.

¶ The Time.

These trees or shrubs floure in May, and in the later end of August, their seed is carried away with the wind.

¶ The Names.

They are called in Greeke *μυρίκη* and in Latine also *Myrica*, and *Tamarix*: in shops, *Tamariscus*: of *Olaus Horatianus*, *Murica*: *Dioscorides* maketh that which groweth in Greece and Italy to be *ῥαίρη*, or wilde Tamariske: it is named in high Dutch *Tamarischen holk*, and *Portk*: in low Dutch, *Ibenboom*, *Tamarischboome*: in Italian, *Tamarigio*: in Spanish, *Tamarguira*, and *Tamariz*: in French, *Tamaris*: in English, Tamariske.

¶ The Temperature and Vertues.

Tamariske hath a clensing and cutting facultie with a manifest drying; it is also somewhat A astringent or binding, and by reason of these qualities it is very good for an hard spleen, being boyled with vineger or wine, either the root or leaues, or tender branches, as *Galen* writeth.

Moreouer *Dioscorides* teacheth, that the decoction of the leaues made with wine, doth waste the B spleene, and that the same is good against the tooth-ache, if the mouth be washed therewith: that it bringeth downe the Menfes, if the patient sit therein; that it killeth lice and nits, if the parts be bathed therewith.

The ashes of burnt Tamariske hath a drying facultie, and greatly scouring withall, and a little C binding.

The floures and downie seed of the greater Tamariske doth greatly binde, infomuch as it com- D meth very neere to the Gall named *Galla Omphacitis*, but that the roughnesse of taste is more euident in the Gall; the which floures are of an vnequall temperature, for there is ioined to the nature thereof a great thinnesse of parts, and clensing facultie, which the Gall hath not, as *Galen* writeth.

These floures we fitly vse (saith *Dioscor.*) in stead of Gall, in medicines for the eies and mouth: E

It is good to stanch bloud, and to stay the laske and womens whites, it helpeth the yellow iaun- F dice, and also cureth those that are bit of the venomous spider called *Phalangium*; the barke serueth for the same purposes.

The leaues and wood of Tamariske haue great power and vertue against the hardnesse and stop- G ping of the spleene, especially the leaues being boiled in water, and the decoction drunke, or else infused in a small vessell of Ale or Beere, and continually drunke: and if it bee drunke forth of a cup or dish made of the wood or timber of Tamariske, is of greater efficacie.

CHAP. 52. Of Heath, Hather, or Linge.

¶ The Kindes.

There be diuers sorts of Heath, some greater, some lesser, some with broad leaues, and some narrower: some bringing forth berries, and others nothing but floures.

¶ The Description.

The common Heath is a low plant, but yet wooddie and shrubby, scarce a cubit high: it bringeth forth many branches, whereupon do grow sundry little leaues somewhat hard and rough, very like to those of Tamariske, or the Cypresse tree: the floures are orderly placed alongst the branches, small, soft, and of a light red colour tending to purple: the root is also wooddie, and creepeth vnder the vpper crust of the earth: and this is the Heath which the Antients tooke to be the right and true Heath.

1 *Erica vulgaris, sive Pumila.*
Common or dwarfe Heath.

‡ *Erica vulgaris hirsuta.*
Rough leaued Heath.

There is another Heath which differeth not from the precedent, sauing that this plant bringeth forth floures as white as snow, wherein consisteth the difference: wherefore we may call it *Erica pumila alba*, Dwarfe Heath with white floures.

2 The great Heath, (which *Carolus Clusius* at his being in England found in the barren grounds about Windfor, which in his Spanish trauels he maketh the first kinde): groweth to the height of two cubits, seldome higher, full of branches, couered with a blackish barke: whereon are set in very good order by couples, small, rough, square leaues finer than those of Tamariske or Cypresse. The floures inclose the little twiggie branches round about at certaine distances, from the lower part to the top fashioned like little bottles, consisting of foure parts, of a shining purple colour, very beautifull to behold, and the rather to be esteemed because it floureth twise in the yeare: the root is like-wisewooddie.

† 3 *Erica maior flore albo Clusij.*

The great Heath with white floures.

4 *Erica maior flore purpureo.*

Great Heath with purple floures.

† 5 *Erica cruciata.*
Crossed Heath.6 *Erica Pyramidalis.*
Steeple Heath.

‡ 3 This, saith *Clusius*, which is the largest that I haue seene, sometimes exceeds the height of a man, very shrubby, hauing a hard and blackish red wood: the leaues are small and short, growing about the branches by foures, of a very astringent taste: it hath plentiful store of floures growing all alongst the branches, so that somtimes the larger branches haue floures for a foot in length: this floure is hollow and longish, well smelling, white and beautifull. It growes betweene Lisbone and the Vniuersity of Conimbrica in Portugal where it floures in Nouember, December, and Ianuarie. ‡

† 4 Of this kind there is another sort with whitish purple floures, more frequently found than the other sort, which floures are somewhat greater than the former, but in forme like, and flowering at the same time. ‡ The leaues also are hairy, and grow commonly by foures: the hollow floures grow clustering together at the very tops of the branches, and are to be found in Iuly and August; it growes on diuers heathy places of this kingdome. ‡

5 Crossed Heath groweth to the height of a cubit and a halfe, full of branches, commonly lying along vpon the ground, of a swart darke colour: whereon do grow small leaues, set at certaine spaces by two vpon one side, and two on the other, opposite, one answering another, euen as doe the leaues of Crosse-wort. The floures in like manner stand alongst the branches Crosse fashion, of a darke ouerborne greenish colour. The root is likewise wooddy, as is all the rest of the plant.

6 This Steeple Heath hath likewise many wooddy branches, garnished with small leaues which easily fall off from the dried stalks; among which come forth diuers little mossie greenish floures of small moment. The whole bush for the most part groweth round together like a little cocke of hay, broad at the lower part, and sharp aboue like a Pyramide or steeple, whereof it tooke his name.

7 *Erica tenuifolia.*
Small leaved Heath.

8 *Erica tenuifolia caliculata.*
Chalice Heath.

7 This small or thinne leaved Heath is also a low and base shrub, hauing many small and slender shoots comming from the root, of a reddish browne colour; whereupon doe grow verie manie small leaues, not vnlike to them of common Time, but much smaller and tenderer: the floures grow in tufts at certaine spaces, of a purple colour. The root is long and of a wooddie substance. ‡ The branches of this are commonly whitish, the leaues very green: the floures are smallest at both ends and biggest in the midst, hollow, and of a faire purple colour, which doth not easily decay: it floures

floures most part of Summer, and growes in many Heathie grounds. ‡

8 Challice Heath hath also many woody branches growing from the roots, slender, of a reddish browne colour, a foot and a halfe high, garnished with very little leaues, lesser than those of Time: the floures grow on the tops and vpper parts of the branches, and be in number, fiue, six or moe, hanging downewards, in fashion long, hollow within like a little tunnell or open cup or challice, of a light purplish colour: the root creepeth and putteth forth in diuers places new springs or shoots.

9 The Heath that bringeth forth berries hath many weake and slender branches of a reddish colour, which trailing vpon the ground do take hold thereof in sundry places, whereby it mightily increaseth: the leaues are somewhat broad, of a thicke and fleshie substance, in taste something drying at the first, but afterwards somewhat sharpe and biting the tongue: among which come forth small floures of an herbie colour: which being vaded there succeed small round berries, that at the first are Greene, and afterward blacke, being as big as those of Iuniper, wherein is contained purple iuice like that of the Mulberry: within those berries are contained also small three cornered grains: the root is hard, and of a woody substance. ‡ I found this growing in great plenty in Yorkshire on the tops of the hills by Gisbrough, between it and Rosemary-topin (a round hill so called) and some of the people thereabouts told me they called the fruit Crake berries. This is the same that *Matthiolus* calls *Erica Baccifera*: and it is the *Erica Coris folio* 11. of *Clusius*. ‡.

‡ 9 *Erica baccifera procumbens*.
Heath bearing Berries.

10 *Erica baccifera tenuifolia*.
Small leaved Heath with Berries.

‡ 10 This which our Authour figured as you seee in the tenth place (putting the description of the former thereto) hath brittle branches growing some cubit high, couered with a barke blacker than the rest: the leaues are like those of the former, but blacker and smaller, growing about the stalks by threes, of a hottish taste with some astringtion. In September and October it carries a fruit on the tops of the branches different from the rest, for it is very beautifull, white, transparent, resembling dusky and vneuen pearles in forme and colour, succulent also, and of an acide taste, commonly containing three little seeds in each berry: in Nouember this fruit becomes dry, and falls away of it selfe. *Clusius* onely obserued this in Portugall, and at the first sight a far off tooke the white berries to haue been graines of Manna. He calls it *Erica Coris folio*. 10.

11 I remember (saith *Dodonaeus*) that I obserued another Heath which grew low, yet sent forth many

‡ 11 *Erica pumila*, 3. *Dod.*
Dodonaus his *Dwarfe* Heath.

‡ 12 *Erica ternis per intervallaramis.*
 Heath with three branches at a joint.

‡ 13 *Erica perigrina* *Lobelij.*
Lobels strange Heath.

‡ 14 *Erica Coris folio* 7. *Clusij.*
 Creeping Dutch Heath.

‡ 15 *Erica Coris folio*. 9. *Clusij*.
Small Austrian Heath.

many wooddy and twiggy branches, hauing vpon them little narrow and longish leaues; on these stalkes spike fashion to the tops of them, yet but on one side, grow elegant redde floures, pointed with blacke. This growes in that tract of Germany which leads from Bohemia to Noremberg on dry and vtilld places, and neere woods. It floures in Aprill.

12 This shrubby Heath is commonly some cubit high, hauing slender branches which come out of the maine stemmes commonly three together; and the leaues also grow in the same order; the tops of the branches are adorned with many floures of a darke purple colour, hollow, round, biggest below, and standing vpon long footstalks. *Clusius* found this growing in the vtilld places of Portingale aboute Lisbone, where it floured in December; he calls it *Erica Coris folio*, 5.

13 Besides all these (saith *Lobel*, hauing first treated of diuers plants of this kinde) there is a certaine rarer species growing like the rest after the manner of a shrub in pots, in the Garden of Mr. *Iohn Brancion*: the leafe is long, and the purple floures, which as far as I remember consisted of foure little leaues apiece, grow on the tops of the branches. I know not whence it was brought, and therefore for the rarity I call it *Erica peregrina*, that is, Strange, or Forreine Heath.

14 This hath many round blackish purple branches some foot or cubit high, lying oft times along vpon the ground: these are beset with many narrow little leaues, almost like those of the

third described, yet somewhat longer, commonly growing foure, yet sometimes fve together, of an astringent taste; the little floures grow on the top of the branches, longish, hollow, and of a light purple colour, comming out of foure little leaues almost of the same colour; when these are ripe and dried they containe a blackish and small seed; the root is hard, wooddy, and runnes diuers waies; the weake branches also that lie vpon the ground now and then take root againe. *Clusius* found this growing plentifully in diuers mountainous places of Germany where it floured in Iune, and Iuly.

15 The weake stalkes of this are some foot high, which are set with many small Greene leaues growing commonly together by threes; the tops of the branches are deckt with little hollow and longish floures diuided at their ends into foure parts, of a flesh colour, together with the foure little leaues out of which they grow, hauing eight blackish little threds in them, with a purplish pointall in the middle. The seed is blacke and small; the root wooddy as in other plants of this kinde. *Clusius* found this in some mountainous woods of Austria, where it floured in Aprill and May. ‡

¶ The Place.

Heath groweth vpon dry mountaines which are hungry and barren, as vpon Hampsteed Heath neere London, where all the sorts do grow, except that with the white floures, and that which beareth berries. ‡ There are not aboute three or foure sorts that I could euer obserue to grow there. ‡

Heath with the white floures groweth vpon the downes neere vnto Grauesend.

Heath which beareth berries groweth in the North parts of England, namely, at a place called Crosby Rauenswaith, and in Crag close also in the same countrey: from whence I haue receiued the red berries by the gift of a learned Gentleman called Mr. *James Thwaites*.

¶ The Time.

These kindes or sorts of Heath do for the most part floure all the Sommer, euen vntill the last of September.

¶ The Names.

Heath is called in Greeke, *ἑρική*: in Latine also *Erica*: diuers do falsly name it *Myrica*: in high and low Dutch, *Heiden*: in Italian, *Erica*: in Spanish, *Breso Quirro*: in French, *Bruyre*: in English, Heath, Harther, and Linge.

¶ The Temperature.

Heath hath, as *Galen* saith, a digesting facultie, consuming by vapors: the floures and leaues are to be vsed.

¶ The Vertues..

A The tender tops and floures, saith *Dioscorides*, are good to be laid vpon the bitings and stings of any venomous beast: of these floures the Bees do gather bad hony.

B The barke and leaues of Heath may be vsed for, and in the same causes that *Tamariske* is vsed.

† The figure which our Author gaue in the ninth place by the name of *Erica baccifera latifolia* I take to be the *Vitis Idæa*, 2. of *Clusius* (which you shall finde in his due place) and in stead thereof I haue giuen you our ordinary berry-bearing Heath.

CHAP. 53. Of Heath of Ierico.

1 *Rosa Hiericonteia maior.*
The Heath Rose of Ierico.

¶ The Description.

1 **T**His kinde of Heath which of the latter writers hath been called by the name *Rosa Hiericonteia*; the coiner spoiled the name in the mint, for of all plants that haue bin written of, there is not any more vnlike vnto the Rose, or any kinde thereof than this plant: what moued them thereto I know not: but thus much of my owne knowledge, it hath neither shape, nature, nor facultie agreeing with any Rose; the which doubtlesse is a kinde of Heath, as the barren soile, and that among Heath, doth euidently shew, as also the Heathie matter where-with the whole plant is possessed, agreeing with the kinds of Heath in very notable points. It riseth vp out of the ground, of the height of four inches, or an hand breadth, compact or made of sundry hard stickes, (which are the stalkes) clasping or shutting it selfe together into a round forme, intricately weauing it selfe one stickie ouerthwart another, like a little net: vpon which woody stickes do grow leaues not vnlike to those of the Oliue tree, which maketh the whole plant of a round forme, and hollow within; among the leaues on the inside grow small mossie floures, of a whitish herbie colour, which

2 *Rosa Hiericonteia siccata.* The Heath Rose of Ierico dried.

turn into little seed, like the seed of Rocket, but lesser: the whole plant is of the substance of heath, and wooddie.

2 The second figure setteth forth the dried plant, as it is brought vnto vs from beyond the seas; which being set into a dish of warme water, for halfe an houre, openeth it selfe in forme, as when it did grow, and taken forth vntill it be drie, returneth shut vp againe as before.

¶ The Place.

It groweth in the barren grounds of France, and other hot regions, among the Heath and such like plants: it is a stranger in England, yet dried we haue them in great plenty. † I haue not read nor heard that this grows wilde in France; but *Belonius* saith it growes in *Arabia deserta*: *Bauhine* saith it easily grew and flourished many yeares in his garden at Basill. †

¶ The Time.

The seed being sowne in our cold climate, is sowne in Aprill; it perisheth when it is sprung vp, and bringeth neither floures nor seed.

¶ The Names.

This kinde of Heath is called *Rosa Hiericontea*, or *de Hiericho*, the Rose of Ierico: of some, the Rose of Ierusalem, and also *Rosa Marie*: in English, the Heath Rose.

¶ The Temperature and Vertues.

There is not any of the antient nor later writers, that haue set downe any certaintie of this plant A as touching the temperature and faculties, but onely a bare picture with a slender description.

CHAP. 54. Of the Chaste Tree.

1 *Vitex, sive Agnus Castus.*

The Chaste tree.

2 *Vitex latiore serrato folio.*

Chaste tree with cut leaues.

Aaaaaa

¶ The

¶ The Description.

1 **V**itex, or the Chaste tree, groweth after the manner of a bushie shrub or hedge tree, hauing many twiggie branches, very pliant and easie to be bent without breaking, like to the willow: the leaues are for the most part diuided into fise or seuen sections or diuisions, much like the leaues of Hemp, whereof each part is long and narrow, very like vnto the willow leafe, but smaller: the floures do grow at the vppermost parts of the branches, like vnto spikie eares, clustering together about the branches, of a light purple or blew colour, and very sweet smel: the fruit is small and round, like vnto the graines or cornes of pepper.

‡ 2 Lobel mentions another varietie hereof that differs from the former onely in that it hath broader leaues, and these also snipt about the edges. ‡

¶ The Place.

Vitex groweth naturally in Italy, and other hot regions, by water courses and running streames: I haue it growing in my garden.

¶ The Time.

Vitex beginneth to recouer his last leaues in May, and the floures come forth in August.

¶ The Names.

† The Grecians call this shrub *ἄγνος*, and *ἄγνος* (i.) *Castus*, Chaste: because, saith *Pliny* in his 24. booke, 9. Chapter, the Athenian Matrons in their feast called *Thesmophoria* dedicated to the honour of *Ceres*, desirous to keepe themselves chaste, doe lay the leaues in their beds vnder them: the Latines name it *Vitex*, and of diuers it is termed, as wee finde among the bastard and counterfeit names, *ἄγνος* in Latine, *Salix marina*, or *Salix Amerina*, and *Piper Agreste*: in high Dutch, *Schaffmulle*, *Heuschbaum*: in low Dutch, and also of the Apothecaries, *Agnus Castus*: the Italians, *Vitice*, *Agno Casto*: in Spanish, *Gattile casto*: in English, Chaste tree, Hempe tree, and of diuers *Agnus castus*. ‡ The name *Agnus Castus* comes by confounding the Greeke name *Agnos* with *Castus*, the Latine interpretation thereof. ‡

¶ The Temperature.

The leaues and fruit of *Agnus castus* are hot and drie in the third degree: they are of very thin parts, and waste or consume winde.

The Vertues.

- A** *Agnus Castus* is a singular medicine and remedie for such as would willingly liue chaste, for it withstandeth all vncleannesse, or desire to the flesh, consuming and drying vp the seed of generation, in what sort soeuer it be taken, whether in poulder onely, or the decoction drunke, or whether the leaues be carried about the body; for which cause it was called *Castus*; that is to say, chaste, cleane, and pure.
- B** The seed of *Agnus Castus* drunken, driueth away, and dissolueth all windinesse of the stomacke, openeth and cureth the stoppings of the liuer and spleen, and in the beginning of dropies, it is good to be drunke in wine in the quantitie of a dram.
- C** The leaues stamped with butter, dissolue and assuage the swellings of the genitories and cods, being applied thereto.
- D** The decoction of the herbe and seed is good against pain and inflammations about the matrix, if women be caused to sit and bathe their priuy parts therein: the seed being drunke with Penny-roiall bringeth downe the menses, as it doth also both in a fume and in a pessary: in a Pultis it cureth the head-ache, the Phrenticke, and those that haue the Lethargie are woont to be bathed here, with oile and vinegar being added thereto.
- E** The leaues vsed in a fume, and also strowed, drive away serpents; and beeing layed on doe cure their bitings.
- F** The seed laied on with water doth heale the clifts or rifts of the fundament, with the leaues, it is a remedie for lims out of ioint, and for wounds.
- G** It is reported that if such as iourney or trauell do carry with them a branch or rod of *Agnus Castus* in their hand, it will keep them from Merry-galls, and wearinesse: *Diosc.*

CHAP. 55. Of the Willow Tree.

¶ The Description.

1 **T**he common Willow is an high tree, with a body of a meane thicknesse, and riseth vp as high as other trees doe if it be not topped in the beginning, soone after it is planted, the barke

barke thereof is smooth, tough, and flexible: the wood is white, tough, and hard to be broken: the leaues are long, lesser and narrower than those of the Peach tree, somewhat Greene on the vpper side and slipperie, and on the nether side softer and whiter: the boughes be couered either with a purple, or else with a white barke: the catkins which grow on the toppes of the branches come first of all forth, being long and moffie, and quickly turne into white and soft downe, that is carried away with the winde.

1 *Salix.*

The common Willow.

2 *Salix aquatica.*

The Ozier or water Willow.

2 The lesser bringeth forth of the head, which standeth somewhat out, slender wands or twigs, with a reddish or Greene barke, good to make baskets and such like workes of: it is planted by the twigs or rods being thrust into the earth, the vpper part whereof when they are growne vp, is cut off, so that which is called the head increaseth vnder them, from whence the slender twigs doe grow, which being oftentimes cut, the head waxeth greater: many times also the long rods or wands of the higher Withy trees be lopped off and thrust into the ground for plants, but deeper, and aboue mans height: of which do grow great rods, profitable for many things, and commonly for bands, wherewith tubs and casks are bound.

3 The Sallow tree or Goats Willow, groweth to a tree of a meane bignesse: the trunke or body is soft and hollow timber, couered with a whitish rough barke: the branches are set with leaues somewhat rough, Greene above, and hoarie vnderneath: among which come forth round catkins, or aglets that turne into downe, which is carried away with the winde.

4 This other Sallow tree differeth not from the precedent, but in this one point, that is to say, the leaues are greater and longer, and euery part of the tree larger, wherein is the difference. † Both those last described haue little roundish leaues like little eares growing at the bottoms of the foot-stalkes of the bigger leaues, whereby they may bee distinguished from all other Plants of this kinde. †

5 The Rose Willow groweth vp likewise to the height and bignesse of a shrubby tree, the body whereof is couered with a scabbed rough barke: the branches are many, whereupon do grow very many twigs of a reddish colour, garnished with small long leaues, somewhat whitish: amongst which come forth little floures, or rather a multiplication of leaues, ioined together in forme of a

3 *Salix Caprea rotundi folia.*
The Goat round leaved Willow.

4 *Salix Caprea latifolia.*
The Goat broad leaved Sallow.

5 *Salix Rosea Anglica.*
The English Rose Willow.

Rose, of a greenish white colour, which doe not only make a gallant shew, but also yeeld a most cooling aire in the heat of Sommer, being set vp in houses, for the decking of the same.

6 The low or base Willow groweth but low, & leaneth weakly vpon the ground, hauing many small and narrow leaues, set vpon limber and pliant branches, of a darke or blackish Greene colour: amongst which comeforth long slender stems full of mossie floures, which turne into a light downie substance that flieth away with the winde.

7 The dwarfe Willow hath very small and slender branches, seldome times aboue a foot, but neuer a cubit high, couered with a duskish barke, with very little and narrow leaues, of a Greene colour aboue, and on the vpper side, but vnderneath of a hory or ouerworne greenish colour, in bignesse and fashion of the leaues of garden Flax: among which come forth little duskish floures, which doe turne into downe that is carried away with the winde: the root is small and threddy, of the bignesse of a finger, and of a blackish colour.

8 There is another kinde of willow like to the former, and differeth from it in that, the leaues of this kinde are smaller and narrower, as big as the leaues of Myrtle, hauing small knobbie floures of a duskish colour,

6 *Salix humilis*.
The low Willow.

7 *Chamaetia, sive Salix pumila*.
The dwarf Willow.

8 *Salix humilis repens*.
Creeping dwarf Willow.

colour, which turne into downe that flyeth away with the winde: the root is small and limber, not growing deep, but running along vpon the vpper crust of the earth.

¶ *The Place.*

These Willows grow in diuers places of England: the Rose-Willow groweth plentifully in Cambridge shire, by the riuers and ditches there in Cambridge towne they grow abundantly about the places called Paradise and Hell-mouth, in the way from Cambridge to Grandchester: I found the dwarf Willowes growing neere to a bog or marish ground at the further end of Hampted heath vpon the declining of the hill, in the ditch that incloseth a small Cottage there, not halfe a furlong from the said house or cottage.

¶ *The Time.*

The willowes do floure at the beginning of the Spring.

¶ *The Names.*

The Willow tree is called in Greeke *Τρίαινα*: in Latine, *Salix*: in high-Dutch, *Weyden*: in low-Dutch, *Wilgen*: in Italian, *Salice*, *Salcio*: in French, *Saux*: in Spanish, *Salgueiro*, *Salzer*, and *Sanz*: in English, *Sallow*, *Withie*, and *Willow*.

The

The greater is called in Latine *Salix perticalis*, common Withy, Willow, and Sallow, especially that which being often lopped sendeth out from one head many boughs: the kinde hereof with the red barke is called of *Theophrastus*, blacke Withy; and the other, white: *Pliny* calleth the black *Græca*, or Greeke Withie (the red, being the Greeke Withy, faith he, is easie to be cleft) and the whiter, *Amerina*.

Theophrastus writeth, that the Arcadians do call the lesser 'Ελικα, not 'Ιρις: *Pliny* also nameth this *Helice*: both of them do make this to be *Salicis tertia species*, the third kinde of Sallow: the same is likewise called in Latine, *Salix pumila*, *Salix viminalis*, *Gallica Salix*; and by *Columella*, *Sabina*, which he faith that many do terme *Amerina*: in high-Dutch, *Kleyn Weyden*: in low-Dutch, *noymen*: in English, Osier, small Withy, Twig Withy: *Petrus Crescentius* nameth it *Vincus*.

¶ The Temperature.

The leaues, floures, seed, and barke of Willows are cold and dry in the second degree, and astringent.

¶ The Vertues.

- A The leaues and barke of Withy or Willows do stay the spitting of bloud, and all other fluxes of bloud whatsoever in man or woman, if the said leaues and barke be boiled in wine and drunke.
- B The Greene boughes with the leaues may very well be brought into chambers and set about the beds of those that be sicke of fevers, for they do mightily coole the heate of the aire, which thing is a wonderfull refreshing to the sicke Patients.
- C The barke hath like vertues: *Dioscorides* writeth, that this being burnt to ashes, and steeped in vinegar, takes away cornes and other like risings in the feet and toes: diuers, faith *Galen*, doe slit the barke whilest the Withy is in flourishing, and gather a certain iuice, with which they vse to take away things that hinder the sight, and this is when they are constrained to vse a cleansing medicine of thin and subtile parts.

CHAP. 56. Of the Oliue Tree.

1 *Olea sativa*.
The manured Oliue tree.

2 *Olea sylvestris*.
The wilde Oliue tree.

¶ The

¶ The Description.

1 **T**He tame or manured Oliue tree groweth high and great with many branches, full of long narrow leaues not much vnlike the leaues of Willows, but narrower and smaller: the floures be white and very small, growing vpon clusters or bunches: the fruit is long and round, wherein is an hard stone: from which fruit is pressed that liquor which we call oyle Oliue.

2 The wilde Oliue is like vnto the tame or garden Oliue tree, sauing that the leaues are something smaller: among which sometimes do grow many prickely thornes: the fruit hereof is lesser than of the former, and moe in number, which do seldome come to maturitie or ripenes in somuch that the oile which is made of those berries continueth euer green, and is called Oile Omphacine, or oile of vnripe Oliues.

¶ The Place.

Both the tame and the wilde Oliue trees grow in very many places of Italy, France, and Spaine, and also in the Islands adioyning: they are reported to loue the sea coasts, for most do thinke, as *Columella* writeth, that aboue sixty miles from the sea they either dy, or else bring forth no fruit: but the best, and they that do yeeld the most pleasant Oyle are those that grow in the Island called Candy.

¶ The Time.

All the Oliue trees floure in the moneth of Iune: the fruit is gathered in Nouember or December: when they be a little dried and begin to wrinkle they are put into the presse, and out of them is squeezed oile, with water added in the pressing: the Oliues which are to be preserued in salt and pickle must be gathered before they be ripe, and whilest they are greene.

¶ The Names.

The tame or garden Oliue tree is called in Greeke *Ελαια*, and *Ελαια σπυρος*: in Latine, *Olea satina*, and *Vrbana*: in high-Dutch, *Delbaum*: in low-Dutch, *Olijfboome*: in Italian, *Oliuo domestico*: in French, *Oliuier*: in Spanish, *Oliuo*, and *Oliuera*: in English, Oliue tree.

The berry is called *Oliua*: in Greeke also *Ελαια*: in Spanish, *Azeytuna*: in French, Dutch, and English, Oliue.

Oliues preserued in brine or pickle are called *Colymbades*.

The wilde Oliue tree is named in Greeke, *Αγρια*: in Latine, *Olea sylvestris*, *Oleaster*, *Cotinus*, *Olea Athiopica*: in Dutch, *Wald Delbaum*: in Italian, *Oliuo saluatico*: in Spanish, *Azebuche*, *Azambulheyro*: in French, *Oliuier sauvage*: in English, wilde Oliue tree.

¶ The Temperature and Vertues.

The Oliues which be so ripe as that either they fall off themselves, or be ready to fall, which are named in Greeke, *Αρπυγίαι*, be moderatly hot and moist, yet being eaten they yeeld to the body little nourishment. **A**

The vnripe oliues are dry and binding. **B**

Those that are preserued in pickle, called *Colymbades*, do dry vp the ouermuch moisture of the stomacke, they remoue the loathing of meate, stirre vp an appetite; but there is no nourishment at all that is to be looked for in them, much lesse good nourishment. **C**

The branches, leaues, and tender buds of the Oliue tree do coole, dry, and binde, and especially of the wilde Oliue: for they be of greater force than those of the tame: therefore by reason they be milder they are better for eye medicines, which haue need of binding things to be mixed with them. **D**

The same do stay S. Anthonies fire, the shingles, epinytides, night wheales, carbuncles, and eating vlcers: being laid on with honey they take away eschares, cleanse foule and filthy vlcers, and quench the heate of hot swellings, and be good for kernels in the flanke: they heale & skin wounds in the head, and being chewed they are a remedie for vlcers in the mouth. **E**

The iuyce and decoction also are of the same effect: moreouer, the iuyce doth stay all maner of bleedings, and also the whites. **F**

The iuyce is pressed forth of the stamped leaues, with wine added thereto (which is better) or with water, and being dried in the Sun it is made vp into little cakes like perfumes. **G**

The sweat or oyle which issueth forth of the wood whilest it is in burning healeth tetters, scurfs and scabs, if they be anointed therewith. **H**

The same which is pressed forth of the vnripe Oliues is as cold as it is binding. **I**

The old oile which is made of sweet and ripe Oliues, being kept long, doth withall become hotter, and is of greater force to digest or waste away; and that oile which was made of the vnripe Oliue, being old, doth as yet retaine some part of his former astringency, and is of a mixt faculty, that is to say, partly binding, and partly digesting; for it hath got this digesting or consuming faculty by age, and the other propertie of binding of his owne nature. **K**

The

L The oile of ripe Oliues mollifieth and asswageth paine, dissolueth tumors or swellings, is good for the stiffenesse of the ioints, and against cramps, especially being mingled according to art, with good and wholesome herbes appropriate vnto those diseases and griefes, as *Hypericon*, *Cammomill*, *Dill*, *Lillies*, *Roses*, and many others, which do fortifie and increase his vertues.

M The oile of vnripe Oliues, called *Omphacium Oleum*, doth stay, repress, and driue away the beginning of tumors and inflammations, cooling the heate of burning vlcers and exulcerations.

CHAP. 57. Of Priuet or Prim Print.

Ligustrum.

Priuet, or Prim Print.

The Description.

Priuet is a shrub growing like a hedge tree, the branches and twigs wherof be straight, and couered with soft glistering leaues of a deepe green colour, like those of Peruinckle, but yet longer, greater also than the leaues of the Oliue tree: the floures be white, sweet of smell, very little, growing in clusters, which being vaded there succeed clusters of berries, at the first greene, and when they be ripe blacke like a little cluster of grapes, which yeeld a purple iuice: the root groweth euery way aslope.

The Place.

The common Priuet groweth naturally in enery wood, and in the hedge rowes of our London gardens: it is not found in the countrey of Polonia and other parts adiacent.

The Time.

It floureth in the end of May, or in Iune: the berries are ripe in Autumne or about Winter, which now and then continue all the Winter long; but in the meane time the leaues fall away, and in the Spring new come vp in their places.

The Names.

It is called in Latine, *Ligustrum*: in Italian at this day, *Gustrico*, by a corrupt word drawne from *Ligustrum*: it is the Grecians *simopia*, and in no wise *simopia*: for Cyprus is a shrub that groweth naturally in the East, and Priuet in the West. They be very like one vnto another, as the descriptions doe declare, but yet in this they differ, as witnesseth *Bellonius*, because the leaues of Priuet do fall away in winter, and the leaues of Cyprus are alwaies greene: moreover, the leaues of Cyprus do make the haire red, as *Dioscorides* saith, and (as *Bellonius* reporteth) do giue a yellow colour: but the leaues of Priuet haue no vse at all in dying. And therefore *Pliny*, lib. 24. cap. 10. was deceiued, in that he iudged Priuet to be the selfe same tree which Cyprus is in the East: which thing notwithstanding he did not write as hee himselfe thought, but as other men suppose; for, lib. 12. cap. 14. he writeth thus: Some (saith he) affirme this, viz. Cyprus, to be that tree which is called in Italy, *Ligustrum*; and that *Ligustrum* or Priuet is that plant which the Grecians call *simopia*, the description doth declare.

Phillyria, saith *Dioscorides*, is a tree like in bignesse to Cyprus, with leaues blacker and broader than those of the Oliue tree: it hath fruit like to that of the Mastick tree, blacke, something sweet, standing in clusters, and such a tree for all the world is Priuet, as we haue before declared.

Serapio the Arabian, cap. 44. doth call Priuet *Mahaleb*. There is also another *Mahaleb*, which is a graine or seed of which *Auicenna* maketh mention, cap. 478. that it doth by his warme and comfortable heate dissolve and assuage paine. *Serapio* seemeth to intreat of them both, and to containe diuers of the *Mahaleb* vnder the title of one chapter: it is named in high-Dutch, *Beinholtzlein*, *Mundholtz*, *Rhein oder Schulweiden*: in low-Dutch, *Keelcrup*, *Monthout*: in French, *Troesne*: in English, Priuet, Primprint, and Print.

Some

Some there be that would haue the berries to be called *Vaccinia*, and *Vaccinium* to be that of which *Vitruvius* hath made mention in his seventh booke of Architecture or the art of building, chap. 14. of purple colours: after the same manner, saith he, they temper *Vaccinium*, and putting milke vnto it do make a gallant purple: in such breuitie of the old writers what can be certainly determined.

¶ The Temperature.

The leaues and fruit of Priuet are cold, dry, and astringent.

¶ The Vertues.

The leaues of Priuet do cure the swellings, apostumations, and vlcers of the mouth or throat, being gargarised with the iuyce or decoction thereof, and therefore they be excellent good to be put into lotions, to wash the secret parts, and the scaldings with women; cankers and sores in childrens mouthes.

CHAP. 58. Of Mocke-Priuet.

1 *Phillyrea angustifolia*.

Narrow leaued Mock-Priuet.

2 *Phillyrea latiore folio*.

The broader leaued Mock-Priuet.

¶ The Description.

1 **C**Yprus is a kinde of Priuet, and is called *Phillyrea*, which name all the sorts or kinds thereof do retaine, though for distinctions sake they passe vnder sundry titles. This plant groweth like an hedge tree, sometimes as big as a Pomegranat tree, beset with slender twiggy boughes which are garnished with leaues growing by couples, very like the leaues of the Oliue tree, but broader, softer, and of a Greene colour: from the bosomes of these leaues come forth great bunches of small white floures, of a pleasant sweet smell: which being vaded, there succeed clusters of blacke berries very like the berries of the Alder tree.

2 The second Cyprus, called also *Phillyrea latifolia*, is very like the former in body, branches, leaues,

3 *Phillyrea ferrata* 2. *Clusij*.
The second toothed Priuet of *Clusius*.

leaves, flowers, and fruit; and the difference is this, that the leaves of this plant are broader, but in facultie they are like.

3 This kinde of Priuet riseth vp like an hedge bush, of the height of five or six cubits: the branches are long, fragile or brittle, couered with a whitish barke; whereon are set leaves somewhat broad, iagged on the edges like the teeth of a saw, and of a deep green colour: among which come forth the flowers, which neither my Author nor my selfe haue seene: the berries grow vpon small foot-stalks, for the most part three together, being round, and of the bignesse of pepper graines, or Myrtle berries, of a blacke colour when they be ripe.

¶ *The Place.*

These plants do grow in Syria neere the city Ascalon, and were found by our industrious *Pena* in the mountaines neere Narbone and Montpellier in France: the which I planted in the garden at Barn-Elmes neere London, belonging to the right Honourable the Earle of Essex: I haue them growing in my garden likewise.

¶ *The Time.*

The leaves shoot forth in the first of the Spring: the flowers shew themselves in May and Iune: the fruit is ripe in September.

¶ *The Names.*

This Priuet is called in Greeke, *κισσός*, and in Latine also *Cyprus*; and may be named in English, Easterlin Priuet, and Mocke-Priuet, for the reason following: they are deceiued who taking *Pliny* for their Author, do thinke that it is *Ligustrum*, or our Westerne Priuet, as wee haue shewed in the former chap. it is the Arabians *Alcanna*, or *Henne*: and it is also called of the Turks *Henne* euen at this present time.

¶ *The Temperature.*

The leaves of these kindes of Priuet haue a binding qualitie, as *Dioscorides* writeth.

¶ *The Vertues.*

- A Being chewed in the mouth they heale the vlcers thereof, and are a remedie against inflammations or hot swellings.
- B The decoction thereof is good against burnings and scaldings.
- C The same being stamped and steeped in the iuice of Mullen and laid on, do make the haire red, as *Dioscorides* noteth. *Bellonius* writeth, that not only the haire, but also the nether parts of mans body and nailes likewise are coloured and died herewith, which is counted an ornament among the Turks.
- D The flowers being moistned in vineger and applied to the temples asswageth head-ache.
- E There is also made of these an oile called *Oleum Cyprinum*, sweet of smell, and good to heate and supple the sinewes.

CHAP. 59. Of bastard Priuet.

¶ *The Description.*

1 **T**His shrubby tree, called *Macaleb*, or *Mahaleb*, is also one of the Priuets: it riseth vp like vnto a small hedge tree, not vnlike vnto the Damson or Bullesle tree, hauing many vp-right stalks and spreading branches: whereon do grow leaves not vnlike those of the *Phillyrea* of *Clusius* description: amongst which come forth mossie flowers of a white colour, and of a perfect sweet

sweet smell, growing in clusters, many hanging vpon one stem, which the Grauer hath omitted: after which come the berries, Greene at the first, and blacke when they be ripe, with a little hard stone within, in which lieth a kernell.

2 *Gesner* and *Matthiolus* haue set forth another *Macaleb*, being also another bastard Priuet. It groweth to a small hedge tree, hauing many Greene branches set with round leaues like those of the Elme tree, somewhat snipt about the edges: the floures are like those of the precedent: The fruit, or rather the kernell thereof, is as hard as a beade of Corall, somewhat round, and of a shining blacke colour; which the cunning French Perfumers do bore thorow, making thereof bracelets, chaines, and such like trifling toyes, which they send into England, smeared ouer with some odde sweet compound or other, and they are here sold vnto our curious Ladies and Gentlewomen for rare and strange Pomanders, for great summes of money.

1 *Phillyrea arbor*, *verior Macaleb*.
Bastard Priuet.

2 *Macaleb Gesneri*.
Corall Priuet.

¶ *The Place.*

These trees grow in diuers places of France, as about Tholouse, and sundry other places: they are strangers in England.

¶ *The Time.*

The floures bud forth in the Spring: the fruit is ripe in Nouember and December.

¶ *The Names.*

This bastard Priuet is that tree which diuers suspect to be that *Mahaleb* or *Macaleb* of which *Auicenna* writeth, cap. 478. and which also *Serapion* speaketh of out of *Mesue*: but it is an hard thing to affirme any certaintie thereby, seeing that *Auicenna* hath described it without markes: notwithstanding this is taken to be the same of most writers, and those of the best: we may call it in English, bastard Priuet, or Corall, or Pomander Priuet, being without doubt a kinde thereof.

¶ *The Temperature and Vertues.*

Concerning this bastard Priuet we haue learned as yet no vse thereof in Physicke. The kernels which are found in the stones or fruit, as they be like in taste to those of Cherries, so be they also answerable to them in temperature; for they are of a temperat heate, and do gently prouoke vrine, and be therefore good for the stone: more we haue not to write than hath beene spoken in the description.

CHAP. 60. Of the fruitlesse Priuet.

¶ The Description.

1 **T**His shrubby bush, called of *Pliny* and *Carolus Clusius*, *Alaternus*, groweth vp to a small hedge tree, in forme like vnto a bastard Priuet; but the leaues are more like those of *Ilex*, or the French Oke, yet stiffer and rounder than those of *Macaleb*: amongst which come forth tufts of greenish yellow floures like those of the Lentiske tree: vnder and among the leaues come forth the berries, like those of *Laurus Tinus*, in which are contained two kernels like to the Acines or stones of the Grape.

1 *Alaternus Plinij.*
Fruitleffe Priuet.

2 *Alaternus humilior.*
The lower fruitlesse Priuet.

2 The second kinde of *Alaternus* is likewise a fruitlesse kinde of Priuet, hauing narrow leaues somewhat snipt about the edges: from the bosomes whereof come forth small herby coloured floures; which being vaded, there succeedeth the fruit, whereof *Auicen* speaketh, calling it by the name *Fagaras*, being a fruit in bignesse and forme like those in shops called *Cocculus indi*, and may be the same for any thing that hath been written to the contrarie. This fruit hangeth as it were in a darke ash-coloured skin or huske, which incloseth a slender stiffe shell like the shell of a nut, couered with a thin or blacke filme, whether it be the fruit of this plant it is not censured; notwithstanding you shall finde the figure hereof among the Indian fruits, by the name *Fagaras*.

† This hath shorter branches and rounder leaues than the former: the floures are larger and greener; to which succeed fruit clustering together, first greene, then red, and afterwards blacke, and consisting of three kernells: it floures in Februarie and the beginning of March, and growes in fundry places of Spaine. The fruit of this is not the *Fagaras*, neither doth the *Fagaras* mentioned by our Author any way agree with the *Cocculus Indi* of the shops, as shall be shewed hereafter in their fitplaces. †

¶ The Place.

These plants do grow in the shadowie woods of France, and are strangers in England.

¶ The

¶ The Time.

The time answereth the rest of the Priuets.

¶ The Names.

Alaternus of *Pliny* is the same *Phillyrea* which *Theophrastus* hath written of by the name *Philyca*, and *Bellonius* also, *lib. 1. cap. 42.* of his Singularities, and the people of Candy call it *Eleprion*: the Portugals, *Casca*: in French, *Dalader*, and *Sangin blanc*: in English, barren or fruitlesse Priuet: notwithstanding some haue thought it to beare fruit, which at this day is called *Fagaras*: with vs, *Cocculus-Indi*, as we haue said. ‡ I can by no meanes approue of the English name here giuen by our Author; but iudge the name of Euer-greene Priuet, (giuen it by *M^r. Parkinson*) to be much more fitting to the thing. ‡

¶ The Temperature and Vertues.

Whether the plant be vsed in medicine I cannot as yet learne: the fishermen of Portugall do vse to see the barke thereof in water, with the which decoction they colour their nets of a red-dish colour, being very fit for that purpose: the wood also is vsed by Dyers to dye a darke blacke withall.

CHAP. 61. Of the white and blew Pipe-Priuet.

1 *Syringa alba.*
White Pipe.

2 *Syringa carulea.*
Blew Pipe.

¶ The Description.

THe white Pipe groweth like an hedge tree, or bushy shrub: from the root wherof arise many shoots, which in short time grow to be equall with the old stocke, whereby in little time it increaseth to infinite numbers, like the common English Prim or Priuet, whereof doubtlesse it is a kinde, if we consider euery circumstance: the branches are couered with a rugged gray barke: the timber is white, with some pith or spongie matter in the middle like Elder, but lesser in quantitie. These little branches are garnished with small crumpled leaues of the shape and bignesse of Peare tree leaues, and very like in forme: among which come forth

Bbbbbb 2

the

‡ 3 *Syringa Arabica.*
Arabian Pipe.

4 *Balanus Myrepica, sine Glans unguentaria.*
The Oylie Acorne.

of the Spanish Iasmine, and Orange floures. It is a tender plant, and may be grafted vpon the common Iasmine, whereon it thrives well, and floures most part of the Sommer. It groweth plentifully in Egypt; and Prosper Alpinus is thought to mention this by the name of *Sambac Arabum, sine Gelseminum Arabicum.* ‡

4 *Glans unguentaria*, or the oylie Acorne, is the fruit of a tree like Tamariske, of the bignesse of an Hasell Nut, out of the kernell whereof, no otherwise than out of bitter Almonds, is pressed an oylie iuyce which is vsed in pretious Oyntments, as *Dioscorides* affirmeth: neither is it in our time wholly reiected; for the oyle of this fruit mixed with sweet odours serueth to perfume gloues

the floures, growing in tufts, compact of foure small leaues of a white colour, and of a pleasant sweet smell; but in my iudgement they are too sweet, troubling and molesting the head in very strange manner. I once gathered the floures and laid them in my Chamber window, which smelled more strongly after they had lien together a few houres, with such an vnacquainted fauor, that they awaked me out of my sleepe, so that I could not take any rest till I had cast them out of my chamber. When the floures be vaded then followeth the fruit, which is small, curled, and as it were compact of many little folds, broad towards the vpper part, and narrow towards the stalk, and black when it is ripe, wherein is contained a slender and long seed. The root hereof spreadeth it selfe abroad in the ground, after the manner of the roots of such shrubbie trees.

2 The blew Pipe groweth likewise in maner of a smal hedge tree, with many shoots rising from the root like the former, as our common Priuet doth, whereof it is a kinde. The branches haue some small quantitie of pith in the middle of the wood, and are covered with a darke blacke greenish barke or rinde. The leaues are exceeding greene, and crumpled or turned vp like the brimmes of an hat, in shape very like vnto the leaues of the Poplar tree: among which come the floures, of an exceeding faire blew colour, compact of many small floures in the forme of a bunch of grapes: each floure is in shew like those of *Valeriana rubra Dodonai*, consisting of foure parts like a little star, of an exceeding sweet fauor or smel, but not so strong as the former. When these floures be gone, there succeed flat cods, and somewhat long, which being ripe are of a light colour, with a thinne membrane or filme in the midst, wherein are seeds almost foure square, narrow and ruddy.

‡ 3 This (which *Clusius* setteth forth by the name of *Iasminum Arabicum*, or *Syringa Arabica*) groweth some two or three cubits high, diuided into many slender branches, whereon by couples at each ioint stand leaues like those of the first described, but thinner, and not snipt about the edges: on the tops of the branches grow the floures, wholly white, consisting of nine, ten, or twelue leaues set in two rankes: these floures are very sweet, hauing a sent as it were compounded

gloues and diuers other things, and is vulgarly knowne by the name of Oyle of Ben.

¶ The Place.

1. 2. These trees grow not wilde in England, but I haue them growing in my garden in very great plenty.

¶ The Time.

They floure in Aprill and May, but as yet they haue not borne any fruit in my garden, though in Italy and Spaine their fruit is ripe in September.

¶ The Names.

The later Physitians call the first *Syringa*, or rather *Σύριγγις*: that is to say, a Pipe, because the stalks and branches thereof, when the pith is taken out, are hollow like a pipe: it is also many times surnamed *Candida*, or white, or *Syringa candida flore*, or Pipe with a white floure, because it should differ from *Lillach*, which is sometimes named *Syringa cærulea*, or blew Pipe: in English, White Pipe.

Blew Pipe the later Physitians, as we haue said, do name *Lillach*, or *Lilac*: of some, *Syringa cærulea*, or blew Pipe: most do expound the word *Lillach*, and call it *Ben*: *Serapio's* and the Arabians *Ben* is *Glans unguentaria*, which the Grecians name *Βάλανος μυρσική*, from which *Lillach* doth very much differ: among other differences it is very apparant, that *Lillach* bringeth forth no Nut, howsoeuer *Matthiolus* doth falsly picture it with one; for it hath only a little cod, the seed whereof hath in it no oile at all. The figure of the *Balanus Myrsefica* we haue thought good to insert in this chapter, for want of a more conuenient roome.

¶ The Temperature and Vertues.

Concerning the vse and faculties of these shrubs neither we our selues haue found out any thing A nor learned ought of others.

‡ The *Balanus Myrsefica* taken in the quantitie of a dram, causeth vomit; drunk with *Hydromel* B it purges by stoole, but is hurtfull to the stomacke.

The oile pressed out of this fruit, which is vsually termed oyle of Ben, as it hath no good or plea- C sing smell, so hath it no ill sent, neither doth it become rancide by age, which is the reason that it is much vsed by perfumers.

The oile smoothes the skin, softens and dissolues hardnesse, and conduces to the cure of all cold D affects of the sinewes; and it is good for the paine and noise in the eares, being mixed with Goosegrease, and so dropped in warme in a small quantitie. ‡

CHAP. 62. Of Widow-Waile, or Spurge Oliue.

¶ The Description.

Widow-waile is a small shrub about two cubits high. The stalke is of a wooddy substance, branched with many small twigs, full of little leaues like Priuer, but smaller and blacker, on the ends whereof grow small pale yellow floures: which being past, there succeedeth a three cornered berrie like the *Tithymales*, for which cause it was called *Tricoccus*, that is, three berried *Chamelea*: these berries are Greene at the first, red afterward, and browne when they be withered, and containe in them an oylie fatnesse like that of the Oliue, being of an hot and biting taste, and that doe burne the mouth, as do both the leaues and rinde. The root is hard and wooddy.

¶ The Place.

It is found in most vtilld grounds of Italy and Languedoc in France, in rough and desert places. I haue it growing in my garden.

¶ The Time.

It is alwaies Greene: the seed is ripe in Autumne.

¶ The Names.

The Grecians call it *Χαμύλαια*, as though they should say, low or short Oliue tree: the Latines, *Oleago*, and *Oleastellus*, and likewise *Citocacium*: it is also named of diuers, *Olinella*, as *Matthiolus Syluaticus* saith: it is called in English, Widow-Waile, *quia facit viduas*.

The fruit is named of diuers, *Κόκκος κνιδίος*: in Latine, *Coccus cnidicus*: but he is deceiued, saith *Dioscorides*, that nameth the fruit of Spurge-Oliue, *Coccus Cnidicus*: *Anicen* and *Serapio* call *Chamelea*, or Spurge Oliue, *Mexereon*: vnder which name notwithstanding they haue also contained both the *Chamaeleons* or *Carlines*; and so haue they confounded *Chamelea* or Spurge Oliue with the *Carlines*, and likewise *Thymalea*, or Spurge flax.

Chamaelea Arabum Tricoccus.
Widow-Waile.

Chamaelea Germanica, siue Mezereon.
Spurge Flax, or the dwarfe Bay.

¶ *The Temperature.*

Both the leaues and fruit of Spurge-Oliue, as we haue said, are of a burning and extreme hot temperature.

¶ *The Vertues.*

The leaues, saith *Dioscorides*, purge both flegme and choler, especially taken in pills, so that two parts of Wormewood be mixed with one of Spurge Oliue, and made vp into pills with Mede or honied water. They melt not in the belly, but as many as be taken are voided whole.

Mesue likewise hath a description of pills of the leaues of *Mezereon*, that is, *Chamaelea*, or Spurge-Oliue (yet *Syluius* expoundeth it *Thymelaea*, or Spurge-Flax) but in stead of Wormewood he taketh the outward substance of the yellow Mirobalans and *Cepula Mirobalans*, and maketh them vp with *Tereniabin*, that is to say, with Manna and soure Dates, which they call *Tamarinds*, dissolued in *Endiue* water; and appointeth the same leaues to be first tempered with very strong vinegar, and to be dried.

These pills are commended against the Dropsie, for they draw forth watery humours, but are violent to nature; therefore we must vse them as little as may be. Moreouer, *Dioscorides* addeth, that the leaues of Spurge Oliue beaten with hony do cleanse filthy or cruised vlcers.

CHAP. 63.

Of Germane Oliue Spurge.

¶ *The Description.*

THE dwarfe Bay tree, called of Dutch men *Mezereon*, is a smal shrub two cubits high: the branches be tough, limber, & easie to bend, very soft to be cut; whereon grow long leaues like those of *Priuet*, but thicker and fatter. The floures appeare before the leaues, oft times in Ianuarie, clustring together about the stalks at certain distances, of a whitish colour tending to purple, and of a most fragrant and pleasant sweet smel: after come the small berries, green at the first, but being ripe, of a shining red colour, and afterward wax of a dark black colour, of a very hot and burning taste, inflaming the mouth and throat, being tasted, with danger of choking. The root is wooddy.

¶ *The Place and Time.*

This plant grows naturally in the moist and shadowy woods of most of the East countries, especially about *Meluin* in Poland, from whence I haue had great plenty thereof for my garden, where they floure in the first of the Spring, and ripen their fruit in August.

¶ *The Names.*

It is vsually called in high-Dutch, *Zeilant*, *Zeidelbast*, *Leuszkraut*, and *Kellerhals*: the Apothecaries

Apothecaries of our countrey name it *Mezereon*, but we had rather call it *Chamelæa Germanica*: in English, Dutch *Mezereon*, or it may be called *Germane Oliue Spurge*. We haue heard, that diuers Italians do name the fruit thereof *Piper Montanum*, Mountaine Pepper. Some say that *Laureola* or *Spurge Laurell* is this plant, but there is another *Laureola*, of which we will hereafter treat: but by what name it is called of the old writers, and whether they knew it or no, it is hard to tell. It is thought to be *Cneoron album Theophrasti*, but by reason of his breuitie, we can affirme no certainty.

There is, saith he, two kindes of *Cneoron*, the white and the blacke, the white hath a leafe, long, like in forme to *Spurge Oliue*: the black is full of substance like *Mirtle*; the low one is more white, the same is with smell, and the blacke without smell. The root of both which groweth deepe, is great: the branches be many, thicke, wooddie, immediatly growing out of the earth, or little aboue the earth, tough: wherefore they vse these to binde with, as with *Oziars*. They bud and floure when the Autumne Equinoctiall is past, and a long time after. Thus much *Theophrastus*.

The *Germane Spurge Oliue* is not much vnlike to the *Oliue tree* in leafe: the floure is sweet of smell: the buds whereof, as we haue written, come forth after Autumne: the branches are wooddy and pliable: the root long, growing deepe: all which shew that it hath great likenesse and affinity with *Cneoron*, if it be not the very same.

¶ The Temperature.

This plant is likewise in all parts extreme hot: the fruit, the leaues, and the rinde are very sharpe and biting: they bite the tongue, and set the throte on fire.

¶ The Vertues.

The leaues of *Mezereon* do purge downeward, flegme, choler, and waterish humours with great A violence.

Also if a drunkard do eat one graine or berry of this plant, hee cannot be allured to drinke any B drinke at that time; such will be the heat of his mouth and choking in the throat.

This plant is very dangerous to be taken into the body, & in nature like to the *Sea Tithymale*, C leauing (if it be chewed) such an heat and burning in the throat, that it is hard to be quenched.

The shops of Germany and of the Low-countries dowhen need require vse the leaues hereof D in stead of *Spurge Oliue*, which may be done without error; for this *Germane Spurge Oliue* is like in vertue and operation to the other, therefore it may be vsed in stead thereof, and prepared after the like and selfe-same manner.

CHAP. 64. Of Spurge Flax.

¶ *Thymelæa.*

Spurge Flax, or mountaine Widow waile.

¶ The Description.

Spurge Flax bringeth forth many slender branched sprigs aboue a cubite high, couered round with long and narrow leaues like those of flax, narrower & lesser than the leaues of *Spurge Oliue*. The floures are white, small, standing on the vpper parts of the sprigs: the fruit is round, greene at the first, but red when it is ripe, like almost to the round berries of the *Hawthorne*, in which is a white kernel couered with a blacke skinne, very hot and burning the mouth like *Mezereon*: the root is hard and wooddie.

¶ The Place.

It groweth in rough mountains, and in vn-toiled places in hot regions. It groweth in my garden.

¶ The Time.

It is greene at any time of the yeare, but the fruit is perfected in Autumne.

¶ The Names.

The Grecians call it *Θυμέλαια*: the Syrians, as *Dioscorides* witnesseth, *Apolinon*: diuers also *Chamelæa*, but not properly: but as *Dioscorides* saith, the leafe is properly called *Cneoron*, & the fruit *Coccus Cnidios*; notwithstanding those which *Theophrastus* calleth *Cneora* seem to differ from *Thymelæa*, or *Spurge Flax*, vnlesse *Nigrum Cneoron* be *Thymelæa* for *Theophrastus* saith that

that there be two kindes of *Cneoron*; the one white, the other blacke: this may be called in English, Spurge Flax, or mountaine Widow Wayle: the seed of *Thymelæa* is called in shops, *Granum Gnidium*.

¶ *The Temperature.*

Spurge Flax is naturally both in leaues and fruit extreme hot, biting and of a burning qualitie.

¶ *The Vertues.*

- A The graines or berries, as *Dioscorides* saith, purge by siege choler, flegme and water, if twenty graines of the inner part be drunke, but it burneth the mouth and throat, wherefore it is to be giuen with fine floure or Barly meale, or in Raisons, or couered with clarified hony, that it may be swallowed.
- B The same being stamped with Niter and vineger, serueth to annoint those with, which can hardly sweat.
- C The leaues must be gathered about haruest, and being dried in the shade, they are to be layed vp and reserued.
- D They that would giue them must beat them, and take forth the strings: the quantity of two ounces and two drams put into wine tempered with water, purgeth and draweth forth watery humors: but they purge more gently if they be boiled with Lentils, and mixed with pot-herbes chopped.
- E The same leaues beaten to pouder and made vp into trochiscs or flat cakes, with the iuice of sower grapes are reserued for vse.
- F The herbe is an enemy to the stomacke, which also destroyeth the birth if it be applied.

† Our Author formerly following *Tabernaemontanus* gaue two figures and descriptions in this Chapter, but being both of one thing I omitted the worse figure and description.

CHAP. 65: Of Spurge Laurell.

Laureola florens.

Laurell, or Spurge Laurell flowering;

Laureola cum fructu.

Laurell with his fruit.

¶ The Description.

Spurge Laurell is a shrub of a cubit high, oftentimes also of two, and spreadeth with many little boughes, which are tough and lithy, and couered with a thicke rinde. The leaues be long, broad, grosse, smooth, blackish Greene, shining, like the leaues of Laurell, but lesler, thicker, and without smell, very many at the top, clustering together. The floures be long, hollow, of a whitish Greene, hanging beneath and among the leaues: the berries when they be ripe are blacke, with a hard kernell within, which is a little longer than the seed of Hempe: the pulpe or inner substance is white: the root wooddie, tough, long, and diuersly parted, growing deepe: the leaues, fruit and barke, as well of the root as of the little boughes, doe with their sharpnesse and burning qualitie bite and set on fire the tongue and throat.

¶ The Place.

It is found on mountaines, in vntilled, rough, shadowie, and wooddie places, as by the lake of Lozanna or Geneua, and in many places neere the riuer of Rhene and of the Maze. ‡ It growes abundantly also in the woods in the most parts of England. ‡

¶ The Time.

The floures bud very soon, a little after the Autume Equinoctiall: they are full blown in Winter, or in the first Spring: the fruit is ripe in May and Iune: the plant is alwaies Greene, and indureth the cold stormes of winter.

¶ The Names.

It is called in Greeke *δρυφύλλος*, of the likenesse it hath with the leaues of the Laurell or Bay tree: in Latine likewise *Daphnoides*: the later Latinists for the same cause name it *Laureola*, as though they should say *Minor Laurus*, or little Laurell: it is called *χαμυδάριον*, and *πένθος*, notwithstanding there is another *Chamaedaphne*, and another *Peplion*. This shrub is commonly called in English, Spurge Laurell, of diuers, Laurell or Lowry.

Some say that the Italians name the berries hereof *Piper montanum*, or Mountaine Pepper, as also the berries of Dutch Mezereon: others affirme them to bee called in High Dutch also, *Zeilant*.

It may be *Theophrastus* his *Cneoron*: for it is much like to a Mirtle in leafe, it is also a branched plant, tough and pliable, hauing a deep root, without smell, with a blacke fruit.

¶ The Temperature.

It is like in temperature and facultie to the Germane Spurge Oliue, throughout the whole substance biting and extreme hot.

¶ The Vertues.

The drie or Greene leaues of Spurge Laurell, saith *Dioscorides*, purgeth by siege flegmaticke humors; it procureth vomite and bringeth downe the menfes, and being chewed it draweth water out of the head.

It likewise causeth neezing; moreouer, fifteene graines of the seed thereof drunke, are a purgation.

CHAP. 66. Of Rose Bay, or Oleander.

¶ The Description.

Rose Bay is a small shrub of a gallant shew like the Bay tree, bearing leaues, thicker, greater, longer and rougher than the leaues of the Almond tree: the floures be of a faire red colour, diuided into five leaues, not much vnlike a little Rose: the cod or fruit is long, like *Aselepias*, or *Vincetoxicum*, and full of such white downe, among which the seed lieth hidden: the root is long, smooth, and wooddie.

The second kinde of Rose bay, is like the first, & differeth in that, that this plant hath white floures; but in other respects it is very like.

The

1 *Nerium, five Oleander.*
The Rose Bay.

2 *Nerium flore albo.*
The Rose Bay with white floures

¶ *The Place.*

These grow in Italy and other hot regions, by riuers and the Sea side: I haue them growing in my garden.

¶ *The Time.*

In my garden they floure in Iuly and August: the cods be ripe afterwards.

¶ *The Names.*

This plant is named in Greeke *Nerion*, by *Nicander*, *Neris*: in Latine likewise *Nerion*, and also *Rhododendron*, and *Rhododaphne*, that is to say, *Rosea arbor*, and *Rosea Laurus*: in shops, *Oleander*: in Italian, *Oleandro*: in Spanish, *Adelfa*, *Eloendro*, and *Alendro*: in French, *Rosagine*: in English, *Rose tree*, *Rose Bay*, *Rose Bay tree* and *Oleander*.

¶ *The Temperature and Vertues.*

- A This tree being outwardly applied, as *Galen* saith, hath a digesting facultie: but if it be inwardly taken it is deadly and poisonfome, not only to men, but also to most kindes of beasts.
- B The floures and leaues kill dogs, asses, mules, and very many of other foure footed beasts: but if men drinke them in wine they are a remedy against the bitings of Serpents, and the rather if Rue be added.
- C The weaker sort of cattell, as sheep and goats, if they drinke the water wherein the leaues haue been steeped, are sure to die.

CHAP. 67. Of dwarfe Rose Bay.

¶ *The Description.*

D Warfe *Nerium*, or Rose Bay, hath leaues which for the most part are alwaies green, rough, and small, of a pale yellow colour like Box, far lesser than Oleander: the whole plant is of a shrubby stature, leaning this way and that way, as not able to stand vpriight without helpe; his branches are couered and set full of small floures, of a shining scarlet or crimson colour; growing vpon the

1 *Chamaerhododendros Alpigena.*
Dwarfe Rose Bay.

Laurus.
The Bay tree.

the hills as ye go from Trent to Verona, which in Iune and Iuly are as it were couered with a scarlet coloured carpet, of an odoriferous fauor, and delectable aspect, which being fallen there commeth seed and faire berries like *Asparagus*.

¶ *The Place.*

The place and time are expressed in the description.

¶ *The Names.*

This may be called in English, Dwarfe Rose Bay of the Alps. I find not any thing extant of the vertues, so that I am constrained to leaue the rest vnto your owne discretion.

† The other plant our Author formerly described in this chapter in the 2. place by the name of *Chamaerhododendros montana*, I haue here omitted, because he set it forth before by the name of *Cistus Ledum Silesiacum*, giuing 2. figures and one description, in the 11. and 12. places of the 8. chap. of this 3. Booke.

CHAP. 68. Of the Bay or
Laurell tree.

¶ *The Description.*

THE Bay or Laurell tree commeth oftentimes to the height of a tree of a mean bignesse; it is full of boughes, couered with a Greene barke: the leaues thereof are long, broad, hard, of colour Greene, sweetly smelling, and in taste somewhat bitter: the floures alongst the boughes and leaues are of a Greene colour: the berries are more long than round, and be couered with a black rind or pill: the kernell within is clouen into two parts, like that of the Peach and Almond, and other such, of a browne yellowish colour, sweet of smell, in taste somewhat bitter, with a little sharpe or biting qualitie.

2 There is also a certaine other kinde hereof more like to a shrub, sending forth out of the roots many offsprings, which notwithstanding groweth not so high as the former, and the barkes of the boughes be somewhat red: the leaues be also tenderer, and not so hard: in other things not vnlike.

These two Bay trees *Dioscorides* was not ignorant of; for he saith, that the one is narrow leaved, and the other broader leaved, or rather harder leaved which is more like.

¶ *The Place.*

The Laurell or bay tree groweth naturally in

ly in Spaine and such hot regions; we plant and set it in gardens, defending it from cold at the beginning of March especially.

I haue not seene any one tree thereof growing in Denmarke, Sweuia, Poland, Liuania, or Ruffia, or in any of those cold countries where I haue trauelled.

¶ *The Time.*

The Bay tree groweth greene winter and Sommer: it floureth in the Spring, and the black fruit is ripe in October.

¶ *The Names.*

This tree is called in Greeke *Lauro*: in Latine, *Laurus*: in Italian, *Lauro*: in high Dutch, *Looerbeerbaum*: in low Dutch, *Laurus boome*: in French, *Laurier*: in Spanish, *Laurel*, *Lorel*, and *Loureiro*: in English, *Laurell*, or Bay tree.

The fruit is named in Greeke *Lauri bacca*: in Latine, *Lauri bacca*: in high Dutch, *Looerbeeren*: in low Dutch, *Bakeleer*: in Spanish, *Vayas*: in English, Bay berries.

The Poets faine that it tooke his name of *Daphne*, Lado his daughter, with whom *Apollo* fell in loue.

¶ *The Temperature and Vertues.*

A The Berries and leaues of the Bay tree, saith *Galen*, are hot and very drie, and yet the berries more than the leaues.

B The barke is not biting and hot, but more bitter, and it hath also a certaine astrictiue or binding qualitie.

C Bay Berries with Hony or Cute, are good in a licking medicine, saith *Dioscorides*, against the pthificke or Consumption of the lungs, difficulty of breathing, and all kinde of fluxes or rheumes about the chest.

D Bay Berries taken in wine, are good against the bitings and stings of any venomous beast, and against all venome and poison: they cleanse away the morpew: the iuice pressed out hereof is a remedy for paine of the eares, and deafenesse, if it be dropped in with old wine and oile of Roses: this is also mixed with ointments that are good against wearisomnesse, and that heate and discusse or waste away humors.

E Bay berries are put into Mithridate, Treacle, and such like medicines that are made to refresh such people as are growne sluggish and dull by meanes of taking opiate medicines, or such as haue any venomous or poisoned quality in them.

F They are good also against cramps and drawing together of sinewes.

G We in our time do not vse the berries for the infirmities of the lungs, or chest, but minister them against the diseases of the stomacke, liuer, spleene, and bladder: they warme a cold stomacke, cause concoction of raw humours, stirre vp a decayed appetite, take away the loathing of meat, open the stopping of the liuer and spleene, prouoke vrine, bring down the menses, and driue forth the secundine.

H The oile pressed out of these, or drawne forth by decoction, doth in short time take away scabs and such like filth of the skin.

I It cureth them that are beaten blacke and blew, and that be bruised by squats and falls, it remoueth blacke and blew spots and congealed bloud, and digesteth and wasteth away the humors gathered about the grieved part.

K *Dioscorides* saith, that the leaues are good for the diseases of the mother and bladder, if a bath be made thereof to bathe and sit in: that the greene leaues do gently binde, that being applied, they are good against the stings of waspes and Bees, that with Barly meale parched and bread, they assuage all kinde of inflammations, and that being taken in drinke they mitigate the paine of the stomacke, but procure vomite.

L The Berries of the Bay tree stamped with a little Scammonic and Saffron, and laboured in a mortar with vineger and oile of Roses to the forme of a liniment, and applied to the temples and forepart of the head, do greatly cease the paine of the Megrim.

M It is reported that common drunkards were accustomed to eat in the morning fasting two leaues thereof against drunkenesse.

N The later Physitions doe oftentimes vse to boyle the leaues of Laurell with diuers meats, especially fishes, and by so doing there happeneth no desire of vomiting: but the meat seasoned herewith becommeth more sauory and better for the stomacke.

O The barke of the root of the Bay tree, as *Galen* writeth, drunken in wine prouoketh vrine, breakes the stone, and driueth forth grauell: it openeth the stoppings of the liuer, the spleene, and all other stoppings of the inward parts: which thing also *Dioscorides* affirmeth, who likewise addeth that it killeth the childe in the mothers wombe.

It helpeth the dropſie and the iaundife, and procureth vnto women their deſired ſickneſſe.

Our Author here alſo gaue the two figures of *Tabernamontanum*; the firſt by the name of *Laurus mas*, or the male Bay tree, and the other by the name of *Laurus femina*, the female Bay: the difference in the figures was little or none, wherefore I haue made one figure.

CHAP. 69. Of the Wilde Bay tree.

¶ The Deſcription.

1 *Laurus Tinus*, or the wilde Bay tree, groweth like a ſhrub or hedge buſh, hauing many tough and pliant branches, ſet full of leaues very like to the Bay leaues, but ſmaller and more crumpled, of a deepe and ſhining greene colour: among which come forth tufts of whitish floures, turning at the edges into a light purple: after which follow ſmall berries of a blew colour, containing a few graines or ſeeds like the ſtones or ſeeds of grapes: the leaues and all the parts of the plant are altogether without ſmell or ſauour.

1 *Laurus Tinus*.
The wilde Bay tree.

2 *Laurus Tinus Luſitanica*.
The Portingale wilde Bay tree.

2 *Tinus Luſitanica* groweth verie like to *Cornus Fæmina*, or the Dog-berry tree, but the branches be thicker, and more ſtiſſe, couered with a reddiſh barke mixed with greene: the leaues are like the former, but larger, hauing many ſinewes or vaines running through the ſame like as in the leaues of Sage: the floures hereof grow in tufts like the precedent, but they are of colour more declining to purple: the ſmall branches are likewiſe of a purple colour: the leaues haue no ſmell at all, either good or bad: the berries are ſmaller than the former, of a blew colour declining to blackneſſe.

¶ The Place.

The wilde Bay groweth plentifully in euery field of Italy, Spain, and other regions, which differ according to the nature and ſcituation of thoſe countries: they grow in my garden and proſper very well.

Cccccc

¶ The

¶ The Time.

The wilde Laurell is euer Greene, and may oftentimes be seene most part of the winter, and the beginning of the spring, with the floures and ripe berries growing both at one season.

¶ The Names.

It is called in Latine *Tinus*, and *Laurus sylvestris*: in Greeke, *δασυλάρυξ*: Cato nameth it *Laurus sylvestica*: in Italian, *Lauro syluatico*: in Spanish, *Vua de Perro*, otherwise *Follado*; and of diuers, *Durillo*: in English wilde Bay.

¶ The Temperature and Vertues.

Pliny nor any other of the Antients haue touched the faculties of this wilde Bay, neither haue we any vnderstanding thereof by the later writers, or by our owne experience.

CHAP. 70. Of the Box Tree.

Buxus.

The Box tree.

¶ The Description.

THE great Box is a faire tree, bearing a great body or trunk: the wood or timber is yellow and very hard, and fit for sundry workes, hauing many boughes and hard branches, beset with sundry small hard green leaues, both winter and Sommer like the Bay tree: the floures are very little, growing among the leaues, of a Greene colour: which being vaded there succeed small blacke shining berries, of the bignes of the seeds of Corianders, which are inclosed in round greenish huskes, hauing three feet or legs like a brasse or boiling pot: the root is likewise yellow, and harder than the timber, but of greater beauty, and more fit for dagger haftes, boxes, and such like vses, whereto the trunk or body serueth, than to make medicines; though foolish empericks and women leaches, do minister it against the Apoplexie and such diseases: Turners and Cutlers, if I mistake not the matter, do call this wood Dudgeon, wherewith they make Dudgeon hafted daggers.

There is also a certaine other kinde hereof, growing low, and not aboue halfe a yard high, but it spreadeth all abroad: the branches hereof are many and very slender: the leaues be round, and of a light Greene.

¶ The Place.

Buxus, or the Box tree groweth vpon sundry waste and barren hills in England, and in diuers gardens.

¶ The Time.

The Box tree groweth Greene winter and Sommer: it floureth in Februarie and March, and the seed is ripe in September.

¶ The Names.

The Grecians call it *μύρος*: in Latine, *Buxus*: in high Dutch, *Buchszbaum*: in low Dutch, *Burboom*: in Italian, *Bosso*: in English, Box tree.

The lesser may be called *χαμηλὸν μύρος*: and in Latine, *Humi Buxus*, or *Humilis Buxus*: in English, dwarf Box, or ground Box, and it is commonly called Dutch Box.

¶ The Temperature and Vertues.

A The leaues of the Box tree are hot, drie, and astringent, of an euill and lothsome smell, not vsed in medicine, but onely as I said before in the description.

CHAP.

CHAP. 71. Of the Myrtle Tree.

¶ The Description.

1 THE first and greatest *Myrtus* is a small tree, growing to the height of a man, having many faire and pliant branches, couered with a browne barke, and set full of leaues much like vnto the Laurell or Bay leafe, but thinner and smaller, somewhat resembling the leaues of Peruncle, which being bruised do yeeld forth a most fragrant smell, not much inferiour vnto the smell of Cloues, as all the rest of the kindes do : among these leaues come forth small white floures, in shape like the floures of the Cherry tree, but much smaller, and of a pleasant sauour, which do turn into small berries, greene at the first, and afterwards blacke.

1 *Myrtus Laurea maxima.*
The Myrtle tree.

2 *Myrtus Batia latifolia.*
Great Spanish Myrtle.

2 There is also another kind of *Myrtus* called *Myrtus Batia latifolia*, according to *Clusius Myrtus Laurea*, that hath leaues also like Bay leaues, growing by couples vpon his pleasant greene branches, in a double row on both sides of the stalkes, of a light greene colour, and somewhat thicker than the former, in sent and smell sweet : the floures and fruit are not much differing from the first kinde.

3 There is likewise another kinde of *Myrtus* called *Exotica*, that is strange and not common: it groweth vpright vnto the height of a man like vnto the last before mentioned, but that it is replenished with greater plenty of leaues, which do fold in themselves hollow and almost double, broader pointed, and keeping no order in their growing, but one thrusting within another, and as it were crossing one another confusedly; in all other points agreeing with the precedent.

4 There is another sort like vnto the former in floures and branches, but the leaues are smooth, flat and plaine, and not crumpled or folded at all, they are also much smaller than any of the former. The fruit is in shape like the other, but that it is of a white colour, whereas the fruit of the other is blacke.

5 There is also another kinde of Myrtle, called *Myrtus minor*, or noble Myrtle, as being the chief

‡ 3 *Myrtus exotica.*
Strange Myrtle.

‡ 4 *Myrtus fructu albo.*
Myrtle with white berries.

‡ 5 *Myrtus minor.*
The little Myrtle.

‡ 6 *Myrtus Batia sylvestris.*
Wilde Spanish Myrtle.

chiefe of all the rest (although most common and best knowne) and it groweth like a little shrub or hedge bush, very like vnto the former, but much smaller: the leaues are smal and narrow, very much in shape resembling the leaues of Masticke Tree called *Marum*, but of a fresher Greene colour: the floures be white, nothing differing from the former sauing in greatnesse, and that sometimes they are more double.

‡ 6 This growes not very high, neither is it so shrubby as the former: the branches are small and brittle: the leaues are of a middle bignesse, sharpe pointed, standing by couples in two rowes, seldome in foure as the former, they are blackish also and wel smelling. the floure is like that of the rest: the fruit is round, growing vpon long stalks out of the bosomes of the leaues, first Greene, then whitish, lastly blacke, of a winy and pleasant taste with some astringtion. This growes wilde in diuers places of Portugall, where *Clusius* found it flourishing in October: he calls it *Myrtus Batia syluestris*. ‡

¶ The Place.

These kindes of Myrtles grow naturally vpon the wooddy hills and fertill fields of Italy and Spain. ‡ The two last are nourished in the garden of Mistresse Tugge in Westminster, and in some other gardens. ‡

¶ The Time.

Where they ioy to grow of themselves they floure when the Roses do: the fruit is ripe in Autumne: in England they neuer beare any fruit.

¶ The Names.

It is called in Greeke *μύρτιν*: in Latine, *Myrtus*: in the Arabicke tongue, *Alas*: in Italian, *Myrto*: in Spanish, *Arrayhan*: in the Portugale language, *Murta*, and *Murtella*: other Nations doe almost keepe the Latine name, as in English it is called Myrtle, or Myrtle tree.

Among the Myrtles that which hath the fine little leafe is surnamed of *Pliny*, *Tarentina*; & that which is so thicke and full of leaues is *Exotica*, strange or forteine. *Nigra Myrtus* is that which hath the blacke berries: *Candida*, which hath the white berries, and the leaues of this also are of a lighter Greene: *Sativa*, or the tame planted one is cherished in gardens and orchards: *Syluestris*, or the wild Myrtle is that which groweth of it selfe; the berries of this are oftentimes lesser, and of the other, greater. *Pliny* doth also set downe other kindes; as *Patritia*, *Plebeia*, and *Conigalis*: but what manner of ones they are he doth not declare: he also placeth among the Myrtles, *Oxymyr sine*, or Kneeholm, which notwithstanding is none of the Myrtles, but a thornie shrub.

Pliny in his 14. book, 16. chap. saith, that the wine which is made of the wilde Myrtle tree is called *Myrtidanum*, if the copie be true. For *Dioscorides* and likewise *Sotion* in his *Geoponikes* report, that wine is made of Myrtle berries when they be thorow ripe, but this is called *Vinum Myrteum*, or *Myrtites*, Myrtlewine.

Moreouer, there is also a wine made of the berries and leaues of Myrtle stamped and steeped in Must, or wine new pressed from the grape, which is called, as *Dioscorides* saith, *Myrsinite vinum*, or wine of Myrtles.

The Myrtle tree was in times past consecrated to *Venus*. *Pliny* in his 15. booke, 29. chapter, saith thus, There was an old Alter belonging to *Venus*, which they now call *Murtia*.

¶ The Temperature and Vertues.

The Myrtle consisteth of contrary substances, a cold earthinesse bearing the preheminnence, it A hath also a certaine subtil heat, therefore, as *Galen* saith, it drieth notably.

The leaues, fruit, buds, and iuice do binde, both outwardly applied and inwardly taken: they stay B the spitting of bloud, and all other issues thereof: they stop both the whites and reds in women, if they sit in a bath made therewith: after which manner and by fomenting also they stay the superfluous course of the hemorrhoides.

They are a remedy for laskes, and for the bloody flux, they quench the fiery heat of the eies, if C they be laid on with parched Barly meale.

They be also with good successe outwardly applied to all inflammations newly beginning, and D also to new paine vpon some fall, stroke or straine.

They are wholsome for a moist and watery stomacke: the fruit and leaues dried prouoke vrine: E for the Greene leaues containe in them a certaine superfluous and hurtfull moisture.

It is good with the decoction herof made with wine, to bathe the lims that are out of ioint, and bur- F stings that are hard to be cured, and vlcers also of the outward parts: it helpeth spreading tetters, scoureth away the dandrife and sores of the head, maketh the haire blacke, and keepeth them

from shedding, withstandeth drunkenesse, if it be taken fasting, and preuaileth against poison, and the bitings of any venomous beast.

G There is drawne out of the green berries thereof a iuice, which is dried and reserued for the foresaid vses.

H There is likewise pressed out of the leaues a iuice, by adding vnto them either old wine or raine water, which must be vsed when it is new made, for being once drie it putrifieth, and as *Dioscorides* saith, loseth his vertues.

CHAP. 72. Of sweet Willow or Gaule.

Myrtus Brabantica, sive Eleagnus Cordi.
Gaule, sweet willow, or Dutch Myrtle tree.

¶ The Description.

G aule is a low and little shrub or wooddy plant hauing many brown & hard branches: whereupon doe grow leaues somewhat long, hard, thicke, and oileous, of an hot fauour or smell somewhat like *Myrtus*: among the branches come forth other little ones, wherupon do grow many spokie eares or tufts, full of small floures, and after them succeed great store of square seeds clustering together, of a strong and bitter taste. The root is hard, and of a wooddie substance.

¶ The Place.

This Gaule groweth plentifully in sundry places of England, as in the Ile of Ely, & in the Fennie countries thereabouts, wherof there is such store in that countrey, that they make fagots of it and sheaues, which they call Gaule sheaues, to burne and heat their ouens. It groweth also by Colebrooke, and in sundry other places.

¶ The Time.

The Gaule floureth in May and Iune, and the seed is ripe in August.

¶ The Names.

This tree is called of diuers in Latine, *Myrtus Brabantica*, and *Pseudomyrsine*, and *Cordus* calleth it *Eleagnus*, *Chameleagnus*, and *Myrtus Brabantica*. *Eleagnus* is described by *Theophrastus* to

be a shrubbie plant like vnto the Chaste tree, with a soft and downie leafe, and with the floure of the Poplar tree, and that which we haue described is no such plant. It hath no name among the old writers for ought we know, vnlesse it be *Rhus sylvestris Plinij*, or *Pliny* his wilde Sumach, of which hee hath written in his 24. book, 11 chap. [There is, saith he, a wilde herbe with short stalkes, which is an enemy to poison, and a killer of mothes.] It is called in low Dutch, *Gagel*; in English, Gaule.

¶ The Temperature.

Gaule or the wilde Myrtle, especially the seed, is hot and drie in the third degree: the leaues be hot and drie, but not so much.

¶ The Vertues.

A The fruit is troublesome to the brain; being put into beere or aile whilest it is in boiling (which many vse to do) it maketh the same heady, fit to make a man quickly drunke.

B The whole shrub, fruit and all, being laied among clothes, keepeth them from moths and worms.

CHAP. 73. Of Worts or Wortle berries.

¶ The Kindes.

Vaccinia, or Worts, of which we treat in this place, differ from Violets; neither are they esteemed for their floures but berries: of these Worts there be diuers sorts found out by the later Writers.

1 *Vaccinia nigra*.

Blacke Worts or Wortle berries.

2 *Vaccinia rubra*.

Red Worts or Wortle berries.

¶ The Description.

1 **V**accinia nigra, the blacke Wortle or Hurtle, is a base and low shrub or woody plant, bringing forth many branches of a cubit high, set full of small leaues of a dark greene colour, not much vnlike the leaues of Box or the Myrtle tree: amongst which come forth little hollow floures turning into small berries, greene at the first, afterward red, and at the last of a blacke colour, and full of a pleasant and sweet iuyce: in which doe lie diuers little thinne whitish seeds: these berries do colour the mouth and lips of those that eate them, with a black colour: the root is woody, slender, and now and then creeping.

2 *Vaccinia rubra*, or red Wortle, is like the former in the manner of growing, but that the leaues are greater and harder, almost like the leaues of the Box tree, abiding greene all the Winter long: amongst which come forth small carnation floures, long and round, growing in clusters at the top of the branches: after which succeed small berries, in shew and bignesse like the former, but that they are of an excellent red colour, and full of iuyce, of so orient and beautifull a purple to limnewithall, that Indian *Lacca* is not to be compared thereunto, especially when this iuyce is prepared and dressed with Allom according to art, as my selfe haue proued by experience: the tast is rough and astringent: the root is of a woody substance.

3 *Vaccinia alba*, or the white Wortle, is like vnto the former, both in stalks and leaues, but the berries are of a white colour, wherein consisteth the difference.

¶ The figure which our Author here giues in the third place hath need of a better description, for

3 *Vaccinia alba*.
The white Worts or Wortle berries.

5 *Vaccinia Vrsi*, sine *Vna Vrsi* apud *Clusium*.
Beare Wortle berries.

4 *Vaccinia Pannonica*, sine *Vitis Idea*.
Hungarie Wortle berries.

+ 6 *Vitis Idea folijs subrotundis maior*.
Great round leaved Wortle berries.

for the difference is not onely in the colour of the berries. This differs from the former in forme and bignesse, for it sends forth many stalkes from the root, and these three, foure, or five cubits high, thicke, and diuided into sundry branches, couered for the most part with a blackish barke: at the beginning of the Spring from the buds at the sides of the branches it sends forth leaues all horie and hairy vnderneath, and greene aboue: from the midst of these, vpon little foot-stalkes stand clustering together many little floures, consisting of five white leaues apiece without smell; and then the leaues by little and little vnfold themselues; and cast off their downinesse, and become snipt about the edges. The fruit that succeeds the floures is round, blacke, somewhat like, but bigger than a Haw, full of iuyce of a very sweet taste, wherein lies ten or more longish smooth blackish seeds. It growes vpon the Austrian and Stirian Alps, where the fruit is ripe in August. *Clusius* calls it *Vitis Idea* 3. *Pena* and *Lobel*, *Amelancher*: *Gesner* by diuers names, as *Myrtomalus*, *Petromelis*, *Pyrus ceruinus*, &c. ‡

4 *Carolus Clusius* in his Pannonicke Obseruations hath set downe another of the Wortle berries, vnder the name of *Vitis Idea*, which differeth from the other Wortle berries, not onely in stature, but in leaues and fruit also. ‡ The leaues are long, narrow, sharpe pointed, full of veines, a little hairy, and lightly snipt about the edges, greener aboue than below: the fruit growes from the tops of the branches of the former yeare, hanging vpon long foot-stalkes, and being as big as little Cherries, first greene, then red, and lastly blacke, full of iuyce, and that of no vnpleasant taste, containing no kernels, but flat white seeds commonly five in number: the stalkes are weake, and commonly lie vpon the ground: *Clusius* found it vpon the Austrian mountaine Snealben, with the fruit partly ripe, and partly vnrise, in August. It is his *Vitis Idea* 1. ‡

5 The same Author also setteth forth another of the Wortle berries, vnder the title of *Vua Vrsi*, which is likewise a shrubby plant, hauing many feeble branches, whereon grow long leaues blunt at the points, and of an ouerworn green colour: among which, at the tops of the stalks come forth clusters of bottle-like floures of an herby colour: the fruit followeth, growing likewise in clusters, green at the first, and blacke when they be ripe: the root is of a woody substance. ‡ This is alwaies greene, and the floures are of a whitish purple colour. ‡

6 ‡ This differs from the second, in that the leaues are thinner, more full of veines, and whiter vnderneath: the floure is like the common kind, whitish purple, hollow, and diuided into five parts: the fruit also is blacke, and like that of the first described. This growes on diuers mountainous places of Germany, where *Clusius* obserued it, who made it his *Vitis Idea* 2. ‡

¶ The Place.

These plants prosper best in a lean barren soile, and in vntoiled woody places: they are now and then found on high hills subiect to the winde, and vpon mountaines: they grow plentifully in both the Germanies, Bohemia, and in diuers places of France and England; namely in Middlesex on Hampsted heath, and in the woods thereto adioyning, and also vpon the hills in Cheshire called Broxen hills, neere Beeston castle, seuen miles from the Nantwich; and in the wood by Highgate called Finchley wood, and in diuers other places.

The red Wortle berry groweth in Westmerland at a place called Crosby Rauenswaith, where also doth grow the Wortle with the white berry, and in Lancashire also vpon Pendle hills.

‡ I haue seene none of these but only the first described, growing vpon Hampsted heath. The white formerly mentioned in the third description, and here againe in the place, seems only a varietie of the second hauing white berries, as far as I can gather by our Author; for it is most certaine, that it is not that which he figured, and I haue described in the third place. ‡

¶ The Time.

The Wortle berries do floure in May, and their fruit is ripe in Iune.

¶ The Names.

Wortle berries is called in high-Dutch, *Heydelbeeren*: in low-Dutch, *Crakebesien*, because they make a certaine cracke whilst they be broken betweene the teeth: of diuers, *Hauerbesien*: the French men, *Airelle*, or *Aurelle*, as *Iohannes de Choul* writeth: and we in England, *VVorts*, *VVhortle berries*, *Blacke-berries*, *Bill-berries*, and *Bull-berries*, and in some places, *VVin-berries*.

Most of the shops of Germany do call them *Myrtilli*, but properly *Myrtilli* are the fruit of the Myrtle tree, as the Apothecaries name them at this day. This plant hath no name for ought wee can learne, either among the Greekes or antient Latines; for whereas most doe take it to be *Vitis Idea*, or the Corinth tree, which *Pliny* synnameth *Alexandrina*, it is vntrue; for *Vitis Idea* is not onely like to the common Vine, but is also a kinde of Vine: and *Theophrastus*, who hath made mention hereof doth call it, without an Epithete, simply, as a little after we wil declare; which without doubt he would not haue done if he had found it to differ from the common Vine: For what things soeuer receiue a name of some plant, the same are expresseed with some Epethit added to be known to differ from others; as *Laurus Alexandrina*, *Vitis alba*, *Vitis nigra*, *Vitis syluestris*, and such like. Moreouer, those things which haue borrowed a name from some plant are like thereunto, if not wholly,

wholly, yet either in leafe or fruit, or in some other thing. *Vitis alba & nigra*, that is, the white and blacke Bryonies, haue leaues and clasping tendrels as hath the common Vine, and clyme also after the same manner: *Vitis sylvestris*, or the wilde Vine, hath such like stalks as the Vine hath, and bringeth forth fruit like to the little Grapes. *Laurus Alexandrina*, and *Chamedaphne*, and also *Daphnoides*, are like in leaues to the Laurell tree: *Sycomorus* is like in fruit to the Fig tree, and in leaues to the Mulberry tree: *Chamedrys* hath the leafe of an Oke, *Pencedanus* of the Pine tree: so of others which haue taken their names from some other: but this low shrub is not like the Vine either in any part, or in any other thing.

This *Vitis Idea* groweth not on the vppermost and snowie parts of mount Ida (as some would haue it, but about Ida, euen the hill Ida, not of Candy, but of Troas in the lesser Asia, which *Ptolemy* in his fifth booke of Geographie, chap. 3. doth call *Alexandri Troas*, or *Alexander* his Troy: whereupon it is also aduisedly named of *Pliny*, lib. 14. cap. 3. *Vitis Alexandrina*, no otherwife than *Alexandrina Laurus* is said of *Theophrastus* to grow there: *Laurus*, surnamed *Alexandrina*, and *Ficus quædam*, or a certaine Fig tree, and *ἄμπελος*, that is to say the Vine, are reported, saith he, to grow properly about Ida. Like vnto this Vine are those which *Philostratus* in the life of *Apollonius* reporteth to grow in Mæonia, and Lydia, scituated not far from Troy, comparing them to those vines which grow in India beyond Caucasus: The Vines there, saith he, be very small, like as be those that do grow in Mæonia and Lydia, yet is the wine which is pressed out of them of a maruellous pleasaunt taste.

This Vine which growes neere to mount Ida is reported to be like a shrub, with little twigs and branches of the length of a cubit, about which are grapes growing aslope, blacke, of the bignes of a beane, sweet, hauing within a certaine winie substance, soft: the leafe of this is round, vncut, and little.

This is described by *Pliny*, lib. 14, cap. 3. almost in the selfe same words: It is called, saith he, *Alexandrina vitis*, and groweth neere vnto Phalacra: it is short, with branches a cubit long, with a blacke grape of the bignes of the Latines Beane, with a soft pulpe and very little, with very sweet clusters growing aslope, and a little round leafe without cuts.

And with this description the little shrub which the Apothecaries of Germany do call *Myrtillus* doth nothing at all agree, as it is very manifest; for it is low, scarce a cubit high, with a few short branches not growing to a cubit in length: it doth not bring forth clusters or bunches, nor yet fruit like vnto grapes, but berries like those of the Yew tree, not sweet, but somewhat soure and astringent, in which also there are many little white flat seeds: the leafe is not round, but more long than round, not like to that of the Vine, but of the Box tree. Moreouer, it is thought that this is not found in Italy, Greece, or in the lesser Asia, for that *Matthioli* affirmeth the same to grow nowhere but in Germanie and Bohemia; so far is it from being called or accounted to be *Vitis Idea* or *Alexandrina*.

The fruit of this may be thought not without cause to be named *Vaccinia*, sith they are berries; for they may be termed of *Bacca*, berries, *Vaccinia*, as though they should be called *Baccinia*. Yet this letteth not that there may be also other *Vaccinia's*: for *Vaccinia* is *ποικίλος διέτις*, or a word of diuers significations. *Virgil* in the first booke of his *Bucolicks*, *Eclog. 10.* affirmeth, that the written Hyacinth is named of the Latines, *Vaccinium*, translating into Latine *Theocritus* his verse which is taken out of his tenth *Eidyl*.

Καὶ τὸ λὺν μέλαν ἴσκιον ἀγγεῖα δάμνεται.

Virgil:

Et nigra Viola, sunt & Vaccinia nigra.

Vitruvius, lib. 7. of his Architecture doth also distinguish *Vaccinium* from the Violet, and sheweth, that of it is made a gallant purple; which seeing that the written Hyacinth cannot do, it must needs be that this *Vaccinium* is another thing than the Hyacinth is, because it serues to giue a purple dye.

Pliny also, lib. 16. cap. 18. hath made mention of *Vaccinia*, which are vsed to dye bond-slaues garments with, and to giue them a purple colour.

But whether these be our *Vaccinia* or Whortle berries it is hard to affirme, especially seeing that *Pliny* reckoneth vp *Vaccinia* amongst those plants which grow in waterie places; but ours grow on high places vpon mountaines subiect to windes, neither is it certainly knowne to grow in Italy. Howsoeuer it is, these our Whortles may be called *Vaccinia*, and do agree with *Plinies* and *Vitruvius* his *Vaccinia*, because garments and linnen cloath may take from these a purple die.

The red Whortle berries haue their name from the blacke Whortles, to which they be in form very like, and are called in Latine, *Vaccinia rubra*: in high-Dutch, *Rooter Heidelbeere*: in low-Dutch, *Roodde Crakebesien*: the French men, *Aurelles Rouges*: they be named in English Red,

Red Worts, or red Wortle berries. *Conradus Gesnerus* hath called this plant *Vitis Idea rubris acinis*: but the growing of the berries doth shew, that this doth farre lesse agree with *Vitis Idea*, than the blacke; for they do not hang vpon the sides of the branches as do the black (which deceiued them that thought it to be *Vitis Idea*) but from the tops of the sprigs in clusters.

As concerning the names of the other they are touched in their feuerall descriptions.

¶ *The Temperature.*

These *Vaccinia* or Wortle berries are cold euen in the later end of the second degree, and dry also, with a manifest astringion or binding qualitie.

Red Wortle berries are cold and dry, and also binding.

¶ *The Vertues.*

The iuyce of the blacke Wortle berries is boyled till it become thicke, and is prepared or kept by adding hony and sugar vnto it: the Apothecaries call it *Rob*, which is preferred in all things before the raw berries themselues; for many times whilest they be eaten or taken raw they are offensive to a weake and cold stomacke, and so far are they from binding the belly, or staying the laske, as that they also trouble the same through their cold and raw qualitie, which thing the boiled iuyce called *Rob* doth not any whit at all.

They be good for an hot stomacke, they quench thirst, they mitigate and allay the heate of hot burning agues, they stop the belly, stay vomiting, cure the bloody flux proceeding of choler, and helpe the felonie, or the purging of choler vpwads and downwards.

The people of Cheshire do eate the blacke wortles in creame and milke, as in these South parts we eate Strawberries, which stop and binde the belly, putting away also the desire to vomit.

The red Wortle is not of such a pleasant taste as the blacke, and therefore not so much vsed to be eaten; but (as I said before) they make the fairest carnation colour in the world.

CHAP. 74.

Of the Marish Worts or Fenne-Berries.

Vacciniapalustria.
Marish Worts.

¶ *The Description.*

THE Marish Wortle berries grow vpon the bogs in marish or moorish grounds, creeping thereupon like vnto wilde Time, hauing many small limmer and tender stalkes layd almost flat vpon the ground, beset with smal narrow leaues fashioned almost like the leaues of Thyme, but lesser: among which come forth little berries like vnto the common blacke Wortle berrie in shape, but somewhat longer, sometimes all red, and sometimes spotted or specked with red spots of a deeper colour: in taste rough and astringent.

¶ *The Place.*

The Marish Wortle growes vpon bogs and such like waterish and fenny places, especially in Cheshire and Staffordshire, where I haue found it in great plenty.

¶ *The Time.*

The Berries are ripe about the end of Iuly, and in August.

¶ *The Names.*

They are called in high-Dutch, *Moszbeeren*, *Ueenbesten*: that is to say, Fen-Grapes, or Fen-Berries, and Marish-worts, or Marish-Berries. *Valerius Cordus* nameth them *Oxyccoon*: wee haue called them *Vacciniapalustria*, or Marish Wortle berries, of the likenesse they haue to the other berries: some also call them Mosse-Berries, or Moore-berries.

¶ *The Temperature.*

These Wortle berries are cold and dry, hauing withall a certain thinnesse of parts and substance, with a certaine binding qualitie adioyned.

¶ *The*

¶ The Vertues.

- A They take away the heate of burning agues, and also the drought, they quench the furious heate of choler, they stay vomiting, restore an appetite to meate which was lost by reason of cholericke and corrupt humors, and are good against the pestilent diseases.
- B The juice of these also is boyled till it be thicke, with sugar added that it may be kept, which is good for all things that the berries are, yea and far better.

† I have brought this Chapter and the next following from the place they formerly held, and seated them here amongst the rest of their Kindred.

CHAP. 75. Of Cloud-berry.

Vaccinia Nubis.
Cloud-berries.

¶ The Description.

THE Cloud-berry hath many small threddy roots, creeping farre abroad vnder the vpper crust of the earth, and also the mosse, like vnto Couch-grasse, of an ouerworn reddish colour, set here and there with smal tufts of hairy strings: from which rise vp two small stalks, hard, tough, and of a woody substance (neuer more nor lesse) on which doe stand the leaues like those of the wilde Mallow, and of the same colour, full of small nerues or sinewes running in each part of the same: between the leaues commeth vp a stalke likewise of a woody substance, whereon doth grow a small floure consisting of five leaues, of an herby or yellowish green colour like those

of the wilde Auens. After commeth the fruit, Greene at the first, after yellow, and the sides next the Sun red when they be ripe; in forme almost like vnto a little heart, made as it were of two, but is no more but one, open aboue, and closed together in the bottom, of a harsh or sharpe taste, wherein is contained three or foure little white seeds.

¶ The Place.

This plant groweth naturally vpon the tops of two high mountaines (among the mossie places) one in Yorkshire called Ingleborough, the other in Lancashire called Pendle, two of the highest mountaines in all England, where the clouds are lower than the tops of the same all Winter long, whereupon the people of the countrey haue called them Cloud-berries, found there by a curious gentleman in the knowledge of plants, called M^r. Hesketh, often remembred.

¶ The Time.

The leaues spring vp in May, at which time it floureth: the fruit is ripe in Iuly.

¶ The Temperature.

The fruit is cold and dry, and very astringent.

¶ The Vertues.

- A The fruit quencheth thirst, cooleth the stomacke, and allayeth inflammations, being eaten as Worts are, or the decoction made and drunke.

† My friend M. Pimble of Maribone receiued a plant hereof out of Lancashire: and by the shape of the leafe I could not iudge it to differ from the *Chamaemorus* formerly described, pag. 1273. neither doe the descriptions much differ in any materiall point: the figures differ more; but I iudge this a very imperfect one.

CHAP. 76. Of shrub Heart-Wort of Æthiopia.

¶ The Description.

THIS kind of Sefely, being the Æthiopian Sefely, hath blackish stalks of a woody substance: this plant diuideth it selfe into sundry other armes or branches, which are beset with thicke fat and oileous leaues, fashioned somewhat like the Wood-binde leaues, but thicker, and more

Seseli Ethiopicum frutex.

Shrub Sesely, or Hart-woort of Ethiopia.

more gummie, approaching very neere vnto the leaues of Oleander both in shape and substance, being of a deepe or darke green colour, and of a very good saour and smell, and continueth Greene in my garden both winter and Sommer, like the Bay or Laurell. The floures do grow at the tops of the branches in yellow rundles like the floures of Dill; which being past, there succeedeth a darke or duskie seed resembling the seed of Fennell, and of a bitter taste. The root is thicke and of a woody substance.

¶ *The Place.*

It is found both in stony places, and on the sea coasts not farre from Marfilles, and likewise in other places of Languedocke: it also groweth in Ethiopia, in the darke and desert woods: it groweth in my garden.

¶ *The Time.*

It flourisheth, floureth and seedeth in Iuly and August.

¶ *The Names.*

The Grecians call it *Αλκυμνός ορεινός*: the Latines likewise *Æthiopicum Seseli*: the Egyptians, *uorac opian*: that is, Dogs horreur: in English, Sesely of Ethiopia, or Ethiopian Hart-woort.

¶ *The Temperature and Vertues.*

Sesely of Ethiopia is thought to haue the same faculties that the Sesely of Marfilles hath, A whereunto I refer it.

CHAP. 77. Of the Elder tree.

¶ *The Kindes.*

There be diuers sorts of Elders, some of the land, and some of the water or marish grounds; some with very jagged leaues, and others with double floures, as shall be declared.

¶ *The Description.*

THe common Elder groweth vp now and then to the bignesse of a meane tree, casting his boughes all about, and oftentimes remaineth a shrub: the body is almost all wood-die, hauing very little pith within; but the boughes and especially the young ones which be iointed, are full of pith within, and haue but little wood without: the barke of the body and great armes is rugged and full of chinks, and of an ill fauoured wan colour like ashes: that of the boughes is not very smooth, but in colour almost like; and that is the outward barke, for there is another vnder it neerer to the wood, of colour Greene: the substance of the wood is found, somewhat yellow, and that may be easily cleft: the leaues consist of fise or six particular ones fastened to one rib, like those of the Walnut tree, but euery particular one is lesser, nicked in the edges, and of a ranke and stinking smell. The floures grow on spokie rundles, which be thin and scattered, of a white colour and sweet smell: after them grow vp little berries, Greene at the first, afterwards blacke, whereout is pressed a purple juice, which being boiled with Allom and such like things, doth serue very well for the Painters vse, as also to colour vineger: the seeds in these are a little flat, and somewhat long. There groweth oftentimes vpon the bodies of those old trees or shrubs a certaine excrescence called *Auricula Iudæ*, or Iewes eare, which is soft, blackish, couered with a skin, somewhat like now and then to a mans eare, which being plucked off and dried,

D d d d d

shrinketh

shrinketh together and becommeth hard. This Elder groweth euery where, and is the common Elder.

2 There is another also which is rare and strange, for the berries of it are not blacke, but white: this is like in leaues to the former.

1 *Sambucus*.
The common Elder tree.

2 *Sambucus fructu albo*.
Elder with white berries.

3 The jagged Elder tree groweth like the common Elder in body, branches, shootes, pith, floures, fruit, and stinking smell, and differeth onely in the fashion of the leaues, which doth so much disguise the tree, and put it out of knowledge, that no man would take it for a kinde of Elder, vntill he hath smelt thereunto, which will quickly shew from whence he is descended: for these strange Elder leaues are very much jagged, rent or cut euen vnto the middle rib. From the trunke of this tree as from others of the same kinde, proceedeth a certaine fleshie excrescence like vnto the eare of a man, especially from those trees that are very old.

4 This kinde of Elder hath floures which are white, but the berries redde, and both are not contained in spokie rundles, but in clusters, and grow after the manner of a cluster of grapes: in leaues and other things it resembleth the common Elder, saue that now and then it groweth higher.

¶ The Place.

The common Elder groweth euery where: it is planted about conie-burrowes for the shadow of the Conies; but that with the white berries is rare: the other kindes grow in like places; but that with the clustered fruit groweth vpon mountaines; that with the jagged leaues groweth in my garden.

¶ The Time.

These kindes of Elders do floure in Aprill and May, and their fruit is ripe in September.

¶ The Names.

This tree is called in Greeke, *σάμβυκος*: in Latine and of the Apothecaries, *Sambucus*: of *Guilielmus Salicetus*, *Beza*: in high Dutch, *Holunder*, *Holder*: in low Dutch, *Wlier*: in Italian, *Sambuco*: in French, *Hus* and *Suin*: in Spanish, *Sauco*, *Sauch*, *Sambugueyro*: in English, Elder, and Elder tree: that with the white berries diuers would haue to be called *Sambucus sylvestris*, or wilde Elder, but *Matthiolus* calleth it *Montana*, or mountaine Elder.

¶ The

3 *Sambucus laciniatis folijs.*
The jagged Elder tree.

4 *Sambucus racemosa, vel Ceruina.*
Harts Elder, or Cluster Elder.

¶ The Temperature and Vertues.

Galen attributeth the like facultie to Elder that he doth to Danewoort, and saith that it is of a **A**
drying qualitie, gluing, and moderatly digesting : and it hath not only these faculties, but others
also; for the barke, leaues, first buds, floures, and fruit of Elder, do not only dry, but also heate, and
haue withall a purging qualitie, but not without trouble and hurt to the stomacke.

The leaues and tender crops of common Elder taken in some broth or pottage open the belly, **B**
purging both slimie flegme and cholericke humors : the middle barke is of the same nature, but
stronger, and purgeth the said humors more violently.

The feeds contained within the berries dried are good for such as haue the dropsie, and such as **C**
are too fat, and would faine be leaner, if they be taken in a morning to the quantity of a dram with
wine for a certaine space.

The leaues of Elder boiled in water vntill they be very soft, and when they are almost boiled e- **D**
nough a little oile of sweet Almonds added thereto, or a little Lineseed oile ; then taken forth and
laid vpon a red cloath, or a piece of scarlet, and applied to the hemorrhoides or Piles as hot as can
be suffered, and so let to remaine vpon the part affected, vntill it be somewhat cold, hauing the like
in a readinesse, applying one after another vpon the diseased part, by the space of an houre or more,
and in the end some bound to the place, and the patient put warme a bed ; it hath not as yet failed
at the first dressing to cure the said disease ; but if the Patient be dressed twice it must needs doe
good if the first faile.

The greene leaues powned with Deeres suet or Bulls tallow are good to be laid to hot swellings **E**
and tumors, and doth assuage the paine of the gout.

The inner and greene barke doth more forcibly purge : it draweth forth choler and waterie hu- **F**
mors ; for which cause it is good for those that haue the dropsie, being stamped, and the liquor
pressed out and drunke with wine or whay.

Of like operation are also the fresh floures mixed with some kinde of meat, as fried with egges, **G**
they likewise trouble the belly and moue to the stoole : being dried they lose as well their purging
qualitie as their moisture, and retaine the digesting and attenuating qualitie.

- H The vinegar in which the dried floures are steeped are wholsome for the stomacke: being vsed with meate it stirreth vp an appetite, it cutteth and attenuateth or maketh thin grosse and raw humors.
- I The facultie of the seed is somewhat gentler than that of the other parts: it also moueth the belly, and draweth forth waterie humors, being beaten to powder, and giuen to a dram weight: being new gathered, steeped in vineger, and afterwards dried, it is taken, and that effectually, in the like weight of the dried lees of wine, and with a few Anise seeds, for so it worketh without any manner of trouble, and helpeth those that haue the dropie. But it must be giuen for certaine daies together in a little wine, to those that haue need thereof.
- K The gelly of the Elder, otherwise called Iewes eare, hath a binding and drying qualitie: the infusion thereof, in which it hath bin steeped a few houres, taketh away inflammations of the mouth, and almonds of the throat in the beginning, if the mouth and throat be washed therewith, and doth in like manner helpe the uvula.
- L *Dioscorides* saith, that the tender and greene leaues of the Elder tree, with barley meale parched, do remoue hot swellings, and are good for those that are burnt or scalded, and for such as be bitten with a mad dog, and that they glew and heale vp hollow vlcers.
- M The pith of the young boughes is without qualitie: This being dried, and somewhat pressed or quashed together, is good to lay vpon the narrow orifices or holes of fistula's and issues, if it be put therein.

CHAP. 78. Of Marish or Water Elder.

1 *Sambucus aquatilis, sine palustris.*
Marish or water Elder.

2 *Sambucus Rosea.*
The Rose Elder.

¶ The Description.

- 1 **M**arish Elder is not like to the common Elder in leaues, but in boughes: it groweth after the manner of a little tree: the boughes are covered with a barke of an ill fauoured Ash colour, as be those of the common Elder: they are set with ioints by certaine

certaine distances, and haue in them great plenty of white pith, therefore they haue lesse wood, which is white and brittle: the leaues be broad, cornered, like almost to Vine leaues, but lesser and softer: among which come forth spoked rundles which bring forth little floures, the vttermost whereof alongst the borders be greater, of a gallant white colour, euery little one consisting of fve leaues: the other in the midst and within the borders be smaller, and it floures by degrees, and the whole tuft is of a most sweet smell: after which come the fruit or berries, that are round like those of the common Elder, but greater, and of a shining red colour, and blacke when they be withered.

2 *Sambucus Rosea*, or the Elder Rose groweth like an hedge tree, hauing many knotty branches or shoots comming from the root, full of pith like the common Elder: the leaues are like the vine leaues; among which come forth goodly floures of a white colour, sprinkled and dashed here and there with a light and thin Carnation colour, and do grow thicke and closely compact together, in quantitie and bulke of a mans hand, or rather bigger, of great beauty, and sauring like the floures of the Haw-thorne: but in my garden there groweth not any fruit vpon this tree, nor in any other place, for ought that I can vnderstand.

3 This kinde is likewise an hedge tree, very like vnto the former in stalks and branches, which are iointed and knotted by distances, and it is full of white pith: the leaues be likewise cornered: the floures hereof grow not out of spoky rundles, but stand in a round thicke and globed tuft, in bignesse also and fashion like to the former, sauing that they tend to a deeper purple colour, wherein only the difference consists.

¶ *The Place.*

Sambucus palustris, the water Elder, growes by running streames and water courses, and in hedges by moist ditch sides.

The Rose Elder groweth in Gardens, and the floures are there doubled by Art, as it is supposed.

¶ *The Time.*

These kindes of Elders do floure in Aprill and May, and the fruit of the water Elder is ripe in September.

¶ *The Names.*

The water Elder is called in Latine, *Sambucus aquatica*, and *Sambucus palustris*: it is called *Opulus*, and *Platanus*, and also *Chameplatanus*, or the dwarfe Plane tree, but not properly: *Valerius Cordus* maketh it to be *Lycostaphylos*: the Saxons, saith *Gesner*, do call it *Vua Lupina*; from whence *Cordus* inuented the name *Λυκοσταφυλος*: it is named in high-Dutch, *Walt holder*, and *Hirsch holder*: in low Dutch, *Swelcken*, and *Swelckenhout*: of certaine French men, *Obiere*: in English, *Marish Elder*, and *Whitten tree*, *Ople tree*, and *dwarfe Plane tree*.

The Rose Elder is called in Latine, *Sambucus Rosea*, and *Sambucus aquatica*, being doubtles a kind of the former water Elder, the floures being doubled by art, as we haue said: it is called in Dutch, *Gheldersche Roose*: in English, *Gelders Rose*, and *Rose Elder*.

¶ *The Temperature and Vertues.*

Concerning the faculties of these Elders, and the berries of the Water Elder, there is nothing found in any writer, neither can we set downe any thing hereof of our owne knowledge.

CHAP. 79.

Of Dane-Wort, Wall-Wort, or Dwarfe Elder.

¶ *The Description.*

DAne-wort, as it is not a shrub, neither is it altogether an herby plant, but as it were a Plant participating of both, being doubtles one of the Elders, as may appeare both by the leaues, floures, and fruit, as also by the smell and taste.

Wall-wort is very like vnto Elder in leaues, spoky tufts, and fruit, but it hath not a wooddie stalke, it bringeth forth only greene stalks, which wither away in Winter: these are edged, and full of ioynts, like to the yong branches and shoots of Elder: the leaues grow by couples, with distances, wide, and consist of many small leaues which stand vpon a thicke ribbed stalke, of which euery one is long, broad, and cut in the edges like a saw, wider and greater than the leaues of the common Elder tree: at the top of the stalkes there grow tufts of white floures tipt with red, with fve little chiues in them pointed with blacke, which turne into blacke berries like the Elder, in the which be little long seed: the root is tough, and of a good and reasonable length, better for Physicks vse than the leaues of Elder.

Ebulus, sine Sambucus humilis.
Dane-wort, or dwarfe Elder.

F

G

The leaues do consume and waste away hard swellings if they be applied pultif-wise, or in a fomentation or bath.

Dioscorides saith, that the roots of Wall-wort doe soften and open the matrix, and also correct the infirmities thereof, if they be boiled for a bath to sit in; and dissolue the swellings and paines of the belly.

The iuice of the root of Dane-wort doth make the haire blacke.

The yong and tender leafe quencheth hot inflammations, being applied with Barly meale: it is with good successe laid vpon burnings, scaldings, and vpon the bitings of mad dogs; and with Bulls tallow or Goats suet it is a remedie for the gout.

The seed of Wall-wort drunke in the quantitie of a dram is the most excellent purger of waterie humors in the world, and therefore most singular against the dropsie.

If one scruple of the seed be bruised and taken with syrrop of Roses and a little Secke, it cureth the dropsie, and easeth the gout, mightily purging downwards waterish humors, being once taken in the weeke.

¶ The Place.

Dane-wort growes in vntoiled places neere common waies, and in the borders of fields: it groweth plentifully in the lane at Kilburne Abbey by London: also in a field by S. Ioans neere Dartford in Kent: and also in the highway at old Branford townes end next London, and in many other places.

¶ The Time.

The floures are perfected in Sommer, and the berries in Autumne.

¶ The Names.

It is named in Greeke, *χαμῆν*, that is, *humilis Sambucus*, or low Elder: it is called in Latine, *Ebulus*, and *Ebulum*: in high-Dutch, *Attich*: in low-Dutch, *Hadich*: in Italian, *Ebulo*: in French, *Hieble*: in Spanish, *Yezgos*: in English, Wall-wort, Dane-wort, and dwarfe Elder.

¶ The Temperature.

Wall-wort is of temperature hot and drie in the third degree, and of a singular qualitie, which *Galen* doth attribute vnto it, to wast and consume; and also it hath a strange and speciall facultie to purge by the stoole: the roots be of greatest force, the leaues haue the chieftest strength to digest and consume.

¶ The Vertues.

The roots of Wall-wort boiled in wine and drunken are good against the dropsie, for they purge downwards watery humors.

CHAP. 80. Of Beane Trefoile.

¶ The Description.

The first kinde of *Anagyris* or *Laburnum* groweth like vnto a small tree, garnished with many small branches like the shoots of Oziars, set full of pale greene leaues, alwaies three together, like the *Lotus* or meadow Trefoile, or rather like the leaues of *Vitex*, or the *Cytisus* bush: among which come forth many tufts of floures of a yellow colour, not much vnlike the floures of Broome: when these floures be gone there succeed small flat cods, wherein are contained seeds like *Galega* or the *Cytisus* bush: the whole plant hath little or no saueur at all: the root is soft and gentle, yet of a woody substance.

2 Stinking

2 Stinking Trefoile is a shrub like to a little tree, rising vp to the height of six or eight cubits, or sometimes higher: it sendeth forth of the stalks very many slender branches; the barke whereof is of a deep Greene colour: the leaues stand alwaies three together, like those of *Lotus* or meadow Trefoile, yet of a lighter Greene on the vpper side: the floures be long, as yellow as gold, very like to those of Broome, two or three also ioined together: after them come vp broad cods, wherein do lie hard fruit like Kidney Beanes, but lesser, at the first white, afterwards tending to a purple, and last of all of a blackish blew: the leaues and floures hereof haue a filthy sinell, like those of the stinking Gladdon, and so ranke withall, as euen the passers by are annoied therewith.

1 *Anagyris*.

Beane Trefoile.

2 *Anagyris fetida*.

Stinking Beane Trefoile.

† Of *Anagyris* there are foure kindes, two with stinking leaues; the one with longish leaues, the other with rounder.

Two other whose leaues do not stinke; the one of these hath sometimes foure or fiue leaues on one stalke, and the leaues are long and large. The other hath them lesser and narrower. †

¶ The Place.

These grow of themselves in most places of Languedocke and Spaine, and in other countries, also by high waies sides, as in the Isle of Candy, as *Bellonius* writeth: the first I haue in my garden, the other is a stranger in England. † Master *Tradescant* hath two sorts hereof in his garden. †

¶ The Time.

They floure in Iune, and the seed is ripe in September.

¶ The Names.

The Beane Trefoile is called in Greeke *anagyris*, which name remaineth vncorrupt in Candy euen to this day: in Latine also *Anagyris*, and *Laburnum*: of the people of Anagni in Italy named *Eghela*, which is referred vnto *Laburnum*, of which *Pliny* writeth in his 16. booke, 18. chapter. In English, Beane Trefoile, or the Peas-cod tree.

¶ The Temperature.

Beane Trefoile, as *Galen* writeth, hath a hot and digesting faculty.

¶ The

¶ The Vertues.

- A The tender leaues,saith *Dioscorides*,being stamped and layed vpon cold swellings,do waste away the same.
- B They are drunke with Cute in the weight of a dram against the stuffing of the lungs, and doe bring downe the menses,the birth, and the afterbirth.
- C They cure the head-ache being drunke with wine; the iuice of the root digesteth and ripeneth, if the seed be eaten it procureth vomite, which thing, as *Matthiolus* writeth,the seed not onely of stinking Beane Trefoile doth effect, but that also of the other likewise.

CHAP. 81. Of Iudas Tree.

Arbor Iuda.
Iudas Tree.

¶ The Description.

Iudas tree is likewise one of the hedge plants: it groweth vp vnto a tree of a reasonable bignesse, covered with a dark coloured barke, whereon doe grow many twiggie tough branches of a brown colour, garnished with round leaues, like those of round Birthwoort, or Sowbread, but harder, and of a deeper Greene colour: among which come forth small floures like those of Peason, of a purple colour, mixed with red, which turn into long flat cods, pressed hard together, of a tawny or wan colour, wherein is contained small flat seeds, like the Lentill, or rather like the seed of Medica, fashioned like a little kidney: the root is great and wooddie.

¶ The Place.

This shrub is found in diuers prouinces of Spaine, in hedges, and among briars & brambles: the mountaines of Italy, and the fields of Languedocke are not without this shrub: it groweth in my garden.

¶ The Time.

The floures come forth in the Spring, and before the leaues: the fruit or cods be ripe in Sommer.

¶ The Names.

It is commonly named in Latine *Arbor Iuda*: some haue called it *Sycomorus*, or *Sycamore* tree, and that because the floures and cods hang downe from the bigger branches: but the right *Sycamore* tree is like the Fig-tree in fruit, & in leaues to the Mulberrie tree, wherupon it is so named. Others take it to be *Cercis*: of which *Theophrastus* writeth thus, *Cercis* bringeth forth fruit in a cod; which words are all so few, as that of this no certaintie can be gathered, for there be more shrubs that bring forth fruit in cods. The French men call it *Guainier*, as though they should say, *Vaginula*: or a little sheath: most of the Spaniards do name it *Algorouo loco*, that is, *Siliqua sylvestris* or *fatua*, wilde or foolish cod: others, *Arbol d' amor*, for the brauenesse sake: it may be called in English, *Iudas* tree, for that it is thought to be that wherupon *Iudas* did hang himselfe, and not vpon the Elder tree, as it is vulgarly said.

¶ The Temperature and Vertues.

The temperature and vertues of this shrub are vnkowne, and not found out: for whereas *Matthiolus* maketh this to be *Acacia*, by adding falsely thornes vnto it, it is but a surmise.

CHAP. 82. Of the Carob tree, or Saint Johns Bread.

¶ The Description.

THE Carob tree is also one of those that beare cods; it is a tree of a middle bignesse, very full of boughes: the leaues long, and consist of many set together vpon one middle rib, like those of the Ash, but euery particular one of them is broader, harder and rounder: the fruit or long cods in some places are a foot in length, in other places shorter by halfe, an inch broad, smooth, & thick; in which do lie flat and broad feeds: the cods themselues are of a sweet taste, and are eaten of diuers, but not before they be gathered and dried; for being as yet green, though ripe, they are vnpleasant to be eaten by reason of their ill fauoured taste.

Ceratia siliqua, siue Ceratonia.
The Carob tree.

¶ The Place.

This groweth in Apulia, a Prouince of the kingdome of Naples, and also in diuers vntoiled places in Spaine: it is likewise found in India and other countries Eastward, where the cods are so full of sweet iuice as that it is vsed to preserue Ginger and other fruites, as *Matthiolus* sheweth. *Strabo lib. 15.* saith, that *Aristobulus* reporteth how there is a tree in India of no great bignes, which hath great cods, ten inches long, full of hony; *Quas qui edere non facile seruari*, which thing peradventure is onely to be vnderstood of the greene cods, & those that are not yet dry: it is very wel known in the coasts of Nicca and Liguria in Italy, as also in all the tracts and coasts of the West Indies, and Virginia. It groweth also in sundry places of Palestine, where there is such plenty of it, that it is left vnto swine and other wilde beasts to feed vpon, as our Acornes and Beech mast. Moreouer, both young and old feed thereon for pleasure, and some haue eaten thereof to supply and help the necessary nourishment of their bodies. This of some is called Saint *Iohns* bread, and thought to be that which is translated Locusts, whereon *S. Iohn* did feed when he was in the wilderness, besides the wilde hony whereof he did also eat; but there is small certainty of this: but most certaine that the people of that countrey doe feed vpon these cods, in Greeke called *Keratia*.

in Latine, *Siliqua*: but Saint *Iohns* food is called in Greeke *ἀκρίαι*: which word is often vsed in the Reuelation written by Saint *Iohn*, and translated Locusts. Now wee must also remember that this Greeke word hath two seuerall interpretations or significations, for taken in the good part, it signifieth a kinde of creeping creature, or flie, which hoppeth or skippeth vp and down, as doth the grasshopper; of which kinde of creatures it was lawfull to eat, *Leuit. 11. 22.* and *Mat. 3. 4.* It signifieth also those Locusts which came out of the smoke of the bottomles pit, mentioned *Apoc. 9. v. 3. 4. &c.* which were like vnto horses prepared for battell. The Hebrew word which the English translators haue turned Grasshoppers, *Tremelus* dares not giue the name *Locust* vnto it, but calleth it by the Hebrew name *Arbis*, after the letters and Hebrew name, saying thus in the note vpon the 22. verse of the 11. chapter of *Leuit*. These kinde of creeping things neither the Hebrews nor the Historiographers, nor our selues do know what they meane: wherefore we still retaine the Hebrew words, for all the foure kinde thereof: but it is certaine that the East countrey Grasshoppers and Locusts were sometimes vsed in meat, as *Math. 3. 4.* and *Marc. 1. 6. Plin lib. 11. Natur. Histor. cap. 26. and 29.*

Thus

Thus far *Tremelius* and *Iunius*. By that which hath been said it appeareth what *S. Iohn* the Baptist fed of, vnder the title Locusts: and that it is nothing like vnto this fruit *Ceratia siliqua*: I rather take the husks or shells of the fruit of this tree to be the cods or husks whereof the prodigall childe would haue fed, but none gaue them vnto him, though the swine had their fill thereof. These cods being drie are very like beane cods, as I haue often seen. I haue sowne the seeds in my garden, where they haue prospered exceeding well.

† There is no doubt but the *Κρινα* or *Siliqua* mentioned in Saint *Lukes* Gospel, Chap. 15. v. 16. were the cods or fruit of this tree. I cannot beleue that either the fruit of this or the Locusts, were the *Acridæ*, mentioned in the third chapter of Saint *Mat.* v. 4. But I am of the opinion of the Greeke Father *Isidore Pelusiota*, who, lib. 1. Epist. 132. hath these words, *Ἀκριδῆς, ἢ Ἰωάννης ἔβριτο, ἐν ζῆα ἱστοῦ, ὡς πρὸς ἐσθλὰ ἐκδοῦν, καὶ δὲ ἐστὶν ἀποκρίματα, καὶ γὰρ οὗτοι ἀκριβοῦς βοτάνης φύει· ἐπὶ δὲ πῶς τις ἐστὶν πάλιν τῷ μῦθῳ ἀκριβοῦς, ἀλλὰ μὴ ἐπὶ τῷ ὄντι· μετὰ τοῦ ἀκριβοῦς ἐστὶν ἡ ἀκριβία.* That is: The *Acridæ* which *Iohn* fed vpon are not liuing creatures like to Beetles, as some vnlearnedly suppose, farre be it from vs so to thinke; but they are the tender buds of herbes and plants or trees; neither on the other side is the *Meli agrion* any herbe so called, but mountaine hony gathered by wilde Bees, &c. †

¶ The Time.

The Carob tree bringeth forth fruit in the beginning of the Spring, which is not ripe till Autumne.

¶ The Names.

The Carob tree is called *καρῳνία*: in Latine likewise, *Ceratonia*: in Spanish, *Garono*: in English, Carob tree; and of some, Beane tree, and Saint *Iohns* Bread: the fruit or cod is named *καρῳν*: in Latine *Siliqua*, or *Siliqua dulcis*: in diuers shops, *Xylocaracta*: in other shops in Italy, *Carobe*, or *Carobole*: of the Apothecaries of Apulia, *Salequa*: it is called in Spanish, *Alfarobas*, or *Algarobas*: and without an article *Garonas*: in high Dutch, *S. Iohansbrot*: that is to say, *Sancti Iohan. panis*, or *S. Iohns* Bread, neither is it knowne by any other name in the Low-countries: Some call it in English, Carob.

¶ The Temperature.

The Carob tree is drie and astringent, as is also the fruit, and containeth in it a certaine sweetnes as *Galen* saith.

¶ The Vertues.

A The fruit of the Carob Tree, beeing eat when it is greene, doth gently loose the belly; but beeing dry it is hard of digestion, and stoppeth the belly, it prouoketh vrine, it is good for the stomacke, and nourisheth well, and much better than when it is greene and fresh.

CHAP. 83. Of Cassia Fistula, or Pudding Pipe.

¶ The Description.

Cassia purgatrix, or Cassia fistula, groweth vp to be a faire tree, with a tough barke like leather, of the colour of Box, whereupon some haue supposed it to take the Greeke name *κίσπος*, in Latine, *Coriaceus*: the armes and branches of this are small and limber, beset with many goodly leaues, like those of the Wall-nut tree: among which come forth small floures of a yellow colour, compact or consisting of six little leaues, like the floures of *Chelidonium minus*, or Pile-woort: after these be vaded, there succeed goodly blacke round, long cods, whereof some are two foot long, and of a wooddy substance: in these coddes are contained a blacke pulpe, very sweet and soft, of a pleasant taste, and seruing to many vses in Physicke, in which pulpe lieth the seed couched in little cels or partitions: this seed is flat and brownish, not vnlike the seed of *Ceratia Siliqua*, and in other respects very like vnto it also.

¶ The Place.

This tree groweth much in Egypt, especially about Memphis and Alexandria, and most parts of Barbarie, and is a stranger in these parts of Europe.

¶ The Time.

The Cassia tree groweth green winter and sommer: it sheddeth his old leaues when new are come, by meanes whereof it is neuer void of leaues: it floureth early in the spring, and the fruit is ripe in Autumne.

¶ The

Cassia fistula.
Pudding Pipe tree.

¶ The Names.

This tree was unknowne to the old writers, or so little accounted of, as that they haue made no mention of it at all: the Arabians were the first that esteemed of it, by reason they knew the vse of the pulpe which is found in the Pipes: and after them the later Grecians, as *Actuarius* & other of his time, by whom it was named *κασιανή* that is to say in Latine, *Casia nigra*. The fruit thereof, saith *Actuarius* in his fift booke, is like a long pipe, hauing within it a thicke humour or moisture, which is not congealed all alike thorow the pipe, but is separated and diuided with many partitions, being thin wooddy skins. The Apothecaries call it *Casia fistula*, and with a double *Cassia fistula*: it is called in English after the Apothecaries word, *Cassia fistula*, and may also be Englished, Pudding Pipe, because the cod or Pipe is like a pudding: but the old *Cassia fistula*, or *κασιανή* in Greeke, is that sweet and odoriferous barke that is rolled together, after the manner of a long and round pipe, now named of the Apothecaries *Cassia lignea*, which is a kinde of Cinamon.

¶ The Temperature.

The pulpe of this pipe which is chiefly in request, is moist in the later end of the first degree, and little more than temperatly hot.

The Vertues.

The pulpe of *Cassia fistula* extracted with violet water, is a most sweet and pleasant medicine, and **A** may be giuen without danger to all weak people of what age and sex soeuer they be, yea it may be ministred to women with childe, for it gently purgeth cholericke humours and slimie flegme, if it be taken in the weight of an ounce.

Cassia is good for such as be vexed with hot agues, pleurifies, iaudice, or any other inflammation **B** of the liuer, being taken as afore is shewed.

Cassia is good for the reines and kidneies, driueth forth grauell and the stone, especially if it bee **C** mingled with the decoction of Parsley, and Fennell roots, and drunke.

It purgeth and purifieth the blood, making it more cleane than before, breaking therewith the **D** acrimonie and sharpnesse of the mixture of blood and choler together.

It dissolueth all phlegmons and inflammations of the brest, lungs, and the rough artery called **E** *Trachea arteria*, easing those parts exceeding well.

Cassia abateth the vehemencie of thirst in agues, or any hot disease whatsoeuer, especially if it be **F** taken with the iuice of *Intybum*, *Cichoreum*, or *Solanum*, depured according to Art: it abateth also the intemperate heat of the reines, if it be receiued with diureticke simples, or with the decoction of Licorice onely, and will not suffer the stone to grow in such persons as do receiue and vse this medicine.

The best *Cassia* for your vse is to be taken out of the most full, most heauy, & fairest cods, or canes, **G** and those which do shine without, and are full of soft pulpe within; that pulpe which is newly taken forth is better than that which is kept in boxes, by what Art soeuer.

Cassia being outwardly applied, taketh away the roughnesse of the skin, and being laid vpon hot **H** swellings, it bringeth them to suppuration.

Many singular compounded medicines are made with this *Cassia*, which here to recite belongs **I** not to my purpose or history.

CHAP. 84. Of the *Lentiske*, or *Masticke* tree.

¶ The Description.

Lentiscus.
The Masticke tree.

¶ The Description.

THE Mastic tree groweth commonly like a shrub without any great body, rising vp with many springs and shoots like the Hasell; and oftentimes it is of the height and bignesse of a meane tree: the boughes thereof are tough, and flexible; the barke is of a yellowish red colour, pliable likewise, and hard to be broken: there stand vpon one rib for the most part 8 leaues, set vpon a middle rib, much like to the leaues of Licorice, but harder, of a deepe Greene colour, and oftentimes somewhat red in the brims, as also hauing diuers vains running along of a red colour, and something strong of smel: the floures be mossie, and grow in clusters vpon long stems: after them come vp the berries, of the bignesse of Vetches, Greene at the first, afterwards of a purple colour, and last of all, black, fat, and oily, with a hard black stone within, the kernel whereof is white, of which also is made oile, as *Dioscorides* witnesseth: it bringeth forth likewise cods besides the fruit (which may be rather termed an excrescence, than a cod) writhed like a horn, in which lieth at the first a liquour, and afterwards when this waxeth stale, little liuing things like vnto gnats, as in the Turpentine hornes, and in the folded leaues of the Elm tree. There commeth forth of the Mastic tree a Rosin, but dry, called Masticke.

¶ The Place.

The Masticke tree groweth in many regions, as in Syria, Candy, Italy, Languedocke, and in most Prouinces of Spaine: but the chiefeest is in Chios an Island in Greece, in which it is diligently and specially looked vnto, and that for the Masticke sake, which is there gathered from the husbanded Masticke trees by the inhabitants euery yeare most carefully, and is sent from thence into all parts of the world.

¶ The Time.

The floures be in their pride in the spring time, and the berries in Autumne: the Masticke must be gathered about the time when the Grapes be.

¶ The Names.

This tree is named in Greeke *λεντισκος*: in Latine, *Lentiscus*: in Italian, *Lentisque*: in Spanish, *Mata*, and *Arcoyra*: in English, Masticke tree; and of some, Lentiske tree.

The Rosin is called in Greeke *ρυσιν*, and *μαστιχα*: in Latine, *Lentiscina Resina*, and likewise, *Mastiche*: in shops, *Mastix*: in Italian, *Mastice*: in high and low Dutch and French also, *Mastic*: in Spanish, *Almastiza*, *Mastech*, and *Almecega*: in English, Masticke.

Clusius writeth, that the Spaniards call the oile that is pressed out of the berries, *Axeyte de Mata*.

¶ The Temperature.

The leaues, barke, and gum of the Masticke tree are of a meane and temperate heate, and are drie in the second degree, and somewhat astringent.

¶ The Vertues.

A The leaues and barke of the Masticke tree stoppe the laske, the bloudy fluxe, the spitting of bloud,

bloud, the pissing of bloud, and all other fluxes of bloud: they are also good against the falling sicknesse, the falling downe of the mother, and comming forth of the fundament.

The gum Masticke bath the same vertue, if it be relented in wine and giuen to be drunke.

Masticke chewed in the mouth is good for the stomacke, staieth vomiting, increaseth appetite, comforteth the braines, staieth the falling downe of the rheumes and watery humors, and maketh a sweet breath.

The same infused in Rose water is excellent to wash the mouth withall, to fasten loose teeth, and to comfort the iawes.

The same spread vpon a piece of leather or veluer, and laid plaisterwise vpon the temples, staieth the rheume from falling into the iawes and teeth, and easeth the paines thereof.

It preuaileth much against vlcers and wounds, being put into digestiues and healing vnguents.

It draweth flegme forth of the head gently and without trouble.

It is also vsed in waters which serue to cleanse and make faire the face with.

The decoction of this filleth vp hollow vlcers with flesh if they be bathed therewith.

It knitteth broken bones, staieth eating vlcers, and prouoketh vrine.

CHAP. 85. Of the Turpentine Tree:

1 *Terebinthus.*

The Turpentine tree.

2 *Terebinthus latifolia.*

The broad leaved Turpentine tree.

The Description.

THE first Turpentine Tree groweth to the height of a tall and faire tree, hauing many long boughes or branches, dispersed abroad, beset with long leaues, consisting of sundry other small leaues, each whereof resembleth the Bay leafe, growing one against another vpon a little stem or middle rib, like vnto the leaues of the Ash tree: the floures be small & reddish, growing vpon clusters or bunches that turne into round berries, which at their beginning are greene, afterwards reddish; but being ripe wax blacke, or of a darke blew colour, clammy, full of fat

Eeeeeee

and

and oilous in substance, and of a pleasant saour: this plant beareth an empty cod, or crooked horne somewhat reddish, wherein are found small flies, wormes or gnats, bred and ingendred of a certaine humorous matter, which cleaueth to the inner sides of the said cods or hornes, which wormes haue no physicall vse at all. The right Turpentine issueth out of the branches of these trees, if you do cut or wound them, the which is faire and cleere, and better than that which is gathered from the barke of the Firre tree.

2 The second kinde of Turpentine tree is very like vnto the former, but that it groweth not so great: yet the leaues are greater and broader, and of the same fashion, but very like to the leaues of the Pistacia tree. The berries are first of a scarlet colour, and when they be ripe of a skie colour. The great horned cods are sharpe pointed, and somewhat cornered, consisting as it were of the substance of gristles. And out of those bladders being broken, do creepe and come small flies or gnats, bred of a fuliginous excrement, and ingendred in those bladders. The tree doth also yeeld his Turpentine by dropping like the former.

¶ The Place.

These trees grow, as *Dioscorides* saith, in Iurie, Syria, Cyprus, Africke, and in the Islands called *Cyclades*. *Belonius* reporreth that there are found great store of them in Syria, and Cilicia, and are brought from thence to Damascus to be sold. *Clusius* saith, that it growes of it selfe in Languedocke, and in very many places of Portingale and Spaine, but for the most part like a shrub, and without bearing Turpentine.

Theophrastus writeth, that it groweth about the hill Ida, and in Macedonia, short, in manner of a shrub, and writhed; and in Damascus and Syria great, in manner of a small tree: he also setteth downe a certaine male Turpentine tree, and a female: the male, saith he, is barren, and the female fruitfull. And of these he maketh the one with a berry red at the first, of the bignesse of a Lentill, which cannot come to ripenes; and the other with the fruit greene at the first, afterwards somewhat of a yellowish red, and in the end blacke, waxing ripe in the spring, of the bignesse of the Grecians Beane, and rosenny.

He also writeth of a certaine Indian Turpentine tree, that is to say, a tree like in boughes and leaues to the right Turpentine tree, but differing in fruit, which is like vnto Almonds.

¶ The Time.

The floures of the Turpentine tree come forth in the spring together with the new buds: the berries are ripe in September and October, in the time of Grape gathering. The hornes appeare about the same time.

¶ The Names.

This tree is called in Greeke *τερεβινθος*, and also many times *τερεβινθος*: in Latine, *Terebinthus*: in Italian, *Terebintho*: in Spanish, *Cornicabra*: in French, *Terebinte*: in English, Turpentine tree: the Arabians call it *Botin*, and with an article *Albotin*.

The Rosin is furnamed *τερεβινθίνη*: in Latine, *Terebinthina*: in high Dutch, *Terminthijn*: in English, Turpentine, and right Turpentine: in the Arabian language *Albotin*, who name the fruit *Granum viride*, or greene berries.

¶ The Temperature and Vertues.

- A The barke, leaues, and fruit of the Turpentine tree do somewhat binde, they are hot in the second degree, and being greene they dry moderately; but when they are dried they dry in the second degree; and the fruit approacheth more neere to those that be dry in the third degree, and also hotter. This is fit to be eaten, as *Dioscorides* saith, but it hurteth the stomacke.
- B It prouoketh vrine, helpeth those that haue bad spleenes, and is drunke in wine against the bitings of the poysonsome spiders called *Phalangia*.
- C The Rosin of the Turpentine tree excelleth all other Rosins, according to *Dioscorides* his opinion: but *Galen* writeth, that the Rosin of the masticke tree beareth the preheminance, and then the Turpentine.
- D This Rosin hath also an astringent or binding facultie, and yet not so much as masticke; but it hath withall a certaine bitternesse ioyned, by reason whereof it digesteth more than that of the Masticke tree: thorow the same qualitie there is likewise in it so great a clensing, as also it healeth scabs, in his 8. booke of the faculties of simple medicines; but in his booke of medicines according to the kindes, he maketh that of the Turpentine tree to be much like the Rosins of the Larch tree, which he affirmeth to be moister than all the rest, and to be without both sharpnesse and biting.
- E The fruit of Turpentine prouoketh vrine and stirreth vp fleshly lust.
- F The Rosine of this tree, which is the right Turpentine, looseth the belly, openeth the stoppings of the liuer and spleene, prouoketh vrine, and driueth forth grauell, being taken the quantitie of two or three Beanes.

The like quantitie washed in water diuers times vntill it be white, then must be put thereto the like quantity of the yolk of an egge, and laboured together adding thereto by little and little (continually stirring it) a small draught of possit drinke made of white wine, and giuen to drinke in the morning fasting, it helpeth most speedily the Gonorrhæa, or running of the reines, commonly at the first time, but the medicine neuer faileth at the second time of the taking of it, which giues stooles from foure to eight, according to the age and strength of the patient.

CHAP. 86. Of the Frankincense tree.

The Description.

The tree from which Frankincense floweth is but low, and hath leaues like the Mastick tree, yet some are of opinion that the leafe is like the leafe of a Peare tree, and of a grassie colour: the rinde is like that of the Bay tree, whereof there are two kindes: the one groweth in mountains and rockie places, the other in the plaine: but those in the plaines are much worse than those of the mountaines: the gum hereof is also blacker, fitter to mingle with Pitch, and such other stufte to trim ships, than for other vses.

Arbor Thurifera.

The Frankincense tree.

Thuris Limpidisolium Lobelij.

The supposed leafe of the Frankincense tree.

Theuet in his *Cosmographie* saith, that the Frankincense tree doth resemble a gummie or rosiny Pine tree, which yeeldeth a iuice that in time groweth hard, and is called *Thus*, Frankincense, in whom is found sometime certaine small graines like vnto grauell, which they call the Manna of Frankincense.

Of this there is in Arabia two other sorts, the one, the gum wherof is gathered in the Dog daies when the Sun is in Leo, which is white, pure, cleare, and shining. *Pena* writeth that he hath seene the cleare Frankincense called *Limpidum*, and yeelding a very sweet smell when it is burnt, but the leafe hath been seldome seene, which the Physitian *Launanus* gaue to *Pena* and *Lobel*, together with some pieces of the Rosine, which he had of certaine mariners, but he could affirme nothing of certaintie whether it were the leafe of the Frankincense, or of some other Pine tree, yeelding the like iuice or gum. It is, saith he (which doth seldom happen in other leaues) from the lower part or foot of the leafe, to the vpper end, as it were doubled, consisting of two thin rindes or coats, with a sheath a span and a halfe long, at the top gaping open like a hood or fooles coxcombe, and as it were couered with a helmet, which is a thing seldome seene in a leafe, but is proper to the floures of *Napellus*,

or *Lonchitis*, as writers affirme; the other is gathered in the spring, which is reddish, worser than the other in price or value, because it is not so well concocted in the heat of the Sunne. The Arabians wound this tree with a knife, that the liquour may flow out more abundantly, whereof some trees yeeld three score pounds of Frankinsence.

¶ The Place.

Dioscorides saith it groweth in Arabia, and especially in that quarter which is called *Thurifera*, the best in that countrey is called *Stagonias*, and is round, and if it be broken, is fat within, and when it is burned doth quickly yeeld a smel: next to it in goodnes is that which groweth in *Smilo*, lesser than the other, and more yellow.

¶ The Time.

The time is already declared in the description.

¶ The Names.

It is called in Greeke *ῥοσιν*: in Latine, *Thus*: in Italian, *Incenso*: in Dutch, *Queirauch*: in Spanish, *Encenso*: in French, *Encens*: in English, *Frankincense*, and *Incense*: in the Arabian tongue, *Louan*, and of some few, *Conder*. † The Rosin carries the same name; but in shops it is called *Olibanum*, of the Greeke name and article put before it. †

¶ The Temperature and Vertues.

- A It hath, as *Dioscorides* saith, a power to heate and binde.
 B It driueth away the dimnesse of the eye-sight, filleth vp hollow vlcers, it closes raw wounds, staieth all corruptions of blood, although it fall from the head.
 C *Galen* writeth thus of it; *Thus* doth heate in the second degree, and drie in the first, and hath some small astringion, but in the white there is a manifest astringion, the rinde doth manifestly binde and dry exceedingly, and that most certainly in the second degree, for it is of more grosser parts than *Frankincense*, and not so sharpe, by reason whereof it is much vsed in spitting of blood, swellings in the mouth, the collicke passion, the flux in the belly rising from the stomacke, and bloody fluxes.
 D The fume or smoke of it hath a more drier and hotter quality than the *Frankincense* it selfe, being dry in the third degree.
 E It doth also clense and fill vp the vlcers in the eies, like vnto *Myrrhe*: thus far *Galen*.
 F *Dioscorides* saith, that if it be drunk by a man in health, it driueth him into a frensie: but there are few Greekes of his minde.
 G *Auicenn* reporteth that it doth helpe and strengthen the wit and vnderstanding, but the often taking of it will breed the head-ache, and if too much of it be drunke with wine it killeth.

CHAP. 87. Of Fisticke Nuts.

Pistacia. The Fisticke Nut.

¶ The Description.

THE tree which beareth Fisticke Nuts is like to the Turpentine tree: the leaues herof be greater than those of the Masticke tree, but set after the same maner, and in like order that they are, being of a faint yellow colour out of a green; the fruit or Nuts do hang by their stalks in clusters, being greater than the Nuts of Pine Apples, and much lesser than Almonds: the husks without is of a grayish colour sometimes reddish, the shell bricke and white; the substance of the kernell greene; the taste sweet, pleasant to be eaten, and something sweet of smell.

¶ The Place.

Fisticke Nuts grow in Persia, Arabia, Syria, and in India; now they are made free Denizons in Italy, as in Naples and in other Prouinces there.

¶ The Time.

This tree doth floure in May, and the fruit is ripe in September.

¶ The Names.

This Nut is called in Greeke *πισταχίου* in *Athenaus*: *Nicander Colophonius* in his booke of *Treacles* nameth it *πισταχίου*: *Possidonius* nameth it *πισταχίου*: others, *πισταχίου*: the Latines obseruing the same termes, haue named it *Pistacion*, *Bistacion*, or *Phistacion*:

station: the Apothecaries, *Fistici*: the Spaniards, *Alhocigos*, and *Fisticos*: in Italian, *Pistacchi*: in English, Fisticke Nut.

¶ The Temperature and Vertues.

The kernels of the Fisticke Nuts are oftentimes eaten as be those of the Pine Apples; they be of temperature hot and moist; they are not so easily concocted, but much easier than common nuts: the iuice is good, yet somewhat thicke; they yeeld to the body no small nourishment, they nourish bodies that are consumed: they recouer strength.

They are good for those that haue the pthificke, or rotting away of the lungs.

They concoct, ripen, and cleanse forth raw humours that cleaue to the lights and chest.

They open the stoppings of the liner, and be good for the infirmities of the kidneies; they also remoue out of the kidneies sand and grauell; and assuage their paine: they are also good for vlcers.

The kernels of Fisticke nuts condited, or made into comfits, with sugar, and eaten, doe procure bodily lust, vnstop the lungs and the brest, are good against the shortnesse of breath, and are an excellent preseruatiue medicine being ministred in wine against the bitings of all manner of wilde beasts.

CHAP. 88. Of the Bladder Nut.

Nux vesicaria.

The Bladder Nut.

¶ The Description.

THIS is a low tree, hauing diuers young springs growing forth of the root: the substance of the wood is white, very hard & sound; the barke is of a light Greene: the leaues consist of fise little ones, which be nicked in the edges like those of the Elder, but lesser, not so Greene nor ranke of smell. It hath the pleasant whitish floures of Bryonie or *Labrusca*, both in smell and shape, which turne into smal cornered bladders of winer Cherries, called Alkengie, but of an ouerworne greenish colour: in these bladders are contained two little nuts, and sometimes no more but one, lesser than the Hasell nut, but greater than the Ram Cich, with a wooddie shel and somewhat red: the kernell within is something green; in taste at the first sweet, but afterwards lothsome, and ready to prouoke vomit.

¶ The Place.

It groweth in Italy, Germany and France; it groweth likewise at the house of sir Walter Culpepper neere Flimmewell in the Weild of Kent, as also in the Frier-yard without Saint Pauls gate in Stamford, and about Spalding Abbey, and in the garden of the right honorable the Lord Treasurer my very good Lord and Master, and by his house in the Strand. It groweth also in my garden, and in the garden hedges of sir Francis Carew neere Croydon, ten miles from London.

¶ The Time.

This tree floureth in May, the Nuts be ripe in August and September.

¶ The Names.

It is commonly called in high Dutch, *Dimpernusz*, which signifieth in low Dutch *Dimperno*: diuers call it in Latine *Pistacium Germanicum*: we thinke it best to call it *Nux vesicaria*. *Mathiolus* in his Epistles doth iudge the Turks *Coulcoul* and *Hebulben* to agree with this: *Gulielmus Quatzenus* affirmeth, *Coulcoul* to be vsed of diuers in Constantinople for a daintie, especially when they be new brought out of Egypt. This plant hath no old name, vnlesse it be *Staphylodendron* *Plinij*:

for which it is taken of the later writers: and *Pliny* hath written of it in his 16. book, 16. chap. There is also (saith he) beyond the Alpes a tree, the timber whereof is very like to that of white Maple, and is called *Staphylodendron*; it beareth cods, and in those kernels, hauing the taste of the Hasel nut. It is called in English, S. Anthonies nuts, wilde Pistacia, or Bladder nuts: the Italians call it *Pistachia Saluaticke*: the French men call it *Baguenaudes a patre nostres*, for that the Friars doe use to make beads of the nuts.

¶ The Temperature and Vertues.

A These nuts are moist and full of superfluous raw humours, and therefore they easily procure a readinesse to vomite, and trouble the stomacke, by reason that withall they be somewhat binding, and therefore they be not to be eaten.

B They haue as yet no use in medicine, yet notwithstanding some haue attributed vnto them some vertues in prouoking of Venerie.

CHAP. 89. Of the Hasell tree.

¶ The Description.

1 **T**He Hasell tree groweth like a shrub or small tree, parted into boughes without ioints, tough and pliable: the leaues are broad, greater and fuller of wrinckles than those of the Alder tree, cut in the edges like a saw, of colour greene, and on the backside more white, the bark is thin: the root is thicke, strong, and growing deep; in stead of floures hang downe catkins, aglets, or blowings, slender, and well compact: after which come the Nuts standing in a tough cup of a greene colour, and iagged at the vpper end, like almost vnto the beards in Roses. The shell is smooth and wooddie: the kernel within consisteth of a white, hard, and sound pulpe, and is couered with a thin skin, oftentimes red, most commonly white; this kernell is sweet and pleasant vnto the taste.

1 *Nux Aueclana, siue Corylus.*
The Filberd Nut.

2 *Corylus syluestris.*
The wilde hedge Nut.

2 *Corylus*

2 *Corylus sylvestris* is our hedge Nut or Hasell Nut tree, which is very well knowne, and therefore needeth not any description: whereof there are also sundry sorts, some great, some little, some rather ripe, some later, as also one that is manured in our gardens, which is very great, bigger than any Filberd, and yet a kinde of Hedge nut: this then that hath beene said shall suffice for Hedge-Nuts.

† 3 The small Turkey Nut tree growes but low, and the leaues grow without order, vpon the twigs, they are in shape like those of the former, but somewhat longer: the chiefe difference consists in the fruit, which is small, and like an Hasell Nut, but shorter: the huske, wherein sometimes one, otherwhiles more Nuts are contained, is very large, tough, and hard, diuided both aboue and below into a great many iags, which on euery side couer and hold in the Nuts, and these cups are very rough without, but smooth on the inside. *Clusius* first set this forth (hauing receiued it from Constantinople) by the name of *Auellana pumila Byzantina*. †

3 *Auellana pumila Byzantina cum suo fructu.*
The Filberd Nut of Constantinople.

¶ The Place.

The Hasell trees do commonly grow in Woods and in dankish vntoiled places: they are also set in Orchards, the Nuts whereof are better, and of a sweeter taste, and be most commonly red within.

¶ The Time.

The catkins or aglets come forth very timely, before winter be fully past, and fall away in March or Aprill, so soone as the leaues come forth: the Nuts be ripe in August.

¶ The Names.

This shrub is called in Latine, *Corylus*: in Greeke, *κάρυα*, that is, *Nux Pontica*, or Ponticke Nut: in high-Dutch, *Hasel strauck*: in low-Dutch, *Haseleer*: in English, Hasel tree, and Filberd tree; but the Filberd tree is properly that which groweth in gardens and Orchards, and whose fruit is commonly wholly couered ouer with the huske, and the shell is thinner.

The Nut is named in Latine, *Nux Pontica*, *tenuis Nux*, *parua Nux*: it is also called *Nux Prænestina*, *Nux Heracleotica*, and commonly *Nux auellana*, by which name it is vsually knowne to the Apothecaries: in high-Dutch, *Hasel Nutz*: in low-Dutch, *Hasel Noten*: in Italian, *Nocciuole*, *Auellane*, *Nucelle*: in French, *Noisettes*, & *Noiselles*: in Spanish, *Anellanas*: in English, Hasell nut, and Filberd.

These

These Nuts that haue their skinned red are the garden and planted Nuts, and the right Pontick Nuts or Filberds: they are called in high-Dutch, *Rhurnusz*, and *Rotnusz*: in low-Dutch, *Roode Hasel Noten*: in English, Filberds, and red Filberds.

The other Nuts which be white are iudged to be wilde.

¶ *The Temperature and Vertues.*

- A Hasell Nuts newly gathered, and not as yet dry, containe in them a certaine superfluous moisture, by reason whereof they are windie: not onely the new gathered Nuts, but the dry also, be very hard of digestion; for they are of an earthy and cold essence, and of an hard and sound substance, for which cause also they very slowly passe thorow the belly, therefore they are troublesome and clogging to the stomacke, cause head-ache, especially when they be eaten in too great a quantitie.
- B The kernells of Nuts made into milke like Almonds do mightily bind the belly, and are good for the laske and the bloody flux.
- C The same doth coole exceedingly in hot feuers and burning agues.
- D The catkins are cold and dry, and likewise binding: they also stay the laske.
- E ‡ The kernels of Nuts rather cause than cure the bloody flux and lasks, wherefore they are not to be vsed in such diseases. ‡

CHAP. 90. *Of the Wall-nut tree.*

Nux Juglans.
The Walnut tree.

¶ *The Description.*

THIS is a great tree with a thicke and tall body: the barke is somewhat Greene, and tending to the colour of ashes, and oftentimes full of clefts: the boughes spread themselves far abroad: the leaues consist of five or six fastened to one rib, like those of the Ash tree, and with one standing on the top, which be broader and longer than the particular leaues of the Ash, smooth also, and of a strong smell: the catkins or aglets come forth before the Nuts: these Nuts do grow hard to the stalke of the leaues, by couples, or by three & three; which at the first when they be yet but tender haue a sweet smell, and be covered with a green huske: vnder that is a woody shell in which the kernell is contained, being covered with a thin skin, parted almost into foure parts with a woody skin as it were: the inner pulp whereof is white, sweet and pleasant to the tast; and that is when it is new gathered, for after it is dry it becommeth oily and ranck.

¶ *The Place.*

The Walnut tree groweth in fields neere common high-ways, in a fat and fruitfull ground, and in orchards: it prospereth on high fruitfull bankes, it loueth not to grow in waterie places.

¶ *The Time.*

The leaues together with the catkins come forth in the Spring: the Nuts are gathered in August.

¶ *The Names.*

The tree is called in Greeke, *Κάρυα*: in Latine, *Nux*, which name doth signifie both the tree and the fruit: in high-Dutch, *Nuszbaum*: in low-Dutch, *Noote boome*, and *Nootelact*: in French, *Neisier*: in Spanish, *Nogueyra*: in English, Walnut tree, and of some, Walsh nut tree. The Nut is called in Greeke, *Κάρυον Βασιλικόν*, that is to say, *Nux Regia*, or the Kingly Nut: it is likewise named

Nux

Nux Inglands, as though you should say *Iouis glans*, Jupiters Acorne; or *Iuvans glans*, the helping Acorne: and of diuers, *Perſica Nux*, or the Perſian Nut: in high-Dutch, *Welſch Nuß*, and *Baumnuß*: in low-Dutch, *Dokernoten*, *Walſch Noten*: In Italian, *Noci*: in French, *Noix*: in Spaniſh, *Nuezes*, and *Nous*: in English, Walnut; and of ſome, Walſh nut.

¶ *The Temperature and Vertues.*

The freſh kernels of the nuts newly gathered are pleaſant to the taſte: they are a little cold, and haue no ſmall moiſture, which is not perfectly concocted: they be hard of digeſtion, and nourish little: they ſlowly deſcend. A

The dry nuts are hot and dry, and thoſe more which become oily and ranke: theſe be very hurtfull to the ſtomacke, and beſides that they be hardly concocted, they increaſe choler, cauſe headache, and be hurtfull for the cheſt, and for thoſe that be troubled with the cough. B

Dry Nuts taken faſting with a fig and a little Rue withſtand poyſon, preuent and preſerue the body from the infection of the plague, and being plentifully eaten they driue wormes forth of the belly. C

The greene and tender Nuts boiled in Sugar and eaten as Suckad, are a moſt pleaſant and delectable meate, comfort the ſtomacke, and expell poyſon. D

The oile of Walnuts made in ſuch manner as oile of Almonds, maketh ſmooth the hands and face, and taketh away ſcales or ſcurfe, blacke and blew marks that come of ſtripes or bruifes. E

Milke made of the kernels, as Almond milke is made, cooleth and pleaſeth the appetite of the languishing ſicke body. F

With onions, ſalt, and hony, they are good againſt the biting of a mad dog or man, if they be laid vpon the wound. G

Being both eaten, and alſo applied, they heale in ſhort time, as *Dioſcorides* ſaith, Gangrens, Carbuncles, ægilops, and the pilling away of the haire: this alſo is effectually done by the oile that is preſſed out of them, which is of thin parts, digeſting and heating. H

The outward greene huſke of the Nuts hath a notable binding facultie. I

Galen deuifed and taught to make of the iuyce thereof a medicine for the mouth, ſingular good againſt all inflammations thereof. K

The leaues and firſt buds haue a certaine binding qualitie, as the ſame Authour ſheweth; yet there doth abound in them an hot and dry temperature. L

Some of the later Phyſitions uſe theſe for baths and lotions for the body, in which they haue a force to digeſt and alſo to procure ſweat. M

CHAP. 91. Of the Cheſtnut tree.

¶ *The Deſcription.*

THE Cheſtnut tree is a very great an high tree: it caſteth forth very many boughes: the body is thicke, and ſometimes of ſo great a compaſſe as that two men can hardly fa-
thom it: the timber or ſubſtance of the wood is ſound and durable: the leaues be great, rough, wrinkled, nicked in the edges, and greater than the particular leaues of the Walnut tree. The blowings or catkins be ſlender, long, and greene: the fruit is incloſed in round a rough and prickly huſke like to an hedge-hog or Vrchin, which opening it ſelfe doth let fall the ripe fruit or Nut. This nut is not round, but flat on the one ſide, ſmooth, and ſharpe pointed: it is couered with a hard ſhell, which is tough and very ſmooth, of a darke browne colour: the meate or inner ſubſtance of the nut is hard and white, and couered with a thin ſkin which is vnder the ſhell.

2 The Horſe Cheſtnut groweth likewise to be a very great tree, ſpreading his great and large armes or branches far abroad, by which meanes it maketh a very good coole ſhadow. Theſe branches are garniſhed with many beautifull leaues, cut or diuided into ſiue, ſix, or ſeu ſections or diuiſions, like to the Cink foile, or rather like the leaues of *Ricinus*, but bigger. The floures grow at the top of the ſtalks, conſiſting of foure ſmall leaues like the Cherry bloſſome, which turne into round rough prickly heads like the former, but more ſharpe and harder: the nuts are alſo rounder.

† The floures of this, ſaith *Cluſius* (whoſe figure of them I here giue you) come out of the boſom of the leafe which is the vppermoſt of the branch, and they are many in number growing vpon prettie long foot-ſtalkes, conſiſting each of them of foure white leaues of no great bigneſſe; the two vppermoſt are a little larger than the reſt, hauing round purple ſpots in their middles: out of the middle of the floure come forth many yellowiſh threds with golden pendants. The fruit is contained in a prickly huſke that opens in three parts, and it is rounder and not ſo ſharpe pointed as the

1 *Castanea*.
Chestnut tree.*Castanea Equina fructus.*‡ 3 *Castanea Peruana fructus.*2 *Castanea Equina cum flore.*
Horse Chestnut tree in floure.

the ordinary Chestnut, neither vnder the vtter coat hath it any peeling within as the other hath, neither is it of so good a taste. ‡

‡ 3 This Americane Chestnut is almost round, but that it is a little flatted on the sides, especially whereas it is fastned to the stalke: the vtter coat is sufficiently thicke, yet brittle, and as it were fungous, of a brownish yellow colour: vnder this are a-bundance of small yet stiffe prickles, fast sticking to the shell that contains the kernell: the shell it selfe is brownish, not thick, but tough and hard to breake, smooth and shining on the inside, wherein is contained a kernel of the bignesse and colour of an hares kidney, white within, and sweet in taste like an almond or the common Chestnut. *Clusius* calls this *Castanea Peruana*, or Chestnut of Peru; and hee saith hee had it from the famous Geographer *Abraham Ortelius*, who had it sent him by *Benedictus Arias Montanus*. The figure is exprest vnder that of the Horse Chestnut. ‡

¶ The Place.

The first growes on mountaines and shadowie places, and many times in the vallies: they loue a soft and blacke soile. There be fundry woods of Chestnuts in England, as a mile

mile and a halfe from Feuerham in Kent, and in sundry other places: in some countries they be greater and pleasanter: in others smaller, and of worse taste.

The Horse Chestnut groweth in Italy, and in sundry places of the East countries. ‡ It is now growing with M^r. Tradescant at South Lamberh. ‡

¶ The Time.

The blowings or aglets come forth with the leaues in Aprill; but the Nuts later, and be not ripe till Autumne.

¶ The Names.

The Chestnut tree beares the name of the Nut both in Greeke and Latine: in high-Dutch, *Ke-
denbaum*, and *Kastanibaum*: in low-Dutch, *Castaniboom*: in French, *Castaignier*: in English,
Chestnut tree.

The Nut is called in Greeke, *Κεστρον*: in Latine, *Castanea*, *Iouis glans*, *Sardinia glans*: in high-Dutch
Besten: in low-Dutch, *Castanien*: in Italian, *Castagne*: in French, *Chastaigne*: in Spanish, *Morones*,
Castanas: in English, Chestnut: the greater Nuts be named of the Italians, *Marroni*: of the French
men and of diuers base Almaines, *Marons*.

The Horse Chestnut is called in Latine, *Equina Castanea*: in English, Horse Chestnut, for that
the people of the East countries do with the fruit thereof cure their horses of the cough, shortnesse
of breath, and such like diseases.

¶ The Temperature and Vertues.

Our common Chestnuts are very dry and binding, and be neither hot nor cold, but in a mean be- A
tweene both: yet haue they in them a certaine windinesse, and by reason of this, vnlesse the shell
be first cut, they skip suddenly with a cracke out of the fire whilest they be roasting.

Of all the Acornes, saith *Galen*, the Chestnuts are the chiefeft, and doe onely of all the wilde B
fruits yeeld to the body commendable nourishment; but they slowly descend, they be hardly con-
cocted, they make a thicke blood, and ingender winde: they also stay the belly, especially if they
be eaten raw.

Being boiled or roasted they are not of so hard digestion, they more easily descend, and are lesse C
windy, yet they also make the body costiu.

Some affirme, that of raw Chestnuts dried, and afterwards turned into meale, there is made a D
kinde of bread: yet it must needs be, that this should be dry and brittle, hardly concocted, and ve-
rie slow in passing thorow the belly; but this bread may be good against the laske and bloody flux.

An Electuarie of the meale of Chestnuts and hony is very good against the cough and spitting E
of blood.

The barke of the Chestnut tree boiled in wine and drunke, stops the laske, the bloody flux, and F
all other issues of blood.

CHAP. 92. Of the Beech tree.

¶ The Description.

THE Beech is an high tree, with boughes spreading oftentimes in manner of a circle, and with
a thicke body hauing many armes: the barke is smooth: the timber is white, hard, and verie
profitable: the leaues be smooth, thin, broad, and lesser than those of the blacke Poplar: the
catkins or blowings be also lesser and shorter than those of the Birch tree, and yellow: the fruit or
Mast is contained in a huske or cup that is prickly, and rough bristled, yet not so much as that of
the Chestnut: which fruit being taken forth of the shells or vrchin husks, be couered with a soft
and smooth skin like in colour and smoothnesse to the Chestnuts, but they be much lesser, and of
another forme, that is to say, triangled or three cornered: the kernell within is sweet, with a cer-
taine astringent or binding qualitie: the roots be few, and grow not deepe, and little lower than
vnder the turfe.

¶ The Place.

The Beech tree loueth a plaine and open countrey, and groweth very plentifully in many For-
rests and desert places of Suffex, Kent, and sundry other countries.

¶ The Time.

The Beech floureth in Aprill and May, and the fruit is ripe in September, at what time the
Deere do eate the same very greedily, as greatly delighting therein; which hath caused forresters
and huntsmen to call it Buck-mast.

¶ The

Fagus.
The Beech.

¶ The Names.

The tree is called in Greeke, *φύλη*: in Latine, *Fagus*: in high-Dutch, *Buchbaum*, or *Buch*: in low-Dutch, *Bukenboom*: in Italian, *Faggi*: in Spanish, *Haia*, *Faia*, and *Fax*: in French, *Fau*, or *Hestre*: in English, Beech tree, Beech-mast, and Buck-mast.

The fruit is called in Latine, *Nuces Fagi*: in Greeke, *Βάλαροι τῆ φύλης*: in low-Dutch, *Buken nootkens*: in French, *Faine*: in English, Beech-mast. *Dioscorides* reckons the Beech among the Acorne trees; and yet is the mast nothing at all like to an Acorne. Of *Theophrastus* it is called *Oxya*: of *Gaza*, *Sciiscina*.

Pliny also makes mention of this tree, but vnder the name of *Ostrya* (if so be in stead of *Ostrya* we must not reade *Oxya*) lib. 13. ca. 21. It bringeth forth (saith he, meaning Greece) the tree *Ostrys*, which they likewise call *Ostrya*, growing alone among waterie stones, like to the Ash tree in barke and boughes, with leaues like those of the Peare tree, but somewhat longer and thicker, and with wrinkled cuts which runne quite thorow, with a seed like in colour to a Chestnut, and not vn-to barley: the wood is hard and firme, which being brought into the house there follows hard trauell of childe, and miserable deaths, as it is reported; and therefore it is to be forborne, and not vsed as fire wood, if *Plinies* copies be not corrupted.

¶ The Temperature.

The leaues of Beech do coole: the kernell of the Nut is somewhat moist.

¶ The Vertues.

A The leaues of Beech are very profitably applied vnto hot swellings, blisters, and excoriations; and being chewed they are good for chapped lips, and paine of the gums.

B The kernels or mast within are reported to ease the paine of the kidneyes proceeding of the stone, if they be eaten, and to cause the grauell and sand the easier to come forth. With these, mice and Squirrels are greatly delighted, who do mightily encrease by feeding thereon: Swine also be fatned herewith, and certaine other beasts: also Deere do feed thereon very greedily: they be likewise pleasant to Thrushes and Pigeons.

C *Petrus Crescentius* writeth, That the ashes of the wood is good to make glasse with.

D The water that is found in the hollownesse of Beeches cureth the naughty scurfe, tetter, and scabs of men, horses, kine, and sheepe, if they be washed therewith.

CHAP. 93. Of the Almond tree.

¶ The Description.

THE Almond tree is like to the Peach tree, yet is it higher, bigger, of longer continuance: the leaues be very long, sharpe pointed, snipt about the edges like those of the Peach tree: the floures be alike: the fruit is also like a peach, hauing on one side a cleft, with a soft skin without, and couered with a thin cotton; but vnder this there is none, or very little pulp, which is hard like a gristle not eaten: the nut or stone within is longer than that of the peach, not so rugged, but smooth; in which is contained the kernel, in taste sweet, and many times bitter: the root of the tree groweth deepe: the gum which soketh out hereof is like that of the peach tree.

† There are diuers sorts of Almonds, differing in largenes and taste: we commonly haue three or foure sorts brought to vs, a large sweet Almond, vulgarly termed a Iordan almond; and a lesser, called a Valence Almond: a bitter Almond of the bignesse of the Valence almond, and somtimes another bitter one lesse than it. †

¶ The

Amygdalus.
The Almond tree.

¶ *The Place.*

The natural place of the Almond is in the hot regions, yet we haue them in our London gardens and orchards in great plenty.

¶ *The Time.*

The Almond floureth betimes with the Peach: the fruit is ripe in August.

¶ *The Names.*

The tree is called in Greeke, *Ἀμυγδαλὴ*: in Latine, *Amygdalus*: in French, *Amandier*: in English, Almond tree.

The fruit is called in Greeke, *Ἀμυγδαλόν*: in Latine, *Amygdalum*: in shops, *Amygdala*: in high-Dutch, *Mandel*: in low-Dutch, *Mandelen*: in Italian, *Mandole*: in Spanish, *Almendras*, *Amelles*, and *Amendoas*: in French, *Amandes*: in English, Almond.

¶ *The Temperature and Vertues.*

Sweet Almonds when they be dry be moderately hot; but the bitter ones are hot and dry in the second degree. There is in both of them a certaine fat and oily substance, which is drawne out by pressing.

Sweet Almonds being new gathered are pleasant to the taste, they yeeld some kind of nourishment, but the same grosse and earthy, and grosser than those that be dry, and not as yet withered. These do likewise slowly descend, especially being eaten without their skins; for euen as the huskes or branny parts of corne doe serue to drine downe the grosse excrements of the belly, so doe likewise the

skins or husks of the almonds: therefore those that be blanced do so slowly descend, as that they do withall binde the belly; whereupon they are giuen with good successe to those that haue the laske or the bloody flux.

There is drawne out of sweet Almonds, with liquor added, a white iuice like milke, which ouer and besides that it nourisheth, and is good for those that are troubled with the laske and bloudie flux, it is profitable for those that haue the pleurisie and spit vp filthy matter, as *Alexander Trallianus* witnesseth: for there is likewise in the Almonds an opening and concocting qualitie, with a certaine clensing faculty, by which they are medicinable to the chest and lungs, or lights, and serue for the raising vp of flegme and rotten humors.

Almonds taken before meate do stop the belly, and nourish but little; notwithstanding many excellent meates and medicines are therewith made for sundry griefes, yea very delicat and wholesome meates, as Almond butter, creame of Almonds, marchpane, and such like, which dry and stay the belly more than the extracted iuyce or milke; and they are also as good for the chest and lungs.

They do serue also to make the Physicall Barley water, and Barley Creame, which are giuen in hot Feuers, as also for other sicke and feeble persons, for their further refreshing and nourishments.

The oile which is newly pressed out of the sweet Almonds is a mitigater of paine and all maner of aches. It is giuen to those that haue the pleurisie, being first let blood; but especially to those that are troubled with the stone of the kidnies; it slackens the passages of the vrine, and maketh them glib or slipperie, and more ready to suffer the stone to haue free passage: it maketh the belly soluble, and therefore it is likewise vsed for the collicke.

It is good for women that are newly deliuered; for it quickly remoueth the throwes which remaine after their deliury.

The oile of Almonds makes smooth the hands and face of delicat persons, and clenseth the skin from all spots, pimples, and lentils.

Bitter Almonds doe make thinne and open, they remoue stoppings out of the liuer and spleene, therefore they be good against paine in the sides: they make the body soluble, prouoke vrine, bring

FFFFF

downe

downe the menfes, helpe the strangurie, and clense forth of the cheft and lungs clammy humors: it they be mixed with fome kinde of looch or medicine to licke on: with starch they ftay the spitting of bloud.

- L And it is reported that five or fix being taken fafting do keepe a man from being drunke.
M Thefe alfo clense and take away spots and blemifhes in the face, and in other parts of the body; they mundifie and make cleane foule eating vlcers.
N With hony they are laid vpon the biting of mad dogs; being applied to the temples with vineger or oile of Rofes, they take away the head-ache, as *Dioscorides* writeth.
O They are alfo good againft the cough and shortneffe of winde.
P They are likewise good for thofe that spit bloud, if they be taken with the fine floure of *Amylum*.
Q There is alfo preffed out of thefe an oile which prouoketh vrine, but efpecially if a few fcorpions be drowned, and fteeped therein.
R With oile it is fingular good for thofe that haue the ftone, and cannot eafily make water but with extremitie of paine, if the fhare and place betweene the cods and fundament be anoynted therewith.
S *Dioscorides* faith, that the gum doth heate and binde, which qualities notwithstanding are not perceiued in it.
T It helpeth them that spit bloud, not by a binding facultie, but thorow the clammineffe of his fubftance, and that is by closing vp of the paffages and pores, and fo may it alfo cure old coughes, and mitigate extreame paines that proceed of the ftone, and efpecially take away the sharpenefle of vrine, if it be drunke with Bastard, or with any other sweet potion, as with the decoction of Licorice or of Raifons of the funne. The fame doth likewise kill tetter in the outward parts of the bodie (as *Dioscorides* addeth) if it be diffolued in vineger.

CHAP. 94. Of the Peach tree.

¶ The Kindes.

† There are diuers forts of Peaches befides the foure here fet forth by our Author, but the trees do not much differ in fhape, but the difference chiefly confifts in the fruit, whereof I will giue you the names of the choice ones, and fuch as are to be had from my friend Mr. *Milten* in Old-ftreet, which are thefe; two forts of Nutmeg Peaches; The Queenes Peach; The Newington Peach; The grand Carnation Peach; The Carnation Peach; The Blacke Peach; the Melocotone; the White; The Romane; The Alberza; The Island Peach; Peach du Troy. Thefe are all good ones. He hath alfo of that kinde of Peach which fome call *Nuciperfica* or *Nectarins*, thefe following kinds; the Roman red, the beft of fruits; the bastard Red; the little dainty green; the yellow; the white; the ruffet, which is not fo good as the reft. Thofe that would fee any fuller difcourfe of thefe may haue recourfe to the late worke of Mr. *Iohn Perkinfon*, where they may finde more varieties, and more largely handled, and therefore not neceffarie for me in this place to inlift vpon them. †

¶ The Description.

1 The Peach tree is a tree of no great bignefle: it fendeth forth diuers boughes, which be fo brittle, as oftentimes they are broken with the weight of the fruit or with the winde. The leaues be long, nicked in the edges, like almoft to thofe of the Walnut tree, and in tafte bitter: the floures be of a light purple colour. The fruit or Peaches be round, and haue as it were a chinke or cleft on the one fide; they are couered with a foft and thin downe or hairie cotton, being white without, and of a pleasant tafte; in the middle whereof is a rough or rugged ftone, wherein is contained a kerneil like vnto the Almond; the meate about the ftone is of a white colour. The root is tough and yellowifh.

2 The red Peach tree is likewise a tree of no great bignefle: it alfo fendeth forth diuers boughes or branches, which be very brittle. The leaues be long, and nicked in the edges like to the precedent. The floures be alfo like vnto the former; the fruit or Peaches be round, of a red colour on the outside; the meate likewise about the ftone is of a gallant red colour. Thefe kinds of Peaches are very like to wine in tafte, and therefore marvellous pleasant.

3 *Persica praeocia*, or the d'auant Peach tree is like vnto the former, but his leaues are greater and larger. The fruit or Peaches be of a ruffet colour on the one fide, and on the other fide next vnto the fun of a red colour, but much greater than the red Peach: the ftones whereof are like vnto the former: the pulpe or meate within is of a golden yellow colour, and of a pleasant tafte.

4 *Persica*

Persica alba.
The white Peach.

4 *Persica lutea*, or the yellow Peach tree, is like vnto the former in leaues and floures: his fruit is of a yellow colour on the outside, and likewise on the inside, harder than the rest, in the middle of the Peach is a woody, hard, and rough stone, full of crests and gutters, in which doth lie a kernell much like to that of the Almond, and with such a like skin: the substance within is white, and in taste something bitter. The fruit hereof is of greatest pleasure, and best taste of all the other of his kinde, although there be found at this day diuers other sorts that are of very good taste, not remembered of the ancient, or set downe by the later writers, whereof to speake particularly, would not be greatly to our pretended purpose, considering we hasten to an end.

‡ 5 There is also kept in some of our choise gardens a kind of Peach which hath a very double and beautiful floure, but it is seldome succeeded by any fruit; they call this, *Persica flore pleno*, The double blossomed Peach. ‡

¶ The Place.

They are set and planted in gardens and vineyards: I haue them all in my garden, with many other sorts.

¶ The Time.

The Peach tree soone commeth vp: it beares fruit the third or fourth yeere after it is planted, and it soone decaieth, and is not of long continuance; it floureth in Aprill, or a little while after that the leaues appeare, and hath his fruit ripe in September.

¶ The Names.

The Peach tree is called in Greeke, *μαλίαν περσική*: in Latine, *Malus Persica*, and *Persica*: in high Dutch, *Persichboom*: in low Dutch, *Perse boom*: in French, *Perscher*: in English, Peach tree.

The fruit, as *Galen* testifieth, is named *μάλον περσικόν*, and *περσικόν* also without any addition: in Latine, *Malum Persicum*, and *Persicum*: in high Dutch, *Piersting*: in low Dutch, *Persen*: in Italy, *Pesche*: in Spanish, *Pexegos*: in French, *Pisches*: in English, Peach.

¶ The Temperature and Vertues.

Peaches be cold and moist, and that in the second degree; they haue a iuice and also a substance that doth easily putrifie, which yeeldeth no nourishment, but bringeth hurt, especially if they be eaten after other meates; for then they cause the other meates to putrifie. But they are lesse hurtfull if they be taken first; for by reason that they are moist and slippery, they easily and quickly descend, and by making the belly slippery, they cause other meates to slip downe the sooner.

The kernels of the Peaches be hot and dry, they open and cleanse; they are good for the stoppings of the liuer and spleene.

Peaches before they be ripe do stop the laske, but being ripe they loose the belly, and ingender naughty humors, for they are soone corrupted in the stomacke.

The leaues of the Peach tree do open the stopping of the liuer, and do gently loosen the belly: and being applied plaisterwise vnto the nauell of young children, they kill the wormes, and driue them forth.

The same leaues boiled in milke, do kill the wormes in children very speedily.

The same being dried, and cast vpon greene wounds, cure them.

The floures of the Peach tree infused in warme water for the space of ten or twelue houres, and strained, and more floures put to the said liquor to infuse after the same manner, and so iterated six or eight times, and strained again, then as much sugar as it will require added to the same liquor and boiled vnto the consistence or thicknes of a syrrip, and two spoonefulls hereof taken, doth so singularly well purge the belly, that there is neither Rubarbe, Agaricke, nor any other purger comparable vnto it; for this purgeth downe waterish humors mightily, and yet without grieve or trouble, either to the stomacke, or lower parts of the body.

Ffffff 2

The

H The kernell within the Peach stone stamped small, and boiled with Vineger vntill it be brought to the forme of an ointment, is good to restore and bring again the haire of such as be troubled with the *Alopecia*.

I There is drawne forth of the kernels of Peaches, with Peniroyall water, a iuice like vnto milke, which is good for those that haue the Apoplexy: if the same be oftentimes held in the mouth it draweth forth water and recouereth the speech.

K The gum is of a meane temperature, but the substance thereof is tough and clammy, by reason whereof it dulleth the sharpnes of thin humors: it serueth in a looch or licking medicine for those that be troubled with the cough, and haue rotten lungs, and stoppeth the spitting and raising vp of blood, and also stayeth other fluxes.

CHAP. 95.

Of the Aprecocke or Abrecocke tree.

1 *Armeniaca malus maior.*
The greater Aprecocke tree.

2 *Armeniaca malus minor.*
The lesser Aprecocke tree.

¶ The Description.

1 **T**His tree is greater than the Peach tree, and hath a bigger body, it lasteth longer, especially if it be grafted or inoculated: the leaues hereof are broad, and sharpe pointed, like those of blacke Poplar, but lesser, and comming more neere to the leaues of birch, nicked in the edges: the floures are somewhat white: the fruit round like a peach, yellow within and without, in which doth lie a browne stone, nothing rough at all as is that of the Peach, shorter also, and lesser, in which is included a sweet kernell.

2 We haue another sort of Aprecocke, whose trunk or body is equall with the other in greatness, it is like also in leaues and brittle branches: his time of flourishing, flourishing, and manner of growing accordeth: the only point wherein they differ is, that this tree bringeth forth lesse fruit, and not so good in taste, in euery other respect it is like.

¶ Of this also Mr. Parkinson hath set forth diuers varieties, and my forementioned friend Mr. Millen hath these fve sorts, the common, the long and great, the Muske, the Barbary, and the early Aprecocke. ‡

¶ The

¶ The Place.

These trees do grow in my garden, and now adaies in many other gentlemens gardens throughout all England.

¶ The Time.

They floure and flourish in Aprill, and their fruit is ripe in Iuly.

¶ The Names.

This tree is called in Greeke, *Μάλη Αρμενιάκη* : in Latine, *Malus Armeniaca* : in English, Abrecocke tree, and Aprecocke tree.

The fruit is named *Μάλη Αρμενιάκη*, and of diuers *Περσικόν*, or *Βασιλικόν*, which be words corrupted from the Latine; for *Præcox* in Latine is diuers times called *Præcoquum* : it is named *Malum Armeniacum*, and commonly *Armeniacum* : it is called in high-Dutch, *Molletten Mollelin*, *S. Johans Pterling* : in low-Dutch, *Uroeghe Persen*, *Auant Persen* : in Italian, *Armeniache*, *Bacoché*, *Grisomele*, *Moniache* : in French, *Abricots* : in Spanish, *Aluarcoques*, *Aluarchigas*, and *Albercocs* : in English, Abrecocke, and of some, Aprecocke, and Aprecox.

Galen seemeth to make a difference betweene *Præcocia* and *Armeniaca*, in his booke of the Faculties of nourishments, preferring *Præcocia* before *Armeniaca*; yet he doth confesse that both of them be called *Armeniaca* : others pronounce them *Armenia* with foure syllables. And in his booke of the faculties of simple medicines he affirmeth, that both the fruit and the tree are called *Περσικόν* : diuers of the later Physitions do between these also make a difference, saying, that the greater ones and those that are grafted be *Armeniaca* (which the French men call *Auant Perses*) and the lesser *Præcocia* : in French, *Abricots*.

¶ The Temperature and Vertues.

Aprecocks are cold and moist in the second degree, but yet not so moist as Peaches, for which **A** cause they do not so soone or easily putrifie, and they are also more wholesome for the stomacke, and pleasant to the taste; yet do they likewise putrifie, and yeeld but little nourishment, and the same cold, moist, and full of excrements: being taken after meate they corrupt and putrifie in the stomacke; being first eaten before other meate they easily descend, and cause the other meates to passe downe the sooner, like as also the Peaches do.

The kernell within the same is sweet, and nothing at all like in facultie to that of the Peach. **B**

The vertues of the leaues of this tree are not as yet found out. **C**

CHAP. 96. Of Pomegranat tree.

¶ The Kindes.

AS there be sundry sorts of Apples, Peares, Plums, and such like fruits; so there are two sorts of Pomegranates, the garden and the wilde, and a third sort which is barren and fruitles: the fruit of the garden Pomegranat is of three sorts; one hauing a soure iuyce or liquour; another hauing a very sweet and pleasant liquor, and the third the taste of Wine: of the wilde also there be two sorts, and the difference betweene them is no more than betwixt crabs and weildings, which are both wilde kinds of Apples: therefore the description of the garden Pomegranat shal suffice for the rest.

¶ The Description.

THe manured Pomegranat tree groweth vp to the height of a hedge tree, being seuen or eight cubits high, hauing many pliant and twiggy branches, very limber, tough, and of a browne colour: whereon are set very many leaues in shape like those of the Priuet, but more like those of the Myrtle tree, of a bright shining greene colour tending to yellowesse: amongst which there stand certaine sharpe thornes confusedly set, and likewise hollow floures like vnto the hedge Rose, indented on the edges like a starre, of a Carnation colour, and very single: after which commeth the fruit, couered with a hard barke, of an ouerworne purplish colour, full of graines and kernels, which after they be ripe are of a gallant crimson colour, and full of iuyce, which differeth in taste according to the soile, clymat, and countrey where they grow; some be sweet, others soure, and the third are in a middle betweene them both, hauing the taste of Wine.

1 *Malus Granata, sine Punica.*
The Pomegranat tree.

2 *Malus Punica sylvestris.*
The wilde Pomegranat.

Balaustia, sine Pleni flores Gran. syl.
The double floures of wild Pomegranat.

† 2 The wilde Pomegranat tree is like the other in leaues and twiggy branches, but it is more prickly and horrid: of this there are two sorts, the one hauing such floures & fruit as the tame Pomgranat; the other bearing floures very double, as may appeare by the figure, which wither and fall away, leauing no fruit behind them, as the double floured Cherry doth, and diuers other herbes and trees also; & it is altogether barren of fruit: of this *Dioscorides* makes sundry sorts, differing in colour: one is white, saith he; another yellowish red, and a third sort of the colour of the Rose: this with red floures is best knowne among the Apothecaries.

¶ The Place.

Pomegranats grow in hot countries toward the South, in Italy, Spaine, and chiefly in the kingdome of Granado, which is thought to be so named of the great multitude of Pomgranats, which be commonly called *Granata*: they grow in a number of places also without manuring: yet being manured they prosper better; for in gardens, vineyards, orchards, and other like husbanded grounds they come vp more cheerefully: I haue recouered diuers yong trees hereof, by sowing of the seed or grains, of the height of three or foure cubits, attending Gods leisure for floures and fruit.

¶ The Time.

The Pomegranate floureth in the moneths of May and Iune: the fruit is ripe in the end of August.

¶ The

¶ The Names.

The Pomegranate tree is called in Latine, *Malus Punica*: in Greeke, of the Athenians, *ῥόζον*, and as Galen saith: in English, Pomegranate tree: the fruit is also named *ῥόζον*, or *ῥόζα*: in Latine, *Malum Punicum*: in shops, *Malum*, or *Pomum Granatum*: in high Dutch, *Granatopffel*: in low Dutch, *Grattappel*: in Italian, *Melagrano*, and *Pomo Granato*: in Spanish, *Granadas*, and *Romanas*: in French, *Pommes Granades*: in English, Pomegranate.

The floure of the fruitfull Pomegranate tree is called of the Grecians, *ῥοζάριον*: which is notwithstanding properly the cup of the floure: the Latines name it also *Cytinus*.

The floure of the wilde and barren Pomegranate tree is called *Βαλάντιον*: the Apothecaries doe likewise terme it *Balanstium*.

The pill or rinde of the Pomegranate which is so much in vse, is named in Greeke *σίδιον*: in Latine, *Malicorium*, and *Sidium*: in shops it is called *Cortex granatorum*, or Pomegranate Pill.

¶ The Temperature and Vertues.

The iuicie grains of the Pomegranate are good to be eaten, hauing in them a meetly good iuice: **A** they are wholesome for the stomacke, but they all containe in them a thin and small nourishment, or none at all.

The sweet ones be not so cold as the rest, but they easily cause hot swellings to arise, and they **B** are not so much commended for agues.

The soure ones, and especially if they be withall something harsh, doe evidently coole, dry, and **C** something binde.

They are good for the heart burne, they repress and stay the ouermuch vomiting of choler, **D** called the Felonie: they are a remedie against the bloody fluxe, aptnesse to vomite, and vomite it selfe.

There is made of the iuice of these soure Pomegranats a syrrop, which serueth for the same pur- **E** poses, and is also many times very profitable against the longing of women with childe, vnlesse the coldnesse of the stomacke be a hinderance thereunto.

The seeds of the graines, and especially of the sower Pomegranat, being dried, do likewise coole **F** and binde.

They stop the flux, stay vomiting, and stanch the spitting vp of blood, they strengthen the sto- **G** macke.

Of the same effect be the floures, both of the tame and wilde Pomegranate tree, being like to the **H** seeds in temperature and vertues.

They fasten the teeth, and strengthen the gums, if the same be washed therewith. **I**

They are good against burstings that come by falling downe of the guts, if they be vsed in plai- **K** sters and applied.

The rinde or pill is not onely like in facultie to the seeds, and both the sorts of floures, but also **L** more auailable, for it cooleth and bindeth more forceably, it bringeth downe the hot swellings of the almonds in the throat, being vsed in a gargarisme or a lotion for the throat, and it is a singular remedy for all things that need cooling and binding.

Dioscorides writeth, that there is also gathered a iuice out of both those sorts of floures, which is **M** very like in facultie and vertue to *Hypocistis*, as the same Autho^r affirmeth.

The blossomes of the tame and wilde Pomegranates, as also the rinde or shell thereof made into **N** pouder, and drunke in red wine, or boyled in red wine, and the decoction drunke, is good against the bloody flux, and all other issues of blood; yea it is good for women to sit ouer, & bathe themselves in the decoction hereof: these foresaid blossomes and shels are good also to put into restraining pouders, for the stanching of blood in wounds.

The seeds or stones of Pomegranats dried in the Sun, and beaten to pouder, are of like operati- **O** on with the floures: they stop the laske and all issues of blood in man or woman, being taken in the manner aforesaid.

CHAP. 97. Of the Quince Tree.

¶ The Kindes:

Columella maketh three Kindes of Quinces, *Struthia*, *Chrysomeliana*, and *Mustela*, but what manner ones they be hee doth not declare, notwithstanding wee finde diuers sorts differing as well in forme,

forme, as taste and substance of the fruit, wherof some haue much core and many kernels, and others fewer.

Malus Cotonea.

The Quince tree.

¶ The Description.

The Quince tree is not great, but groweth low, and many times in maner of a shrub: it is couered with a rugged barke, which hath on it now and then certaine scales: it spreadeth his boughes in compasse like other trees; about which stand leaues somewhat round, like those of the common Apple tree, greene and smooth aboue, and vnderneath soft and white: the floures be of a white purple colour: the fruit is like an apple, saue that many times it hath certaine embowed and swelling diuisions: it differeth in fashion and bignesse; for some Quinces are lesser and round trust vp together at the top with wrinkles, others longer and greater: the third sort be after a middle manner betweene both; they are all of them set with a thin cotton or freeze, and be of the colour of gold, and hurtfull to the head by reason of their strong smell; they all likewise haue a kinde of choking taste: the pulp within is yellow, and the seed blackish, lying in hard skins, as doe the kernels of other apples.

¶ The Place.

The Quince tree groweth in gardens and orchards, and is planted oftentimes in hedges and fences belonging to gardens & vineyards: it delighteth to grow on plaine and euen grounds, and somewhat moist withall.

¶ The Time.

These apples be ripe in the fall of the leafe, and chiefly in October.

¶ The Names.

The tree is called in Greeke *μᾶλε κυδωνία*: in Latine, *Malus Cotonea*: in English, Quince tree.

The fruit is named *μᾶλον κυδωνιον*: *Malum Cotoneum*, *Pomum Cydonium*, and many times, *Cydonium*, without any addition; by which name it is made known to the Apothecaries: it is called in high Dutch, *Quitten*, *Quittenopffel*, or *Kuttienopffel*: in low Dutch, *Queappel*: in Italian, *Mele cotogne*: in Spanish, *Codoyons*, *Membrillos*, and *Marmellos*: in French, *Pomme de coing*: in English, Quince.

¶ The Temperature and Vertues.

- A Quinces be cold and dry in the second degree, and also very much binding, especially when they be raw: they haue likewise in them a certaine superfluous and excrementall moisture, which will not suffer them to lie long without rotting: they are seldom eaten raw: being roasted or baked they be more pleasant.
- B They strengthen the stomacke, stay vomiting, stop lasks, and also the bloody flux.
- C They are good for those that spit vp blood, or that vomit blood, and for women also that haue too great plenty of their monethly courses.
- D *Simeon Sethi* writeth, that the woman with childe, which eateth many Quinces during the time of her breeding, shall bring forth wise children, and of good vnderstanding.
- E The Marmalade, or Cotiniat, made of Quinces and sugar, is good and profitable for the strengthening of the stomacke, that it may retaine and keepe the meat therein vntill it be perfectly digested: it likewise stayeth all kindes of fluxes, both of the belly and other parts, and also of blood: which Cotiniat is made in this manner:
- F Take faire Quinces, pare them, cut them in pieces, and cast away the core, then put vnto euery pound of Quinces a pound of sugar, and to euery pound of sugar a pinte of water: these must bee boiled together ouer a still fire till they be very soft, then let it be strained or rather rubbed through a strainer, or an hairy sieue, which is better, and then set it ouer the fire to boile againe, vntill it be stiffe,

stiffe, and so box it vp, and as it cooleth put thereto a little Rose water, and a few graines of Muske, well mingled together, which will giue a goodly taste vnto the Cotiniat. This is the way to make Marmalade:

Take whole Quinces and boile them in water vntill they be as soft as a scalded codling or apple, G then pill off the skin, and cut off the flesh, and stampe it in a stone mortar; then straine it as you did the Cotiniat, afterward put it into a pan to drie, but not to seeth at all: and vnto euery pound of the flesh of Quinces, put three quarters of a pound of sugar, and in the cooling you may put in rose water and a little Muske, as was said before.

There is boiled with Quinces oile which therefore is called in Greeke *Melinon*, or oile of Quin- H ces, which we vse, saith *Dioscorides*, so oft as we haue need of a binding thing.

The seed of Quinces tempered with water, doth make a muscilage, or a thing like ielly, which I being held in the mouth, is maruellous good to take away the roughnesse of the tongue in hot burning fevers.

The same is good to be layed vpon burnings or scaldings, and to be put into clifters against the K bloody flux, for it easeth the paine of the guts, and alaieth the sharpnesse of biting humors.

Many other excellent, dainty and wholesome confections are to be made of Quinces, as ielly of L Quinces, and such odde conceits, which for breuitie sake I do now let passe.

CHAP. 98. Of the Medlar Tree.

¶ The Kindes.

There are diuers sorts of Medlars, some greater, others lesser: some sweet, and others of a more harsh taste: some with much core, and many great stony kernels, others fewer: and likewise one of Naples called *Aronia*.

1 *Mespilus sativa*.

The manured Medlar.

2 *Mespilus sativa altera*.

The other Garden Medlar.

The

¶ The Description.

1 The manured Medlar tree is not great, the body whereof is writhed, the boughes hard, not easie to be broken: the leaues be longer, yet narrower than those of the apple tree, darke, Greene above, and somewhat whiter and hairy below: the floures are white and great, hauing five leaues a piece: the fruit is small, round, and hath a broad compassed nauell or crowne at the top: the pulpe or meat is at the first white, and so harsh or choking, that it cannot be eaten before it become soft, in which are contained five seeds or stones, which be flat and hard.

† 2 There is another which differeth from the last described, in that the leaues are longer and narrower, the stocke hath no prickles vpon it: the fruit also is larger and better tasted: in other respects it is like to the last described. This is the *Mespilus fructu prestantiore* of *Tragus*, and *Mespilus Domestica* of *Lobel*. †

3 The Neapolitane Medlar tree groweth to the height and greatnesse of an Apple tree, hauing many tough and hard boughes or branches, set with sharp thornes like the white Thorne, or Hawthorne: the leaues are very much cut or ragged like the Hawthorne leaues, but greater, and more like Smallage or Parsley, which leaues before they fall from the tree do wax red: among these leaues come forth great tufts of floures of a pale herby colour: which being past, there succeed small long fruit, lesser than the smallest Medlar, which at the first are hard, and Greene of colour, but when they be ripe, they are both soft and red, of a sweet and pleasant taste: wherein is contained three small hard stones, as in the former, which be the kernels or seeds thereof.

3 *Mespilus Aronia*.
The Neapolitane Medlar.

† 4 *Chamamespilus*.
Dwarfe Medlar.

4 There is a dwarfe kinde of Medlar growing naturally vpon the Alpes, and hils of Narbone, and on the rocks of Mount Baldus nigh Verona, which hath been by some of the best learned esteemed for a kinde of Medlar: others, whose iudgements cannot stand with truth or probability, haue supposed it to be *Euonymus*, of the Alpes: this dwarfe Medlar groweth like a small hedge tree, of four or five cubits high, bearing many smal twiggie wands or crops, beset with many slender leaues green above, and of a skie colour vnderneath, in shew like to a dwarfe Apple tree, but the fruit is very

very like the Haw, or fruit of the white Thorne, and of a red colour. † The floures come forth in the Spring three or foure together, hollow, and of an herbie colour, it growes in diuers places of the Alpes: it is the *Chamemespilum* of the *Aduers.* and the *Chamemespilus* *Gesneri*, of *Clusius.* †

¶ The Place.

The Medlar trees do grow in Orchards, and oftentimes in hedges among Briars and Brambles; being grafted in a white Thorne it prospereth wonderfull well, and bringeth forth fruit twise or thrise bigger than those that are not grafted at all, almost as great as little apples: we haue diuers sorts of them in our Orchards.

¶ The Time.

It is very late before Medlars be ripe, which is in the end of October, but the floures come forth timely enough.

¶ The Names.

The first is called in Greeke by *Theophrastus* *μίσπλον*: in Latine, *Mespilus*: in high Dutch, *Nespeibaum*: in low Dutch, *Mispelboome*: in French, *Nefflier*: in English, Medlar tree.

The Apple or fruit is named in Greeke, *μίσπλον*: in Latine likewise, *Mespilum*: in high Dutch, *Nespel*, in low Dutch, *Mispel*: in Italian, *Nespola*: in French, *Neffle*: in Spanish, *Nesperas*: in English, Medlar.

Dioscorides affirmeth, that this Medlar tree is called *ἐπιμήλις*, and of diuers, *Sitanion*: *Galen* also in his booke of the faculties of simple medicines nameth this *Epimelis*, which is called, as he saith, by the countrey men in Italy, *Vnedo*, and groweth plentifully in Calabria; for vnder the name of *Mespilus*, or Medlar tree, he meaneth no other than *Tricoccus*, which is also named *Aronia*.

The Neapolitane Medlar tree is called in Greeke *μίσπλον* and *μίσπλον*: *Galen* calleth it *Epimelis*.

The fruit hereof is called *Tricoccus*, of the three graines or stones that it hath: they of Naples call it *Azarolo*: and we may name it in English, three graine Medlar, or Neapolitane Medlar, or Medlar of Naples.

¶ The Temperature.

The Medlars are cold, drie, and astringent; the leaues are of the same nature: the dwarfe Medlar is dry, sharpe, and astringent.

¶ The Vertues.

Medlars do stop the belly, especially when they be greene and hard, for after that they haue been kept a while, so that they become soft and tender, they doe not binde or stop so much, but are then more fit to be eaten.

The fruit of the three grain Medlar, is eaten both raw and boiled, and is more wholesome for the stomacke.

These Medlars be oftentimes preferued with sugar or hony: and being so prepared they are pleasant and delightfull to the taste.

Moreouer, they are singular good for women with childe: for they strengthen the stomacke, and stay the lothsomnesse thereof.

The stones or kernels of the Medlars, made into pouder and drunke, doe breake the stone, expell grauell, and procure vrine.

CHAP. 99. Of the Peare tree.

¶ The Description.

TO write of Peares and Apples in particular, would require a particular volume: the stocke or kindred of Peares are not to be numbred: every country hath his peculiar fruit: my selfe knows one curious in grafting and planting of fruits, who hath in one piece of ground, at the point of three score sundry sorts of Peares, and those exceeding good, not doubting but if his minde had been to seeke after multitudes, he might haue gotten together the like number of those of worse kinds: besides the diuersities of those that be wilde, experience sheweth sundry sorts: and therefore I thinke it not amisse to set downe the figures of some few with their seuerall titles, as well in Latine as English, and one generall description for that, that might be said of many, which to describe apart, were to send an owle to Athens, or to number those things that are without number.

† Our Author in this chapter gaue eight figures with seuerall titles to them, so I pluckt a peare from each tree, and put his title to it, but not in the same order that he obserued, for hee made the Katherine peare tree the seuenth, which I haue now made the first, because the figure expresse the whole tree. †

¶ The

¶ The generall description.

The Peare tree is for the most part higher than the Apple tree, hauing boughes not spread a-broad, but growing vp in height: the body is many times great: the timber or wood it selfe is very tractable or easie to be wrought vpon, exceeding fit to make moulds or prints to be grauen on, of colour tending to yellowesse: the leafe is somewhat broad, finely nicked in the edges, greene aboue, and somewhat whiter vnderneath: the floures are white: the Peares, that is to say, the fruit, are for the most part long, and in forme like a Top; but in greatnes, colour, forme, and tast very much differing among themselues, they be also couered with skins or coats of sundry colours: the pulpe or meat differeth, as well in colour as tast: there is contained in them kernels, blacke when they be ripe: the root groweth strait downe with some branches running aslope.

Pirus superba, siue Katherina.
The Katherine Peare tree.

- 1 *Pyra Pracocia*. The Ienneting Peare.
2 *Pyra Iacobea*. Saint Iames Peare.
3 *Pyrum regale*. The Peare royall.

- 4 *Pyrum Palatinum*. The Burgomot Peare.
5 *Pyrum Cydonium*. The Quince peare.
6 *Pyrum Episcopatum*. The Bishops peare.
7 *Pyrum hyemale*. The Winter peare.

¶ The Place.

The tame Peare trees are planted in Orchards, as be the apple trees, and by grafting, though vpon wilde stockes, come much varietie of good and pleasant fruits. All these before specified, and many sorts more, and those most rare and good, are growing in the ground of Master Richard Poin-ter, a most cunning and curious graffer and planter of all manner of rare fruits, dwelling in a small village neere London called Twicknam; and also in the ground of an excellent graffer and painfull planter, M^r. Henry Banbury, of Touthill street neere Westminster, and likewise in the ground of a diligent and most affectionate louer of plants M^r. Warner neere Horsey downe by London, and in diuers other grounds about London. ‡ Most of the best peares are at this time to be had with M^r. Iohn Millen in Old-street, in whose nursery are to be found the choicest fruits this kingdom yeelds. ‡

¶ The Time.

The floures do for the most part come forth in Aprill, the leaues afterwards: all peares are not ripe at one time: some be ripe in Iuly, others in August, and diuers in September and later.

¶ The Names.

The tame or Orchard peare tree is called in Greeke *ἄμωρ*, or with a double *πῶς ἀμωρ*: in Latine, *Py-rus urbana*.

urbana, or *Cultiua*: of *Tarentinus* in his *Geoponikes* *βίρbaum*: in high Dutch, *Birbaum*, in low Dutch, *Beerboom*: in French, *Porrier*.

The Peare or fruit it selfe is called in Greeke *πύρον*: in Latine, *Pyrum*: in high Dutch, *Birn*: in low Dutch, *Beere*: in Italian, *Pere*: in French, *Poyre*: in Spanish, *Peras*: in English, Peare.

¶ *The Temperature and Vertues.*

Leauing the diuers and sundry surnames of Peares, let vs come to the faculties which the Physitions ought to know; which also varie according to the differences of their tastes: for some Peares are sweet, diuers fat and vnctuous, others soure, and most are harsh, especially the wilde peares, and some consist of diuers mixtures of tastes, and some hauing no taste at all, but as it were a waterish taste.

All Pears are cold, and all haue a binding qualitie and an earthie substance: bur the Choke pears and those that are harsh be more earthie, and the sweet ones lesse: which substance is so full of superfluous moisture in some, as that they cannot be eaten raw. All manner of Peares doe binde and stop the belly, especially the Choke and harsh ones, which are good to be eaten of those that haue the laske and the bloody flux.

The harsh and austere Peares may with good successe be laied vpon hot swellings in the beginning, as may be the leaues of the tree, which do both binde and coole.

Wine made of the iuice of peares called in English, Perry, is soluble, purgeth those that are not accustomed to drinke thereof, especially when it is new; notwithstanding it is as wholesome a drink being taken in small quantitie as wine; it comforteth and warmeth the stomacke, and caueth good digestion.

CHAP. 100. *Of the wilde Peare tree.*

¶ *The Kindes.*

AS there be sundry Kindes of the manured Peares, so are there sundry wilde; wherof to write apart were to small purpose: therefore one description with their seuerall titles shall be sufficient for their distinctions.

Pyrum strangulatorium maius.

The great Choke peare.

¶ *The generall Description.*

THE wilde Peare tree grows likewise great, vpright, full of branches, for the most part Pyramides like, or of the fashion of a steeple, not spread abroad as is the Apple or Crab tree: the timber of the trunke or body of the tree is very firme and sollid, and likewise smooth, a wood very fit to make diuers sorts of instruments of, as also the hafts of sundry tooles to worke withal, and likewise serueth to be cut into many Kindes of moulds, not only such prints as these figures are made of, but also many sorts of pretty toies, for coifes, brest-plates, and such like, vsed among our English gentlewomen: the branches are smooth, couered with a blackish barke, very fragile or easie to break, whereon do grow leaues, in some greater, in other lesser: the floures are like those of the manured Pear-tree, yet some whiter than others: the fruit differ not in shape, yet some greater than others; but in taste they differ among themselves in diuers points, some are sharpe, soure, and of an austere taste; some more pleasant, others harsh and bitter, and some of such a choking taste, that they are not to be eaten of hogs & wild beasts, much lesse of men: they also differ in colour, euery circumstance whereof to distinguish apart would greatly enlarge our volume, and bring to the Reader small profit or commoditie.

Gggggg

¶ *The*

1 *Pyrus strangulatorium maius.*
The great Chokepeare.

2 *Pyrus strangulatorium minus.*
The small Chokepeare.

3 *Pyrus sylvestris.*
The wilde hedgepeare tree.

4 *Pyrus sylvestris minima.*
The wilde Crabpeare tree.

5 *Pyrus pedicularia.*
The Low sie wildepeare.

6 *Pyrus Cornina.*
The Crowpeare tree.

¶ The Place.

The wilde peares grow of themselves without manuring in most places, as woods, or in the borders of fields, and neere to high waies.

¶ The Time.

The time of wilde peares answereth the tame or manured peare, notwithstanding for the most part they are not ripe much before Winter.

¶ The Names.

The wilde peare tree is called in Latine, *Pyrus sylvestris* and *Pyraster*: in Greeke, *πυρρα*: by which name both the fruit and tree are knowne. Peares haue diuers synnames among the antient Writers, and specially in *Pliny*,

in his 15. booke, 15. chapter, none of which are knowne to the later Writers (or not desired): euery citie or euery countrey haue names of themselves, and peares haue also diuers names according to the places.

The Temperature.

All peares are of a cold temperature, and the most part of them of a binding qualitie and an earthie substance.

¶ The Vertues.

The vertues of the wilde peares are referred vnto the garden peares as touching their binding facultie, but are not to be eaten, because their nourishment is little and bad.

CHAP. IOI. Of the Apple tree.

¶ The Kindes.

The Latine name *Malus* reacheth far among the old Writers, and is common to many trees, but we will briefly first intreat of *Mali*, properly called Apple trees, whose stocke or kindred is so infinite, that we haue thought it not amisse, to vse the same order or method with Apples that wee haue done with peares, that is, to giue them seuerall titles in Latine and English, and one generall description for the whole.

¶ The Description.

The Apple tree hath a body or truncke commonly of a meane bignesse, not very high, hauing long armes or branches, and the same disordered: the barke somewhat plaine, and not verie rugged: the leaues bee also broad, more long than round, and finely nicked in the edges. The floures are whitish tending vnto a bluish colour. The fruit or Apples doe differ in greatnesse, forme, colour, and taste; some couered with a red skinne, others yellow or greene, varying infinitely.

nitely according to the soyle and climate, some very great, some little, and many of a middle sort; some are sweet of taste, or something soure; most be of a middle taste between sweet and soure; the which to distinguish I thinke it impossible; notwithstanding I heare of one that intendeth to write a peculiar volume of Apples, and the vse of them; yet when he hath done what hee can doe, hee hath done nothing touching their severall kindes to distinguish them. This that hath beene said shall suffice for our Historie.

† Our Author gaue foure figures more out of *Taberna montanus*, with these titles. 3. *Malum reginale*, the Queening or Queene of Apples. 5. *Platomela sive Pyra aestiva*: The Sommer Peare-maine. 6. *Platarchapia sive Pyra hyemalis*: the Winter Pearemaine. †

1. *Malus Carbonaria*.

The Pome Water tree.

2. *Malus Carbonaria longo fructu*.

The Bakers ditch Apple tree.

¶ The Place.

The tame and grafted Apple trees are planted and set in gardens and orchards made for that purpose: they delight to grow in good and fertile grounds: Kent doth abound with apples of most sorts. But I have seene in the pastures and hedge-rows about the grounds of a worshipful gentleman dwelling two miles from Hereford called Master Roger Bodnorne, so many trees of all sorts, that the seruants drinke for the most part no other drinke but that which is made of Apples; The quantity is such, that by the report of the Gentleman himselfe, the Parson hath for tithe many hog-heads of Syder. The hogs are fed with the fallings of them, which are so many, that they make choise of those Apples they doe eat, who will not taste of any but of the best. An example doubtles to be followed of Gentlemen that haue land and liuing: but enuie saith, the poore wil break down our hedges, and we shall haue the least part of the fruit) but forward in the name of God, graffe, set, plant and nourish vp trees in euery corner of your grounds, the labour is small, the cost is nothing, the commoditie is great, your selues shall haue plenty, the poore shall haue somewhat in time of want to relieue their necessitie, and God shall reward your good mindes and diligence.

¶ The Time.

They bloom about the end of Aprill, or in the beginning of May. The forward apples be ripe about the Calends of Iuly, others in September.

Gggggg 2

¶ The

¶ The Names.

The Apple tree is called in Greeke *μῆλον* in Latine, *Malus* and *Pomus* : in high Dutch, *Opffelbaum* : in low Dutch, *Appelboom* : in French, *Pommier* : in English, Apple-tree.

The Grecians name the fruit *μῆλον* : the Latines, *Malum* or *Pomum* : in high Dutch, *Opffel* : in low Dutch, *Appel* : in French and Spanish, *Manzana* : in English, Apple.

¶ The Temperature.

All Apples be of temperature cold and moist, and haue ioined with them a certaine excrementall or superfluous moisture: but as they be not all of like coldnesse, so neither haue they like quantitie of superfluous moisture. They are soonest rotten that haue greatest store of moisture, and they may be longer kept in which there is lesse store: for the abundance of excrementall moisture is the cause why they rot.

Sweet Apples are not so cold and moist, which being roasted or boyled, or otherwise kept, retaine or keepe the soundnesse of their pulpe.

They yeeld more nourishment, and not so moist a nourishment as do the other Apples, and doe not so easily passe through the belly.

Soure Apples are colder and also moister: the substance or pulpe of these when they be boyled doth run abroad, and retaineth not his soundnesse: they yeeld a lesser nourishment, and the same raw and cold.

They do easily and speedily passe through the belly, and therefore they do mollifie the belly, especially being taken before meat.

Harsh or Austere Apples being vnripe, are cold; they ingender grosse bloud, and great store of winde, and often bring the Collicke.

Those Apples which be of a middle taste containe in them oftentimes two or three sorts of tastes, and yet do they retaine the faculties of the other.

¶ The Vertues.

A Roasted Apples are alwaies better than the raw, the harm whereof is both mended by the fire, and may also be corrected by adding vnto them seeds or spices.

B Apples be good for an hot stomacke: those that are austere or somewhat harsh doe strengthen a weake and feeble stomacke proceeding of heat.

C Apples are also good for all inflammations or hot swellings, but especially for such as are in their beginning, if the same be outwardly applied.

D The iuice of Apples which be sweet and of a middle taste, is mixed in compositions of diuers medicines, and also for the tempering of melancholy humours, and likewise to mend the qualities of medicines that are dry: as are *Serapium ex pomis Regis Saporis*, *Confectio Alkermes*, and such like compositions.

E There is likewise made an ointment with the pulpe of Apples and Swines grease and Rose water, which is vsed to beautifie the face, and to take away the roughnesse of the skin, which is called in shops *Pomatum*: of the Apples whereof it is made.

F The pulpe of the roasted apples, in number foure or fve, according to the greatnesse of the Apples, especially of the Pome-water, mixed in a wine quart of faire water, laboured together vntill it come to be as apples and Ale, which wee call Lambes Wooll, and the whole quart drunke last at night, within the space of an houre, doth in one night cure those that pisse by droppes with great anguish and dolour; the strangurie, and all other diseases proceeding of the difficultie of making water, but in twise taking it, it neuer faileth in any: oftentimes there happeneth with the foresaid diseases the Gonorrhæa, or running of the Raines, which it likewise healeth in those persons, but not generally in all; which my selfe haue often proued, and gained thereby both crownes and credit.

G The leaues of the tree do coole and binde, and be also counted good for inflammations, in the beginning.

H Apples cut in pieces, and distilled with a quantitie of Camphere and butter-milke, take away the markes and scarres gotten by the small pockes, being washed therewith when they grow vnto their state and ripenesse: provided that you giue vnto the patient a little milk and Saffron, or milk and mithridate to drinke, to expell to the extreme parts that venome which may lie hid, and as yet not seene.

CHAP. 102 Of the Wilding or Crab tree.

¶ The Kindes.

Like as there be diuers manured Apples, so are there sundry wilde Apples, or Crabs, whereof to write apart were to small purpose, and therefore one description shall suffice for the rest.

Malus sylvestris.

The wilding or Crab tree.

¶ The generall Description.

There be diuers wilde Apple trees not husbanded, that is to say, not grafted; the fruit whereof is harsh and binding: for by grafting both Apples and Peares become more milde and pleasant. The crab or wilding tree growes oftentimes to a reasonable greatnesse, equall with the Apple tree: the wood is hard, firme, and sollid; the barke rough; the branches or boughes many, the floures and fruit like those of the apple tree, some red, others white, some greater, others lesser: the difference is known to all, therefore it shall suffice what hath been said for their seuerall distinctions: we haue in our London gardens a dwarfe kinde of sweet Apple, called *Chamamalus*, the dwarfe apple tree, or Paradise apple, which beareth apples very timely without grafting.

† Our Author here also (out of *Taberna-montanus*) gaue foure figures, whereof I onely retaine the best, with their seuerall titles. 1 *Malus sylvestris rubens*. The great wilding or red Crab tree: 2 *Malus sylvestris alba*. The white wilding or Crab tree: 3 *Malus sylvestris minor*. The smaller Crab tree: 4 *Malus duracina sylvestris*. The choking leane Crab-tree. †

¶ The Place.

The Crab tree groweth wilde in woods and hedge rowes almost euery where.

¶ The Time.

The time answereth those of the garden.

¶ The Names.

Their titles doth set forth their names in Latine and English.

¶ The Temperature.

Of the temperature of wilde apples hath beene sufficiently spoken in the former Chapter.

¶ The Vertues.

The iuice of wilde Apples or crabs taketh away the heate of burnings, scaldings, and all inflammations: and being laid on in short time after it is scalded, it keepeth it from blistering.

The iuice of crabs or Veriuiice is astringent or binding, and hath withall an absterfiue or clensing qualitie, beeing mixed with hard yeast of Ale or Beere, and applied in manner of a cold ointment, that is, spread vpon a cloth first wet in the Veriuiice and wrung out, and then laid to, taketh away the heat of Saint Anthonies fire, all inflammations whatsoeuer, healeth scab'd legs, burnings and scaldings wherefoeuer it be.

Gggggg 3

CHAP. 103

CHAP. 103. *Of the Citron, Limon, Orange, and Assyrian Apple trees.*

¶ *The Kindes.*

THe Citron tree is of kindred with the Limon tree, the Orange is of the same house or stocke, and the Assyrian Apple tree claimeth a place as neereft in kinred and neighbourhood: wherefore I intend to comprehend them all in this one chapter.

¶ *The Description.*

1 **T**He Citron tree is not very great, having many boughes or branches, tough and pliable, couered with a greene barke: whereon do grow greene leaues, long, somewhat broad, very smooth, and sweet of smell like those of the Bay tree: among which come forth here and there certaine prickles, set far in sunder: from the bosome whereof come forth smal floures, consisting of fine little leaues, of a white colour tending to purple, with certaine threds like haire growing in the middle: the fruit is long, greater many times than the Cucumber, often lesser, and not much

1 *Malus medica.*

The Pome Citron tree.

2 *Malus Limonia.*

The Limon tree.

greater than the Limon: the barke or rinde is of a light golden colour, set with diuers knobs or bumps, and of a very pleasant smell: the pulpe or substance next vnto it is thick, white, hard, having a kinde of aromaticall or spicie smell, almost without any taste at all: the softer pulpe within that is not so firme or solid, but more spungie, and full of a sower iuice, in which the seed lieth hid, greater and thicker than a graine of Barley.

2 The Limon tree is like vnto the Pome Citron tree in growth, thorny branches, and leaues of a pleasant

a pleasant sweet smell, like those of the Bay-tree: the floures hereof are whiter than those of the Citron tree, and of a most sweet smell: the fruit is long and thicke, lesser than the Pome Citron: the rinde is yellow, somewhat bitter in taste, and sweet of smell: the pulpe is white, more in quantitie than that of the Citron, respecting the bignes; in the middle part whereof is contained more soft spungie pulpe, and fuller of soure juice: the seeds are like those of the Pome Citron.

3 The Orange tree groweth vp to the height of a small Peare tree, hauing many thornie boughes or branches, like those of the Citron tree: the leaues are also like those of the Bay-tree, ‡ but that they differ in this, that at the lower end next the stalke there is a lesser leafe made almost after the vulgar figure of an heart, whereon the bigger leafe doth stand, or is fastned: ‡ & they are of a sweet smell: the floures are white, of a most pleasant sweet smell also: the fruit is round like a ball, euery circumstance belonging to the forme is very well knowne to all; the taste is soure, sometimes sweet, and often of a taste betweene both: the seeds are like those of the Limon.

3 *Malus arantia.*
The Orange tree.

4 *Malus Assyria.*
The Assyrian Apple tree.

4 The Assyrian Apple tree is like vnto the Orange tree: the branches are like: the leaues are greater: the floures are like those of the Citron tree: the fruit is round, three times as big as the Orange: the barke or peeling is thicke, rough, and of a pale yellow colout, wherein appeare often as it were small clifts or crackes: the pulpe or inner substance is full of iuice, in taste sharpe, as that of the Limon, but not so pleasant: the seeds are like those of the Citron.

¶ The Place.

The Citron, Limon, and Orange trees do grow especially on the sea coasts of Italy, and on the Islands of the Adriaticke Turrhene, and also Ægæan Seas, & likewise on the maine land, neer vnto meeres and great lakes: there is also great store of them in Spaine, but in places especially ioining to the sea, or not farre off: they are also found in certaine prouinces of France which lie vpon the midland sea. They were first brought out of Media, as not onely *Plinie* writeth, but also the Poet *Virgil* affirmeth in the second book of his *Georgickes*, writing of the Citron tree after this maner:

*Media fert tristes succos, tardumque saporem
Felicis mali, quo non presentius vllum,
Pocula si quando saua infecere nouerca,*

discueruntque

*Miscueruntque herbas, & non innexia verba,
Auxilium venit, ac membris agit atra venena.
Ipsa ingens arbor, faciesque simillima Lauro;
Et, si non alium late iactaret odorem,
Laurus erit; folia haud ullis labentia ventis;
Flos apprime tenax. Animas & olentia Medi
Ora fouent illo, & senibus medicantur anhelis.*

The Countrey Media beareth iuyces sad,
And dulling tastes of happy Citron fruit,
Than which, no helpe more present can be had,
If any time stepmothers worfe than brute
haue poyson'd pots, and mingled berbs of suite
With hurtfull charmes: this Citron fruit doth chase
Blacke venome from the body in euery place.
The tree it selfe in growth is large and big,
And very like in shew to th' Laurell tree;
And would be thought a Laurell, leafe and twig,
But that the smell it casts doth disagree:
The floure it holds as fast as floure may be:
Therewith the Medes a remedie do finde
For stinking breaths and mouthes a cure most kinde,
And helpe old men which hardly fetch their winde.

¶ The Time.

These trees be alwaies greene, and do, as *Pliny* saith, beare fruit at all times of the yere, some falling off, others waxing ripe, and others newly comming forth.

¶ The Names.

The first is called in Greeke, *Μαλαμειδων*: in Latine, *Malus Medica*, and *Malus Citria*: in English, Citron tree, and Pomecitron tree.

The fruit is named in Greeke, *Μαλον μεδικον*: in Latine, *Malum Medicum*, and *Malum Citrium*: and *Citromalum*. *Emilianus* in *Athenaus* sheweth, that *Iuba* King of Mauritania hath made mention of the Citron, who saith that this Apple is named among them, *Malum Hespericum*: *Galen* denieth it to be called any longer *Malum Medicum*, but *Citrium*; and saith, that they who call it *Medicum* do it to the end that no man should vnderstand what they say: the Apothecaries call these apples *Citrones*: in high-Dutch, *Citrin opffel*, *Citrinaten*: in low-Dutch, *Citroenen*: in Italian, *Citroni*, and *Cedri*: in Spanish, *Cidras*: in French, *Citrons*: in English, Citron Apple, and Citron.

The second kinde of Citron is called in Latine, *Limonium Malum*; in shops, *Limones*: in French, *Limons*: in low-Dutch, *Limonen*: in English, Limon, and Lemon.

The third is named in Latine, *Malum anarantium* or *Anerantium*: and of some *Aurantium*: of others, *Aurengium*, of the yellow colour of gold: some would haue them called *Arantia*, of *Arantium*, a towne in Achaia or Arania, of a countrey bearing that name in Persia: it is termed in Italian *Arancio*: in high-Dutch, *Pomeranken*: in low-Dutch, *Araengie Appelen*: in French, *Pommes d'Orenge*: in Spanish, *Naransas*: in English, Orenge.

The fourth is named of diuers, *Pomum Assyrium*, or the Citron of Assyria, and may be Englished Adams Apple, after the Italian name; and among the vulgar sort of Italians, *Lomie*, of whom it is also called *Pomum Adami*, or Adams Apple; and, that came by the opinion of the common rude people, who thinke it to be the same Apple which *Adam* did eate of in Paradise, when he transgressed Gods commandment; whereupon also the prints of the biting appeare therein, as they say: but others say that this is not the Apple, but that which the Arabians do call *Musa* or *Mofa*, whereof *Auicen*, cap. 395. maketh mention: for diuers of the Iewes take this for that through which by eating, *Adam* offended, as *Andrew Thevet* sheweth.

¶ The Temperature and Vertues.

- A All these fruits consist of vnlike parts, and much differing in facultie.
- B The rindes are sweet of smell, bitter, hot, and dry.
- C The white pulpe is cold, and containeth in it a grosse iuice, especially the Citron.
- D The inner substance or pap is soure, as of the Citrons and Limons, cold and dry, with thinnesse of parts.
- E The seed because it is bitter is hot and dry.
- F The rinde of the Pomecitron is good against all poysons, for which cause it is put into treacles and such like confections.

It is

It is good to be eaten against a stinking breath, for it maketh the breath sweet; and being so taken it comforteth the cold stomacke exceedingly. G

The white, sound, and hard pulpe is now and then eaten, but very hardly concocted, and ingendred a grosse, cold, and phlegmaticke iuyce; but being condite with sugar, it is both pleasant in taste, and easie to be digested, more nourishing, and lesse apt to obstruction and binding or stopping. H

Galen reporteth, that the inner iuice of the Pomecitron was not wont to be eaten, but it is now vsed for sauce; and being often vsed, it represseth choler which is in the stomacke, and procures appetite: it is excellent good also to be giuen in vehement and burning feuers, and against all pestilent and venomous or infectious diseases: it comforteth the heart, cooleth the inward parts, cutteth, diuideth, and maketh thin, grosse, tough, and slimy humors. I

Of this foresaid sharpe iuice there is a syrrup ptepared, which is called in shops, *Syrupus de Acetositate Citri*, very good against the foresaid infirmities. K

Such a syrrup is also prepared of the sharpe iuice of Limons, of the same quality and operation, so that in stead of the one, the other will serue very well. L

A dozen of Orenge cut in slices and put into a gallon of water, adding thereto an ounce of Mercurie sublimate, and boiled to the consumption of the halfe, cureth the itch and manginess of the body. M

Men in old time (as *Theophrastus* writeth in his fourth booke) did not eate Citrons, but were contented with the smell, and to lay them amongst cloathes, to preserue them from Moths. N

As often as need required they vsed them against deadly poysons; for which thing they were especially commended euen by *Virgils* verses, which we haue before alledged. O

Athenaus, lib. 3. hath extant a story of some that for certaine notorious offences were condemned to be destroyed of Serpents, who were preserued and kept in health and safetie by the eating of Citrons. P

The distilled water of the whole Limons, rinde and all, drawne out by a glasse Still, takes away tetters and blemishes of the skin, and maketh the face faire and smooth. Q

The same being drunke prouoketh vrine, dissolueth the stone, breaketh and expelleth it. R

The rinde of Orenge is much like in facultie to that of the Citrons and Limons, yet it is so much the more hot as it is more biting and bitter. S

The inner substance or soure pap which is full of iuice is of like facultie, or not much inferiour to the facultie of the pap of Citrons or Limons; but the sweet pap doth not much coole or drie, but doth temperatly heate and moisten, being pleasant to the taste: it also nourisheth more than doth the soure pap, but the same nourishment is thin and little; and that which is of a middle tast, hauing the smacke of wine, is after a middle sort more cold than sweet, and lesser cold than soure: the sweet and odoriferous floures of orenge be vsed of the perfumers in their sweet smelling ointments. T

Two ounces of the iuice of Limons, mixed with the like quantitie of the spirit of wine, or the best *Aqua vite* (but the spirit of wine rectified is much better) and drunk at the first approach of the fit of an ague, taketh away the shaking presently: the medicine seldome faileth at the second time of the taking thereof perfectly to cure the same; but neuer at the third time, provided that the Patient be couered warme in a bed, and caused to sweat. V

There is also distilled out of them in a glasse still, a water of a maruellous sweet smell, which being inwardly taken in the weight of an ounce and a halfe, moueth sweat, and bealeth the ague. X

The seed of all these doth kill wormes in the belly, and driueth them forth: it doth also mightily resist poyson, and is good for the stinging of scorpions, if it be inwardly taken. Y

Those which be called Adams Apples are thought to be like in faculties to the soure iuyce, especially of the Limons, but yet they be not so effectuell. Z

CHAP. 104. Of the Cornell tree.

¶ The Description.

THe tame Cornell tree groweth sometime of the height and bignesse of a smal tree, with a great number of springs: it is couered with a rugged barke: the wood or timber is very hard and dry, without any great quantity of sap therein: the leaues are like vnto the Dog berry leaues, crumpled rugged, and of an ouerworne colour: the floures grow in small bunches before any leaues do appeare, of colour yellow, and of no great value (they are so small) in shew like the floures of the

Oliue

Cornus mas.
The male Cornel tree.

Olive tree: which being vaded, there come small long berries, which at the first be greene, and red when they be ripe; of an austere and harsh taste, with a certaine sourenesse: within this berry is a small stone, exceeding hard, white within like that of the Olive, wherunto it is like both in the fashion and oftentimes in the bignesse of the fruit.

¶ *The Place.*

This groweth in most places of Germanie without manuring: it growes not wild in England. But yet there be sundry trees of them growing in the gardens of such as loue rare and dainty plants, whereof I haue a tree or two in my garden.

¶ *The Time.*

The tame Cornell tree floureth sometime in February, & commonly in March, and afterwards the leaues come forth as an vntimely birth: the berries or fruit are ripe in August.

¶ *The Names.*

The Grecians call it *κρουν*: the Latines, *Cornus*: in high-Dutch, *Cornelbaum*: in low-Dutch, *Cognoele boom*: the Italians, *Corniolo*: in French, *Cornillier*: in Spanish, *Cornizolos*: in English, the Cornell tree, and the Cornelia tree; of some, long Cherie tree.

The fruit is named in Latine, *Cornum*: in high-Dutch, *Cornell*: in low-Dutch, *Cognoele*: in Italian, *Cornole*: in English, *Cornel berries* and *Cornelian Cherries*.

This is *Cornus mas Theophrasti*, or *Theophrastus* his male Cornell tree, for he setteth downe two sorts of the Cornell trees, the male and the female: he maketh the wood of the male to be found, as in this Cornell tree; which we both for this cause and for others also haue made to be the male. The female is that which is commonly called *Virga sanguinea*, or Dogs berry tree, and *Cornus syluestris*, or the wilde Cornell tree, of which we will treat in the next Chapter following.

¶ *The Temperature and Vertues.*

- A The fruit of the Cornell tree hath a very harsh or choking taste: it cooleth, drieth, and bindeth, yet may it also be eaten, as it is oftentimes.
- B It is a remedie against the laske and bloody flix, it is hurtfull to a cold stomacke, and increaseth the rawnesse thereof: the leaues and tender crops of the tree are likewise of an harsh and choking taste, and do mightily dry.
- C They heale greene wounds that are great and deepe, especially in hard bodies, but they are not so good for small wounds and tender bodies, as *Galen* writeth.

CHAP. IO5.

Of the female Cornell or Dog-Berry tree.

¶ *The Description.*

That which the Italians call *Virga sanguinea*, or the bloody Rod, is like to the Cornel tree, yet it groweth not into a tree, but remaineth a shrub: the yong branches thereof are iointed, and be of an obscure red purple: they haue within a white spongie pith like that of Elder, but the old stalks are hard and stiffe, the substance of the which is also white, and answerable to those of the Cornell tree: the leaues are also like, the middle rib whereof as also the brittle foot-stalkes are somewhat reddish: at the top whereof stand white floures in spoky rundles, which turne into berries,

Cornus fœmina.
The Dog-berry tree.

greene at the first, and of a shining black colour when they be ripe, in taste vnpleasant, and not cared for of the birds.

¶ *The Place.*

This shrub groweth in hedges and bushes in euery countrey of England.

¶ *The Time.*

The floures come forth in the Spring in the moneth of Aprill: the berries are ripe in Autumne.

¶ *The Names.*

The Italians do commonly call it *Sanguino*, and *Sanguinello*: *Petrus Crescentius* termes it *Sanguinus*; and *Matthiolus*, *Virga sanguinea*: *Pliny*, lib. 24. cap. 10. hath written a little of *Virga Sanguinea*: Neither is *Virga Sanguinea*, saith hee, counted more happy, the inner barke whereof doth breake open the scarres which they before haue healed. It is an hard thing, or peradventure a rash part, to affirme by these few words, that *Pliny* his *Virga Sanguinea* is the same that the Italian *Sanguino* is. This is called in high-Dutch, *Hartriegel*: in low-Dutch, *wilde Cor-noelle*, that is to say, *Cornus syluestris*, or wilde Cornell tree: and in French, *Cornellier sauvage*: in English, Hounds tree, Hounds berry, Dogs berry tree, Pricke-Timber: in the North countrey they call it Gaten tree, or Gater tree; the berries whereof seem to be those which *Chaucer* calleth Gater berries: *Valerius Cordus* nameth it *laudaparia*, that is to say, *Falsa* or *Spuria Cornus*,

false or bastard Cornell tree: this seemeth also to be *Theophrastus* his *Androparia*, or *Cornus fœmina*, female Cornell tree. This hath little branches hauing pith within, neither be they hard nor sound, like those of the male: the fruit is *Asperum*, that is, not fit to be eaten, and a late fruit which is not ripe till after the Autumne Equinoctiall; and such is the wilde Cornell tree or Gater tree, the yong and tender branches whereof be red, and haue (as wee haue written) a pith within: the fruit or berries be vnpleasant, and require a long time before they can be ripe.

¶ *The Temperature.*

The berries hereof are of vnlike parts; for they haue some hot, bitter, and clenring, and very many cold, dry, harsh, and binding, yet they haue no vse in medicine.

¶ *The Vertues.*

Matthiolus writeth, that out of the berries first boiled, and afterwards pressed, there issueth an oyle which the Anagnian countrey people do vse in lamps: but it is not certaine, nor very like, that the barke of this wilde Cornell tree hath that operation which *Pliny* reporteth of *Virga Sanguinea*; for he saith, as we haue already set downe, that the inner barke thereof doth break and lay open the scars which they before haue healed.

CHAP. 106. Of Spindle tree or Pricke-wood.

¶ *The Description.*

Prickewood is no high shrub, of the bignesse of the Pomegranat tree: it spreadeth farre with his branches: the old stalks haue their barke somewhat white; the new and those that be lately growne be greene, and foure square: the substance of the wood is hard, and mixed with a light yellow: the leaues be long, broad, slender, and soft: the floures be white, many standing vpon one foot-stalke, like almost to a spoked rundle: the fruit is foure square, red, and containing foure white seeds, euery one whereof is couered with a yellow coat, which being taken off giueth a yellow die.

1 This

1 *Euonymus Theophrasti.*
English Prick-timber tree.

2 *Euonymus latifolius.*
Broad leaved Spindle tree.

3 *Euonymus Pannonicus.*
Hungarie Spindletree.

2 This other sort of *Euonymus* groweth to the forme of an hedge tree, of a meane bignesse; the trunke or body whereof is of the thicknesse of a mans leg, covered with a rough or scabbed barke of an ouerworn russet colour. The branches thereof are many, slender, and very euen, covered with a greene barke whilest they be yet young and tender; they are also very brittle, with some pith in the middle like that of the Elder. The leaves are few in number, full of nerues or sinues dispersed like those of Plantaine, in shape like those of the Pomecitron tree, of a lothsome smell and bitter taste: amongst which come forth slender footstalks very long and naked, whereon do grow small floures consisting of foure small leaues like those of the Cherrie tree, but lesser, of a white colour tending to a blush, with some yellownesse in the middle: after commeth the fruit, which is larger than the former, and as it were winged, parted commonly into foure, yet somtimes into five parts; and opening when it is ripe, it sheweth the white graines filled with a yellow pulpe. The root is tough and wooddy, dispersing it selfe farre abroad vnder the vpper crust of the earth.

3 The same Author setteth forth another sort which he found in the mountaines of Moravia and Hungary, hauing a trunke or stocke of the height of three or foure cubits, couered with a bark Greene at the first, afterward sprinkled ouer with many blacke spots: the boughes are diuided toward the top into diuers small branches, very brittle and easie to breake, whereon are placed leaues by couples also, one opposite to another, somewhat snipt about the edges, in shape like those of the great Myrtle, of an astringent taste at the beginning, after somewhat hot and bitter: amongst which come forth small floures standing vpon long naked foot-stalkes, consisting of foure little leaues of a bright shining purple colour, hauing in the middle some few spots of yellow: after commeth the fruit, foure cornered, not vnlike to the common kinde, of a spongiouse substance, and a gold yellow colour: wherein is contained not red berries like the other, but blacke, very like to those of *Fraxinella*, of a shining blacke colour like vnto burnished horne; which are deuoured of birds when they be ripe, and the rather because they fall of themselves out of their huskes, otherwise the bitterneffe of the husks would take away the delight.

¶ The Place.

The first commeth vp in vntoiled places, and among shrubs, vpon rough bankes and heapes of earth: it serueth also oftentimes for hedges in fields, growing amongst Brambles and such other Thornes.

The other sorts *Carolus Clusius* found in a wood of Hungarie beyond the riuer Drauus, and also vpon the mountaines of Moravia and other places adiacent.

¶ The Time.

The floures appeare in Aprill: the fruit is ripe in the end of August, or in the moneth of September.

¶ The Names.

Theophrastus calleth this shrub *Ευρυμύρος*, and describeth it in his third booke of the Historie of Plants: diuers also falsly reade it *Anonymos*: *Petrus Crescentius* calleth it *Fusanum*, because spindles be made of the wood hereof, and for that cause it is called in high-Dutch, *Spindelbaum*, yet most of them *Hanhodlin*: in low-Dutch, *Papenhout*: in Italian, *Fusano*: in French, *Fusin*, and *Bonnet de prestre*: in English, Spindle tree, Prick-wood, and Prick-timber.

¶ The Temperature and Vertues.

This shrub is hurtfull to all things, as *Theophrastus* writeth, and namely to Goats: hee saith the fruit hereof killeth; so doth the leaues and fruit destroy Goats especially, vnlesse they scoure as well vpwards as downwards: if three or foure of these fruits be giuen to a man they purge both by vomit and stoole.

CHAP. 107. Of the blacke Aller tree.

¶ The Description.

THE blacke Aller tree bringeth forth from the root straight stalkes diuided into diuers branches: the outward barke whereof is blacke, and that next to the wood yellow, and giueth a colour as yellow as Saffron: the substance of the wood is white and brittle, with a reddish pith in the midst: the leaues be like those of the Alder tree, or of the Cherry tree, yet blacker, and a little rounder: the floures be somewhat white: the fruit are round berries, in which appeare a certaine rift or chinke, as though two were ioined together, at the first Greene, afterwards red, and last of all blacke: in this there be two little stones: the root runneth along in the earth.

¶ The Place.

The Aller tree groweth in moist woods and copses: I found great plenty of it in a wood a mile from Islington, in the way from thence toward a small village called Harnsey, lying vpon the right hand of the way; and in the woods at Hampsted neere London, and in most woods in the parts about London.

¶ The Time.

The leaues and floures appeare in the beginning of the Spring; and the berries in Autumne.

¶ The Names.

This shrub is called *Alnus nigra*, or blacke Alder: and by others, *Frangula*: *Petrus Crescentius* nameth it *Auornus*: in low-Dutch, *Sparkenhout*, and oftentimes *Bijlhout*, because boies make for themselves arrowes hereof: in high-Dutch, *Faulbaum*: it is called in English, blacke Aller tree; and of diuers Butchers pricke tree.

H h h h h

¶ The

Alnus nigra, siue Frangula.
The blacke Aller tree.

¶ *The Temperature.*

The inner barke of the blacke Aller tree is of a purging and dry qualitie.

¶ *The Vertues.*

The inner barke hereof is vsed of diuers country men, who drink the infusion thereof when they would be purged: it purgeth thicke phlegmaticke humors, and also cholericke, and not only by the stooles, but many times also by vomit, not without great trouble and paine to the stomacke: it is therefore a medicine more fit for clownes than for ciuill people, and rather for those that feed grossely, than for dainty people.

There be others who affirme that the dried barke is more gentle, and causeth lesser paine: for the Greene bark (say they) which is not yet dried containeth in it a certaine superfluous moisture which causeth gripings and vomitings, and troubles the stomacke.

The same barke being boiled in wine or vineger makes a lotion for the tooth-ache; and is commended against scabs and filthinesse of the skin.

The leaues are reported to be good fodder for cattell, especially for kine, and to cause them to yeeld good store of milke.

D der for cattell, especially for kine, and to cause them to yeeld good store of milke.

CHAP. 108. Of the Seruice tree.

¶ *The Description.*

1 **T**He Seruice tree groweth to the height and bignesse of a great tree, charged with many great armes or boughes which are set with sundry small branches, garnished with many great leaues somewhat long like those of the Ash: the floures are white, and stand in clusters, which turne into small browne berries somewhat long, which are not good to be eaten vntill they haue lien a while, and vntill they be soft like the Medlar, whereto it is like in taste and operation.

2 The common Seruice tree groweth likewise to the height of a great tree, with a straight body of a brownish colour, full of branches, set with large displayed leaues like the Maple or the White-Thorne, sauing that they are broader and longer: the floures are white, and grow in tufts; which being fallen, there come in place thereof small round berries, browne vpon one side, and reddish toward the Sun, of an vnpleasant taste in respect of the former: in which are contained little blackish kernels.

¶ *The Place.*

These trees are found in woods and groues in most places of England: there be many smal trees thereof in a little wood a mile beyond Islington from London: in Kent it groweth in great abundance, especially about Southfleet and Grauesend. ‡ The later of these I haue seene growing wilde in diuers places, but not the former in any place as yet. ‡

¶ *The Time.*

They floure in March, and their fruit is ripe in September.

¶ *The Names.*

The first is called in Greeke, *σύν*, and *οὖρον*: in Latine, *Sorbus*: in high-Dutch, *Sperwerbaum*: in low-Dutch, *Sorbedboom*: in French, *Cormier*: in English, Seruice tree, and of some after the Latines, Sorbe tree.

The

1 *Sorbus*.
The Seruice tree.

2 *Sorbus terminalis*.
Common Seruice tree.

The common Seruice tree is named of *Pliny*, *Sorbus terminalis*: in high-Dutch, *Aressel*, *Eichholz*, and *Wilder Sperberbaum*: in English, Common Seruice tree.

The berries or fruit of the Seruice tree is called 'osir, or 'osor: in Latine, *Sorbum*: in high Dutch, *Speierling*, *Sporopffel*: in low-Dutch, *Sorben*: in Italian, *Sorbe*, and *Sorbole*: in French, *Corme*: in Spanish, *Seruas*, and *Sorbas*: in English, Seruice; of some, Sorbe Apple.

¶ The Temperature and Vertues.

Seruice berries are cold and binding, and much more when they be hard, than when they are milde and soft: in some places they are quickly soft, either hanged in a place which is not altogether cold, or laid in hay or chaffe: those Seruices are eaten when the belly is too soluble, for they stay the same; and if they yeeld any nourishment at all, the same is very little, grosse, and cold; and therefore it is not expedient to eate of these or other-like fruits, nor to vse them otherwise than in medicines.

These do stay all manner of fluxes of the belly, and likewise the bloody fluxe; as also vomiting: they stanch bleeding if they be cut and dried in the sunne before they be ripe, and so reserued for vse: these we may vse diuers waies according to the manner of the greife and grieued part.

CHAP. 109. Of the Ash tree.

¶ The Description.

1 THE Ash also is an high and tall tree: it riseth vp with a straight body, now and then of no small bignesse, now and then of a middle size, and is couered with a smooth bark: the wood is white, smooth, hard, and somewhat rough grained: the tender branches hereof and such as be new growne vp are set with certaine ioints, and haue within a white and spongie pith: but the old boughes are woody throughout, and be without either ioints or much pith: the leaues are long and winged, consisting of many standing by couples, one right against another vpon one rib or stalke, the vpermōst of all excepted, which standeth alone; of which euery particular one is long, broad, like to a Bay leafe, but softer, and of a lighter greene, without any sweet

H h h h h h 2

smell,

smell, and nicked round about the edges : out of the yonger sort of the boughes, hard to the setting on of the leaues, grow forth hanging together many long narrow and flat cods, as it were like almost to diuers birds tongues, where the seed is perfected, which is of a bitter taste: the roots be many, and grow deepe in the ground.

Fraxinus.
The Ash tree.

¶ *The Place.*

The Ash doth better prosper in moist places, as about the borders of Medowes and Riuer sides, than in dry grounds.

¶ *The Time.*

The leaues and keyes come forth in Aprill and May, yet is not the seed ripe before the fall of the leafe.

¶ *The Names.*

This tree is called in Greeke, *Μαλία*, and of diuers, *μαλία* : in Latine, *Fraxinus* : in high-Dutch, *Eschernaum*, *Eschernaoltz*, and *Stepneschern* : in low-Dutch, *Eschen*, and *Eschenboom* : in Italian, *Fraſſino* : in French, *Fresne* : in Spanish, *Fresno*, *Fraxino*, and *Freixo* : in English, Ash tree.

The fruit like unto cods is called of the Apothecaries, *Lingua Auis*, and *Lingua Passerina* : it may be named in Greeke, *ὀρνιθόγλωσσον* : yet some would haue it called *Orneoglossum* : others make *Ornus* or the wilde Ash to be called *Orneoglossum* : it is termed in English, Ash keyes, and of some, Kite-keyes.

¶ *The Temperature and Vertues.*

The leaues and bark of the Ash tree are dry and moderatly hot : the seed is hot and dry in the second degree.

The iuice of the leaues or the leaues themselves being applied, or taken with wine, cure the bitings of vipers, as *Dioscorides* saith.

C The leaues of this tree are of so great vertue against serpents, as that they dare not so much as touch the morning and euening shadowes of the tree, but shun them afar off, as *Pliny* reports, *li. 16. cap. 13*. He also affirmeth, that the serpent being penned in with boughes layd round about, will sooner run into the fire, if any be there, than come neere the boughes of the Ash : and that the Ash doth floure before the Serpents appeare, and doth not cast his leaues before they be gon againe.

D We write (saith he) vpon experience, that if the serpent be set within the circle of a fire and the boughes, the serpent will sooner run into the fire than into the boughes. It is a wonderfull courtesie in nature, that the Ash should floure before these serpents appeare, and not cast his leaues before they be gon againe.

E Both of them, that is to say the leaues and the barke, are reported to stop the belly : and being boiled with vineger and water, do stay vomiting, if they be laid vpon the stomacke.

F The leaues and barke of the Ash tree boiled in wine and drunk, do open the stoppings of the liuer and spleene, and do greatly comfort them.

G Three or foure leaues of the Ash tree taken in wine each morning from time to time, doe make those leane that are fat, and keepeth them from feeding which do begin to wax fat.

H The seed or Kite-keyes of the Ash tree prouoke vrine, increase naturall seed, and stirre vp bodily lust, especially being poudred with nutmegs and drunke.

I The wood is profitable for many things, being exalted by *Homers* commendations, and *Achilles* speare, as *Pliny* writeth. The shauings or small pieces thereof being drunke are said to be pernicious and deadly, as *Dioscorides* affirmeth.

K The Lee which is made with the Ashes of the barke cureth the white scurfe, and such other like roughnesse of the skin, as *Pliny* testifieth.

CHAP.

CHAP. IIO.

Of the wilde Ash, otherwise called Quicke-Beame or Quicken tree.

Sorbus sylvestris, sine Fraxinus Bubula.

The Quicken tree, wilde Ash, or wilde Seruice tree.

¶ The Description.

THe wilde Ash or Quicken Tree *Pena* setteth forth for the wilde Seruice: this tree groweth seldome or neuer to the stature and height of the Ash tree, notwithstanding it growes to the bignes of a large tree: the leaues be great and long, and scarcely be discerned from the leaues of the Seruice tree: the floures bee white, and sweet of smell, and grow in tufts, which do turne into round berries, greene at the first, but when they be ripe of a deepe red colour, and of an vnpleasant taste: the branches are as full of iuice as the Osier, which is the cause that boyes doe make Pipes of the barke thereof as they doe of Willows.

¶ The Place.

The wilde Ash or Quicken tree groweth on high mountaines, and in thicke high woods in most places of England, especially about Namptwich in Cheshire, in the Weilds of Kent, in Suffex and diuers other places.

¶ The Time.

The wild Ash floures in May, and the berries are ripe in September.

¶ The Names.

The Latines call this tree *Ornus*, and oftentimes *Sylvestris Fraxinus*, or wilde Ash: and it is also *Fraxini species*, or a kinde of Ash; for the Grecians (as not only *Pliny* writeth, but also *Theophrastus*) hath made two kindes of Ash, the one high and tall, the other lower: the high and tall one is *Fraxinis vulgaris*, or the common Ash; and the lower *Ornus*, which also is named *ορεινη μελος*, or *Montana Fraxinus*, mountaine Ash; as the other, *πεδινη*, or field Ash; which is also named *βουμλια*, or as *Gaza* translateth it, *Bubula Fraxinus*, but more truly *Magna Fraxinus*, or great Ash; for the syllable *βο* is a signe of bignesse: this *Ornus* or great Ash is named in high-Dutch, *Walbaum*: in low-Dutch, *Hauerefschen*, or *Querefschen*, of diuers, *Qualster*: in French, *Fresne sauvage*: in English, *Wilde Ash*, *Quicken tree*, *Quick-beame tree*, and *Wicken tree*. *Matthioli* makes this to be *Sorbus sylvestris*, or wilde Seruice tree.

¶ The Temperature and Vertues.

Touching the faculties of the leaues, barke, or berries, as there is nothing found among the old, so is there nothing noted among the later writers: but *Pliny* seemeth to make this wilde Ash like in faculties to the common Ash; for *lib. 16. cap. 12.* where he writes of both the Ashes, hee saith, that the common Ash is *Crispa*, and the mountaine Ash *Spissa*: and forthwith he addeth this: The Grecians write, that the leaues of them do kill cattell, and yet hurt not those that chew their cud; which the old writers haue noted of the Yew tree, and not of the Ash tree. *Pliny* was deceiued by the neereness of the words *μυλος* and *μελια*: *μυλος* is the Yew tree, and *μελια* the Ash tree: so that hee hath falsly attributed that deadly facultie to the Ash tree, which doth belong to the Yew tree.

The leaues of the wilde Ash tree boiled in wine are good against the paine in the sides, and the stopping of the liuer, and assuage the bellies of those that haue the tympanie and dropsie.

Benedictus Curtius Symphorianus is deceiued in the historie of *Ornus*, when he thinketh out of *Virgil's Georgicks*, that *Ornus* hath the floure of the Peare tree; for out of *Virgil's* verses no such thing at

all can be gathered : for he in intreateth not of the forms of trees, but of the grafting of diuers into others, vnlike and differing in nature ; as of the grafting of the Nut tree into the Strawberry tree ; the Apple into the Plane tree, the Beech into the Chestnut tree ; the Peare into the wilde Ash or Quick-beame tree, the Oke into the Elme tree : and in this respect hee writeth, that the Plane tree bringeth forth an Apple, the Beech tree a Chestnut ; the wilde Ash tree bringeth forth the white floure of the Peare tree, as is most manifest out of *Virgils* owne words, after this manner, in the second booke of his *Georgicks* :

*Inseritur vero ex factu nucis Arbutus horrida,
Et steriles Platani malos gessere valentes,
Castanea Fagos : Ornus incanuit albo
Flore Pyri, glandemque sues fregere sub Vlmis.*

The Tree-Strawb'ry on Walnuts stocke doth grow,
And barren Planes faire Apples oft haue borne ;
Chestnuts, Beech-Mast ; the Quickene tree doth shew
The Peares white floure ; and twine oft times th' Acorn
Haue gathered vnder Elmes. —

CHAP. III. Of Coriars Sumuch.

1 *Rhus Coriaria*.
Coriar Sumach.

2 *Rhus Myrtifolia*.
Wilde or Myrtle Sumach.

¶ The Description.

1 **C**oriars Sumach groweth vp vnto the height of a hedge tree, after the manner of the Elder tree, bigger than *Dioscorides* reporteth it to be, or others, who affirme that *Rhus* groweth two cubits high : whose errors are the greater : but this *Rhus* is so like to the Service

Serice tree in shape and manner of growing, that it is hard to know one from the other; but that the leaues are soft and hairy, hauing a red sinew or rib thorow the midst of the leafe: the floures grow with the leaues vpon long stems clustering together like cats taile, or the catkins of the nut tree, but greater, and of a whitish green colour: after which come clusters of round berries, growing in bunches like grapes,

2 *Pliny* his Sumach, or the Sumach of *Plinies* description, groweth like a small hedge tree, hauing many slender twiggie branches, garnished with little leaues like *Myrtus*, or rather like the leaues of the *Iuibe* tree, among which come forth slender mossie floures, of no great account or value, which bring forth small seeds, inclosed within a cornered case or huske, fashioned like a spoon: the trunk or body of both these kindes of Sumach being wounded with some iron Instrument, yeeldeth a gum or liquour.

¶ The Place.

Sumach groweth, as *Dioscorides* saith, in stony places: it is found in diuers mountaines & woods in Spaine, and in many places on the mount Apennine in Italy, and also neere vnto Pontus. *Archigenes* in *Galen*, in the 8. book of medicines according to the places affected, sheweth, that it groweth in Syria, making choice of that of Syria.

¶ The Time.

The floures of Sumach come forth in Iuly, the seed with the berries are ripe in Autumne.

¶ The Names.

This is called in Greeke *ῥhus*, saith *Pliny*, hath no Latine name, yet *Gaza* after the significati on of the Greeke word, faineth a name, calling it *Fluida*: the Arabians name it *Sumach*: the Itali- ans, *Sumacho*: the Spaniards, *Sumagre*: in low Dutch, by contracting of the word they cal it **Smack** or **Sumach**: in English, Sumach, Coriars Sumach, and Leather Sumach: the leaues of the shrub be called *ῥυσις* *ῥυσιδαν*: in Latine, *Rhus coriaria*, or *Rhoe*.

The seed is named *Eruthros*: and *ῥυσις* *ῥυσιδαν* *ῥυσις*: in Latine, *Rhus Culinaria*, and *Rhus obsoniorum*: in En- glish, Meat Sumach, and Sauce Sumach.

¶ The Temperature.

The fruit, leaues, and seed hereof do very much binde, they also coole and drie: drie they are in the third degree, and cold in the second, as *Galen* teacheth.

¶ The Vertues.

The leaues of Sumach boyled in wine and drunken, do stop the laske, the inordinate course of A womens sicknesses, and all other inordinate issues of blood.

The seed of Sumach eaten in sauces with meat, stoppeth all manner of fluxes of the belly, the B bloody flux, and all other issues, especially the white issues of women.

The decoction of the leaues maketh haire blacke, and is put into stooles to fume vpward into C the bodies of those that haue the Dysenterie, and is to be giuen them also to drinke.

The leaues made into an ointment or plaister with hony and vineger, staith the spreading nature D of *Gangranes* and *Pterygia*.

The drie leaues sodden in water vntill the decoction be as thicke as hony, yeeld forth a certaine E oiliness, which performeth all the effects of *Licum*.

The seed is no lesse effectually to be strowed in pouder vpon their meats which are *Caliaci* or Dy- F senterici.

The feedes poudered, mixed with hony and the powder of Oken coles, healeth the Hemor- G rhoides.

There issueth out of the shrub a gum, which being put into the hollownesse of the teeth, taketh H away the paine, as *Dioscorides* writeth.

CHAP. II.2: Of red Sumach.

¶ The Description.

1 THele two figures are of one and the selfe same plant; the first sheweth the shrub being in floure: the other when it is full floured with the fruit growne to ripenesse, notwithstanding some haue deemed them to be of two kindes, wherein they were deceived.

† This excellent and most beautifull plant *Coggyria* (beeing reputed of the Italians and the Venetians for a kind of *Rhus* or Sumach, because it is vsed for the same purposes whereto *Rhus* ser- ueth,

weth and therein doth farre excell it) is an hedge plant growing not aboue the height of foure or five cubits, hauing tough and pliant stalks and twiggie branches like to Oziers, of a brown colour. The leaues be round, thick, and stiffe like the leaues of *Capparis*, in colour and savor of *Pistacia* leaues, or *Terebinthus*, among which ariseth a small vpright sprig, bearing many smal clustering little greenish yellow floures, vpon long and red stalks. After which follow small reddish Lentill-like feeds that carry at the tops a most fine woolly or flockie tuft, crisped and curled like a curious wrought filken fleece, which curleth and foldeth it selfe abroad like a large bush of haire.

1 *Coggygia Theophrasti.*
Venice Sumach.

♂
or

Cotinus Coriarius Plinij.
Red Sumach.

¶ The Place.

Coggygia groweth in Orleans neere Auignon, and in diuers places of Italy, vpon the Alpes of Styria, and many other places. It groweth on most of the hils of France, in the high woods of the vpper Pannonia or Austria, and also of Hungaria and Bohemia.

¶ The Time.

They floure and flourish for the most part in Iuly.

¶ The Names.

The first is called *Coggygia*, and *Coccygia* in English, Venice Sumach, or Silken Sumach, of *Plinij*, *Cotinus*, in his 16. booke, 18. chapter. There is, faith he, on mount Apennine a shrub which is called *Cotinus ad lineamentum modo Conchylj colore insignis*, and yet *Cotinus* is *Oleaster*, or *Olea syluestris*, the wilde Oliue tree, from which this shrub doth much differ, and therefore it may rightly be called *Cotinus Coriaria*. Diuers would haue named it *Scotinus*, which name is not found in any of the old writers. The Pannonians do call it *Farblauff*: it is also thought that this shrub is *Coggygia Plinij*, of which in his 12. booke, 22. chapter he writeth in these words: *Coggygia* is also like to *Vnedo* in leafe, not so great, it hath a property to loose the fruit with downe, which thing happeneth vnto no other tree.

¶ The Temperature.

The leaues and slender branches together with the seeds are very much binding, cold and drie as the other kindes of Sumach are.

¶ The Vertues.

A The leaues of *Coggygia*, or Silken Sumach, are sold in the markets of Spaine and Italy for great summes

summes of money, vnto those that dresse Spanish skinned, for which purpose they are verie excellent.

The root of *Cotinus*, as *Anguillara* noteth, serueth to die with, giuing to wooll and cloth a reddish B colour, which *Pliny* knew, shewing that this shrub (that is to say the root) is *ad lineamenta modo Conchylij colore insignis*.

CHAP. II3. Of the Alder Tree.

¶ The Description.

1 The Alder tree or Aller, is a great high tree hauing many brittle branches, the barke is of a browne colour, the wood or timber is not hard, and yet it will last and indure verie long vnder the water, yea longer than any other timber whatsoeuer: wherefore in the fenny and soft marish grounds they do vse to make piles and posts thereof, for the strengthening of the walls and such like. This timber doth also serue very well to make troughes to conuey water in stead of pipes of Lead. The leaues of this tree are in shape somewhat like the Hasell, but they are blacker & more wrinckled, very clammy to handle, as though they were sprinckled with honie. The blossome or floures are like the aglets of the Birch tree: which being vaded, there followeth a scaly fruit closely growing together, as big as a Pigeons egge, which toward Autumne doth open, and the seed falleth out and is lost.

1 *Alnus*.

The Alder tree.

† 2 *Alnus hirsuta*.

Rough leaued Alder.

† 2 *Clusius* and *Bauhine* haue obserued another kinde of this which differs from the ordinary, in that it hath larger and more cut leaues, and these not shining aboue, but hoary vnderneath: the catkins, as also the rough heads are not so large as those of the former: the barke also is whiter. *Clusius* makes it his *Alnus altera*: and *Bauhine*, his *Alnus hirsuta*, or *folio incano*. †

The

¶ The Place.

The Aller or Alder tree delighteth to grow in low and moist waterish places.

¶ The Time.

The Aller bringeth forth new leaues in Aprill, the fruit whereof is ripe in September.

¶ The Names.

This tree is called in Greeke *αἰδύνη*: in Latine, *Alnus*: *Petrus Crescentius* nameth it *Amedanus*: it is called in high Dutch, *Erlenbaum* and *Ellernbaum*: in low Dutch, *Elzen* and *Elzen-boom*: in Italian, *Alno*: in French, *Aulne*: in English, Alder and Aller.

¶ The Temperature.

The leaues and barke of the Alder tree are cold, drie, and astringent.

¶ The Vertues.

A The leaues of Alder are much vsed against hot swellings, vlcers, and all inward inflammations, especially of the Almonds and kernels of the throat.

B The barke is much vsed of poore countrey Diers, for the dying of course cloth, cappes, hose, and such like into a blacke colour, whereunto it serueth very well.

CHAP. II4. Of the Birch tree.

Betula.

The Birch tree.

¶ The Description.

THE common Birch tree waxeth likewise a great tree, hauing many boughes beset with many small rods or twigs, very limber and pliant: the barke of the young twigs and branches is plaine, smooth, and full of sap, in colour like the Chestnut, but the rind of the body or trunk is hard without, white, rough, and vneuen, full of chinkes or creuises: vnder which is found another fine barke, plaine, smooth, and as thin as paper which heretofore was vled in stead of paper, to write vpon, before the making of paper was knowne: in Russia and these cold regions it serueth in stead of tiles and slate to couer their houses withall: this tree beareth for his floures certaine aglets like the Hasell tree, but smaller, wherein the seed is contained.

¶ The Place.

This common Birch tree grows in woods, fenny grounds, and mountaines, in most places of England.

¶ The Time.

The catkins or aglets do first appeare, and then the leaues, in Aprill or a little later.

¶ The Names.

Theophrastus calleth this tree in Greeke, *βετούλα*: diuers, *βετούλα*: others *βετούλα*: it is named in Latine, *Betula*: diuers also write it with a double *ll* *Betulla*, as some of *Plinies* copies haue it: it is called in high Dutch, *Birkenbaum*: in low Dutch, *Berckenboom*: in Italian, *Betula*.

la: by them of Trent, *Bedallo*: in French, *Bouleau*: in English, Birch tree.

¶ The Temperature and Vertues.

Concerning the medicinable vse of the Birch tree, or his parts, there is nothing extant either in the old or new writers.

This tree, saith *Pliny* in his 16-booke, 18. chapter, *Mirabili candore & tenuitate terribilis magistratum virgis*: for in times past the Magistrates rodde were made heereof: and in our time also the Schoolemasters and parents do terrifie their children with rods made of Birch.

It serueth well to the decking vp of houses, and banquetting roomes, for places of pleasure, and beautifying of streets in the crosse or gang weeke, and such like.

CHAP. II5. Of the Hornebeame, or Hard beame Tree.

Betulus, five Carpinus.
The Hornebeame tree.

¶ The Description.

B*etulus*, or the Hornebeam tree grows great, and very like vnto the Elme, or Wich Hasel tree, hauing a great body: the wood or timber whereof is better for arrowes and shafts, pulleies for mills, and such like deuises, than Elme or Wich Hazell; for in time it waxeth so hard, that the toughnesse and hardnesse of it may be rather compared vnto horn than vnto wood, and therefore it was called Hornebeame, or Hardbeame: the leaues hereof are like the Elme, sauing that they be tenderer: among those hang certaine triangled things, vpon which be found knaps, or little heads of the bignesse of Ciches, in which is contained the fruit or seed: the roote is strong and thicke.

¶ The Place.

Betulus or the Hornebeame tree growes plentifully in Northamptonshire, also in Kent by Grauesend, where it is commonly taken for a kinde of Elme.

¶ The Time.

This tree doth spring in Aprill, and the seed is ripe in September.

¶ The Names.

The Hornebeam tree is called in Greek *ζυγία*, which is as if you should say *Coniugalis*, or belonging to the yoke, because it serueth well to make *ζυγία* of, in Latine, *Iuga*, yokes wherewith oxen are yoked together, which are also euen at

this time made thereof, as witnesseth *Benedictus Curtius Symphorianus*, and our selues haue sufficient knowledge thereof in our owne country; and therefore it may be Englished Yoke Elme. It is called of some, *Carpinus* and *Zugia*: it is also called *Betulus*, as if it were a kinde of Birch, but my selfe better like that it should be one of the Elmes: in high Dutch, *Alhorne*: in French, *Carne*: in Italian, *Carpino*: in English, Hornebeame, Hardbeame, Yoke Elme, and in some places, Witch-hasell.

¶ The Temperature and Vertues.

This tree is not vsed in medicine, the vertues are not expressed of the Antients, neither haue wee any certaine experiments of our owne knowledge more than hath beene said for the vse of Husbandrie.

CHAP. II6. Of the Elme tree.

† **O**Ur Author onely described two Elmes, and those not so accurately but that I thinke I shall giue the Reader content, in exchanging them for better receiued from Mr. Goodyer; which are these.

Ulmus vulgarissimus folio lato scabro. The common Elme.

THis Elme is a very great high tree, the barke of the young trees, and boughes of the El-der, which are vsually lopped or shred, is smooth and very tough, and wil strip or pil from the wood a great length without breaking: the bark of the body of the old trees as the trees grow in bignesse, teares or rents, which makes it very rough. The innermost wood of the tree is of reddish yellow

yellow or brownish colour, and curled, and after it is drie, very tough, hard to cleave or rent, whereof
 aues of Carts are most commonly made: the wood next the barke, which is called the sap, is white.
 Before the leaues come forth the floures appeare, about the end of March, which grow on the twigs
 or branches, closely compacted or thrust together, and are like to the chiues growing in the mid-
 dle of most floures, of a reddish colour: after which come flat seed, more long than broad, not much
 vnlike the garden Arach seed in forme and bignesse, and doe for the most part fall away before or
 shortly after the leaues spring forth, and some hang on a great part of the Sommer: the leaues grow
 on the twigges, of a darke Greene colour; the middle size whereof are two inches broad, and
 three inches long, some are longer and broader, some narrower and shorter, rough or harsh
 in handling on both sides, nickt or indented about the edges, and many times crumpled, hauing a
 nerue in the middle, and many smaller nerues growing from him: the leafe on one side of the nerue
 is alwaies longer than on the other. On these leaues oftentimes grow blisters or small bladders, in
 which at the spring are little wormes, about the bignesse of Bed-fleas. This Elme is common in
 all parts of England, where I haue trauelled.

Ulmus minor folio angusto scabro.
 The Narrow leaued Elme.

2 This tree is like the other, but much lesser and lower, the leaues are vsually about two inches
 and a halfe long, and an inch or an inch and a quarter broad, nickt or indented about the edges, and
 hath one side longer than the other, as the first hath, and are also harsh or rough on both sides, the

1 *Ulmus vulgariss. folio lato scabro.*
 The common Elme tree.

† 2 *Ulmus minor folio angusto scabro.*
 The narrow leaued Elme.

barke or rinde will also strip as the first doth: hitherto I haue not obserued either the floures or
 seed, or blisters on the leaues, nor haue I had any sight of the timber, or heard of any vse
 thereof. This kinde I haue seene growing but once, and that in the hedges by the high
 way as I rode betweene Christ Church and Limmington in the New Forrest in Hampshire,
 about

about the middle of September 1624. from whence I brought some small plants of it, not a foot in length, which now, 1633. are risen vp ten or twelue foot high, and grow with me by the first kinde, but are easily to be discerned apart, by any that will looke on both.

‡ 3 *Ulmus folio latissimo scabro.*

Witch Hasell, or the broadest leaued Elme.

4 *Ulmus folio glabro.*

Witch Elme, or smooth leaued Elme.

Ulmus folio latissimo scabro.

Witch Hasell, or the broadest leaued Elme.

3 This groweth to be a very great tree, and also very high, especially when he groweth in woods amongst other trees: the barke on the outside is blacker than that of the first, and is also very tough, so that when there is plenty of sap it will strip or peelee from the wood of the boughes from the one end to the other, a dozen foot in length or more, without breaking, whereof are often made cords or ropes: the timber hereof is in colour neere like the first, it is nothing so firme or strong for naues of Carts as the fruit is, but will more easily cleaue; this timber is also couered with a white sappe next the barke: the branches or young boughes are grosser and bigger, and do spread themselues broader, and hang more downewards than those of the first; the floures are nothing but chiues, very like those of the first kind: the seed is also like, but something bigger: the leaues are much broader and longer than any of the kindes of Elme, vsually three or foure inches broad, and five or six inches long, also rough or harsh in handling on both sides, snipt or indented about the edges, neere resembling the leaues of the Hasell: the one side of the leaues are also most commonly longer than the other, also on the leaues of this Elme are sometimes blisters or bladders like those on the first kinde. This prospereth and naturally groweth in any soile moist or dry, on high hills, and in low vallies in good plenty in most places in Hampshire, wher it is commonly called VVitch Hasell. Old men affirme, that when long boughes were in great vse, there were very many made of the wood of this tree, for which purpose it is mentioned in the statutes of England by the name of VVitch Hasell, as 8. El. 10. This hath little affinitie with *Carpinus*, which in Essex is called VVitch Hasell.

I i i i i

Ulmus

Vlmus folio glabro.

VVitch Elme, or smooth leauen Elme.

4 This kinde is in bignesse and height like the first, the boughes grow as those of the VVitch Haffell doe, that is hanged more downewards than those of the common Elme, the barke is blacker than that of the first kinde, it will also peelee from the boughes: the floures are like the first, and so are the seeds: the leaues in forme are like those of the first kinde, but are smooth in handling on both sides. My worthy friend and excellent Herbarist of happy memorie Mr. *William Coys* of Stubbers in the parish of Northokington in Essex told me, that the wood of this kinde was more desired for naues of Carts than the wood of the first. I obserued it growing very plentifully as I rode between Rumford and the said Stubbers, in the yeere 1620. intermixed with the first kinde, but easily to be discerned apart, and is in those parts vsually called VVitch Elme. ‡

¶ The Place.

The first kinde of Elme groweth plentifully in all places of England. The rest are set forth in their descriptions.

¶ The Time.

The seeds of the Elme sheweth it selfe first, and before the leaues; it falleth in the end of Aprill, at what time the leaues begin to spring.

¶ The Names.

The first is called in Greeke, *μύρτις*: in Latine, *Vlmus*: in high Dutch, *Rust holtz*, *Rustbaum*, *Uimbaum*: in low Dutch, *Dimen*: in French, *Orme*, and *Omeau*: in Italian, *Olmo*: in Spanish, *Vlmo*: in English, Elme tree.

The seed is named by *Plinie* and *Columella*, *Samera*. The little wormes which are found with the liquor within the small bladders be named in Greeke, *μύρτις*: in Latine, *Culices*, and *Muliones*.

The other Elme is called by *Theophrastus*, *μυρτινία*; which *Gaza* translateth *Montiumus* or mountaine Elme. *Columella* nameth it *Vernacula*, or *Nostros Vlmus*, that is to say, *Italica*, or Italian Elme: it is called in low Dutch, *Heerseleer*, and in some places, *Heerenteer*.

¶ The Temperature and Vertues.

- A The leaues and barke of the Elme be moderately hot, with an euident clenfing facultie; they haue in the chewing a certaine clammie and glewing qualitie.
- B The leaues of Elme glew and heale vp greene wounds, so doth the barke wrapped and swadled about the wound like a band.
- C The leaues being stamped with vineger do take away scurfte.
- D *Dioscorides* writeth, that one ounce weight of the thicker barke drunke with wine or water purgeth flegme.
- E The decoction of Elme leaues, as also of the barke or root, healeth broken bones very speedily, if they be fomented or bathed therewith.
- F The liquor that is found in the blisters doth beautifie the face, and scoureth away all spots, freckles, pimples, spreading tetter, and such like, being applied thereto.
- G It healeth greene wounds, and cureth ruptures newly made, being laid on with Spleenwoort and the trusse closely set vnto it.

CHAP. II. Of the Line or Linden Tree.

¶ The Description.

1 THE female Line or Linden tree waxeth very great and thicke, spreading forth his branches wide and farre abroad, being a tree which yeeldeth a most pleasant shadow, vnder and within whose boughes may be made braue sommer houses and banqueting arbors; because the more that it is surcharged with weight of timber and such like, the better it doth flourish. The barke is brownish, very smooth, and plaine on the outside, but that which is next to the timber is white, moist and tough, seruing very well for ropes, trases, and halters. The timber is whitish, plaine and without knots, yea very soft and gentle in the cutting or handling. Better gunpowder is made of the coles of this wood than of VVillow coles. The leaues are greene, smooth,

smooth, shining and large, somewhat snipt or toothed about the edges: the floures are little, whitish, of a good saour, and very many in number, growing clustering together from out of the middle of the leafe: out of which proceedeth a small whitish long narrow leafe: after the floures succeed cornered sharpe pointed Nuts, of the bignesse of Hasell Nuts. This tree seemeth to be a kinde of Elme, and the people of Essex about Henningham (wheras great plenty groweth by the way sides) do call it broad leaved Elme.

1 *Tilia femina.*

The female Line tree.

2 *Tilia mas.*

The male Line tree.

2 The male *Tilia* or Line tree groweth also very great and thicke, spreading it selfe far abroad like the other Linden tree: his bark is very tough and pliant, and serueth to make cords and halters of. The timber of this tree is much harder, more knottie, and more yellow than the timber of the other, not much differing from the timber of the Elme tree: the leaues hereof are not much vnlike Iuy leaues, not very Greene, somewhat snipt about the edges: from the middle whereof come forth clusters of little white floures like the former: which being vaded, there succeed small round pellets, growing clustering together, like Iuy berries, within which is contained a little round blackish seed, which falleth out when the berry is ripe.

¶ *The Place.*

The female Linden tree groweth in some woods in Northampton shire, also neere Colchester, and in many places alongst the high way leading from London to Henningham, in the countie of Essex.

The male Linden tree groweth in my Lord Treasurers garden at the Strand, and in sundry other places, as at Barn-elmes, and in a garden at Saint Katherines neere London. ‡ The female growes in the places here named, but I haue not yet obserued the male. ‡

¶ *The Time*

These trees floure in May, and their fruit is ripe in August.

¶ *The Names.*

The Linden tree is called in Greeke *φιλύρα*: in Latine, *Tilia*: in high Dutch, *Linden*, and *Lindenbaum*: in low Dutch, *Linde*, and *Lindenboom*: the Italians, *Tilia*: the Spaniards, *Teia*: in French, *Tiler* and *Tilieul*: in English, Linden tree, and Line tree.

IIIIII 2

¶ *The*

¶ The Temperature.

The barke and leaues of the Linden or Line tree, are of a temperate heat, somewhat drying and astringent.

¶ The Vertues.

- A The leaues of *Tilia* boiled in Smithes water with a piece of Allom and a little honey, cure the sores in childrens mouthes.
- B The leaues boiled vntill they be tender; and powned very small with hogs grease, and the powder of Fenugreeke and Linefeed, take away hot swellings and bring impostumes to maturation, being applied thereto very hot.
- C The floures are commended by diuers against paine of the head proceeding of a cold cause, against diffineste, the Apoplexie, and also the falling sicknesse, and not onely the floures, but the distilled water thereof.
- D The leaues of the Linden (saith *Theophrastus*) are very sweet, and be a fodder for most kinde of cattle: the fruit can be eaten of none.

CHAP. II8. Of the Maple tree.

‡ 1 *Acer maius.*

The great Maple.

† 2 *Acer minus.*

The lesser Maple.

¶ The Description.

The great Maple is a beautifull and high tree, with a barke of a meane smoothnesse: the substance of the wood is tender and easie to worke on; it sendeth forth on euery side very many goodly boughes and branches, which make an excellent shadow against the heate of the Sun; vpon which

which are great, broad, and cornered leaues, much like to those of the Vine, hanging by long reddish stalks: the floures hang by clusters, of a whitish Greene colour; after them commeth vp long fruit fastened together by couples, one right against another, with kernels bumping out neere to the place in which they are combined: in all the other parts flat and thin like vnto parchment, or resembling the innermost wings of grasshoppers: the kernels be white and little.

2 There is a small Maple which doth oftentimes come to the bignes of a tree, but most commonly it groweth low after the maner of a shrub: the barke of the young shoots hereof is likewise smooth; the substance of the wood is white, and easie to be wrought on: the leaues are cornered like those of the former, slippery, and fastened with a reddish stalke, but much lesser, very like in bignes, and smoothnes to the leafe of Sanicle, but that the cuts are deeper: the floures be as those of the former, Greene, yet not growing in clusters, but vpon spoked roundles: the fruit standeth by two and two vpon a stem or foot-stalke.

¶ The Place.

The small or hedge Maple groweth almost euery where in hedges and low woods.

The great Maple is a stranger in England, only it groweth in the walkes and places of pleasure of noble men, where it especially is planted for the shadow sake, and vnder the name of Sycomore tree.

¶ The Time.

These trees floure about the end of March, and their fruit is ripe in September.

¶ The Names.

This tree is called in Greeke *ογινδαμνος*: in Latine, *Acer*: in English, Maple, or Maple tree.

The great Maple is called in high Dutch, *Alhorne*, and *waldescherne*: the French men, *Grand Erable*, and *Plasne* abusiuely, and this is thought to be properly called *ογινδαμνος*: but they are far deceived that take this for *Platanus*, or the Plane tree, being drawne into this errour by the neerenesse of the French word, for the Plane tree doth much differ from this. ‡ This is now commonly (yet not rightly) called the Sycomore tree. And seeing we will haue it so, I thinke it were not vnfit to call it the bastard Sycomore. ‡

The other is called in Latine, *Acer minor*: in high Dutch, *Wassholder*: in low Dutch, *Booghout*: in French, *Erable*: in English, small Maple, and common Maple.

¶ The Temperature and Vertues.

What vse the Maple hath in medicine we finde nothing written of the Grecians, but *Pliny* in his 14. booke, 8. chapter affirmeth, that the root pouned and applied, is a singular remedy for the paine of the liuer. *Serenus Sammonicus* writeth, that it is drunke with wine against the paines of the side.

*Si latus immeritum morbo tentatur acuto,
Accensum tinges lapidem stridentibus undis.
Hinc bibis: aut Aceris radicem tundis, & vna.
Cum vino capis: hoc præsens medicamen habetur.*

Thy harmelesse side if sharpe disease inuade,
In hissing water quench a heated stone:
This drinke. Or Maple root in powder made,
Take off in wine, a present medicine knowne.

CHAP. II9. Of the Poplar tree.

¶ The Kindes.

There be diuers trees vnder the title of Poplar, yet differing very notably, as shall be declared in the descriptions, whereof one is the white, another the blacke, and a third sort set downe by *Pliny*, which is the Aspe, named by him *Lybica*, and by *Theophrastus*, *ερκίς*: likewise there is another of America, or of the Indies, which is not to be found in these regions of Europe.

¶ The Description.

1 The white Poplar tree commeth soone to perfection, and groweth high in short time, full of boughes at the top: the barke of the body is smooth, and that of the boughes is likewise white withall: the wood is white, easie to be cleft: the leaues are broad, deeply galled, & cornered like almost to those of the Vine, but much lesser, smooth on the vpper side, glib, and somewhat Greene; and on the nether side white and woolly: the catkins are long, downy, at the first of a purplish colour: the roots spread many waies, lying vnder the turfe, and not growing deepe, and therefore it happeneth that these trees be oftentimes blowne downe with the winde.

1 *Populus alba.*

The white Poplar tree.

2 *Populus nigra.*

The blacke Poplar tree.

2 The black Poplar tree is as high as the white, and now and then higher, oftentimes fuller of boughes, and with a thicker body: the barke thereof is likewise smooth, but the substance of the wood is harder, yellower, and not so white, fuller of veines, and not so easily cleft: the leaues be somewhat long, and broad below towards the stem, sharp at the point, and a little snipt about the edges, neither white nor woolly, like the leaues of the former, but of a pleasant Greene colour: amongst which come forth long aglets or catkins, which do turne into clusters: the buds which shew themselves before the leaues spring out, are of a reasonable good sauour, of the which is made that profitable ointment called *Vnguentum Populeon*.

3 The third kinde of Poplar is also a great tree: the barke and substance of the wood is somewhat like that of the former: this tree is garnished with many brittle and tender branches, set full of leaues, in a manner round, much blacker and harder than the blacke Poplar, hanging vpon long and slender stems, which are for the most part still wauering, and make a great noise by being beaten one to another, yea though the weather be calme, and scarce any winde blowing; and it is knowne by the name of the Aspen tree: the roots hereof are stronger, and grow deeper into the ground than those of the white Poplar.

4 This strange Poplar, which some do call *Populus rotundifolia*, in English, the round leaved Poplar of India, waxeth a great tree, bedecked with many goodly twiggie branches, tough and limmer like the

3 *Populus Libyca.*
The Aspen tree.

4 *Populus Americana.*
The Indian Poplar tree.

5 *Populus alba folijs minoribus.*
The lesser leaved white Poplar.

the Willow, full of ioints where the leaues do grow, of a perfect roundnesse, saue where it cleaueth or groweth to the stalk: from the bosoms or corners of these leaues come forth small aglets, like vnto our Poplar, but smaller: the leafe is thick, and very like the leaues of *Arbor Indæ*, but broader, of an astringent taste, somewhat heating the mouth, and sal-tish.

5 There is also another sort of Poplar which groweth likewise vnto a great tree, the branches whereof are knotty and bunched forth as though it were full of scabs or sores: the leaues come forth in tufts most commonly at the end of the boughes, not cut or iagged, but resembling the leaues of that *Atriplex* called *Pes Anserinus*; in colour like the former, but the aglets are not so closely packed together, otherwise it is like.

¶ *The Place.*

These trees doe grow in low moist places, as in meadowes neere vnto ditches, standing waters and riuers.

The first kinde of white Poplar groweth not very common in England, but in some places here and there a tree: I found many both small & great growing in a low meadow turning

turning vp a lane at the farther end of a village called Black-wall, from London; and in Essex at a place called Ouenden, and in diuers other places.

The Indian Poplar groweth in most parts of the Islands of the West Indies.

¶ The Time.

These trees do bud forth in the end of March and beginning of Aprill, at which time the buds must be gathered to serue for *Vnguentum Populeon*.

¶ The Names.

The white Poplar is called in Greeke, *Λύκρη*: in Latine, *Populus alba*: of diuers, *Farfarus*, as of *Plautus* in his Comedie *Penulus*, as you may see by his words set downe in the chap. of Colts-foot, pag. 813.

It is called in high-Dutch, *Doppelbaum*, *Weiß Alberbaum*: in low-Dutch, *Abeel*, of his horie or aged colour, and also *Abeelboome*; which the Grammarians doe falsly interpret *Abies*, the Firre tree: in Italian, *Popolo nero*: in French, *Peuplier blanc*, *Aubel*, *Obel*, or *Aubean*: in English, white Poplar tree, and Abeell, after the Dutch name.

The second is called in Greeke, *Αίγυπτος*: in Latine, *Populus nigra*: by *Petrus Crescentius*, *Albarus*: in high-Dutch, *Aspen*: in low-Dutch, *Populier*: in Italian, *Popolo nero*: in French, *Peuplier noir*: in Spanish, *Alamo nigailho*: in English, Poplar tree, blacke Poplar, and Pepler. The first or new sprung buds whereof are called of the Apothecaries, *Oculi Populi*, Poplar buds: others chuse rather to call it *Gemma Populi*: some of the Grecians name it *Σπίγος*: whereupon they grounded their error, who rashly supposed that those rosenny or clammy buds are not to be put or vsed in the composition of the ointment bearing the name of the Poplar, and commonly called in English, Popilion and Pompillion; but the berries that grow in clusters, in which there is no clamminesse at all.

They are also as far deceiued, who giuing credit to Poets fables, do beleue that Amber cometh of the clammy rosin falling into the riuer Poo.

The third is called of diuers, *Populus tremula*, which word is borrowed of the French men, who name it *Tremble*: it also receiued a name amongst the low Countrey men, from the noise and rattling of the leaues, viz. *Rateeler*: this is that which is named of *Pliny*, *Libyca*: and by *Theophr.* *Κερίσις*, which *Gaza* calleth *Populus montana*: in English, *Aspe*, and *Aspen* tree, and may also be called *Tremble*, after the French name, considering it is the matter whereof womens tongues were made, (as the Poets and some others report) which seldom cease wagging.

¶ The Temperature and Vertues.

A The white Poplar hath a clensing facultie, saith *Galen*, and a mixt temperature, consisting of a waterie warme essence, and also a thin earthy substance.

B The barke, as *Dioscorides* writeth, to the weight of an ounce (or as others say, and that more truly, of little more than a dram) is a good remedie for the Sciatica or ache in the huckle bones, and for the strangurie.

C That this barke is good for the Sciatica, *Serenus Sammonicus* doth also write:

*Sapius occultus victa coxendice morbus
Perfurit, & gressus diro languore moratur:
Populus alba dabit medicos de cortice potus.*

An hidden disease doth oft rage and raine,
The hip ouercome and vex with the paine,
It makes with vile aking one tread slow and shrinke;
The barke of white Poplar is helpe had in drunke.

D The same barke is also reported to make a woman barren, if it be drunke with the kidney of a Mule, which thing the leaues likewise are thought to perform, being taken after the floures or reds be ended.

E The warme iuice of the leaues being dropped into the eares doth take away the paine thereof.

F The rosin or clammy substance of the blacke Poplar buds is hot and dry, and of thin parts, attenuating and mollifying: it is also fitly mixed *acopis & malagmatis*: the leaues haue in a manner the like operation for all these things, yet weaker, and not so effectually, as *Galen* teacheth.

G The leaues and yong buds of blacke Poplar doe asswage the paine of the gout in the hands or feet, being made into an ointment with May butter.

H The ointment made of the buds is good against all inflammations, bruses, squats, falls, and such like: this ointment is very well knowne to the Apothecaries.

I *Paulus Aegineta* teacheth to make an oile also hereof, called *Agyrinum*, or oile of blacke Poplar.

CHAP. 120. Of the Plane tree.

Platanus.
The Plane tree.

¶ The Description.

THe Plane is a great tree, having very long and farre spreading boughes casting a wonderfull broad shadow, by reason wherof it was highly commended and esteemed of among the old Romans: the leaues are cornered like those of *Palma Christi*, greater than Vine leaues, and hanging vpon little red foot-stalkes: the floures are small and mossie, and of a pale yellowish colour: the fruit is round like a ball, rugged, and somewhat hairy; but in Asia more hairy and greater, almost as big as a Walnut: the root is great, dispersing it selfe far abroad.

¶ The Place.

The Plane tree delighteth to grow by springs or riuers: *Pliny* reports that they were wont to be cherished with wine: they grew afterward (saith he) to be of so great honour (meaning the Plane trees) as that they were cherished and watered with wine: and it is found by experience that the same is very comfortable to the roots, and wee haue alreadie taught that trees desire to drinke wine. This tree is strange in Italy, it is no where seene in Germany, nor in the low-Countries: in Asia it groweth plentifully: it is found also

in Candy, growing in vallies, and neere vnto the hill Athos, as *Petrus Bellonius* in his Singularities doth declare: it groweth in many places of Greece, and is found planted in some places of Italy, for pleasure rather than for profit. My seruant *William Marshall* (whom I sent into the Mediterranean sea as Surgeon vnto the Hercules of London) found diuers trees hereof growing in Lepanto, hard by the sea side, at the entrance into the towne, a port of Morea, being a part of Greece, and from thence brought one of those rough buttons, being the fruit thereof. ‡ There are one or two yong ones at this time growing with M^r. *Tradescant*. ‡

— The Plane trees cast their leaues in Winter, as *Bellonius* testifieth, and therefore it is no maruel that they keepe away the Sun in Sommer, and not at all in Winter: there is, saith *Pliny*, no greater commendation of the tree, than that it keepeth away the Sunne in Sommer, and entertaineth it in Winter.

¶ The Names.

— This tree is called in Greeke, *Πλάτανος*: and likewise in Latine *Platanus*: it beareth his name of the bredth: the French mens *Plasne* doth far differ from this, which is a kind of Maple: this tree is named in English, Plane tree.

¶ The Temperature and Vertues.

The Plane tree is of a cold and moist essence, as *Galen* saith: the Greene leaues are good to be A laid vpon hot swellings and inflammations in the beginning.

Being boiled in wine they are a remedie for the running and the watering of the eyes, if they be B applied.

The barke and balls do dry: the barke boiled in vineger helpeth the tooth-ache,

The fruit of the Plane tree drunke with wine helpeth the bitings of mad dogs and serpents, and C mixed with hogs grease it maketh a good ointment against burning and scalding.

— The burned barke doth mightily dry, and scoureth withall; it remoueth the white scurfe, and cureth D moist vlcers.

The

F The dust or downe, saith *Galen*, that lieth on the leaues of the tree is to be taken heed of, for if it be drawne in with the breath, it is offensiue to the winde-pipe by his extreme drinesse, and making the same rough, and hurting the voice, as it doth also the sight and hearing, if it fall into the eyes or eares. *Dioscorides* doth not attribute this to the dust or downe of the leaues onely, but also to that of the balls.

CHAP. 121. Of the Wayfaring Tree.

Lantana, sine Viburnum.
The Wayfaringtree.

¶ The Description.

THe Wayfaring mans tree growes vp to the height of an hedge tree, of a mean bignes: the trunk or body thereof is couered with a russet barke: the branches are long, tough, and easie to be bowed, and hard to be broken, as are those of the Willow, couered with a soft whitish barke, whereon are broad leaues thicke and rough, sleightly indented about the edges, of a white colour, and somewhat hairy whilest they be fresh and green; but when they begin to wither and fall away, they are reddish, and set together by couples one opposit to another. The floures are white, and grow in clusters: after which come clusters of fruit of the bignes of a pease, somewhat flat on both sides, at the first greene, after red, and blacke when they be ripe: the root disperseth it selfe far abroad vnder the vpper crust of the earth.

¶ The Place.

This tree groweth in most hedges in rough and stony places, vpon hills and low woods, especially in the chalky grounds of Kent about Cobham, Southfleet, and Grauesend, and in all the tract to Canturbury.

¶ The Time.

The floures appeare in Sommer: the berries are ripe in the end of Autumne, and new leaues come forth in the Spring.

This hedge tree is called *Viurna* of *Ruellius*: in French, *Viorne*, and *Viorna*: in Italian, *Lantana*: it is reputed for the tree *Viburnum*, of which *Virgil* maketh mention in the first Eclog, where hee commendeth the city Rome for the loftinesse and statelinesse thereof, aboue other Cities, saying, that as the tall Cypres trees do shew themselues aboue the low and shrubby Viorn, so doth Rome aboue other cities lift vp her head very high; in these verses:

*Verum hac tantum alias inter caput exulit vrbes,
Quantum lenta solent inter viburna cupressi.*

But this all other cities so excels,
As Cypresse, which 'mongst bending Viornes dwels.

‡ I iudge *Viburnum* not to be a name to any particular plant, but a generall name to all low and bending shrubs; amongst which this here described may take place as one. I enquired of a countrey man in Essex, if he knew any name of this: he answered, it was called the Cotton tree, by reason of the softnesse of the leaues. ‡

¶ The Temperature.

The leaues and berries of *Lantana* are cold and dry, and of a binding qualitie.

¶ The

¶ The Vertues.

The decoction of the leaues of Lantana is very good to be gargled in the mouth against all swellings and inflammations thereof, against the scurvie and other diseases of the gums, and fastneth loose teeth. A

The same boiled in lee doth make the haire blacke if they be bathed or washed therewith, and suffered to dry of it selfe. B

The berries are of the like facultie, the powder whereof when they be dried stay the laske, all issues of blood, and also the whites. C

It is reported, that the barke of the root of the tree buried a certaine time in the earth, and afterwards boiled and stamped according to art, maketh good Bird-lime for Fowlers to catch Birds with. D

CHAP. 122. Of the Beade tree.

1 *Zizypha candida*.
The Beade tree.

2 *Zizypha Cappadocica*.
The Beade tree of Cappadocia.

¶ The Description.

THIS tree was called *Zizypha candida* by the Herbarists of Montpellier; and by the Venetians and Italians, *Sycomorus*, but vntuly: the Portugals haue termed it *Arbor Paradiso*: all which and each whereof haue erred together, both in respect of the fruit and of the whole tree: some haue called it *Zizypha*, though in facultie it is nothing like; for the taste of this fruit is very vnpleasant, virulent, and bitter. But deciding all controuersies, this is the tree which *Anicem* calleth *Azederach*, which is very great, charged with many large armes, that are garnished with twiggie branches, set full of great leaues consisting of sundry small leaues, one growing right opposite to another like the leaues of the Ash tree or Wicken tree, but more deeply cut about the edges like the teeth of a saw: among which come the floures, consisting of five small blew leaues layd abroad in manner of a starre: from the middest whereof groweth forth a small hollow cup resembling

resembling a Chalice: after which succeedeth the fruit, couered with a brownish yellow shel, very like vnto the fruit of Iuiubes (whereof *Dodonæus* in his last edition maketh it a kinde) of a rancke, bitter, and vnpleasant taste, with a six cornered stone within, which being drawne on a string, serueth to make Beades of, for want of other things.

2 *Zizyphus Cappadocica* groweth not so great as the former, but is of a meane stature, and full of boughes: the barke is smooth and euen, and that which groweth vpon the trunke and great boughes is of a shining scarlet colour: out of these great armes or boughes grow slender twigges, white and soft, which are set full of whitish leaues, but more white on the contrarie or backe part, and are like to the leaues of Willow, but narrower and whiter: amongst these leaues come forth small hollow yellowish floures, growing at the ioints of the branches, most commonly three together, and of a pleasant saueur, with some few threds or chiues in the middle thereof. After which succeedeth the fruit, of the bignesse and fashion of the smallest Oliue, white both within and without, wherein is contained a small stone which yeeldeth a kernell of a pleasant taste, and very sweet.

¶ The Place.

Matthiolus writeth, that *Zizyphus candida* is found in the cloisters of many monasteries in Italy; *Lobel* saith that it groweth in many places in Venice and Narbon; and it is wont now of late to be planted and cherished in the goodliest orchards of all the low-Countries.

Zizyphus Cappadocica groweth likewise in many places of Italy, and specially in Spaine: it is also cherished in gardens both in Germany and in the low-Countries. ‡ It groweth also here in the garden of M^r. *John Parkinson*. ‡

¶ The Time.

These trees floure in Iune in Italy and Spain; their fruit is ripe in September; but in Germany and the low-Countries there doth no fruit follow the floures.

¶ The Names.

Zizyphus candida *Auicen* calleth *Azederach*, or as diuers read it, *Azederaeth*: and they name it, saith he, in Rechi, *Arbor Miobalanorum*, or the Miobalane tree, but not properly, and in Tabrasten, and Kien, and Thihich. The later writers are far deceiued in taking it to be the Sycomore tree; and they as much, that would haue it to be the Lote or Nettle tree: it may be named in English, Bead tree, for the cause before alledged.

The other is altera species *Zizyphi*, or the second kinde of Iuiube tree, which *Columella* in his ninth booke and fourth chap. doth call *Zizyphus alba*, or white Iuiube tree, for difference from the other that is surnamed *Rutila*, or glittering red. *Pliny* calleth this *Zizyphus Cappadocica*, in his 21 booke, ninth chapter, where he entreateth of the honour of Garlands, of which he saith there be two sorts, whereof some be made of floures, and others of leaues: I would call the floures (saith he) brooms, for of those is gathered a yellow floure, and *Rhododendron*, also *Zizypha*, which is called *Cappadocica*. The floures of these are sweet of smell, and like to Oliue floures. Neither doth *Columella* or *Pliny* vnaduisedly take this for *Zizyphus*, for both the leaues and floures grow out of the tender and yong sprung twigs, as they likewise do out of the former: the floures are very sweet of smel, and cast their sauer far abroad: the fruit also is like that of the former.

¶ The Temperature.

Auicen writing and intreating of *Azadaræth*, saith, that the floures thereof be hot in the third degree, and dry in the end of the first.

Zizyphus Cappadocica is cold and dry of complexion.

¶ The Vertues.

- A The floures of *Zizyphus*, or *Azadaræth* open the obstructions of the braine.
- B The distilled water thereof killeth nits and lice, preserueth the haire of the head from falling, especially being mixed with white wine, and the head bathed with it.
- C The fruit is very hurtfull to the chest, and a troublesome enemy to the stomacke; it is dangerous, and peraduenture deadly.
- D Moreouer, it is reported, that the decoction of the barke and of *Fumitorie*, with *Miobalans* added, is good for agues proceeding of flegme.
- E The iuice of the vppermost leaues with honey is a remedie against poison.
- F The like also hath *Rhasis*: the Beade tree, saith he, is hot and dry: it is good for stoppings of the head, it maketh the haire long; yet is the fruit thereof very offensive to the stomacke, and oftentimes found to be pernicious and deadly.
- G *Matthiolus* writeth, that the leaues and wood bringeth death euen vnto beasts, and that the poison thereof is resisted by the same remedies that *Oleander* is.
- H *Zizyphus Cappadocica* preuaileth against the diseases aforesaid, but the decoction thereof is verie good for those whose water scaldeth them with the continuall issuing thereof, as also for such as haue the running of the reines and the exulcerations of the bladder and priuy parts.

A looch

A looch or licking medicine made thereof or the syrrup, is excellent good against spitting of G
bloud proceeding of the distillations of sharpe or salt humors.

† The figure that formerly was in the second place, was of the narrow leaved kinde of *Gusjatum Patavinum*, which you shall finde in the second place of the next chapter save one.

CHAP. 123. Of the Lote, or Nettle tree.

Lotus arbor.
The Nettle tree.

¶ The Description.

THE Lote whereof we write is a tree as big as a Peare tree, or bigger and higher: the body and armes are very thicke, the barke whereof is smooth, of a gallant green colour tending to blewnesse: the boughes are long, and spread themselves all about: the leaues be like those of the Nettle, sharpe pointed, and nicked in the edges like a saw, and dashed here and there with stripes of a yellowish white colour: the berries be round, and hang vpon long stalkes like Cherries, of a yellowish white colour at the first, and afterwards red, but when they be ripe they be somewhat blacke.

¶ The Place.

This is a rare and strange tree in both the Germanies: it was brought out of Italy, where there is found store thereof, as *Matthi-olus* testifieth: I haue a small tree thereof in my garden. There is likewise a tree thereof in the garden vnder London wall, sometime belonging to Mr. Gray, an Apothecary of London; and another great tree in a garden neere Coleman street in London, being the garden of the Queenes Apothecarie at the impression hereof, called Mr. *Hugh Morgan*, a curious conseruer of rare simples. The Lote tree doth also grow in Africke, but it

somewhat differeth from the Italian Lote in fruit, as *Pliny* in plaine words doth shew in his thirteenth booke, seuenteenth chapter. That part of Africke, saith he, that lieth towards vs, bringeth forth the famous Lote tree, which they call *Celtis*, and the same well knowne in Italy, but altered by the soile: it is as big as the Peare tree, although *Nepos Cornelius* reporteth it to be shorter: the leaues are full of fine cuts, otherwise they be thought to be like those of the Holme tree. There be many differences, but the same are made especially by the fruit: the fruit is as big as a Beane, and of the colour of Saffron, but before it is thorow ripe, it changeth his color as doth the Grape. It growes thicke among the boughes, after the manner of the Myrtle, not as in Italy, after the manner of the Cherry; the fruit of it is there so sweet, as it hath also giuen a name to that countrie and land, too hospitable to strangers, and forgetfull of their owne countrey.

It is reported that they are troubled with no diseases of the belly that eate it. The better is that which hath no kernell, which in the other kinde is stony: there is also pressed out of it a wine, like to a sweet wine; which the same *Nepos* denieth to endure aboue ten daies, and the berries stamped with *Alica* are reserued in vessels for food. Moreouer we haue heard say, that armies haue been fed therewith, as they haue passed too and fro thorow Africke. The colour of the wood is blacke: they vse to make flutes and pipes of it: the root serueth for kniues hafts, and other short workes: this is there the nature of the tree: thus farre *Pliny*. In the same place he saith, that this renowned tree doth grow about Syrtis and Nafamone: and in his 5. booke, 7. chapter he sheweth that there is not far from the lesser Syrtis, the Island Menynx, surnamed *Lotophagitis*, of the plenty of Lote trees.

Kkkkkk

Strabo

Strabo in his 17. booke affirmeth, that not onely *Menynx*, but also the lesser *Syrtis* is said to be *Lotophagitis*: first, saith he, lieth *Syrtis* a certaine long Island by the name *Cercinna*, and another lesser, called *Circinnitis*; next to this is the lesser *Syrtis*, which they call *Lotophagitis Syrtis*: the compasse of this gulfe is almost 1600. furlongs; the bredth of the mouth 600. By both the capes there be Islands ioined to the maine land, that is, *Circinna* and *Menynx*, of like bignesse: they thinke that *Menynx* is the countrey of the *Lotophagi*, or those that feed of the *Lote* trees; of which countrey *Homer* maketh mention, and there are certaine monuments to be seen, and *Ulysses* Altar, and the fruit is selte, for there be in it great plenty of *Lote* trees, whose fruit is wonderful sweet: thus saith *Strabo*.

This *Lote* is also described by *Theophrastus*; in his fourth booke he saith, that there be very many kindes, which be seuered by the fruit: the fruit is of the bignes of a beane, which when it waxeth ripe doth alter his colour as grapes do: the fruit of which the *Lotophagi* do eate is sweet, pleasant, harmeles, and wholesome for the belly, but that is pleasanter which is without kernels, and of this they make their wine.

This *Lote* tree, as the same Author affirmeth, is by nature euerlasting: as for example, the *Lote* trees whereof *Pliny* hath written in his 16. booke, 44. chapter. At Rome, saith he, the *Lote* tree in *Lucinas* court, how much elder it was than the church of the citie, built in the yeere which was without magistrates, 469. it is vncertaine: there is no doubt but that it was elder, because *Lucina* bare the name of that *Lucus* or groue. This is now about 450. yeeres old. That is elder which is furnamed *Capillata*, or hairie; because the haire of the vestall virgins was brought vnto it: but the other *Lote* tree in *Vulcans* church, which *Romulus* built by the victory of tenths is taken to be as old as the citie, as *Massurius* witnesseth.

¶ The Time.

They lose their leaues at the first approach of winter; and recouer them againe in Aprill: the fruit is ripe in September.

¶ The Names.

This tree is called in Greeke, *λωτός*: in Latine by *Pliny*, *Celtis*: in Italian, *Perlaro*: by those of Trent, *Bagolaro*: and in English, *Lote* tree, and *Nettle* tree.

¶ The Temperature and Vertues.

- A The *Lote* tree is not greatly binding as *Galen* saith, but of thin parts, and of a drying nature.
- B The decoction of the wood beaten small, being either drunke or vsed clisterwise, is a remedy for the bloody flux; and for the whites and reds.
- C It stoppeth the laske, and maketh the haire yellow, and as *Galen* addeth, keepeth haire from falling.
- D The shiuers or small pieces thereof, as the same Author alleageth, are boiled sometimes in water, sometimes in wine, as need shall require.

CHAP. 124.

Of Italian wood of Life, or Pocke wood, vulgarly called *Lignum vitæ*.

¶ The Description.

1 Italian *Lignum vitæ*, or Wood of Life, groweth to a faire and beautifull tree, hauing a straight and vpriight body, couered ouer with a smooth and darke greene barke, yeelding forth many twiggy branches, set forth of goodly leaues, like those of the Peare tree, but of greater beautie, and somewhat broader: among which commeth forth the fruit, growing close to the branches, almost without stalkes: this fruit is round, and at the first greene, but blacke when it is ripe, as big as Cherries, of an excellent sweet taste when it is dried: but this is not the Indian *Lignum sanctum*, or *Guaiacum*, whereof our bowles and physicall drinckes be made, but it is a bastard kind therof, first planted in the common garden at Padua, by the learned *Fallopins*, who supposed it to be the right *Guaiacum*.

2 The leaues of this are longer and narrower than the former, but firme also and nervous like as they are; the fruit is in shape like *Sebestens*, but much lesse, of a blewish colour when it is ripe, with many little stones within; the taste hereof is not vnpleasant. *Matthiolus* calls this *Pseudolotus*; and *Tabernamontanus*, *Lotus Africana*; whose figure our Author in the last chapter saue one gaue vnfitly for the *Zizyphus Cappadocica*. ‡

¶ The Place.

Guaiacum Patavinum groweth plentifully about *Lugdunum*, or *Lions* in France: I planted it in the

the garden of Barne-Elmes neere London two trees: besides, there groweth another in the garden of M^r. Gray an Apothecarie of London, and in my garden likewise.

1. *Guaiacum Patavinum latifolium*.
Broad leaved Italian Wood of life.

2. *Guaiacum Patavinum angustifol.*
Narrow leaved Italian Guaiacum.

¶ The Time.

It floureth in May, and the fruit is ripe in September.

¶ The Names.

Guaiacum Patavinum hath been reputed for the *Lotus* of *Theophrastus*: in English it is called the bastard Meuywood.

‡ This hath no affinitie with the true Indian *Guajacum* which is frequently vsed in medicine. ‡

¶ The Temperature and Vertues.

‡ The fruit of this is thought to be of the same temper and qualitie with that of the Nettle-tree. ‡

CHAP. 125. Of the Strawberry tree.

¶ The Description.

THe Strawberry tree groweth for the most part low, very like in bignesse to the Quince tree (whereunto *Dioscorides* compareth it.) The body is couered with a reddish barke, both rough and scaly: the boughes stand thicke on the top, somewhat reddish: the leaues bee broad, long, and smooth, like those of Bayes, somewhat nicked in the edges, and of a pale greene colour: the floures grow in clusters, being hollow and white, and now and then on the one side somewhat of a purple colour: in their places come forth certaine berries hanging downe vpon little long stems like vnto Strawberries, but greater, without a stone within, but onely with little seeds, at the first greene, and when they be ripe they are of a gallant red colour, in taste somewhat harsh, and in a manner without any relish; of which Thrushes and Black-birds do feed in Winter.

Kkkkkk 2

¶ The

Arbutus.

The Strawberry tree.

¶ The Place.

The Strawberry tree groweth in most Countreies of Greece, in Candy, Italy, and Spaine, also in the vallies of the mountaine Athos, where, being in other places but little, they become great huge trees, as *P. Bellonius* writeth. *Inba* also reporteth, that there be in Arabia of them fifty cubits high. They grow only in some few gardens with vs. *They grow naturally in Ireland.*

¶ The Time.

The Strawberry tree floureth in Iuly and August, and the fruit is ripe in September, after it hath remained vpon the tree by the space of an whole yeare.

¶ The Names.

This tree is called in Greek, *Κίμαρος*: in Latine, *Arbutus*: in English, Strawberry tree, and of some, Arbutus tree.

The fruit is named in Creeke, *μυρσίνος*, or as others reade it, *μυρσινος*: in Latine, *Memecylon*, and *Arbutus*; and *Pliny* calleth it *Vnedo*: Ground Strawberries (saith he) haue one body, and *Vnedo*, much like vnto them, another body, which onely in apple is like to the fruit of the earth: The Italians call this Strawberry *Albatro*: the Spaniards, *Madrono*, *Medronheyro*, and *Medronho*: in French, *Arboutes*, *Arbous*: It may be termed in English, Tree Strawberry.

¶ The Temperature and Vertues.

A The fruit of the Strawberry tree is of a cold temperature, hurting the stomacke, and causing head-ache; wherefore no wholesome food, though it be eaten in some places by the poorer sort of people.

CHAP. 126. Of the Plum tree.

¶ The Kindes.

TO write of Plums particularly would require a peculiar volume, and yet the end not to be attained vnto, nor the stocke or kindred perfectly knowne, neither to be distinguished apart: the number of the sorts or Kindes are not knowne to any one countrey: euery Clymat hath his owne fruit, far different from that of other countries: my selfe haue three score sorts in my garden, and all strange and rare: there be in other places many more common, and yet yearly commeth to our hands others not before knowne, therefore a few figures shall serue for the rest. ‡ Let such as require a larger historie of these varieties haue recourse to the oft mentioned Worke of *M^r. Parkinson*: and such as desire the things themselues may finde most of the best with *M^r. Iohn Millen* in Old street. ‡

¶ The Description.

THe Plum or Damson tree is of a meane bignesse: it is couered with a smooth barke: the branches are long, whereon do grow broad leaues, more long than round, nicked in the edges: the floures are white: the Plums do differ in colour, fashion, and bignes, they all consist of pulpe and skin, and also of kernell, which is shut vp in a shell or stone. Some Plums are of a blackish blew, of which some be longer, others rounder, others of the colour of yellow wax, diuers of a crimson red, greater for the most part than the rest. There be also green Plums, and withall very long, of a sweet and pleasant taste: moreouer, the pulpe or meate of some is drier, and easlier separated from the stone: of other some it is moister, and cleaueth faster: our common Damson is knowne to all, and therefore not to be stood vpon.

1 *Prunus Domestica*.
The Damson tree.

2 *Prunus Mirobalana*.
The Mirobalane Plum tree.

3 *Prunus Amygdalina*.
The Almond Plum tree.

5 *Prunus sylvestris*.
The Sloe tree.

2 The Mirobalan Plum tree groweth to the height of a great tree, charged with many great armes or boughes, which diuide themselues into small twiggy branches, by means whereof it yeeldeth a goodly and pleasant shadow: the trunke or body is couered with a finer and thinner bark than any of the other Plum trees: the leaues do somewhat resemble those of the Cherry tree, they are very tender, indented about the edges: the floures be white: the fruit is round, hanging vpon long foot-stalkes pleasant to behold, Greene in the beginning, red when it is almost ripe, and being full ripe it glistereth like purple mixed with blacke: the flesh or meate is full of iuice pleasant in taste: the stone is small, or of a meane bignesse: the tree bringeth forth plenty of fruit euery other yeare.

3 The Almond Plum groweth vp to the height of a tree of a meane bignesse: the branches are long, smooth, and euen: the leaues are broad, something long, and ribbed in diuers places, with small nerues running through the same: the floures are white, sprinkled with a little dash of purple scarcely to be perceiued: the fruit is long, hauing a cleft downe the middle, of a browne red colour, and of a pleasant taste.

4 The Damascen Plum tree groweth likewise to a meane height, the branches very brittle; the leaues of a deepe green colour: the fruit is round, of a blewish blacke colour: the stone is like vnto that of the Cherry, wherein it differeth from all other Plums.

5 The Bullesse and the Sloe tree are wilde kindes of Plums, which do vary in their kind, euen as the greater and manured Plums do. Of the Bullesse, some are greater and of better taste than others. Sloes are some of one taste, and some of others, more sharpe; some greater, and others lesser; the which to distinguish with long descriptions were to small purpose, considering they be all and euery of them knowne euen vnto the simplest: therefore this shall suffice for their seuerall descriptions.

¶ The Place.

The Plum trees grow in all knowne countries of the world: they require a loose ground, they also receiue a difference from the regions where they grow, not only of the forme or fashion, but especially of the faculties, as we will forthwith declare.

The Plum trees are also many times grafted into trees of other kindes, and being so ingrafted, they *faciem parentis, succum adoptionis, vt Plinius dicit, exhibent.*

The greatest varietie of these rare Plums are to be found in the grounds of Mr. Vincent Pointer of Twicknam, before remembred in the Chap. of Apples: although my selfe am not without some, and those rare and delicate.

The wilde Plums grow in most hedges through England.

¶ The Time.

The common and garden Plum trees do bloome in April: the leaues come forth presently with them: the fruit is ripe in Sommer, some sooner, some later.

¶ The Names.

The Plumme tree is called in Greeke, *Κοκκυμύλη*: in Latine, *Prunus*: in high-Dutch, *Plausmen-baum*: in low-Dutch, *Prupmen*: in Spanish, *Ciruelo*: in French, *Prunier*: in English, Plum tree.

The fruit is called in Greeke, *Κοκκυμύλη*: in Latine, *Prunum*: in high-Dutch, *Plausmen*: in low-Dutch, *Prupmen*: in Italian and French, *Prune*: in Spanish, *Prunas*: in English, Prune, and Plum. These haue also names from the regions and countries where they grow.

The old Writers haue called those that grow in Syria neere vnto Damascus, *Damascena Pruna*: in English, Damsons, or Damaske Prunes: and those that grow in Spain, *Hispanica*, Spanish Prunes or Plums. So in our age we vse to call those that grow in Hungarie, *Hungarica*, or *Pannonica*, Plums of Hungarie: some, *Gallica Pruna*, or French Prunes, of the country of France. *Clearchus Peripateticus* saith, that they of Rhodes and Sicilia do call the Damaske Prunes *Brabula*.

¶ The Temperature and Vertues.

A Plummes that be ripe and new gathered from the tree, what sort soeuer they are of, do moisten and coole, and yeeld vnto the body very little nourishment, and the same nothing good at all: for as Plummes do very quickly rot, so is also the iuice of them apt to putrifie in the body, and likewise to cause the meate to putrifie which is taken with them: onely they are good for those that would keepe their bodies soluble and coole; for by their moisture and slipperinesse they do mollifie the belly.

B Dried Plums, commonly called Prunes, are wholsomer, and more pleasant to the stomack, they yeeld more nourishment, and better, and such as cannot easily putrifie. It is reported, saith *Galen* in his booke of the faculties of Nourishments, that the best doe grow in Damascus a city of Syria; and next to those, they that grow in Spaine: but these doe nothing at all binde, yet diuers of the Damaske Damson Prunes very much; for Damaske Damson Prunes are more astringent, but they of Spaine be sweeter. *Dioscorides* saith, that Damaske Prunes dried do stay the belly; but *Galen* affirmeth, in his booke of the faculties of simple medicines, that they do manifestly loose the belly,

yet

yet lesser than they that bee brought out of Spaine; being boiled with Mead or honied water, which hath a good quantitie of honey in it, they loose the belly very much (as the same Authour saith) although a man take them alone by themselves, and much more if the Mead be supped after them. We most commend those of Hungarie being long and sweet; yet more those of Moravia the chiefe and principall citie in times past of the Prouince of the Marcomans: for these after they be dried, that the waterie humour may be consumed away, be most pleasant to the taste, and do easily without any trouble so mollifie the belly, as that in that respect they go beyond Cassia and Manna, as *Thomas Iordanus* affirmeth.

The leaues of the Plum tree are good against the swelling of the Vuula, the throat, gums, & kernels vnder the throat and iawes; they stop the rheume and falling downe of humors, if the decoction thereof be made in wine, and gargled in the mouth and throat.

The gumme which commeth out of the Plum-tree doth glew and fasten together, as *Dioscorides* saith.

Being drunke in wine it wasteth away the stone, and healeth Lichens in infants and young children; if it be layed on with vineger, it worketh the same effects that the gum of the Peach and cherrie tree doth.

The wilde Plums do stay and binde the belly, and so do the vnripe plummies of what sort soeuer, whiles they are sharpe and sower, for then are they astringent.

The iuice of Sloes doth stop the belly, the lask and bloody flux, the inordinat course of womens termes, and all other issues of blood in man or woman, and may very well be vsed in stead of Acatia, which is a thornie tree growing in Ægypt, very hard to be gotten, and of a deere price, and therefore the better for wantons; albeit our Plums of this countrey are equall vnto it in vertues.

CHAP. 127. Of Sebesten, or the Assyrian Plum.

Sebestena, Myxa, siue Myxara.
Assyrian Plums.

¶ The Description.

Sebestines are also a kinde of Plums: the tree whereof is not vnlike to the Plum tree, sauing it groweth lower than the most of the manured Plum trees; the leaues be harder and rounder; the floures grow at the tops of the branches consisting of five small white leaues, with pale yellowish threds in the middle, like those of the Plum tree: after followeth the fruit like to little Plummies, fastened in little skinny cups, which when they be ripe are of a greenish black colour, wherein is contained a small hard stone. The fruit is sweet in taste, the pulpe or meat is very tough and clammie.

¶ The Place.

The Sebesten trees grow plentifully in Syria and Egypt; they were in times past forreine and strange in Italy, now they grow almost in euery garden, being first brought thither in *Plinie* his time. Now do the Sebesten trees, saith he, in his 15. booke, 18. chapter, begin to grow in Rome, among the Seruice trees.

¶ The Time.

The time answereth the common Plums.

¶ The Names.

Pliny calleth the tree *Myxa*, it may bee suspected that this is the tree which *Matron Parasus* in his Atticke banquet in *Athenians* doth call *Myxaris*, but we cannot certainly affirme it, and especially because diuers haue diuersly deemed thereof. The berry or fruit is named

Myxon;

Myxon and *Myxarion*, neither haue the Latines any other name. The Arabians and the Apothecaries do call it *Sebesten*: which is also made an English name: we may call it the Assyrian Plum.

¶ *The Temperature and Vertues.*

- A Sebestens be very temperately cold and moist, and haue a thicke and clammie substance; therefore they nourish more than most fruits do, but withall they easily stop the intrayles, and stufte vp the narrow passages, and breed inflammations.
- B They take away the ruggednesse of the throat and lungs, and also quench thirst, being taken in a looch or licking medicine, or prepared any other kinde of way, or else taken by themselves.
- C The weight of ten drams, or of an ounce and a halfe of the pap or pulpe hereof being inwardly taken, doth loose the belly.
- D There is also made of this fruit a purging Electuarie, but such an one as quickly mouldeth, and therefore it is not to be vsed but when it is new made.

CHAP. 128. *Of the Indian Plums, or Mirobalans.*

¶ *The Kindes.*

There be diuers kinds of Mirobalans, as *Chebula*, *Bellirica*, *Emblica*, &c. They likewise grow vpon diuers trees, and in countries far distant one from another, and *Garcias* the Portugall Physition is of opinion, that the fve Kindes grow vpon fve diuers trees.

¶ *The Description.*

1 The first of the Mirobalan trees, called *Chebula*, is a shrubbie tree altogether wilde (which the Indians doe call *Aretica*;) in stature not vnlike to the Plum tree; the branches are many, and grow thicke together, whereon are set leaues like those of the Peach tree. The fruit is greater than any of the rest, somewhat long, fashioned like a peare.

2 This second kinde of Mirobalan, called *Flaua*, or *Citrina*, which some do call *Aritiqui*, but the common people of India, *Arare*, groweth vpon a tree of meane stature, hauing many boughes standing finely in order, and set full of leaues like vnto the Seruice tree.

3 The third kinde of Mirobalans, called *Emblica*, the Indians doe call *Amiale*, which grow vpon a tree of mean stature, like the former, but the leaues are very much iagged, in shape like the leaues of *Ferne*, but that they be somewhat thicker: the Indians do not put the fruit hereof vnto physicall vses, but occupie it for the thickening and tanning of their leather in stead of *Rhus*, or *Coriars Sumach*, as also to make inke and bletch for other purposes.

4 *Mirobalani Bellirica*, called of the Saues *Gotni*, and *Guti*, groweth vp to a meane stature, garnished with leaues like vnto Laurell or the Bay tree, but somewhat lesser, thinner, and of a pale Greene colour.

5 The fift kinde of Mirobalans is called *Indica*, which the Indians do call *ReZannale*; it groweth vpon a tree of meane stature, or rather vpon a shrub or hedge plant, bearing leaues like the Willow, and a fruit eight square. There is a fift kinde, the tree whereof is not mentioned in Authors.

¶ *The Place and Time.*

The last foure Kindes of Mirobalans do grow in the kingdome of Cambaia: they grow likewise in Goa, Batecala, Malanor, and Dabul: the *Kebula* in Bisnager, Decan, Guzarate, and Bengala, & many other places of the East Indies. The time agreeth with other fruits in those countries.

¶ *The Names.*

Those which we haue said to be yellow, the inhabitants of those countries where they grow doe call

call them *Arare*; those that be blacke they call *ReZennale*; the *Bellerica*, *Gotim*, the *Chebula*, *Aretca*, the *Emblica* are called *Aretiqui*.

¶ The Temperature.

All the kindes of Mirobalans are in taste astringent and sharpe like vnto the vnripe *Sorbus* or *Sernice* berries, and therefore they are of complexion cold and drie.

¶ The Vertues.

The Indians vse them rather to bind than purge, but if they do vse them for a purge, they vse the decoction of them, and vse them much conserued in sugar, and especially the *Chebula*; the yellow and blacke be good that way likewise.

The yellow and *Bellerica* taken before meat, are good against a laske, or weake stomacke, as *Garcias* writeth.

The yellow and blacke, or *Indica*, and the *Chebula*, purge lightly, if two or three drams be taken, and draw superfluous humors from the head.

The yellow, as some write, purge choier, *Chebula* flegme, *Indica* melancholie, and strengthen the inward parts, but roasted in the embers, or otherwise wasted, they drie more than they purge.

There are two sorts especially brought into these parts of the world conserued, the *Chebula*, and of them the best are somewhat long like a small Limon, with a hard rinde and black pith, of the taste of a conserued Wall-nut; and the *Bellerica*, which are round and lesser, and tenderer in eating.

Lobel writeth, that of them the *Emblica* do meanly coole, some do drie in the first degree, they purge the stomacke of rotten flegme, they comfort the braine, the sinewes, the heart, and liuer, procure appetite, stay vomite, and coole the heat of choler, helpe the vnderstanding, quench thirst, and the heate of the intrailes: the greatest and heauiest be the best.

They purge best, and with lesser paine, if they be laid in water in the Sun vntill they swell, & sod on a soft fire, & after they haue sod and be cold, preferued in foure times so much white honey, put to them.

Garcias found the distilled water to be right profitable against the French disease, and such like infections.

The *Bellerica* are also of a milde operation, and do comfort, and are cold in the first degree, and drie in the second: the others come neere to the *Emblica* in operation.

† I haue in this chapter contented my selfe with the expressing of the fruits out of *Clusius* and *Lobel*, and omitted the figures of the three Mirabalan trees, which our Author gaue vs out of *Tabernamontanus*; because I iudge them rather drawne by fancy than by the things themselves.

CHAP. 129. Of the Iuiube tree.

Iuiube Arabum, siue *Ziziphus Dodonæi*.
The Iuiube tree.

¶ The Description.

THE Iuiube tree is not much lesser than *Ziziphus candida*, hauing a wreathed trunk or body, and a rough barke full of rifts or cranies, and stiffe branches, beset with strong and hard prickles; from whence grow out many long twigs, or little stalkes, halfe a foot or more in length, in shew like *Rushes*, limmer, and easily bowing themselves, and very slender like the twiggies of *Spartum*: about which come forth leaues one aboue another, which are somewhat long, not very great, but hard and tough like to the leaues of *Peruinca* or *Peruinckle*; & among these leaues come forth pale and mossie little floures: after which succeed long red well tasted sweet berries as big as Oliues (of a meane quantity) or little Prunes, or smal Plums, wherein there are hard round stones, or in which a small kernell is contained.

¶ The Place.

There be now at this day Iuiube trees growing in very many places of Italy, which in times past were newly brought thither out of Syria, and that about *Pliny* his time, as he himselfe hath written in his 17. book, 10. chap.

¶ The Time.

It floureth in Aprill, at which time the seeds or stones are to be set or sowne for increase.

¶ The

¶ The Names.

This tree is called in Greeke *ζίζυφος* and *ζιζυκος* with *Iota* in the second syllable: in Latine likewise, *Zizyphus*; and of *Petrus Crescentius*, *Zexulus*: in English, Iuiube tree.

The fruit or Plums are named in Greeke *ζιζυφα*, *ζιζυγα*: *Galen* calleth them *emprisi*, as *Auicenna* plainly sheweth in his 369. chapter, intreating of the Iuiube, in which be set downe those things that are mentioned concerning *Serica* in *Galen's* books of the faculties of Nourishments: in Latine likewise *Zizypha* and *Serica*: in shops, *Iuinba*: in English, Iuiubes.

¶ The Temperature.

Iuiubes are temperate in heate and moisture.

¶ The Vertues.

A The fruit of the Iuiube tree eaten is of hard digestion, and nourisheth very little, but being taken in syrups, electuaries, and such like confections, it appeaseth and mollifieth the roughnesse of the throat, the brest and lungs, and is good against the cough, but exceeding good for the reines of the backe, and kidneies and bladder.

CHAP. 130. Of the Cherrie Tree.

¶ The Kindes.

THE antient Herbarists haue set downe foure Kindes of Cherrie trees, the first is great and wilde; the second tame or of the garden: the third, whose fruit is soure: the fourth is that which is called in Latine *Chamacerasus*, or the dwarfe Cherrie tree. The later writers haue found diuers sorts more, some bringing forth great fruit, others lesser; some with white fruit, some with blacke, others of the colour of blacke bloud, varying infinitely according to the climate and countrey where they grow.

1 *Cerasus vulgaris*.

The common English Cherrie tree.

3 *Cerasus Hispanica*.

The Spanish Cherrie tree.

¶ The

¶ The Description.

1 The English Cherrie tree groweth to an high and great tree, the body whereof is of a meane bignesse, which is parted aboue into very many boughes, with a barke somewhat smooth, and of a browne crimson colour, tough and pliable: the substance or timber is also browne in the middle, and the outward part is somewhat white. The leaues be great, broad, long, set with veines or nerues, and sleightly nicked about the edges: the floures are white, of a mean bignes, consisting of five leaues, and hauing certaine threds in the middle, of the like colour: the Cherries be round, hanging vpon long stems or foot-stalks, with a stone in the midst which is covered with a pulpe or soft meat; the kernell thereof is not vnpleasant to the taste, though somewhat bitter.

2 The Flanders Cherry tree differeth not from our English Cherrie tree in stature or forme of leaues or floures; the difference consisteth in this, that this tree bringeth forth his fruit sooner, and greater than the other: wherefore it may be called in Latine, *Cerasus precox, sive Belgica*.

5 *Cerasus Serotina.*
Late ripe Cherrie tree:

6 *Cerasus uno pediculo plura.*
The Cluster Cherrie tree.

3 The Spanish Cherrie tree groweth vp to the height of our common Cherrie tree: the wood or timber is soft and loose, couered with a whitish scalie barke: the branches are knottie, greater & fuller of substance than any other Cherry tree: the leaues are likewise greater and longer than any of the rest, in shape like those of the Chestnut tree: the floures are like the others in forme, but whiter of colour: the fruit is greater and longer than any, white for the most part all ouer, except those that stand in the hottest place where the Sun hath some reflexion against a wall: they are also white within, and of a pleasant taste.

4 The Gascoine Cherrie tree groweth very like to the Spanish Cherry tree in stature, floures, and leaues: it differeth in that it bringeth forth very great Cherries, long, sharpe pointed, with a certaine hollownesse vpon one side, and spotted here and there with certaine prickles of purple colour as small as sand: the taste is most pleasant, and excelleth in beautie.

5 The late ripe Cherry tree groweth vp like vnto our wilde English Cherry tree, with the like leaues,

7 *Cerasus multiflora fructus edens.*

The double floured Cherry tree bearing fruit.

8 *Cerasus multiflora pauciores fructus edens.*

The double floured barren Cherry tree.

9 *Cerasus avium nigra & racemosa.*

Birds Cherry, and blacke Grape Cherry tree.

10 *Cerasus racemosa rubra.*

Red Grape Cherry tree.

leaves, branches, and flowers, saying that they are sometimes once doubled: the fruit is small, round, and of a darke bloody colour when they be ripe, which the French-men gather with their stalkes, and hang them vp in their houses in bunches or handfulls against winter, which the Physicians do giue vnto their patients in hot and burning feuers, being first steeped in a little warme water, that causeth them to swell and plump vp as full and fresh as when they did grow vpon the tree.

6 The Cluster Cherry-tree differeth not from the last described either in leaves, branches, or stature: the flowers are also like, but neuer commeth any one of them to be double. The fruit is round, red when they be ripe, and many growing vpon one stem or footstake in clusters, like as the Grapes do. The taste is not vnpleasant, although somewhat soure.

7 This Cherrie-tree with double flowers growes vp vnto a small tree, not vnlike to the common Cherrie-tree in each respect, saying that the flours are somewhat doubled, that is to say, three or foure times double; after which commeth fruit (though in small quantitie) like the other common Cherrie.

8 The double floured Cherrie-tree growes vp like vnto an hedge bush, but not so great nor high as any of the others; the leaves and branches differ not from the rest of the Cherrie-trees. The flowers hereof are exceeding double, as are the flowers of Marigolds, but of a white colour, and smelling somewhat like the Hawthorne flowers; after which come seldome or neuer any fruit, although some Authors haue said that it beareth sometimes fruit, which my selfe haue not at any time seen; notwithstanding the tree hath growne in my garden many yeeres, and that in an excellent good place by a bricke wall, where it hath the reflection of the South sunne, fit for a tree that is not willing to beare fruit in our cold climat.

11 *Cerasus nigra*.

The common blacke Cherry-tree

12 *Chamaecerasus*.

The dwarfe Cherry-tree.

9 The Birds Cherry-tree, or the blacke Cherry-tree, that bringeth forth very much fruit vpon one branch (which better may be vnderstood by sight of the figure, than by words) springeth vp like an hedge tree of small stature, it groweth in the wilde woods of Kent, and are there vsed for stockes to graft other Cherries vpon, of better taste, and more profit, as especially those called the Flanders Cherries: this wilde tree growes very plentifully in the North of England, especially at a place called Heggdale, neer vnto Rosgill in Westmerland, and in diuers other places about Crossebie Rauenstwaith, and there called Hegberrie-tree: it groweth likewise in Martome Parke, foure miles

miles from Blackeburne, and in Harward neere thereunto; in Lancashire almost in euery hedge: the leaues and branches differ not from those of the wilde Cherry-tree: the floures grow alongst the small branches, consisting of five small white leaues, with some greenish and yellow thrums in the middle: after which come the fruit, Greene at the first, blacke when they be ripe, and of the bignesse of Sloes; of an harth and vnpleasant taste.

10 The other birds Cherry-tree differeth not from the former in any respect, but in the colour of the berries; for as they are blacke; so on the contrary, these are red when they be ripe, wherein they differ.

11 The common blacke Cherry-tree growes vp in some places to a great stature: there is no difference betweene it and our common Cherry-tree, sauing that the fruit hereof is very little in respect of other Cherries, and of a blacke colour.

12 The dwarfe Cherry-tree groweth very seldome to the height of three cubits: the trunk or body small, couered with a darke coloured blacke: whereupon do grow very limber and pliant twiggy branches: the leaues are very small, not much vnlike to those of the Priuite bush: the floures are small and white: after which come Cherries of a deepe red colour when they be ripe, of taste somewhat sharpe, but not greatly vnpleasant: the branches laid downe in the earth, quickly take root, whereby it is greatly increased.

My selfe with diuers others haue sundry other sorts in our gardens, one called the Hart Cherry, the greater and the lesser; one of a great bignesse, and most pleasant in taste, which we call *Luke Wardes* Cherry, because he was the first that brought the same out of Italy; another we haue called the Naples Cherry, because it was first brought, into these parts from Naples: the fruit is very great, sharpe pointed, somewhat like a mans heart in shape, of a pleasant taste, and of a deepe blackish colour when it is ripe, as it were of the colour of dried bloud.

We haue another that bringeth forth Cherries also very great, bigger than any Flanders Cherry, of the colour of Iet, or burnished horne, and of a most pleasant taste, as witnesseth Mr. Bull, the Queenes Maiesties Clockemaker, who did taste of the fruit (the tree bearing onely one Cherry, which he did eate; but my selfe neuer tasted of it) at the impression hereof. We haue also another, called the Agriot Cherry, of a reasonable good taste. Another we haue with fruit of a dun colour, tending to a watchet. We haue one of the dwarfe Cherries, that bringeth forth fruit as great as most of our Flanders Cherries, whereas the common sort hath very small Cherries, and those of an harth taste. These and many sorts more we haue in our London gardens, whereof to write particularly would greatly enlarge our volume, and to small purpose: therefore what hath been said shall suffice. † I must here (as I haue formerly done, in Peares, Apples and other such fruites) refer you to my two friends Mr. John Parkinson, and Mr. John Millen, the one to furnish you with the history, and the other with the things themselves, if you desire them. †

¶ The Time.

The Cherrie-trees bloome in Aprill; some bring forth their fruit sooner; some later: the red Cherries be alwaies better than the blacke of their owne kinde.

¶ The Names.

The Cherry-tree is called in Greeke, *κέρσιον*: and also in Latine, *Cerasus*: in high-Dutch, *Kirschenbaum*: in low-Dutch, *Kerssenboome*, and *Crieckenboom*: in French, *Cerisier*: in English, Cherry-tree.

The fruit or Cherries be called in Greeke, *κέρσιον*, and *κέρσιον*: and in Latine likewise, *Cerasa*: in English, Cherries: the Latine and English names in their feuerall titles shall suffice for the rest that might be said.

¶ The Temperature and Vertues.

A The best and principall Cherries be those that are somewhat sower: those little sweet ones which be wilde and soonest ripe be the worst: they containe bad iuice, they very soon putrifie, and do ingender ill bloud, by reason whereof they do not onely breed wormes in the belly, but troublesome agues, and often pestilent feuers: and therefore in well gouerned common wealths it is carefully provided, that they should not be sold in the markets in the plague time.

B Spanish Cherries are like to these in faculties, but they do not so soone putrifie: they be likewise cold, and the iuice they make is not good.

C The Flanders or Kentish Cherries that are through ripe, haue a better iuice but watery, cold and moist: they quench thirst, they are good for an hot stomacke, and profitable for those that haue the ague: they easily descend and make the body soluble: they nourish nothing at all.

D The late ripe Cherries which the French men keep dried against winter, and are by them called *Morelle*, and we after the same name call them Morell Cherries, are dry, and do somewhat binde, these being dried are pleasant to the taste, and wholesome for the stomacke, like as Prunes be, and do stop the belly.

Generally

Generally all the kindes of Cherries are cold and moist of temperature, although some more cold and moist than others: the which being eaten before meat doe soften the belly very gently, they are vnwholsome either vnto moist and rheumaticke bodies, or for vnhealthie and cold stomackes.

The common blacke Cherries do strengthen the stomack, and are wholesomer than the red Cherries, the which being dried do stop the laske.

The distilled water of Cherries is good for those that are troubled with heate and inflammations in their stomackes, and preuaileth against the falling sicknesse giuen mixed with wine.

Many excellent Tarts and other pleasant meats are made with Cherries, sugar, and other delicate spices, whereof to write were to small purpose.

The gum of the Cherrie tree taken with wine and water, is reported to helpe the stone; it may do good by making the passages slippery, and by tempering & alaying the sharpnesse of the humors; and in this maner it is a remedy also for an old cough. *Dioscorides* addeth, that it maketh one well coloured, cleareth the sight, and causeth a good appetite to meat.

CHAP. 131. Of the Mulberrie tree.

1 *Morus.*

The Mulberrie tree.

2 *Morus alba.*

The white Mulberrie tree.

The Description.

The common Mulberrie tree is high, and full of boughes: the body wherof is many times great, the barke rugged, & that of the root yellow: the leaues are broad and sharp pointed, something hard, and nicked on the edges; in stead of floures, are blowings or catkins, which are downie: the fruit is long, made vp of a number of little graines, like vnto a blacke-Berrie, but thicker, longer, and much greater, at the first greene, and when it is ripe blacke, yet is the iuice (whereof it is full) red: the root is parted many waies.

Llllll 2

2 The

2 The white Mulberrie tree groweth vntill it be come vnto a great and goodly stature, almost as big as the former: the leaues are rounder, not so sharpe pointed, nor so deeply snipt about the edges, yet sometimes sinuated or deeply cut in on the sides, the fruit is like the former, but that it is white and somewhat more tasting like wine.

¶ *The Place.*

The Mulberry trees grow plentifully in Italy and other hot regions, where they doe maintaine great woods and groues of them, that there Silke wormes may feed thereon. The Mulberry tree is fitly set by the flip; it may also be grafted or inoculated into many trees, being grafted in a white Poplar, it bringeth forth white Mulberies, as *Beritius* in his *Geoponikes* reporteth. These grow in fundry gardens in England.

¶ *The Time.*

Of all the trees in the Orchard the Mulberry doth last bloome, and not before the cold weather is gone in May (therefore the old Writers were wont to call it the wisest tree) at which time the Silke wormes do seeme to reuiue, as hauing then wherewith to feed and nourish themselves, which all the winter before do lie like small graines or seeds, or rather like the dunging of a flesh flie vpon a glasse, or some such thing, as knowing their proper time both to performe their duties for which they were created, and also when they may haue wherewith to maintaine and preserue their owne bodies, vnto their businesse aforesaid.

The berries are ripe in August and September. *Hegesander* in *Athenaus* affirmeth, that the Mulberrie trees in his time did not bring forth fruit in twentie years together, and that so great a plague of the gout then rained and raged so generally, as not onely men, but boies, wenches, eunuchs, and women were troubled with that disease.

¶ *The Names.*

This tree is named in Greeke *μωρία*, and *συμμιση*: in Latine, *Morus*: in shops, *Morus Celsi*: in high Dutch, *Maulberbaum*: in low Dutch, *Moorbessie boom*: in French, *Meurier*: in English, Mulberry tree.

The fruit is called *μωρον*, and *συμμιση*: in Latine, *Morum*: in shops, *Morum Celsi*: in high Dutch, *Moorbessie*: in Italian, *Moro*: in French, *Meure*: in Spanish, *Moras* and *Mores*: in English, Mulberry.

¶ *The Temperature and Vertues.*

- A Mulberries being gathered before they be ripe, are cold and dry almost in the third degree, and do mightily binde, being dried they are good for the laske and bloody flux, the pouder is vfed in meat, and is drunke with wine and water.
- B They stay bleedings, and also the reds; they are good against inflammations or hot swellings of the mouth and iawes, and for other inflammations newly beginning.
- C The ripe and new gathered Mulberries are likewise cold and be ful of iuice, which hath the taste of wine, and is something drying, and not without a binding qualitie; and therefore it is also mixed with medicines for the mouth, and such as helpe the hot swellings of the mouth, and almonds of the throat, for which infirmities it is singular good.
- D Of the iuice of the ripe berries is made a confection with sugar, called *Diamorum*: that is, after the manner of a syrrop, which is exceeding good for the vlcers and hot swellings of the tongue, throat, and almonds, or Vuula of the throat, or any other malady arising in those parts.
- E These Mulberries taken in meat, and also before meat, do very speedily passe through the belly, by reason of the moisture and slipperinesse of their substance, and make a passage for other meats, as *Galen* saith.
- F They are good to quench thirst, they stir vp an appetite to meat, they are not hurtfull to the stomacke, but they nourish the body very little, being taken in the second place, or after meat, for although they be lesse hurtfull than other like fruits, yet are they corrupted and putrified, vnlesse they speedily descend.
- G The barke of the root is bitter, hot and drie, and hath a scouring facultie: the decoction hereof doth open the stoppings of the liuer and spleen, it purgeth the belly, and driueth forth wormes.
- H The same bark being steeped in vineger helpeth the tooth ache: of the same effect is also the decoction of the leaues and barke, saith *Dioscorides*, who sheweth that about haruest time there issueth out of the root a iuice, which the next day after is found to be hard, and that the same is very good against the tooth-ache; that it wasteth away *Phyma*, and purgeth the belly.
- I *Galen* saith, that there is in the leaues and first buds of this tree a cerraine middle facultie, both to binde and scoure.

CHAP. 132. Of the Sycomore tree.

Sycomorus.

The Sycomore tree.

¶ The Description.

THE Sycomore tree is of no small height, being very like to the mulberrie tree in bignesse & shew, as also in leafe: the fruit is as great as a Fig, and of the same fashion, very like in iuice and taste to the wilde Fig, but sweeter, and without any grains or seeds within, which groweth not forth of the tender boughes, but out of the body and great old armes very fruitfully: this tree hath in it plenty of milkie iuice, which so soon as any part is broken or cut, doth issue forth.

¶ The Place.

It groweth, as *Dioscorides* writeth, very plentifully in Caria and Rhodes, and in fundry places of Egypt, as at the great Cayre or Alkaire, and in places that doe not bring forth much wheat, in which it is an helpe, and sufficeth in stead of bread & corne when there is scarcitie of victuals, *Galen* writeth, that he saw a plant of the Sycomore tree like to the wilde Fig tree, fruit and all.

¶ The Time.

It bringeth forth fruit three or foure times in one yeare, and oftner if it be scraped with an iron knife, or other like instrument.

¶ The Names.

This tree is called in Greeke, *συκωμορ*, of the Fig tree and the Mulberrie tree: in Latine, *Sycomorus*: *Cornelius Celsus* nameth it backward *Morosycos*: the Egyptians of our time do call it *Ficus Pharaonis*, or Pharaoh his Fig tree, as witnesseth *Belonius*: and it is likewise termed *Ficus Egyptia*, Egyptian Fig tree, and also *Morus Egyptia*, or Egyptian Mulberrie tree. We call it English, Sycomore tree after the Greek and Latine, and also Mulberry Fig tree, which is the right Sycomore tree, and not the great Maple, as we haue said in the chapter of the Maple.

The fruit is named in Greeke *Sycomoron*, and in Italian, *Sycomoro* and *Fico d'Egitto*.

¶ The Temperature and Vertues.

The fruit of the Sycomore tree hath no sharpnesse in it at all, as *Galen* saith. It is somewhat sweet A in taste, and is of temperature moist after a sort, and cold as be Mulberries.

It is good, saith *Dioscorides*, for the belly, but it is *asper*, that is, without any nourishment, and B troublesome to the stomacke.

There issueth forth of the barke of this tree in the beginning of the Spring, before the fruit ap- C peareth, a liquour, which being taken vp with a sponge, or a little wooll, is dried, made vp into fine cakes, and kept in gallee pots: this mollifieth, closeth wounds together, and dissolueth grosse humours.

It is both inwardly taken and outwardly applied against the bitings of serpents, hardnesse of the D milt or spleene, and paine of the stomacke proceeding of a cold cause: this liquor doth very quickly putrefie.

CHAP. 133. Of the Figtree.

¶ The Description.

THe garden Fig tree becommeth a tree of a meane stature, hauing many branches full of white pith within, like Elderne pith, and large leaues of a darke greene colour, diuided into sundry sections or diuisions. The fruit commeth out of the branches without any floure at all that euer I could perceiue, which fruit is in shape like vnto Peares, of colour either whitish, or somewhat red, or of a deep blew, full of small graines within, of a sweet and pleasant taste; which beeing broken before it be ripe, doth yeeld most white milk, like vnto the kindes of Spurge, and the leaues also beeing broken doe yeeld the like liquour; but when the Figges be ripe, the iuice thereof is like honic.

1 *Ficus.*

The Fig tree.

† 2 *Chamaeficus.*

The dwarfe Fig tree.

A 12 The dwarfe Fig-tree is like vnto the former in leaues and fruit, but it neuer groweth aboue the height of a man, and hath many small shoots comming from the roots, whereby it greatly increaseth.

There is also another wilde kinde, whose fruit is neuer ripe; *Theophrastus* nameth it *Erineos*; *Pliny* *Caprificus*.

¶ The Place.

The Fig trees do grow plentifully in Spain and Italy, and many other countries, as in England; where they beare fruit, but it neuer commeth to kindly maturitie, except the tree be planted vnder an hot wall, whereto neither North, nor Northeast windes can come.

¶ The Time.

The dwarfe Fig tree groweth in my garden, and bringeth forth ripe and very great fruit in the moneth of August, of which Figs sundry persons haue eaten at pleasure.

In England the Fig trees put not forth their leaues vntill the end of May, where oftentimes the fruit commeth forth before the leaues appeare.

¶ The

¶ The Names.

The Fig tree is called in Greeke, *συκή*, and of diuers, for difference sake betweene it and the wild Fig tree, *συκή ἄγρια*: in Latine, *Ficus*, and *Ficus satina*, and *Vrbana*: in high-Dutch, *Feygenbaum*: in low-Dutch, *Wijghboom*: in French, *Figuier*: in Italian, *Fico*: in Spanish, *Higuera*: in English, Fig tree.

The fruit is named in Greeke, *σῦκα*: in Latine, *Ficus*: and the vnripe fruit, *δρακός*: in Latine, *Gros-sus*: that which is dried is called in Greeke, *βλάστη*: in Latine, *Carica*: in high-Dutch, *Feygen*: in low-Dutch, *Wijghen*: in French, *Figues*: in Italian, *Fichi*: in Spanish, *Higos*: in English, Fig: the little seeds which are found in them are named by Galen, *αρχαμίδες*, *Cechramides*.

¶ The Temperature.

The greene Figs new gathered are somewhat warme and moist: the dry and ripe Figs are hot almost in the third degree, and withall sharpe and biting.

The leaues also haue some sharpnesse, with an opening power, but not so strong as the iuice.

¶ The Vertues.

The dry Figs do nourish better than the greene or new Figs; notwithstanding they ingender A not very good bloud, for such people as do feed much thereon doe become low sie.

Figs be good for the throat and lungs, they mitigate the cough, and are good for them that be B short winded: they ripen flegme, causing the same to be easily spit out, especially when they be sodden with Hyssop, and the decoction drunke.

Figges stamped with Salt, Rew, and the kernels of Nuts withstand all poyson and corruption C of the aire. The King of Pontus, called *Atithridates*, vsed this preseruatiue against all venom and poyson.

Figs stamped and made into the forme of a plaister with wheat meale, the pouder of Fenugreek, D and Linefeed, and the roots of marish Mallowes, applied warme, do soften and ripen impostumes, phlegmons, all hot and angry swellings and tumors behinde the eares: and if you adde thereto the roots of Lillies, it ripeneth and breaketh Venerious impostumes that come in the flanke, which impostume is called *Bubo*, by reason of his lurking in such secret places: in plaine English termes they are called botches.

Figs boiled in Wormwood wine with some Barly meale are very good to be applied as an im-plaister vpon the bellies of such as haue the drop sicke.

Dry Figges haue power to soften, consume, and make thinne, and may be vsed both outwardly and inwardly, whether it be to ripen or soften impostumes, or to scatter, dissolue, and consume them.

The leaues of the Fig tree do waste and consume the Kings Euill, or swelling kernells in the G throat, and do mollifie, waste, and consume all other tumors, being finely pouned and laid thereon: but after my practise, being boiled with the roots of marish Mallowes vntill they be soft, and so incorporated together, and applied in forme of a plaister.

The milky iuyce either of the figs or leaues is good against all roughnesse of the skinne, lepries, H spreading sores, tetters, small pockes, meafels, pushes, wheales, freckles, lentiles, and all other spots, scurvineffe, and deformitie of the body and face, being mixed with Barley meale and applied: it doth also take away warts and such like excrescences, if it be mingled with some fattie or greasie thing.

The milke doth also cure the tooth-ache, if a little lint or cotton be wet therein, and put into the I hollownesse of the tooth.

It openeth the veines of the hemorrhoids, and looseth the belly, being applied to the funda-K ment.

Figs stamped with the pouder of Fenugreek, and vineger, and applied plaisterwise, doe ease L the intollerable paine of the hot gout, especially the gout of the feet.

The milke thereof put into the wound proceeding of the biting of a mad dog, or any other ve-M nomous beast, preserueth the parts adioyning, taketh away the paine presently, and cureth the hurt.

The greene and ripe Figs are good for those that be troubled with the stone of the kidneyes, for they make the conduits slipperie, and open them, and do also somewhat clense: whereupon after the eating of the same, it hapneth that much grauell and sand is conueyed forth.

Dry or barrell Figs, called in Latine *Carica*, are a remedie for the belly, the cough, and for old infirmities of the chest and lungs: they scour the kidnies, and clense forth the sand, they mitigate the paine of the bladder, and cause women with child to haue the easier deliuerance, if they feed thereof for certaine dayes together before their time.

Dioscorides saith, that the white liquor of the Fig tree, and iuice of the leaues, do curdle milke as P rennet doth, and dissolue the milke that is cluttered in the stomacke, as doth vineger.

It bringeth downe the menses, if it be applied with the yolke of an egge, or with yellow wax. Q

CHAP. 134. Of the prickly Indian Fig tree.

Ficus Indica.
The Indian Fig tree.*Fructus.*
The fruit.

¶ The Description.

THis strange and admirable plant, called *Ficus Indica*, seemes to be no other thing than a multiplication of leaues, that is, a tree made of leaues, without body or boughes; for the leafe set in the ground doth in short space take root, and bringeth out of it selfe other leaues, from which do grow others one after another, till such time as they come to the height of a tree, hauing also in the meane season boughes as it were comming from those leaues, sometimes more, otherwhiles fewer, as Nature list to bestow, adding leafe vnto leafe, whereby it occupieth a great piece of ground: these leaues are long and broad, as thicke as a mans thumbe, of a deepe Greene colour, set full of long, slender, sharpe, and whitish prickles: on the tops of which leaues come forth long floures not vnlike to those of the manured Pomegrenat tree, of a yellow colour: after which cometh the fruit like vnto the common Fig, narrow below, and bigger aboue, of a Greene colour, and stuffed full of a red pulpe and iuice, staining the hands of them that touch it, as do the Mulberries, with a bloody or sanguine colour: the top of which Figs are inuironed with certaine scaly leaues like a crowne, wherein are also contained small graines that are the seeds; the which being sowne, do bring forth plants round bodied, like vnto the trunk of other trees, with leaues placed thereon like the other; which being set in the ground bring forth trees of leaues, as we haue shewed.

† Vpon this plant in some parts of the West Indies grow certain excrescences, which in continuance of time turn into Insects; and these out-growings are that high prized Cochenele wherewith they dye colours in graine. †

¶ The Place.

This plant groweth in all the tract of the East and West Indies, and also in the countrey Norrembega, now called Virginia, from whence it hath beene brought into Italy, Spaine, England, and other countries: in Italy it sometimes beareth fruit, but more often in Spaine, and neuer as yet in England, although I haue bestowed great pains and cost in keeping it from the iniury of our cold clymat.

It groweth

It groweth also at S. Crux and other places of Barbary, and also in an Island of the Mediterranean sea, called Zante, about a day and nights sailing with a meane winde from Petrasse a port in Morea, where my seruant *William Marshall* (before remembred) did see not only great store of those trees made of leaues, but also diuers other round bodied plants of a woody substance: from whence he brought me diuers plants thereof in tubs of earth, very fresh and greene, which flourished in my garden at the impression hereof.

¶ *The Time.*

These plants do grow greene and fresh both Winter and Sommer, by the relation of my foresaid seruant: notwithstanding they must be very carefully kept in these countries from the extremitie of Winter.

¶ *The Names.*

This is thought to be the plant called of *Pliny*, *Opuntium*; whereof he hath written, *lib. 21. ca. 17.* in this manner: About Opuns is the herbe *Opuntia*, to mans taste sweet, and it is to be maruelled, that the root should be made of the leaues, and that it should so grow. Opuns is a city neere vnto Phocis in Greece, as *Pausanias*, *Strabo*, and *Pliny* testifie: but it is commonly called in Latine, *Ficus Indica*: of the Indians, *Tune*, and *Tunas*, and also *Anapallus*, as testifieth *Bellonius*: in English, Indian Fig tree.

There is a certaine other described for the Indian Fig tree, by *Theophrastus*, *lib. 4.* which *Pliny*, *lib. 12. cap. 5.* doth eloquently expresse almost in the same words, but turned into Latine, whereof we intend to speake in the next chapter.

¶ *The Temperature and Vertues.*

We haue no certaine instruction from the Antients, of the temperature or faculty of this plant, A or of the fruit thereof: neither haue we any thing whereof to write of our owne knowledge, more than that we haue heard reported of such as haue eaten liberally of the fruit hereof, that it changed their vrine to the colour of bloud; who at the first sight thereof stood in great doubt of their life, thinking it had been bloud, whereas it proued afterwards by experience to be nothing but the tincture or colour the vrine had taken from the iuice of the fruit, and that without all hurt or grieve at all.

It is reported of some, that the iuice of the fruit is excellent good against vlcers of long continuance. B

‡ Cochenele is giuen alone, and mixed with other things, in maligne diseases, as pestilent fevers and the like, but with what successe I know not. ‡ C

CHAP. 135. Of the arched Indian Fig tree.

¶ *The Description.*

THIS rare and admirable tree is very great, straight, and couered with a yellowish bark tending to tawny: the boughes and branches are many, very long, rough, and flexible, growing very long in short space, as do the twigs of Oziers, and those so long and weake, that the ends thereof hang downe and touch the ground, where they take root and grow in such sort, that those twigs become great trees: and these being growne vp vnto the like greatnesse, doe cast their branches or twiggy tendrels vnto the earth, where they likewise take hold and root; by meanes wherof it commeth to passe, that of one tree is made a great wood or desert of trees, which the Indians do vse for couerture against the extreme heate of the Sun, wherewith they are grievously vexed: some likewise vse them for pleasure, cutting downe by a direct line a long walke, or as it were a vault, through the thickest part, from which also they cut certaine loope-holes or windowes in some places, to the end to receiue thereby the fresh coole aire that entreth thereat, as also for light, that they may see their cattell that feed thereby, to auoid any danger that might happen vnto them either by theemie or wilde beasts: from which vault or close walke doth rebound such an admirable echo or answering voice, if one of them speake vnto another aloud, that it doth resound or answer againe foure or fve times, according to the height of the voice, to which it doth answer, and that so plainly, that it cannot be knowne from the voice it selfe: the first or mother of this wood or desert of trees is hard to be knowne from the children, but by the greatnesse of the body, which three men can scarcely fathom about: vpon the branches whereof grow leaues hard and wrinkled, in shape like those of the Quince tree, greene aboue, and of a whitish hoary colour vnderneath, whereupon the Elephants delight to feed: among which leaues come forth the fruit, of the bignes of a mans thumbe, in shape like a small Fig, but of a sanguine or bloudy colour, and of a sweet tast, but

but not so pleasant as the Figs of Spaine; notwithstanding they are good to be eaten, and withall very wholsome.

Arbor ex Goa, sine Indica.
The arched Indian Fig tree.

¶ *The Place.*

This wondrous tree groweth in diuers places of the East Indies, especially neere vnto Goa, and also in Malaca: it is a stranger in most parts of the world.

¶ *The Time.*

This tree keepeth his leaues green winter and Sommer.

¶ *The Names.*

This tree is called of those that haue trauelled, *Ficus Indica*, the Indian Fig; and *Arbor Goa*, of the place where it groweth in greatest plenty: we may call it in English, the arched Fig tree.

‡ Such as desire to see more of this Fig tree, may haue recourse to *Clusius* his *Exoticks*, lib. 1. cap. 1. where he shewes it was mentioned by diuers antient Writers, as *Q. Curtius*, lib. 9. *Plin.* lib. 12. ca. 5. *Strabo*, lib. 5. and *Theophr.* *Hist. Plant.* lib. 4. cap. 5. by the name of *Ficus Indica*. ‡

¶ *The Temperature and Vertues.*

We haue nothing to write of the temperature or vertues of this tree, of our owne knowledge: neither haue wee receiued from others more, than that the fruit hereof is generally eaten, and that without any hurt at all, but rather good, and also nourishing.

CHAP. 136.

Of Adams Apple tree, or the West-Indian Plantaine.

¶ *The Description.*

WHether this plant may be reckoned for a tree properly, or for an herby Plant, it is disputable, considering the soft and herby substance whereof it is made; that is to say, when it hath attained to the height of six or seuen cubits, and of the bignesse of a mans thigh, notwithstanding it may be cut downe with one stroke of a sword, or two or three cuts with a knife, euen with as much ease as the root of a Radish or Carrot of the like bignesse: from a thicke farthreddy root rise immediately diuers great leaues, of the length of three cubits and a halfe, sometimes more, according to the soile where it groweth, and of a cubit and more broad, of bignes sufficient to wrap a childe in of two yeares old, in shape like those of Mandrake, of an ouerworn green colour, hauing a broad rib running thorow the middle thereof: which leaues, whether by reason of the extreme hot scorching Sun, or of their owne nature, in September are so dry and withered, that there is nothing thereof left or to be seene but onely the middle rib. From the midst of these leaues riseth vp a thicke trunk, whereon doth grow the like leaues, which the people do cut off, as also those next the ground, by meanes whereof it riseth vp to the height of a tree, which otherwise would remaine a low and base plant. This manner of cutting they vse from time to time, vntill it come to a certaine height, aboue the reach of the Elephant, which greedily seeketh after the fruit. In the midst of the top among the leaues commeth forth a soft and fungous stumpe, whereon do grow diuers apples in forme like a small Cucumber, and of the same bignesse, couered with

with a thin rinde like that of the Fig, of a yellow colour when they be ripe: the pulpe or substance of the meate is like that of the Pompion, without either seeds, stones, or kernels, in tast not greatly perceiued at the first, but presently after it pleaseth, and entiseth a man to eat liberally thereof, by a certaine entising sweetnes it yeelds: in which fruit, if it be cut according to the length (saith myne Author) oblique, transuerse, or any other way whatsoever, may be seen the shape and forme of a crosse, with a man fastned thereto. My selfe haue seene the fruit, and cut it in pieces, which was brought me from Aleppo in pickle; the crosse I might perceiue, as the forme of a spread-Egle in the root of Ferne; but the man I leaue to be sought for by those that haue better eyes and iudgment than my selfe.

Musa Serapionis.
Adams Apple tree.

Musa Fructus.
Adams Apple.

‡ April 10. 1633. my much honored friend Dr. *Argent* (now President of the Colledge of Physitions of London) gaue me a plant he receiued from the Bermuda's: the length of the stalke was some two foot; the thicknesse thereof some seuen inches about, being crested, and full of a soft pith, so that one might easily with a knife cut it asunder. It was crooked a little, or indented, so that each two or three inches space it put forth a knot of some halfe inch thicknesse, and some inch in length, which incompassed it more than halfe about; and vpon each of these ioints or knots, in two rankes one aboue another, grew the fruit, some twenty, nineteene, eightene, &c. more or lesse, at each knot: for the branch I had, contained nine knots or diuisions, and vpon the lowest knot grew twenty, and vpon the vppermost fiftene. The fruit which I receiued was not ripe, but Greene, each of them was about the bignesse of a large Beane; the length of them some fife inches, and the bredth some inch and halfe: they all hang their heads downwards, haue rough or vneuen ends, and are fife cornered; and if you turne the vpper side downward, they somewhat resemble a boat, as you may see by one of them exprest by it selfe: the huske is as thicke as a Beanes, and will easily shell off it: the pulpe is white and soft: the stalke whereby it is fastned to the knot is verie short, and almost as thicke as ones little finger. This stalke with the fruit thereon I hanged vp in my shop, were it became ripe about the beginning of May, and lasted vntil Iune: the pulp or meat was very soft and tender, and it did eate somewhat like a Muske-Melon. I haue giuen you the figure of the whole branch, with the fruit thereon, which I drew as soone as I receiued it, and it is marked with this figure 1. The figure 2. sheweth the shape of one particular fruit, with the lower side

side vpwards. 3. The same cut through the middle long wayes. 4. The same cut side wayes. I haue been told (but how certaine it is I know not) that the floures which precede the fruit are bell-fashioned, and of a blew colour. I could obserue no seed in the fruit; it may be it was because it had been cut from the stocke so long before it came to maturitie. This Plant is found in many places of Asia, Africke, and America, especially in the hot regions: you may find frequent mention of it amongst the sea voyages to the East and West Indies, by the name of Plantaines, or *Platanus*, *Bannanas*, *Bonnanas*, *Bouanas*, *Dauanas*, *Poco*, &c. some (as our Author hath said) haue iudged it the forbidden fruit; other-some, the Grapes brought to *Moses* out of the Holy-land. †

Musa fructus exactior Icon.

An exacter figure of the Plantaine fruit.

¶ *The Place.*

This admirable tree groweth in Egypt, Cyprus, and Syria, neere vnto a chiefe city there called Alep, which we call Aleppo; and also by Tripolis, not far from thence: it groweth also in Canara, Decan, Guzarate, and Bengala, places of the East Indies.

¶ *The Time.*

From the root of this tree shooteth forth yong springs or shoots, which the people take vp and plant for the increase in the Spring of the year. The leaues wither away in September, as is aboue said.

¶ *The Names.*

It is called *Musa* by such as trauell to Aleppo: by the Arabians, *Musa Maum*: in Syria, *Mose*: The Grecians and Christians which inhabit Syria, and the Iewes also, suppose it to be that tree of whose fruit *Adam* did taste; which others thinke to be a ridiculous fable: of *Pliny*, *Opuntia*.

It is called in the East Indies (as at Malauar where it also groweth) *Palap*: in Malayo, *Pican*: and in that part of Africa which we call Ginny, *Bananas*: in English, Adams Apple tree.

¶ *The Temperature.*

Dioscorides and *Serapio* iudge, that it heateth in the end of the first degree, and moistneth in the end of the same.

¶ *The Vertues.*

A The fruit hereof yeeldeth but little nourishment: it is good for the heate of the breast, lungs, and bladder: it stoppeth the liuer, and hurteth the stomacke if too much of it be eaten, and procureth

cureth loosenesse in the belly: whereupon it is requisit for such as are of a cold constitution, in the eating thereof to put vnto it a little Ginger or other spice.

It is also good for the reines, or kidnies, and to prouoke vrine: it nourisheth the childe in the mothers wombe, and stirreth to generation.

CHAP. 137. Of the Date tree.

Palma.
The Date tree.

Palmarum fructus & flores cum Elate.
The fruit and floures of the Date tree.

¶ The Description.

THe Date tree groweth very great and high: the body or trunk thereof is thicke, and couered with a scaly rugged barke, caused by the falling away of the leaues: the boughes grow onely on the top, consisting of leaues set vpon a woody middle rib like those of Reeds or Flags: the inner part of which rib or stalke is soft, light, hollow, and spongie. Among the leaues come forth the floures included in a long skinny membrane, as it were a sheath or hose, like that which couereth the Floure de-Luce before it be blowne, which being opened of it selfe, white floures start forth, standing vpon short and slender foot-stalkes, which are fastened with certaine small filaments or threddy strings like vnto little branches: after which spring out from the same branches the fruit or Dates, which be in fashion long and round, in taste sweet, and many times somewhat harsh, of a yellowish red colour; wherein is contained a long hard stone, which is in stead of kernell and seed; the which I haue planted many times in my Garden, and haue growne to the height of three foot: but the first frost hath nipped them in such sort, that soone after they perished, notwithstanding my industrie by couering them, or what else I could doe for their succour.

¶ The Place.

The Date trees grow plentifully in Africa and Egypt; but those which are in Palestina and Syria,

M m m m m

Syria be the best: they grow likewise in most places of the East and West Indies, where there be diuers sorts, as well wilde, as tame or manured.

¶ The Time.

The Date tree is alwaies green, and floureth in the Spring time: the fruit is ripe in September, and being then gathered they are dried in the Sunne, that they may be the better both transported into other countries far distant, as also preferred from rotting at home.

¶ The Names.

The tree is called in Greeke, φοίνιξ: in Latine, *Palma*: in English, Date tree.

The fruit is named in Greeke, Βάλανος φοινίκων: that is to say, *Glan's Palmarum*, or the fruit of the Date trees: and by one word, φοινικαβάλανος: in Latine, *Palmula*: in shops, *Dactylus*: in high-Dutch, *Dattel*: in low-Dutch, *Dadelen*: in Italian, *Dattoli*: in French, *Dattes*: in Spanish, *Tamaras*, and *Dattiles*: in English, Date.

The cod or sheath wherein the floures and Dates are wrapped, is called *involucre*: and of some, *Bipraxis*.

¶ The Temperature and Vertues.

- A All manner of Dates whatsoever are hard of digestion, and cause head-ache: the worser sort be those that be dry and binding, as the Egyptian Dates; but the soft, moist, and sweet ones are lesse hurtfull.
- B The blood which is ingendred of Dates in mans body is altogether grosse, and somewhat clammy: by these the liuer is very quickly stopped, especially being inflamed and troubled with some hard swelling: so is the spleene likewise.
- C The Dates which grow in colder regions, when they cannot come to perfect ripenesse, if they be eaten too plentifully, do fill the body full of raw humors, ingender winde, and oft times cause the leprosie.
- D The drier sorts of Dates, as *Dioscorides* saith, be good for those that spet blood, for such as haue bad stomacks, and for those also that be troubled with the bloody flux.
- E The best Dates, called in Latine *Caryota*, are good for the roughnesse of the throat and lungs.
- F There is made hereof both by the cunning Confectioners and Cookes, diuers excellent cordiall, comfortable, and nourishing medicines, and that procure lust of the body very mightily.
- G They do also refresh and restore such vnto strength as are entring into a consumption, for they strengthen the feeblenesse of the liuer and spleene, being made into conuenient broths, and physickall medicines directed by a learned Physitian.
- H Dry Dates do stop the belly, and stay vomiting, and the wambling of womens stomackes that are with childe, if they be either eaten in meates or otherwise, or stamped and applied vnto the stomacke as a pectorall plaister.
- I The ashes of the Date stones haue a binding qualitie, and emplastick facultie, they heale pushes in the eyes, *Staphylomata*, and falling away of the haire of the eye lids, being applied together with Spikenard: with wine it keepeth proud flesh from growing in wounds.
- K The boughes and leaues do euidently binde, but especially the hose, that is to say, the sheath or case of the floures: and therefore it is good to vse these so oft as there is need of binding.
- L The leaues and branches of the Date tree do heale greene wounds and vlcers, refresh and coole hot inflammations.
- M *Galen* in his booke of Medicines according to the kindes mentioneth a composition called *Dialpama*, which is to be stirred with the bough of a Date tree in stead of a spatule or a thing to stirre with, for no other cause than that it may receiue thereby some kinde of astringion or binding force.

CHAP. 138. Of the wilde Date trees.

¶ The Description.

Theophrastus maketh this plant to be a kinde of Date tree, but low and of small growth, feldome attaining aboue the height of a cubit: on the top whereof shoot forth for the most part long leaues like those of the Date tree, but lesser and shorter; from the sides whereof breakes forth a bush of threddy strings: among which riseth vp small branches garnished with clusters of white floures, in which before they be opened are to be seene vnperfect shapes of leaues, closely compassed about with an innumerable sort of thin skinny hulls; which rude shapes with the floures are serued vp and eaten at the second course among other iunkets, with a little salt and pepper, being pleasant to the taste. ‡ The stalke is about the thicknes of ones little

1 *Palmites, sine Chamarripbes.*
The little wilde Date tree.

2 *Palmapius, sine Palma conifera.*
The wilde Date tree bearing cones.

‡ *Fructus Palmapii.*
The fruit of the Cone-Date.

little finger, here and there set with a few crooked pricks: the leaues within some handfull or two of the stalke are cut vp and made into little besomes, which are sold in many glasse shops here in London. ‡

2 The wilde Date tree that brings forth cones or key-clogs, is of most travellers into the Indies thought to be barren of Dates, except sometimes it yeeldeth forth some small berries like unto Dates, but dry, and nothing worth. This tree groweth to the height and bignesse of a low tree, the trunk or body whereof is soft, of a fungous or pithy substance, vnfit for building, as is the manured Date tree: the branch it selfe was brought vnto vs from the Indies, dry & void of leaues, wherefore we must describe the leaues by report of the bringer. The branches (saith my Author) are couered ouer with long flaggie leaues, hanging downe of a great length like those of the Date tree: the branches are also couered with a scaly or scabbed barke, verie rough, one scale or plate lying ouer another, as tiles vpon a house: the fruit growes at the end of the branches, not vnlike a great Pine Apple cone, couered ouer with a skinne like the Indian Nut: wherein is contained a shel, within which shell lieth hid an acorn or long

M m m m m m 2

kernell

kernell of an inch long, and sometimes longer, very hard to be broken, in taste like the Chestnut; which the savage people do grate and stampe to powder to make them bread.

¶ *The Place.*

Theophrastus saith the first growes in Candy, but much more plentifully in Cilicia, and are now found in certaine places of Italy by the sea side, and also in diuers parts of Spaine.

The other hath been found by traellers into the West Indies, from whence haue bin brought the naked branches with the fruit.

¶ *The Time.*

The time answereth that of the manured Date tree.

¶ *The Names.*

The little Date tree or wilde Date tree is named of *Theophrastus*, *χαμῶπις*: in Naples, *Cephaglio-ne*: in Latine commonly *Palmites*. That which is found in the midst of the yong springs, and is vsed to be eaten in banquets, is called in Greeke, *ἡμαρῆς τρυφῆς*: in Latine, *Palma cerebrum*, the brain of the Date tree.

¶ *The Temperature and Vertues.*

A *Galen* supposeth that the brain of the Date tree consisteth of sundry parts, that is to say, of a certaine waterie and warme substance, and of an earthy and cold; therefore it is moist and cold, with a certaine astringion or binding qualitie.

B Being taken as a meat it ingendreth raw humors and winde, and therefore it is good to be eaten with pepper and salt.

CHAP. 139. Of the drunken Date tree.

Areca, sine Fausel.

The drunken Date tree.

¶ *The Description.*

The drunken Date tree, which *Carolus Clusius* calleth *Fausel*, is an Indian tree of a great bignes, the timber whereof is very soft and spongiouse, exceeding smooth and plaine vnto a great height,

height, not possible to be climbed vp, and therefore the Indians for their easier ascending vp, at some distances do tie round about the tree certaine wyths or ropes made of the barkes of trees, as may be perceiued by the figure, whereby very easily they go vp and downe to gather the fruit at their pleasure. The top of the tree is diuided into sundry branches, in substance like to the great cane; whereupon do grow faire flaggie leaues like those of the Palme or Date tree, whereof doubtlesse this is a wilde kinde: from the bottome of which branches commeth forth fruit in long bunches like traces of Onions, couered with a soft pulpe like vnto the Wall-nut, rough, and verie full of haire of a yellowish colour, and like the dried Date when it is ripe: within which huske is contained fruit like vnto the Nutmeg, but greater, very hard, and striped ouer with red and white veines, or sinues.

¶ *The Place, Time, and Names.*

This Date tree, which the Arabians call *Fausel*, that is by interpretation, *Anellana Indica*, the Indian Nut or Filberd, *Auicen* and *Serapio* call *Filfel*, and *Fusel*. It groweth in the East Indies in diuers and sundry places, as in Malauar, where vulgarly it is called *Pac*; and of the Nobles and Gentlemen, *Areca*: which name is vsed amongst the Portugals which dwell in those Indies: in Guzarate and Decan it is called *Cupare*: in Zeilan, *Poaz*: in Malaca, *Pinan*: in Cochin, *Chacani*: in English, the drunken Date tree, which name we haue coined from his qualitie, because the fruit maketh those drunke that eate thereof.

¶ *The Temperature.*

It is cold and dry in the second degree.

¶ *The Vertues.*

The fruit of *Areca* before it be ripe is reckoned amongst the stupefactiue or astonishing medicines; for whosoever eateth thereof waxeth drunke, because it doth exceedingly amase and astonish the senses. A

When the Indians are vexed with some intolerable ache or paine, or must of necessitie endure some great torment or torture, then do they take of this fruit, whereby the rigor of that pain which otherwise they should feelee, is very much mitigated. B

The iuice of the fruit of *Areca* doth strengthen the gums, fasten the teeth, comfort the stomach, stay vomiting and loosenesse of the belly: it doth also purge the body from congealed or clotted blood gathered within the same. C

CHAP. 140. Of the Indian Nut tree.

¶ *The Description.*

THE Grecians haue not known, but the Arabians haue mentioned this Indian Nut tree, the body whereof is very great, smooth and plaine, void of boughes or branches, of a great height; wherefore the Indians do wrap ropes about the body thereof, as they doe vpon the tree last described, for their more ease in gathering the fruit: the timber whereof is verie spongie within, but hard without, a matter fit to make their Canoos and boats of: on the top of the tree grow the leaues like those of the Date tree, but broad, and sharpe at the point as thornes, whereof they vse to make needles, bodkins, and such like instruments, wherewith they sew the sailes of their ships, and do such like businesse: among these leaues come forth clusters of floures like those of the Chestnut tree, which turne into great fruit of a round forme, and somewhat sharp at one end; in that end next vnto the tree is one hole, sometimes two bored through: this Nut or fruit is wrapped in a couerture, consisting of a substance not vnlike to hempe before it be beaten soft: there is also a finer and gentler stufte next vnto the shell, like vnto Flax before it be made soft: in the middle whereof is contained a great Nut couered with a very hard shell, of a browne colour before it be polished, afterward of a blacke shining colour like burnished horne: next vnto the shell vpon the inside there cleaueth a white cornelly substance firme and sollid, of the colour and taste of a blanchd Almond: within the cauitie or hollownes thereof is contained a most delectable liquor like vnto milke, and of a most pleasant taste.

We haue no certaine knowledge from those that haue trauelled into the Indies, of the tree which beareth this little Indian Nut; neither haue we any thing of our owne knowledge, more, than that we see by experience that the fruit hereof is lesser, wherein consisteth the difference.

The other, expressed in the same table with the former, by the name of *Mehenbethene*, *Clusius* receiued it by the same name from *Cortusius* of Padua: yet it doth not (as hee saith) well agree with the description; and he rather approoues of their opinion who refer it to the *Nuxunguentaria*,

1 *Nux Indica arbor.*
The Indian Nut tree.

Nux Indica.
The Indian Nut.

2 *Nucula Indica.*
The little Indian Nut.

Mehenbethene.

or *Ben*. It is some inch long, of a triangular figure, with a hard and woody shell which broken, shewes three cells or partitions, in each whereof is contained a long kernell white and sweet. †

¶ *The Place.*

This Indian Nut groweth in some places of Africa, and in the East Indies, and in all the Islands of the West Indies, especially in Hispaniola, Cuba, and Saint Johns Island, and also vpon the continent by Carthage, Nombre de Dios, and Panama, and in Virginia, otherwise called Norembega, part of the same continent, for the most part neere vnto the sea side, and in moist places, but it is seldome found in the vp-landish countries.

¶ *The Time.*

It groweth greene Winter and Sommer.

¶ *The Names.*

The fruit is called in Latine, *Nux Indica*: of the Indians, *Cocus*: of the Portugals that dwell in the East Indies, *Cocco*, taken from the end, wherein are three holes representing the head of a Monkie: *Serapio* and *Rhasis* do call this tree *Iaralnare*, id est, *Arborem Nuciferam*, the tree bearing Nuts: of *Auicen*, *Glauci al hend*: of the vulgar people, *Maro*, and the fruit *Narel*; which name *Narel* is common among the Persians and Arabians: it is called in Malauar, *Tengamaran*: the ripe fruit, *Tenga*; and the greene fruit, *Eleri*: in Gca it is called *Lanhan*: in Malaio, *Triccan*: and the Nut, *Nihor*.

The distilled liquor is called *Sula*; and the oile that is made thereof, *Copra*.

¶ *The Temperature.*

It is of a meane temper betwixt hot and cold.

¶ *The*

¶ *The Vertues and vse.*

The Indians do vse to cut the twigs and tender branches toward the euening, at the ends where-
 of they haue bottle gourds, hollow canes, and such like things, fit to receiue the water that drop-
 peth from the branches thereof, which pleasant liquor they drinke in stead of wine; from the which
 is drawne a strong and comfortable Aqua Vitæ, which they vse in time of need against all manner
 of sickneses; of the branches and boughes they make their houses; of the trunk or body of the tree,
 ships and boates; of the hempon the outward part of the fruit, they make ropes and cables; and of
 the finer stuffe, sailes for their ships.

Likewise they make of the shell of the Nut, cups to drinke in, which we likewise vse in England,
 garnished with siluer for the same purposes. The kernell serueth them for bread and meat; the
 milkie iuice doth serue to coole and refresh their wearied spirits: out of the kernel when it is stam-
 ped, is pressed a most precious oile, not onely good for meat, but also for medicine; wherewith they
 annoint their feeble lims after their tedious trauell, by meanes whereof the ache and paine is miti-
 gated, and other infirmities quite taken away proceeding of other causes.

CHAP. 141. *Of the Dragon Tree.*I *Draco arbor.*

The Dragon tree.

Draconis fructus.

The Dragon tree fruit.

¶ *The Description.*

THis strange and admirable tree groweth very great, resembling the Pine tree, by reason it doth
 alwaies flourish, and hath his boughes or branches of equal length and bignesse, which are bare
 and naked, of eight or nine cubits long, and of the bignesse of a mans arme: from the ends of which
 do shoot out leaues of a cubit and a halfe long, and full two inches broad, somewhat thicke, and
 raised vp in the middle, then thinner and thinner like a two edged sword: among which come forth
 little mossie floures, of small moment, and turne into berries, of the bignesse of Cherries, of a yel-
 lowish

lowish colour, round, light and bitter, couered with a threefold skin or filme, wherein is to be seene, as *Monardus* and diuers other report, the forme of a Dragon, hauing a long necke or gaping mouth; the ridge or backe armed with sharpe prickles, like the Porcupine; it hath also a long taile, & foure feet, very easie to be discerned: the figure of it we haue set forth vnto you according to the greatnesse thereof, because our words and meaning may be the better vnderstood, and also the lease of the tree in his full bignesse, because it is impossible to be expressed in the figure: the trunke or body of the tree is couered with a rough barke, very thin, and easie to be opened or wounded with any small toole or instrument, which being so wounded in the Dog daies, bruised or bored, doth yeeld forth drops of a thicke red liquour, which of the name of the tree are called Dragons teares, or *Sanguis Draconis*, Dragons blood: diuers haue doubted whether the liquour or gummie iuice were all one with *Cinnabaris* of *Dioscorides* (not meaning that *Cinaber* made of Quickfiluer) but the receiued opinion is, they differ not, by reason their qualitie and temperature worke the like effect.

¶ The Place.

This tree groweth in an Island which the Portugals call Madera, and in one of the Canarie Islands, called *Insula Portus Sancti*; and as it seemeth it was first brought out of Africke, although some are of a contrary opinion, and say, that it was first brought from Carthagen, in America, by the Bishop of the same Prouince.

¶ The Time.

The time of his growing we haue touched in the description, where wee said that it flourisheth and groweth greene all the yeare.

¶ The Names.

The names haue beene sufficiently spoken of in the description and in their seuerall titles.

¶ The Temperature and Vertues.

A ‡ The *Sanguis Draconis* which is thought to proceed from this tree hath an astringent faculty, and is with good successe vsed in the ouermuch flowing of the courses, in fluxes, Dysenteries, spitting of blood, fastening loose teeth, and such other affects which require astringion.

B Smiths also vse it to varnish ouer their workes to giue them a sanguine colour, and keep them from rust. ‡

CHAP. 142. Of the Sassafras, or Ague tree.

¶ The Description.

THE Sassafras tree grows very great, much like vnto the Pine tree: the trunke or body is straight, smooth, and void of boughes, of a great height: it is couered with a two fold grosse rinde, the vppermost of the colour of ashes, that next the wood of a tawnie colour: on the top come forth many goodly branches, like those of the Palme tree, whereon doe grow greene leaues, somewhat like those of the Fig tree, of a sweet smell when they be greene, but much sweeter when they be dry, declining to the smell of Fenell, with much sweetnesse in taste: they are greene Winter and Sommer, neither bearing fruit nor floures, but is altogether barren as it is said: the roots are grosse, conformable to the greatnesse of the tree, of a tawnie colour, dispersing themselves far abroad vnder the vpper crust of the earth, by meanes whereof they are often cast downe with meane blasts of winde. ‡ The wood of the tree is very strong, hard and brittle, it hath not so strong & a pleasant smell as that of the root, neither is it in such vse. The leaues are of two sorts, some long and smooth, and not snipt about the edges: other some, and those chiefly on the ends of the branches, are deeply gashed in, as it were diuided into three seuerall parts. I haue giuen the figure of a branch taken from a little tree, which grew in the Garden of Master *Wilmote* at Bow, who died some few yeares agoe. ‡

¶ The Place.

This tree groweth in the most parts of the West Indies, especially about the cape of Florida Wingandico, and Virginia, otherwise named Norembea.

¶ The Time.

It flourisheth and keepeth greene Winter and Sommer.

¶ The

Sassafras.

The Sassafras tree.

¶ The Names.

The Spaniards and French men haue named this tree, *Sassafras*: the Indians in their tongue, *Panamer*: for want of an English name we are contented to call it the Ague tree, of his vertue in healing the Ague.

¶ The Temperature.

The boughes and branches hereof are hot & dry in the second degree; the rinde is hotter, for that it entreth into the third degree of heate and drinesse, as is manifestly perceiued in the decoction.

¶ The Vertues.

The best of all the tree is the root, and that worketh the best effect, the which hath the rinde cleauing very fast to the inner part, and is of colour tawnie, and much more sweet of smell than all the tree and his branches.

The rinde tasteth of a more sweet smell than the tree; and the water being sod with the root is of greater and better effects than any other part of the tree, and is of a more sweet smell, and therefore the Spaniards vse it, for that it worketh better and greater effects.

It is a tree that groweth neere vnto the sea, and in temperate places that haue not much drouth, nor moisture. There be mountaines growing full of them, and they cast forth a most sweet smell, so that at the beginning when they saw them first, they thought they had been trees of Cinamon, & in part they

were not deceiued: for that the rinde of this tree hath as sweet a smell as Cinamon hath, and doth imitate it in colour and sharpnesse of taste, and pleasantnesse of smell: and so the water that is made of it is of a most sweet smell and taste, as the Cinamon is, and procureth the same works and effects as Cinamon doth.

The wood hereof cut in smal pieces and boiled in water, to the colour of Claret wine, and drunk for certaine daies together, helpeth the dropsie, remoueth oppilation or stopping of the liuer, cureth quotidian and tertian agues, and long feuers.

The root of Sassafras hath power to comfort the liuer, and to free from oppilations, to comfort the weake and feeble stomacke, to cause good appetite, to consume windinesse, the chiefeft cause of cruditie and indigestion, stay vomiting, and make sweet a stinking breath.

It prouoketh vrine, remoueth the impediments that doe cause barrennesse, and maketh women apt to conceiue.

CHAP. 143. Of the Storax tree.

¶ The Description.

The Storax tree groweth to the height and bignesse of the Quince tree: the trunke or bodie is couered with a barke or rinde like vnto the Birch tree: the branches are small and limmer, whereon do grow leaues like those of the Quince tree, greenish aboue, and whitish vnderneath: among which come forth white floures, like those of the Orange tree, of an vnpleasant smell: after commeth the fruit or berries, standing vpon long and slender footstalks, couered ouer with a little woollinesse, of the bignesse of a bladder nut, and of the same colour, wherein is contained small feed;

Styrax arbor.
The Storax tree.

seed, whereunto also cleave certaine gumme teares, bearing the name of the tree, and which issue from the trunk or body when it is wounded.

¶ *The Place.*

This tree groweth in diuers places of France, Italy and Spaine, where it bringeth forth little or no gum at all: it groweth in Iudæa, Pamphylia, Syria, Pifidia, Sidon, and many other places of Iurie or Palestine, as also in diuers Islands in the Mediterranean sea, namely Cyprus, Candy, Zant, and other places, where it bringeth forth his gummy liquour in full perfection of sweetness, and also in great plenty, where it is gathered and put into great Canes or Reeds, whereof as some deeme it took the name *Calamita*; others deeme of the leaues of Reeds wherein they wrap it: hereof I haue two small trees in my garden, the which I raised of seed.

¶ *The Time.*

It floureth in May, and the fruit is ripe in September.

¶ *The Names.*

This tree, as may be gathered by some, was called *Styrax*, by reason of that gum or liquour which droppeth out of the same, being like vnto the hollow pipes of Ise, that hang at the eaves of houses in Winter, called *Styria*, or of the Canes or the leaues of Reeds spoken of before: in Latine, *Storax Calamita*: in English, *Storax*, which is kept in Canes or the leaues of Reeds: there floweth from some of these trees a certain gumme liquor, which neuer groweth naturally hard, but remaineth alwaies thinne, which is called liquid *Styrax*, or *Storax*.

¶ *The Temperature.*

The gum of this tree is of an heating, mollifying, and concocting qualitie.

¶ *The Vertues.*

- A It helpeth the cough, the falling downe of rheumes and humours into the chest, and hoarsnesse of the voice: it also helpeth the noise and founding of the eares, preuaileth against *Strumas*, or the Kings euill, nodes on the nerues, and hard swellings proceeding of a cold cause: it preuaileth also against all cold poisons, as Hemlocks and such like.
- B Of this gum there are made sundry excellent perfumes, pomanders, sweet waters, sweet bags, and sweet washing balls, and diuers other sweet chaines & bracelets, whereof to write were impertinent to this historie.

CHAP. 144. Of the Sorrowfull tree or Indian Mourner.

¶ *The Description.*

A *Rbor tristis*, the sad or sorrowfull tree waxeth as big as an Oliue tree, garnished with many goodly branches, set full of leaues like those of the Plum tree: among which come forth most odoriferous and sweet smelling floures, whose stalkes are of the colour of Saffron, which flourish and shew themselves onely in the night time, and in the day time looke withered and with a mourning cheere: the leaues also at that time shrinke in themselves together, much like a tender plant that is frost bitten, very sadly lumping, lowring, and hanging downe the head, as though it loathed the light, and could not abide the heate of the Sun. I should but in vain lose labour in repeating a foolish fanisie of the Poeticall Indians, who would make fooles beleue, that this tree was once a faire daughter of a great Lord or King, and that the Sun was in loue with her, with other toies which I omit.

Arbor tristis.

The sorrowfull tree.

omit. ‡ The floures are white; somewhat like those of Iasmine, but more double; and they are of a very sweet smell: there succeed them many little cods, containing some six seeds a piece somewhat like those of *Stramonium*. ‡

¶ *The Place, Time, and Names.*

This tree groweth in the East Indies, especially in Goa, and Malayo; in Goa it is called *PariZataco*: in Malayo, *Singadi*: in Decan, *Pul*: of the Arabians, *Guart*: and of the Persians and Turkes, *Gul*: in English, the Sad or Sorrowfull tree, or the Indian mourner. The time is specified in the description.

¶ *The Temperature and Vertues.*

We haue no ceartaine knowledge of the temperature hereof, neuerthelesse we read that the Indians do colour their brothes and meates with the stalkes of the floures hereof in stead of Saffron, or whatsoever that they desire to haue of a yellow colour.

It is reported, that if a linnen cloth be steeped in the distilled water of the floures; and the eyes bathed and washed therewith, helpeth the itching and paine therof, and staieth the humours that fall downe to the same.

There is made of the splinters of the wood certaine tooth-pickes, and many pretty toies for pleasure.

CHAP. 145. *Of the Balsam tree.*¶ *The Kindes.*

There be diuers sorts of trees from which do flow Balsames, very different one from another, not onely in forme, but also in fruit, liquour, and place of growing; the which to distinguish would require more time and trauell than either our small time wil afford, or riches for our maintenance to discouer the same in their naturall countries: which otherwise by report to set downe certaine matter by incertainties, would discredit the Author, and no profit shall arise thereby to the Reader: notwithstanding we wil set downe so much as we haue found in the workes of some trauellers, which best agree with the truth of the historie.

¶ *The Description.*

1 There be diuers trees growing in the Indies, whose fruits are called by the name of the fruit of the Balsam tree: among the rest this whose figure we haue set forth vnto your view, we our selues haue seene and handled; and therefore the better able to describe it. It is a fruit very crooked, and hollowed like the palme of an hand, two inches long, halfe an inch thicke, couered with a thicke smooth rinde, of the colour of a drie Oken leafe; wherein is contained a kernell (of the same length and thickeesse, apt to fil the said shell or rinde) of the substance of an Almond; of the colour of ashes, fat, and oilie, of a good smell, and very vnpleasant in taste.

2 The wood we haue dry brought vnto vs from the Indies for our vse in Physicke (a small description may serue for a dry sticke) neuerthelesse wee haue other fruits brought from the Indies, whose figures are not set forth, by reason they are not so well knowne as desired; whereof one is of the bignes of a Wal-nut, somewhat broad on the vpper side, with a rough or rugged shell, vneuen, blacke of colour, and full of a white kernell, with much iuice in it, of a pleasant taste and smell, like the oile of Mace: the whole fruit is exceeding light, in respect of the quantitie or bigneesse, euen as it

it were a piece of Corke, which notwithstanding sinketh to the bottome when it falleth into the water, like as doth a stone.

1 *Balsami fructus.*
The fruit of the Balsam tree.

† 3 *Balsamum Alpini cum Carpobalsamo.*
The Balsam tree with the fruit.

3 This tree, saith *Garcias*, that beareth the fruit *Carpobalsamum*, is also one of the Balsam trees: it groweth to the height and bignesse of the Pomegranate tree, garnished with very many branches: whereon do grow leaues like those of Rue, but of colour whiter, alwaies growing greene: amongst which come forth floures, whereof we haue no certaintie: after which commeth forth fruit like that of the Turpentine tree, which in shoppes is called *Carpobalsamum*, of a pleasant smell; but the liquour which floweth from the wounded tree is much sweeter: which liquour of some is called *Opobalsamum*.

† *Prosper Alpinus* hath writ a large Dialogue of the Balsam of the Antients, and also figured and deliuered the historie thereof in his booke *De Plant. Egypti*, cap. 14. whether I refer the curious I haue presented you with a slip from his tree, and the *Carpobalsamum* set forth by our Author, which seemes to be of the same plant. The leaues of this are like to those of *Lentiscus*, alwaies greene, and winged, growing three, fve, or seuen fastened to one foot-stalke; the wood is gummie, reddish, and well smelling: the floures are small and white like those of *Acatia*, growing vsually three nigh together: the fruit is of the shape and bignesse of that of the Turpentine tree, containing yellow and well smelling seeds, filled with a yellowish moisture like honey, their taste is bitterish, & somewhat biting the tongue. †

Of these Balsam trees there is yet another sort: the fruit whereof is as it were a kernell without a shell, couered with a thin skin straked with many veines, of a browne colour: the meat is firm and solid, like the kernell of the Indian Nut, of a white colour, and without smell, but of a grateful tast; and it is thought to be hot in the first degree, or in the beginning of the second.

There be diuers sorts more, which might be omitted because of tediousnesse: neuerthelesse I wil trouble you with two speciall trees worthy the noting: there is, saith my Author, in America a great tree of monstrous hugeness, beset with leaues and boughes euen to the ground; the trunke wherof is couered with a twofold bark, the one thick like vnto Corke, & another thin next to the tree: from betweene which barks doth flow (the vpper barke being wounded) a white Balsam like vnto teares

or

or drops, of a most sweet saour, and singular effects, for one drop of this which thus distillecth out of the tree, is worth a pound of that which is made by decoction: the fruit hereof is small in respect of the others; it seldome exceedeth the bignes of a Pease, of a bitter taste, inclosed in a narrow huske, of the length of a finger, something thin, and of a white colour; which the Indians do vse against head-ache: which fruit of most is that we haue before described, called *Carpobalsamum*.

It is also written, that in the Island called *Hispaniola*; there groweth a small tree, of the height of two men, without the industry of man, hauing stalkes or stems of the colour of ashes; whereon do grow Greene leaues, sharpe at both ends; but more Greene on the vpper side than on the lower; hauing a middle rib somewhat thicke and standing out; the foot-stalkes whereon they grow are somewhat reddish: among which leaues commeth fruit growing by clusters, as long as a mans hand, fingers and all: the stones or graines in the fruit be few, and Greene; but growing to rednesse more and more as the fruit waxeth ripe. From the which is gathered a iuice after this manner: they take the young shootes and buds of the tree, and also the clusters of the fruit, which they bruise, and boile in water to the thickenesse of hony, which being strained, they keepe it for their vses.

They vse it against wounds and vlcers; it stoppeth and stancheth the bloud; maketh them cleane; bringeth vp the flesh, and healeth them mightily, and with better successe than true Balsame. The branches of the tree being cut, do cast forth by drops a certaine cleare water, more worth than *Aqua vita*, most wholesome against wounds, and all other diseases proceeding from cold causes, if it be drunken some few daies together.

¶ *The Place.*

These trees grow in diuers parts of the world, some in *Ægypt*, and most of those countries adiacent: there groweth of them in the East and West Indies; as trauellers in those parts report.

¶ *The Time.*

These trees for the most part keepe Greene winter and Sommer.

¶ *The Names.*

Balsame is called in Greeke, *Βάλσαμον*; in Latine also *Balsamum*: of the Arabians *Balseni*, *Balesina*, and *Belsan*: in Italian, *Balsamo*: in French, *Baume*.

The liquor that floweth out of the tree when it is wounded, is called *Opobalsamum*: the wood *Xylobalsamum*: the fruit *Carpobalsamum*: and the liquor which naturally floweth from the tree in *Ægypt* *Balsamum*.

¶ *The Temperature.*

Balsame is hot and dry in the second degree, with astringion.

¶ *The Vertues.*

Naturall Balsame taken in a morning fasting, with a little Rose water or wine, to the quantitie of fve or six drops, helpeth those that be asthmaticke, or short of winde: it preuaileth against the paines of the bladder, and stomacke, and comforteth the same mightily; and also amendeth a stinking breath; & takes away the shaking fits of the quotidian egue, if it be taken two or three times.

It helpeth consumptions, elenseth the barren wombe, especially being annointed vpon a pessary, or mother suppositorie, and vsed.

The stomacke being annointed therewith, digestion is helped thereby; it also preferueth the stomacke from obstructions and windinesse; it helpeth the hardnesse of the spleene; easeth the griefes of the reines and belly, proceeding of cold causes.

It also taketh away all manner of aches, proceeding of cold causes, if they be annointed therewith; but more speedily, if a linnen cloth be wet therein, and laid thereon: vsed in the same manner, it dissolueth hard tumors, called *ædemata*; and strengthneth the weake members.

The same refresheth the braine, and comforteth the parts adioining; it helpeth the palse, convulsions, and all griefes of the sinewes, if they be annoitned therewith.

The marvellous effects that it worketh in new and Greene wound, were heere too long to set downe, and also superfluous; considering the skilfull Chirurgeon whom it most concerneth, doth know the vse thereof; and as for the beggerly Quacksaluers, Runnagates, and knauish Mountebanks, we are not willing to instruct them in things so far aboue their reach, capacitie and worthinesse.

CHAP. 146. Of a kinde of Balme, or Balsame Tree:

¶ *The Description.*

THIS tree which the people of the Indies do call *Molli*, groweth to the bignesse of a great tree, hauing a trunke or body of a darke Greene colour, sprinkled ouer with many ash coloured spots:

N n n n n

spots: the branches are many, and of very great beautie; whereupon do grow leaues not vnlike to those of the Ash-tree, consisting of many small leaues, set vpon a middle rib; growing narrower euer towards the point, euery particular one jagged on the sides like the teeth of a saw; which being plucked from the stem, yeeldeth forth a milkie juice, tough and clammy, sauouring like the bruised leaues of Fenell, and as it seemeth in taste somewhat astringent: the flowers grow in clusters vpon the twiggie branches, like those of the Vine a little before the grapes be formed: after followeth the fruit or berries, somewhat greater than Pepper cornes, of an oilie substance, greene at the first, and of a darke reddish colour when they be ripe. ‡ The first of the figures was taken from a tree, only of three yeeres growth, but the latter from a tree come to his full growth, as it is affirmed in *Clusius* his *Cur. Poster.* It differs only in that the leaues of the old trees are not at all snipt or diuided on the edges. ‡

1 *Molle, siue Molly Clusij, & Lobelij.*
The Balsame tree of *Clusius* and *Lobelij* description.

‡ 2 *Molle arboris adulta ramus.*
A branch of the old tree of *Molle*.

¶ The Place.

This tree, saith a learned Physitian called *Ioh. Fragosus*, doth grow in the King of Spaine his garden at Madryll, which was the first that euer he did see: since which time, *Iohn Ferdinando* Secretary vnto the foresaid king did shew vnto the said *Fragosus* in his owne garden a tree so large, and of such beautie, that he was neuer satisfied with looking on it, and meditating vpon the vertues thereof. Which words I haue receiued from the hands of a famous learned man, called *M^r. Lancelot Browne, D^r.* in Physicke, and Physitian to the Queenes Mateltie, at the impressiion hereof; faithfully translated out of the Spanish tongue, without adding or taking any thing away.

They grow plentifully in the vales and low grounds of Peru, as all affirme that haue trauelled to the VVest Indies; as also those that haue described the singularities thereof. My selfe with diuers others, as namely *M^r. Nicholas Lete*, a worshipfull Merchant of the Citie of London; and also a most skilfull Apothecary, *M^r. Iames Garret*, who haue receiued seeds hereof from the right Honorable the Lord Hunsdon, Lord high Chamberlaine of England, worthy of triple honour for his care in getting, as also for his curious keeping rare and strange things brought from the farthest parts of the world; which seedes we haue sowne in our gardens, where they haue brought forth plants of a foot high; and also their beautifull leaues: notwithstanding our care, diligence, and

and industry, they haue perished at the first approach of winter, as not being able by reason of their tenderneffe to indure the cold of our Winter blasts.

¶ *The Time.*

As touching the time of his flourishing, and bringing his fruit to maturitie, we haue as yet no certaine knowledge, but is thought to be Greene both VVinter and Sommer.

¶ *The Names.*

This most notable tree is called by the Indian name *Molle*: of some, *Molly*, and *Muelle*, taken from his tender softnesse, as some haue deemed: it may be called the Fennell tree, or one of the Balme, or Balsam trees.

¶ *The Temperature.*

This tree is thought to be of an astringent or binding qualitie; whereby it appeares besides the hot temperature it hath, to be compounded of diuers other faculties.

¶ *The Vertues.*

The Indians vse to seeth the fruit or berries hereof in water, and by a speciall skill they haue in the boiling, do make a most wholesome wine or drinke, as also a kind of vineger, and sometimes honny; which are very strange effects, these three things being so contrary in taste.

The leaues boiled, and the decoction drunke, helpeth them of any disease proceeding of a cold cause.

The gum which issueth from the tree, being white like vnto Manna, dissolued in milke, taketh away the web of the eies, and cleareth the sight, being wiped ouer with it.

The barke of this tree boiled, and the legs that be swolne and full of paine, bathed and washed with the decoction diuers times, taketh away both infirmities in short space.

This tree is of such estimation among the Indians, that they worship it as a god, according vnto their sauage rites and ceremonies: much like as *Pliny* reporteth of *Homers Moly*, the most renowned of all plants, which they had in old time in such estimation and reuerence, that as it is recorded, the gods gaue it the name of *Moly*, and so writeth *Ouid*:

*Pacifer huic dederat florem Cyllenius album,
Moly vocant Superi, nigra radice tenetur.*

If any be desirous to see more hereof, they may reade a learned discourse of it set forth in the Latine tongue, by the learned *Lobel*, who hath at large written the historie thereof, dedicated vnto the right Honourable, the Lord Chamberlaine, at the Impression hereof, faithfully ouerseene and examined by the learned Physition before remembred, Mr. Doctor *Browne*, and his censure vpon the same. ‡ Together with *Lobels* reply, who iudged this plant (and not without good reason) to be a kinde of the true Balsam of the Antients, and not much different from that set forth by *Prosper Alpinus*, whereof I haue made mention in the foregoing chapter. ‡

CHAP. 147. Of the Canell, or Cinnamon tree.

¶ *The Description.*

THE tree which hath the Cinnamon for his barke is of the stature of an Oliue tree: hauing a body as thick as a mans thigh, from which the Cinnamon is taken; but that taken from the smaller branches is much better: which branches or boughes are many, and very straight; whereon do grow beautifull leaues, in shape like those of the Orange tree, and of the colour of the Bay leafe (not as it hath been reported) like vnto the leaues of flags or floure de-Luce: among these pleasant leaues and branches come forth many faire white floures, which turne into round blacke fruit or berries, of the bignesse of an Hasell Nut, or the Oliue berry, and of a blacke colour, out of which is pressed an oile, that hath no smell at all vntill it be rubbed and chafed betweene the hands: the trunke or body with the greater armes or boughes of the tree are couered with a double or twofold barke, like that of *Suber*, the Corke tree: the innermost whereof is the true and pleasant Cinnamon, which is taken from the tree, and cast vpon the ground in the heate of the Sunne, through the heate thereof

Nnnnnn a

Canella folium, Bacillus, & Cortex.

The leafe, barke, and trunke of the Cinnamon tree.

thereof it turneth and foldeth it selfe round together, as wee daily see by viewing the thing it selfe: this tree being thus peeled, recouereth a new barke in the space of three yeares, and is then ready to be disbarked as afore. That Cinnamon which is of a pale colour hath not been well dried in the Sunne: that of a faire browne colour is best; & that which is blackish, hath been too much dried, and also hath taken some wet in the time of drying.

‡ 2 Besides the Cinnamon vulgarly knowne and vsed, there is another sort which also is commonly receiued for the *Cassia* of *Dioscorides* and the Antients. Now this differs from the former in that it is of a redder colour, of a more hard, solid, and compact substance, commonly also thicker, & if you chew it, more clammy and viscous: the taste and smell are much like Cinnamon, yet not altogether so strong as that of the best Cinnamon. There is much controuersie in late Writers concerning both the true Cinnamon, and *Cassia* of the Antients: the which I haue not time nor space here to mention, much lesse to insist vpon: I haue obserued that both the Cinnamon and *Cassia* that we haue are couered ouer with a rough grayish barke, like that of an Oke or other such tree, which is cleane scraped off, and taken away before it be brought to vs. ‡

¶ The Place.

The chiefe places where the trees doe grow that beare Cinnamon, are Zeilan, and Malauar: but those of Zeilan are the best: they grow in other of the Molucca Ilands, as Iaoa, or Iaua, the greater and the lesse, and also in Mindanao, for the most part vpon mountaines.

¶ The Time.

The Cinnamon tree groweth green winter and Sommer, as do all the other trees of the Moluccaes, and East Indies for the most part: the boughes whereof are cut off at seasonable times, by the expresse commandement of the King of the Country, and not before he haue appointed the time.

There hath beene some controuersie among writers concerning the tree whose bark is *Cassia*, and that tree that beareth Cinnamon, making them both one tree: but that opinion is not to be receiued: for there is a great difference betweene them, as there is betwixt an Oke, and a Chestnut tree; for the tree whose barke is *Cassia*, is doubtlesse a bastard kinde of *Canell*, or Cinnamon: in shew it is very like, but in sweetnesse of smell and other circumstances belonging to Cinnamon, farre inferior.

¶ The Names.

Cinnamon is called in Italian *Canella*: in Spanish, *Canola*: in French, *Canelle*: in high Dutch, *Zimmet coezlin*: the Grecians, *κινναμωμον*: the Latines likewise *Cinnamomum*: the Arabians, *Darseni*, and as some say, *Querfaa*, others, *Qerfe*: in Zeilan, *Cuurde*: in the Island Iaua they name it *Cameaa*: in Ormus, *Darchini* (i.) *lignum Chinense*, the wood of China: in Malauar, *Cais mains*, which in their tongue signifieth *Dulce lignum*, Sweet wood: in English, Cinnamon, Cinnamome, and Canell. The other is called *Cassia*, and *Cassia lignea*.

¶ The Temperature and Vertues.

Dioscorides writeth, that Cinnamon hath power to warme, and is of thinne parts: it is also drie and

and astringent, it prouoketh vrine, cleareth the eies, and maketh sweet breath.

The decoction bringeth downe the menfes, preuaileth againſt the bitings of venomous beaſts. **B**
the inflammation of the inteſtines and reines.

The diſtilled water hereof is profitable to many, and for diuers infirmities, it comforteth the **C**
weake, cold, and feeble ſtomacke, eaſeth the paines and frettings of the guts and intrailes proce-
ding of cold cauſes, it amendeth the euill colour of the face, maketh ſweet breath, & giueth a moſt
pleaſant taſte vnto diuers ſorts of meats, and maketh the ſame not onely more pleaſant, but alſo
more wholeſome for any bodies of what conſtitution ſoeuer they be, notwithstanding the binding
qualitie.

The oile drawne chimically preuaileth againſt the paines of the breaſt, comforteth the ſtomacke, **D**
breaketh windineſſe, cauſeth good digeſtion, and being mixed with ſome honie, taketh away ſpots
from the face, being annointed therewith.

The diſtilled water of the floures of the tree, as *Garcias* the Luſitanian Phyſition writeth, excel- **E**
leth far in ſweetneſſe all other waters whatſoeuer, which is profitable for ſuch things as the barke
it ſelfe is.

Out of the berries of this tree is drawn by expreſſion, as out of the berries of the Oliue tree, a cer- **F**
taine oyle, or rather a kinde of fat like butter, without any ſmell at all, except it bee made warme,
and then it ſmelleth as the Cinnamon doth, and is much vſed againſt the coldneſſe of the ſinewes
all paines of the ioints, and alſo the paines and diſtemperature of the ſtomacke and breaſt.

To write as the worthineſſe of the ſubieſt requireth, would aſke more time than we haue to be- **G**
ſtow vpon any one plant; therefore theſe few ſhall ſuffice, knowing that the thing is of great vſe a-
mong many, and knowne to moſt.

† *Cassia* vſed in a larger quantitie ſerueth well for the ſame purpoſes which Cinnamon **H**
doth. †

CHAP. 142. Of Gum Lacke and his rotten tree.

Laccatum ſuis bacillis.

Gum Lacke with his ſtaffe or ſticke.

¶ The Deſcription.

THe tree that bringeth forth that excremen-
tal ſubſtance called *Lacca*, both in the ſhops
of Europ and elſewhere, is called of the Arabi-
ans, Perſians and Turkes, *Loc Sumutri*, as who
ſhould ſay, *Lacca* of Sumutra: ſome which haue
ſo termed it, haue thought that the firſt plentie
thereof came from Sumutra, but herein they
haue erred, for the abundant ſtore thereof came
from Pegu, where the inhabitants therof do cal
it *Lac*, & others of the ſame Prouince, *Trec*: the
hiſtory of which tree, according to that famous
Herbariſt *Cluſius* is as followeth. [There is in
the countrey of Pegu and Malabar, a great tree,
whoſe leaues are like them of the Plum tree, ha-
uing many ſmall twiggie branches; when the
trunk or body of the tree waxeth old, it rotteth
in ſundry places, wherein do breed certain great
Ants or Piſmires, which continually work and
labour in the time of Harueſt and Sommer, a-
gainſt the penurie of Winter: ſuch is the dili-
gence of thoſe Ants, or ſuch is the nature of the
tree wherein they harbour, or both, that they
prouide for their winter food, a lumpe or maſſe
of ſubſtance, which is of a crimſon colour, ſo
beautifull and ſo faire, as in the whole World

the like is not ſeene, which ſerueth not onely to phyſicall, vſes but is a perfect and coſtly colour for
Painters, called by vs, Indian Lack. The Piſmires (as I ſaid) worke out this colour, by ſucking the
ſubſtance or matter of *Lacca* from the tree, as Bees do make honie and wax, by ſucking the matter
thereof

thereof from all herbes, trees, and floures, and the inhabitants of that country, do as diligently seek for this Lacca, as we in England and other countries seeke in the woods for honie; which Lacca after they haue found, they take from the tree, and dry it into a lump; among which sometimes there come ouer some sticks and pieces of the tree with the wings of the Ants, which haue fallen among it, as we daily see.

‡ The Indian Lacke or Lake which is the rich colour vsed by Painters, is none of that which is vsed in shops, nor here figured or described by *Clusius*, wherefore our Author was much mistaken in that he here confounds together things so different; for this is of a resinous substance, and a faint red colour, and wholly vnfit for Painters, but vsed alone and in composition to make the best hard sealing wax. The other seemes to be an artificiall thing, and is of an exquisite crimson colour, but of what it is, or how made, I haue not as yet found any thing that carries any probabilitie of truth. ‡

¶ The Place.

The tree which beareth Lacca groweth in Zeilan and Malauar, and in other parts of the East Indies.

¶ The Time.

Of the time we haue no certaine knowledge.

¶ The Names.

Indian Lacke is called in shops *Lacca*: in Italian, *Lachetta*: *Auicen* calleth it *Luch*: *Paulus* and *Dioscorides*, as some haue thought, *Cancamum*: the other names are expressed in the description.

¶ The Temperature and Vertues.

A Lack or Lacca is hot in the second degree, it comforteth the heart and liuer, openeth obstructions, expelleth vrine, and preuaileth against the dropsie.

B There is an artificiall Lack made of the scrapings of Brasill and Saffron, which is vsed of Painters, and not to be vsed in Physicke as the other naturall Lacca.

CHAP. 149. Of the Indian leafe.

Tamalapatra.

The Indian leafe.

¶ The Description.

T *Amalapatra*, or the Indian leafe grows vpon a great tree like the Orenge tree, with like leaues also, but broader, a little sharp pointed, of a greene glistering colour, and three small ribs running through each leafe, after the manner of Ribwort, wherby it is easie to be known: it smelleth somewhat like vnto Cloues, but not so strong as Spikenard or Mace (as some haue deemed) nor yet of so subtile and quick a sent as Cinnamon. There was sent or added vnto this figure by *Cortusius* a certaine fruit like vnto a small Acorn, with this inscription, *Fru-ctus Canella*, the fruit of the Canell tree, which may be doubted of, considering the description of the forenamed tree holden generally of most to be perfect.

¶ The Place.

The Indian leafe groweth not fleeting vpon the water like vnto *Lens palustris*, as *Dioscorides* and *Pliny* do set downe, (though learned and painfull writers) but is the leafe of a great tree, a branch whereof wee haue set forth vnto your view, which groweth in Arabia and Cambaya, far from the water side.

¶ The Time.

Of the time we haue no certain knowledge, but it is supposed to be green winter and summer.

¶ The

¶ The Names.

Tamalapatra is called of the Indians in their mother tongue, especially of the Arabians, *Cadegi Indi*, or *La degi Indi*, that is, *Folium Indicum*, or *Indum*, the Indian leafe: but the Mauritanians doe call it *Tembul*. The Latines and Grecians following some of the Arabians, haue called it *Mala-bathrum*.

¶ The Temperature and Vertues.

The Indian leafe is hot and dry in the second degree, agreeing with *Nardus* in tempefature, or as others report with *Mace*: it prouoketh vrine mightily, warmeth and comforteth the stomacke, and helpeth digestion. A

It preuaileth against the pin and web in the eyes, the inflamed and waterie eyes, and all other infirmities of the same. B

It is laid among cloathes, as well to keepe them from moths and other vermine, as also to giue vnto them a sweet smell. C

CHAP. 150. Of the Cloue tree.

Caryophylli veri Clusij.

The true forme of the Cloue tree.

¶ The Description.

THE Cloue tree groweth great in forme like vnto the Bay tree, the trunk or bodie whereof is couered with a russet barke: the branches are many, long, and very brittle, whereupon do grow leaues like those of the Bay tree, but somewhat narrower: amongst which come the floures, white at the first, after of a greenish colour, waxing of a darke red colour in the end: which floures are the very cloues when they grow hard: after when they be dried in the Sunne they become of that dusky black colour which we dayly see, wherein they continue. For those that wee haue in estimation are beaten downe to the ground before they be ripe, and are suffered there to lie vpon the ground vntill they bee dried throughly, where there is neither grasse, weeds, nor any other herbes growing to hinder the same, by reason the tree draweth vnto it selfe for his nourishment all the moisture of the earth a great circuit round about, so that nothing can there grow for want of moisture, and therefore the more convenient for the drying of the Cloues. Con-

trariwise, that grosse kinde of Cloues which hath beene supposed to be the male, are nothing else than fruit of the same tree tarrying there vntill it fall downe of it selfe vnto the ground, where by reason of his long lying, and meeting with some raine in the mean season, it loseth the quick taste that the others haue. Some haue called these *Fusti*, whereof we may English them *Fusses*. Some affirme that the floures hereof surpass all other floures in sweetnesse when they are greene; and hold the opinion, that the hardned floures are not the Cloues themselues, (as wee haue written) but thinke them rather to be the seat or huske wherein the floures doe grow: the greater number hold the former opinion. And further, that the trees are increased without labour, grafting, planting, or other industrie, but by the falling of the fruit, which beare fruit within eight yeares after they be risen vp, and so continue bearing for an hundred yeares together, as the inhabitants of that countrey do affirme.

¶ The Place.

The Cloue tree groweth in some few places of the Molucca Islands, as in Zeilan, Iaua the greater and the lesse, and in diuers other places.

¶ The

¶ The Time.

The Cloues are gathered from the fifteenth of September vnto the end of Februarie, not with hands, as we gather Apples, Cherries, and such like fruit, but by beating the tree, as Wall-nuts are gotten, as we haue written in the description.

¶ The Names.

The fruit hereof was vnknowne to the antient Grecians : of the later writers called *καρυδανος* : in Latine also *Caryophyllus*, and *Clavus* : in French, *Clou de Gyrofle* : the Mauritanians, *Charumfel* : in Italian, *Carofano* : in high-Dutch, *Paegel* : in Spanish, *Clauo de especia* : of the Indians, *Calafur* : in the Molucca's, *Changue* : of the Panders, *Arumfel*, and *Charumfel* : in English, Cloue tree, & Cloues.

¶ The Temperature.

Cloues are hot and dry in the third degree.

¶ The Vertues.

- A Cloues strengthen the stomacke, liuer, and heart, helpe digestion, and prouoke vrine.
 B The Portugall women that dwell in the East Indies draw from the Cloues when they bee yet greene, a certaine liquor by distillation, of a most fragrant smell, which comforteth the heart, and is of all cordials the most effectuell.
 C Cloues stop the belly : the oile or water thereof dropped into the eyes, sharpenes the sight, and clenfeth away the cloud or web in the same.
 D The weight of foure drams of the poudre of Cloues taken in milke procureth the act of generation.
 E There is extracted from the Cloues a certaine oile or rather thicke butter of a yellow colour ; which being chafed in the hands smelleth like the Cloues themselues, wherewith the Indians do cure their wounds and other hurts, as we do with Balsam.
 F The vse of Cloues, not onely in meat and medicine, but also in sweet poudre and such like, is sufficiently knowne : therefore this shall suffice.

There were formerly three figures in this chapter : wherefore I omitted two as impertinent.

CHAP. 151.

Of the Nutmeg tree.

1 *Nux Muscata rotunda, sine femina.*
 The round or female Nutmeg.

2 *Nux Myristica oblonga, sine mas.*
 The longish or male Nutmeg.

Nux Moschata cum sua Maci.

The Nutmeg with his Mace about him.

¶ The Description.

THe tree that beareth the Nutmeg and the Mace is in forme like to the Peare tree, but the leaues of it are like those of the Bay or Orange tree, alwaies greene on the vpper side, and more whitish vnderneath; among which come forth the Nut and Mace as it were the floures. The Nut appeareth first, compassed about with the Mace, as it were in the middle of a single rose, which in proceffe of time doth wrap and inclose the Nut round on euery side: after cometh a huske like that of the Wall-nut, but of an harder substance, which incloseth the Nut with his Mace as the Wall-nut husk doth couer the Nut, which in time of ripenesse doth cleaue of it selfe as the Wall-nut huske doth, and sheweth his Mace, which then is of a perfect crimson colour, and maketh a most goodly shew, especially when the tree is well laden with fruit: after the Nut becommeth dry, the Mace likewise gapeth and forsaketh the Nut, euen as the first huske or couerture, and leaues it bare and naked, as we all do know; at which time it getteth to it selfe a kinde of darke yellow colour, and loseth that braue crimson dye which it had at the first.

¶ 2 The tree which carrieth the male Nutmeg (according to *Clusius*) thus differs from the last described: the leaues are like those of the former in shape, but much bigger, being sometimes a foot long, and three or foure inches broad; their common length is seuen or eight inches, and bredth two and a halfe: they are of a whitish colour vnderneath, and greene and shining aboue. The Nuts also grow at the very ends of the branches, sometimes two or three together, and not onely one, as in the common kinde. The Nut it selfe is also larger and longer: the Mace that incompasses it is of a more elegant colour, but not so strong as that of the former.

I can scarce beleue our Authors assertion in the foregoing description, that the Nut appeareth first, compassed about with the Mace as it were in the middest of a single Rose, &c. But I rather thinke they all come forth together, the Nutmeg, Mace, the greene outward huske and all, iust as we see Wall-nuts do, and onely open themselues when they come to full maturitie. In the third figure you may see exprest the whole manner of the growing of the Nutmeg, together with both the sorts of Nutmegs taken forth of their shells. ‡

¶ The Place.

The Nutmeg tree groweth in the Indies, in an Island especially called Banda, and in the Islands of Molucca, and in Zeilan, though not so good as the first.

¶ The Time.

The fruit is gathered in September in great abundance, all things being common in those countries.

¶ The Names.

The Nutmeg tree is called of the Grecians, *Κάρυον μυσχάτης*: of the Latines, *Nux Moschata*, and *Nux Myristica*: in Italian, *Noce Moscada*: in Spanish, *Nuez de escetie*: in French, *Noix Muscade*: in high-Dutch, *Moschat Nusz*: of the Arabians, *Leuzbane*, or *Gianziban*: of the countrey people where they grow, *Palla*: The Maces, *Bunapalla*. In Decan the Nut is called *Iapatri*, and the Maces, *Iaisol*: of *Anicen*, *Iausiband*, (i.) *Nux Bandensis*. The Maces he calleth *Befbase*: in English, Nutmeg.

¶ The Temperature.

The Nutmeg, as the Mauritanians write, is hot and dry in the second degree complete, and somewhat astringent.

¶ The Vertues.

Nutmegs cause a sweet breath, and amend those that do stink, if they be much chewed and holden in the mouth.

The

- B** The Nutmeg is good against freckles in the face, quickneth the sight, strengthens the belly and feeble liuer; it taketh away the swelling in the spleene, stayeth the laske, breaketh winde, and is good against all cold diseases in the body.
- C** Nutmegs bruised and boiled in Aqua vitæ untill they haue wasted and consumed the moisture, adding thereto of *Rhodomet* (that is, honey of Roses) gently boiling them, being strained to the forme of a syrrop, cure all paines proceeding of windie and cold causes, if three spoonfulls be giuen fasting for certaine dayes together.
- D** The same bruised and boyled in strong white wine untill three parts be sodden away, with the roots of Mother-wort added thereto in the boyling, and strained: this liquor drunke with some sugar cureth all gripings of the belly proceeding of windinesse.
- E** As touching the choice, there is not any so simple but knoweth that the heauiest, fattest, and fullest of iuice are the best, which may easily be found out by pricking the same with a pinne or such like.

CHAP. 152. Of the Pepper Plant.

¶ The Kindes.

T Here be diuers sorts of Pepper, that is to say, white, blacke, and long Pepper, one greater and longer than the other; and also a kinde of Ethiopian Pepper.

1 *Piper nigrum*.
Blacke Pepper.

2 *Piper album*.
White Pepper.

¶ The Description.

T He Plant that beareth the blacke Pepper groweth vp like a Vine among bushes and brambles where it naturally groweth; but where it is manured it is sowne at the bottom of the tree *Fausel* and the Date trees, whereon it taketh hold, and clymbeth vp euen to the top, as doth the Vine, ramping and taking hold with his clasping tendrels of any other thing

thing it meeteth withall. The leaues are few in number, ‡ growing at each ioint one, first on one side of the stalke, then on the other, like in shape to the long vndiuided leaues of luy, but thinner, sharpe pointed, and sometimes so broad, that they are foure inches ouer, but most commonly two inches broad, and foure long, hauing alwaies fise pretty large nerues running alongst them. The fruit grow clustering together vpon long stalks, which come forth at the ioints against the leaues, as you may see in the figure: the root (as one may coniecture) is creeping; for the branches that lie on the ground do at their ioints put forth new fibres or roots. We are beholden to *Clusius* for this exact figure and description, which he made by certaine branches which were brought home by the Hollanders from the East Indies. The curious may see more hereof in his *Exotickes* and notes vpon *Garcias*. ‡

† 3 *Piper longum*.
Long Pepper.

4 *Piper Ethiopicum, sine Vita longa*.
Pepper of Ethiopia.

2 The Plant that brings white Pepper is not to be distinguished from the other plant, but only by the colour of the fruit, no more than a Vine that beareth blacke Grapes, from that which bringeth white: and of some it is thought, that the selfe same plant doth sometimes change it selfe from black to white, as diuers other plants do. ‡ Neither *Clusius*, nor any other else that I haue yet met with, haue deliuered vs any thing of certaine, of the plant whereon white Pepper growes: *Clusius* only hath giuen vs the manner how it growes vpon the stalkes, as you may see it here exprest ‡.

There is also another kinde of Pepper, feldome brought into these parts of Europe, called *Piper Canarium*: it is hollow within, light, and empty, but good to draw flegme from the head, to helpe the tooth-ache and cholericke affects.

3 The tree that beareth long Pepper hath no similitude at all with the plant that brings black and white Pepper: some haue deemed them to grow all on one tree, which is not consonant to truth, for they grow in countries far distant one from another, and also that countrey where there is blacke Pepper hath not any of the long Pepper; and therefore *Galen* following *Dioscorides*, were together both ouerseen in this point. This tree, saith *Monardes*, is not great, yet of a woody substance, disperfing here and there his clasping tendrels, wherewith it taketh hold of other trees and such other things as do grow neere vnto it. The branches are many and twiggie, whereon growes the fruit, consisting of many graines growing vpon a slender foot-stalke, thrust or compact close together,

‡ 5 *Piper Caudatum*.
Tailed Pepper.

kers or cels, each whereof containeth a round seed somewhat long, lesser than the seeds of Pæony, in taste like common Pepper, or *Cardamomum*, whose facultie and temperature it is thought to haue, whereof we hold it a kinde.

5 Another kinde of Pepper is sometimes brought, which the Spaniards do call *Pimenta de rabo*, that is, Pepper with a taile: it is like vnto Cubebes, round, full, somewhat rough, blacke of colour, and of a sharpe quicke taste, like the common Pepper, of a good smell: it groweth by clusters vpon small stems or stalkes, which some haue vnaduisedly taken for *Amomum*. The King of Portingal forbad this kinde of Pepper to be brought ouer, for feare least the right Pepper should be the lesse esteemed, and so himselfe hindered in the sale thereof.

¶ The Place.

Blacke and white Pepper grow in the kingdome of Malauar, and that very good; in Malaca also, but not so good; and also in the Islands Sunde and Cude: there is great store growing in the kingdome of China, and some in Cananor, but not much.

Pepper of Æthiopia groweth in America, in all the tract of the country where Nata and Carthago are situated. The rest hath been spoken of in their seuerall descriptions. The white Pepper is not so common as the blacke, and is vsed there in stead of salt.

¶ The Time.

The plant riseth vp in the first of the spring; the fruit is gathered in August.

¶ The Names.

The Grecians, who had best knowledge of Pepper, do call it *πικρον*: the Latines, *Piper*: the Arabians, *Fulsel* and *Fulful*: in Italian, *Pepe*: in Spanish, *Pimenta*: in French, *Poivre*: in high-Dutch, *Peffer*: in English, Pepper.

That of Æthiopia is called, *Piper Æthiopicum*, *Amomum*, *Vita longa*, and of some, *Cardamomum*, whereof we hold it to be a kinde. I receiued a branch hereof at the hands of a learned Physition of London, called Mr. Steuen Bredwell, with his fruit also.

¶ The Temperature.

The Arabians and Persian Physitians iudge, that Pepper is hot in the third degree. But the Indian Physitians which for the most part are Emperickes, hold that Pepper is cold, as almost all other spice, which are hot indeed: the long Pepper is hot also in the third degree, and as we haue said, is thought to be the best of all the kindes.

¶ The Vertues.

A *Dioscorides* and others agreeing with him, affirme, that Pepper resisteth poison, and is good to be put in medicaments for the eyes.

All Pepper heateth, prouoketh vrine, digesteth, draweth, disperfeth, and clenfeth the dimneffe of the fight as *Dioscorides* noteth. B

I have omitted in this chapter *Marchiolus* his counterfeit figure, which was formerly here.

CHAP. 153.

Of bastard Pepper, called Betle, or Betre.

Betle, sine Betre.
Bastard Pepper.

¶ The Description.

THIS plant climeth and rampeth vpon trees, bushes, or whatsoeuer else it meeteth withall, like vnto the Vine, or the blacke Pepper, whereof some hold it for a kinde. The leaues are like those of the greater Bindweed, but somewhat longer, of a dustie colour, with diuers veines or ribs running through the same. The fruit groweth among the leaues, very crookedly writhed, in shape like the taile of a Lizard, of the taste of Pepper, yet very pleasant to the palate.

¶ The Place.

It groweth among the Date trees, and *Areca*, in most of the Molucca Islands, especially in the marriish grounds.

¶ The Time.

The time answereth that of Pepper.

¶ The Names.

This hath been taken for the Indian leafe, but not properly: of most it is called *Tembul*, and *Tambul*: in Malauar *Betre*: in Decan, *Guzarat*, and Canam it is called *Pam*: in Molaio, *Siri*.

¶ The Use and Temperature.

The leaues chewed in the mouth are of a bitter taste, whereupon (saith *Garcias*) they put thereto some *Areca* and with the lime made of oyster shels, whereunto they also adde some Amber Giece, *Lignum Aloes*, and such like, which they stampe together, making it into a paste, which they role vp into round balls, keepe dry for their vse, and carry the same in their mouthes vntill by little and little it is consumed; as when we carry sugar-Candy in our mouthes, or the iuice of Licorice; which is not onely vnto the feely Indians meate, but also drinke in their tedious trauels, refreshing their wearied spirits; and helping memory: which is esteemed among the Empericke Physitions, to be hot and dry in the second degree. † *Garcias* doth not affirme that the Indians eate it for meate, or in want of drinke, but that they eate it after meate, and that to giue the breath a pleasant sent, which they count a great grace, so that if an inferiour person that hath not chewed Betre, or some such thing, come to speak with any great man, he holds his hand before his mouth lest his breath should offend him. †

CHAP. 154.

Of Graines, or Graines of Paradise.

¶ The Kindes.

There be diuers sorts of Graines, some long, others Peare fashion; some greater, and others lesser.

○ ○ ○ ○ ○ ○

¶ The

¶ The Description.

† The first figure hereof setteth forth vnto your view the cod wherein the hot spice lieth, which we call Graines : in shops, *Grana Paradisi* : it groweth, by the report of the Learned, vpon a low herby plant: the leaues are some foure inches long, and three broad, with somewhat a thicke middle rib, from which run transuerse fibres; they much in shape resemble those of Cloues. The fruit is like a great cod or huske, in shape like a Fig when it groweth vpon the tree, but of colour russet, thrust full of small seeds or graines of a darke reddish colour (as the Figure sheweth which is diuided) of an exceeding hot taste.

Cardamomi genera.
The kindes or sorts of Graines.

The other sorts may be distinguished by the sight of the picture, considering the onely difference consists in forme.

¶ The Place.

Graines grow in Ginny, and the Cardamones in all the East Indies, from the port of Calecute vnto Cananor; it groweth in Malauar, in Ioa, and in diuers other places.

¶ The Time.

They spring vp in May, being sowne of seed, and bring their fruit to ripenesse in September.

¶ The Names.

Graines are called in Greeke, καρδάμων : in Latine, *Cardamomum* : of the Arabians, *Corrameni* : of diuers Gentiles, *Dore* : of Auicen, *Saccolaa quebir* (i.) *magnum* : the other, *Saccolaa ceguer* (i.) *minus*. It is called in Malauar, *Etremelli* : in Zeilan, *Ençal* : in Bengala, Guzarat, and Decan, *Hil*, and *Elnchi*. The first and largest sort are called of some, *Mileguetta*, and *Milegetta* : in English, Grains, and Graines of Paradise.

¶ The Temperature.

Auicen writeth, that *Saccolaa*, *Cardamomum*, or *Grana Paradisi*, are hot and dry in the third degree, with astringion.

¶ The Vertues.

A The Graines chewed in the mouth draw forth from the head and stomacke waterish and pituitous humors.

B They also comfort and warme the weake, cold, and feeble stomacke, helpe the ague; and rid the shaking fits, being drunke with Sacke.

CHAP. 155. Of Yucca or Fucca.

*Yucca, sine Yucca Peruana.*The root whereof the bread Casaua
or Cazaua is made.

¶ The Description.

THe Plant of whose root the Indian bread called Cazaua is made, is a low herbe consisting onely of leaues and roots: it hath neither stalke, floures, nor fruit, that I can vnderstand of others, or by experience of the plant it selfe, which hath growne in my garden foure yeares together, and yet doth grow and prosper exceedingly; neuertheless without stalke, fruit, or floures, as aforesaid. It hath a very great root, thicke and tuberous, and verie knobby, full of iuice somewhat sweet in taste, but of a pernicious qualitie, as saith my Author: from which root riseth vp immediately forth of the ground very many leaues ioyned vnto the head of the root in a round circle; the which are long, of the length of a cubit, hollowed like a gutter or trough, verie smooth, and of a greene colour, like that of Woade: the edges of the leaues are sharpe like the edge of a knife, and of a browne colour: the point of the leafe is a prick as sharp as a needle, which hurteth those that vnadvisedly passe by it: the leafe with aduised eye viewed is like vnto a little wherry, or such like boat: they are also very tough, hard to break, and not easie to cut, except the knife be very sharpe.

‡ *Lobel* in the second part of his *Aduersaria* largely describes and figures this plant; and there hee affirms hee wrot a description (the which he there sets downe) for our Au-

thor; but he did not follow it, and therefore committed these errors: First, in that hee saith it is the root whereof Cazaua bread was made; when as *Lobel* in his description said he thought it to be *Alia species à Yucca Indica ex qua panis communis fit*. Secondly, in that he set downe the place out of the *Historia Lugd.* (who tooke it out of *Theuet*) endeauouring by that meanes to confound it with that there mentioned, when as he had his from *M^r. Edwards* his man. And thirdly, (for which indeed he was most blame-worthy, and wherein he most shewed his weakenesse) for that hee doth confound it with the *Manihot* or true *Yuicca*, which all affirme to haue a leafe like that of hemp, parted into seuen or more diuisions: and also in that he puts it to the *Arachidne* of *Theophrastus*, when as he denies it both floure and fruit; yet within some few yeares after our Author had set forth this Worke it floured in his garden.

This some yeares puts forth a pretty stiffe round stalke some three cubits high, diuided into diuers vnequall branches carrying many pretty large floures, shaped somewhat like those of *Fritillaria*, but that they are narrower at their bottomes: the leaues of the floure are six: the colour on the inside white, but on the out side of an ouerworne reddish colour from the stalke to the middest of the leafe; so that it is a floure of no great beautie, yet to be esteemed for the raritie. I saw it once floure in the garden of *M^r. Wilmot* at Bow, but neuer since, though it hath been kept for many yeares in sundry other gardens, as with *M^r. Parkinson* and *M^r. Tuggy*. This was first written of by our Author; and since by *Lobel* and *M^r. Parkinson*, who keepe the same name, as also *Bauhine*, who to distinguish it from the other calls it *Yucca folijs Aloes*. ‡

¶ The Place.

This plant groweth in all the tract of the Indies, from the Magellane straights vnto the cape of Florida, and in most of the Islands of the Canibals, and others adioyning, from whence I had that plant brought me that groweth in my garden, by a seruant of a learned and skilfull Apothecary of Excester, named *M^r. Tho. Edwards*.

¶ The Time.

It keepeth Greene both Winter and Sommer in my garden, without any couerture at all, notwithstanding the iniurie of our cold clymat.

¶ The Names.

It is reported vnto me by Trauellers, that the Indians do call it in some parts, *Manibot*, but generally *Yucca* and *Incca*: it is thought to be the plant called of *Theophrastus*, *Arachidna*; and of *Pliny*, *Aracidna*.

¶ The Temperature.

This plant is hot and dry in the first degree, which is meant by the feces or drosse, when the poisonous iuice is pressed or strained forth, and is also dry in the middle of the second degree.

CHAP. 156.

Of the fruit *Anacardium*, and *Caious*, or *Caiocus*.

¶ The Description.

THE antient writers haue been very brieft in the historie of *Anacardium*: the Grecians haue touched it by the name of *Anacardior*, taking the name from the likenesse it hath of an heart both in shape and colour; called of the Portugals that inhabit the East Indies, *Fava de Malagua*, the bean of Malaca; for being Greene, and as it hangeth on the tree, it resemblerh a Beane, sauing that it is much bigger: but when they be dry they are of a shining blackish colour, containing between the outward rinde and the kernell (which is like an Almond) a certaine oile of a sharpe causticke or burning qualitie, called *Mel Acardinum*, although the kernell is vsed in meates and sauces, as we do Oliues and such like, to procure appetite.

Anacardium.

The Beane of Malaca.

*Caious.*

The kidney Beane of Malaca.

The other fruit groweth vpon a tree of the bignesse of a Peare tree: the leaues are much like to those of the Oliue tree, but thicker and fatter, of a feint Greene colour: the floures are white, consisting of many small leaues much like the floures of the Cherry tree, but much doubled, without smell: after commeth the fruit (according to *Clusius*, of the forme and magnitude of a goose egge, full of iuice, in the end whereof is a nut) in shape like an Hares kidney, hauing two rindes, between which is contained a most hot and sharpe oile like that of *Anacardium*, whereof it is a kind.

The Beane or kernell it selfe is no lesse pleasant and wholsome in eating, than the *Pistacia*, or *Fisticke* nut, whereof the Indians do eate with great delight, affirming that it prouoketh Venerie, wherein is their chieft felicitie. The fruit is contained in long cods like those of Beans, but greater: neere vnto which cods commeth forth an excrecence like vnto an apple, very yellow, of a good smell, spongius within, and full of iuice, without any seeds, stones, or graines at all, somewhat sweet in taste, at the one end narrower than the other, Peare fashion, or like a little bottle, which hath bin reputed of some for the fruit, but not rightly; for it is rather an excrecence, as is the oke Apple.

¶ The Place.

The first growes in most parts of the East Indies, especially in Cananor, Calecute, Cambaya, and Decan. The later in Brasile.

¶ The Time.

These trees floure and flourish Winter and Sommer.

¶ The Names.

Their names haue been touched in their descriptions. The first is called *Anacardium*, of the like-nesse it hath with an heart: of the Arabians, *Balador*: of the Indians, *Bibo*.

The second is called *Caius*, and is thus written, *Caiöus*, and *Cains*: of some, *Caiocus*.

¶ The Temperature and Vertues.

The oile of the fruit is hot and dry in the fourth degree, it hath also a causticke or corrosiue qualitie: it taketh away warts, breaketh apostumes, preuaileth against leprie, *alopecia*, and easeth the paine of the teeth, being put into the hollownesse thereof.

The people of Malauar do vse the said oile mingled with chalke, to marke their cloathes or any other thing they desire to be coloured or marked, as we do vse chalke, okar, and red marking stones, but their colour will not be taken forth againe by any manner of art whatsoeuer.

They also giue the kernell steeped in whay to them that be asthmaticke or short winded; and when the fruit is yet green they sticke the same so steeped against the wormes.

The Indians for their pleasure will giue the fruit vpon a thorne or some other sharpe thing, and hold it in the flame of a candle, or any other flame, which there will burne with such crackings, lightnings, and withall yeeld so many strange colours, that it is great pleasure to the beholders which haue not seene the like before.

CHAP. 157.

Of Indian Morrice Bells, and diuers other Indian Fruits.

† 1 *Ahouay Theneri*.

Indian Morrice Bels.

† 2 *Fructus Higuero*.

Indian Morosco bels.

¶ The Description.

THIS fruit groweth vpon a great tree of the bignesse of a Peare tree, full of branches, garnished with many leaues which are alwaies greene, three or foure fingers long, and in bredth two: when the branches are cut off there issueth a milky iuice not inferiour to the fruit in his venomous

O o o o o o 3

qualitie.

qualitie. The trunke or body is couered with a grayish barke: the timber is white and soft, not fit to make fire of, much lesse for any other vse; for being cut and put to the fire to burne, it yeeldeth forth such a loathsome and horrible stinke, that neither man nor beast are able to endure it: wherefore the Indians haue no vse thereof, but onely of the fruit, which in shape is like the Greeke letter α , of the bignesse of a Chestnut, and couered with a most hard shell, wherein is contained a kernel of a most venomous and poysonsome qualitie, wherewith the men being angry with their wiues, do poyson them, and likewise the women their husbands: they likewise vse to dip or anoint and inuene their arrowes therewith, the more speedily to dispatch their enemies. Which kernell they take forth with some conuenient instrument, leauing the shell as whole as may be, not touching the kernell with their hands because of its venomous qualitie, which would spoile their hands, and sometimes take away their life also. In which shells they put some little stones, and tye them vpon strings (as you may perceiue by the figure) which they dry in the Sunne, and after tye them about their legs, as we do bells, to set forth their dances, and Morosco Matachina's, wherein they take great pleasure, by reason they thinke themselves to excell in those kindes of dances. Which ratling sound doth much delight them, because it setteth forth the distinction of sounds, for they tune them and mix them with great ones and little ones, in such sort as we doe chimes or bells.

2 There is also another sort hereof, differing onely in forme; they are of the like venomous qualitie, and vsed for the same purpose. † The fruit of *Higuerro* is like that of a gourd in pulpe, and it may be eaten: the shape of the fruit is round, whereas the former is three cornered. †

¶ The Place.

These do grow in most parts of the West Indies, especially in some of the Islands of the Canibals, who vse them in their dances more than any of the other Indians. † You may see these vpon strings as they are here figured, amongst many other varieties, with Mr. *John Tradescant* at South Lambeth. †

¶ The Time.

We haue no certaine knowledge of the time of flourishing or bringing the fruit to maturitie.

¶ The Names and Vse.

We haue sufficiently spoken of the names and vse hereof, therefore what hath beene said may suffice.

† The figures were transposed.

CHAP. 158. Of the vomiting and purging Nuts.

1 *Nuces vomica.*
Vomiting Nuts.

1 *Nuces purgantes.*
Purging Nuts.

¶ The

¶ The Description.

1 **A** Vicen and Serapio make *Nux vomica*, and *Nux Methel*, to be one, whereabout there hath been much cauelling; yet the case is plaine, if the text be true, that the Thorne Apple is *Nux Methel*. Of the tree that beareth the fruit that is called in shops *Nux vomica*, and *Nux Methel*, we haue no certaine knowledge: some are of opinion, that the fruit is the roote of an herbe, and not the nut of a tree: and therefore since the case among the learned resteth doubtful, we leaue the rest that might be said to a further consideration. The fruit is round, flat, like a little cake, of a russet ouerworne colour, fat and firme, in taste sweet, and of such an oily substance, that it is not possible to stampe it in a mortar to powder; but when it is to be vsed, it must be grated or scraped with some instrument for that purpose.

2 There be certaine Nuts brought from the Indies, called purging Nuts, of their qualitie in purging grosse and filthie humors, for want of good instruction from those that haue trauelled the Indies, we can write nothing of the tree it selfe: the Nut is somewhat long, ouall, or in shape like an egge, of a browne colour: within the shell is contained a kernell, in taste sweet, and of a purging facultie.

¶ The Place and Time.

These Nuts do grow in the desarts of Arabia, and in some places of the East Indies: we haue no certaine knowledge of their springing, or time of maturitie.

¶ The Names.

Auicenn affirmeth the vomiting Nut to be of a poisonous qualitie, cold in the fourth degree, ha-
uing a stupifying nature, and bringeth deadly sleepe.

¶ The Vertues.

Of the Physicall vertues of the vomitting Nuts we thinke it not necessarie to write, because the danger is great, and not to be giuen inwardly, but mixed with other compositions, and that very cu-
riously by the hands of a faithfull Apothecarie.

The pouder of the Nut mixed with some flesh, and cast vnto crows and other rauinous fowles, B
doth kill and so dull their senses at the least, that you may take them with your hands.

They make also an excellent sallet, mixed with some meat or butter, and laied in the garden C
where cats vse to scrape to burie their excrements, spoyling both the herbes and also seeds new
sowne.

CHAP. 159. Of diuers sorts of Indian fruits.

¶ The Kindes.

THese fruits are of diuers sorts and kinds, wherof we haue little knowledge, more than the fruits
themselues, with the names of some of them: therefore it shall suffice to set forth vnto your
view the forme onely, leauing vnto Time, and those that shall succeed, to write of them at large,
which in time may know that, that in this time of infancie is vnkowne.

† **O**Vr Authour formerly in this Chapter set forth diuers figures of Indian fruits, and
amongst the rest *Beritinus*, *Cacao*, *Cocci Orientales*, *Buna*, *Fagaras*, *Cubiba*, &c. but he gaue
but onely three descriptions, and these either false or to no purpose; wherefore I haue
omitted them, and in this chapter giuen you most of these fruits which were formerly figured ther-
in, together with an addition of sundry other out of *Clusius* his *Exotickes*, whose figures I haue
made vse of, and here giuen you all those which came to my hands, though nothing so many as are
set forth in his *Exotickes*; neither, if I should haue had the figures, would the shortnesse of my time
nor bignesse of the booke (being already growne to so large a volume) suffer mee to haue inserted
them; therefore take in good part those I here giue, together with the brieue histories of them.

¶ The Description.

1 **T**He first and one of the best knowne of these fruits, are the *Cubiba*, called of the Arabi-
an Physicians *Cubibe* and *Quabeb*; but of the vulgar *Quabebochini*: in Iaoa where they
plentifully grow, *Cumuc*: the other Indians, (the Malayans excepted) call them *Cu-
bas fini*, not for that they grow in China, but because the Chinois vse to buy them in Iaoa and Sun-
da, and so carry them to the other ports of India. The plant which carries this fruit hath leaues
like

1 *Cubiba. Cubibs.*2 *Cocci Orientales. Cocculus Indi.*‡ 6 *Amomum verum.**cubibe**Cocci.*3 *Fagara.*4 *Mungo.*5 *Buna.*‡ 7 *Amomum purum.*‡ 8 *ymomis.*9 *Beritinus.*‡ 10 *Nuces insana. Mad Nuts.*

like those of pepper, but narrower, and it also windes about trees like as Iuy or Pepper doth: the fruit hangs in clusters, like as those we call red Currans, and not close thrust together in bunches, as grapes: the fruit or berries are of the bignesse of Pepper cornes, wrinkled, and of a brownish colour: they are of a hot and biting aromaticke taste, and oft times hollow within, but if they be not hollow, then haue they a pretty reddish smooth round seed vnder their rough vtter huske, each of these berries commonly hath a piece of his foot-stalke adhering to it. It is reported that the Natiues where it growes first gently boile or scald these berries before they sell them, that so none els may haue them, by sowing the seeds. Some haue thought these to haue beene the *Carpesum* of the Antients; and other-some haue iudged them the seeds of *Agnus Castus*, but both these opinions are erroneous.

These are hot and dry in the beginning of the third degree; wherefore they are good against the cold and moist affects of the stomacke and flatulencies: they helpe to cleanse the breast of tough and thicke humours; they are good for the spleene, for hoarsnesse and cold affects of the wombe, chewed with Masticke, they draw much flegmaticke matter from the head, they heat and comfort the braine. The Indians vse them macerated in wine to excite venerie. A

2 The Plant which carries this fruit is vnkowne, but the berrie is well knowne in shoppes by the name of *Cocculus Indicus* some call them *Cocci Orientales*: others, *Coccula Orientales*: some, as *Cordus* for one, thinke them the fruit of *Solanum furiosum*: others iudge them the fruit of a *Tithymale*, or of a *Clematis*. These berries are of the bignesse of Bay berries, commonly round, and growing but one vpon a stalke; yet sometimes they are a little cornered, and grow two or three clustering together: their outer coat or shell is hard, rough, and of a brownish duskie colour: their inner substance is very oily, of a bitter taste.

They are vsed with good successe to kill lice in childrens heads, being made into pouder and so strowed amongst the haire. They haue also another faculty which our Author formerly set downe in the chapter of *Alaternus* (where he confounded these with *Fagaras*) in these words, which I haue there omitted, to insert here; B

In England we vse the fruit called *Cocculus Indi* in pouder mixed with flower, hony, and crummes of bread to catch fish with, it being a numming, soporiferous, or sleeping medicine, causeth the fish to turne vp their bellies, as being senselesse for a time. C

3 *Fagara* is a fruit of the bignesse of a Chich-pease, couered with a thin coat of a blackish ash colour, vnder which outer coat is a slender shell containing a sollid kernell, involued in a thin and blacke filme. The whole fruit both in magnitude, forme, and colour is so like the *Cocculus Indus* last described, that at the first sight one would take it to be the same. *Auicenna* mentions this in his 266. Chap. after this manner. What is *Fagara*? It is a fruit like a Chich, hauing the seed of *Mahaleb*, and in the hollownesse is a blacke kernell as in *Schebedenegi*, and it is brought out of *Sofale*.

He places it amongst those that heate and dry in the third degree, and commends it against the coldnesse of the stomacke and liuer, it helps concoction, and bindes the belly.

4 This which *Clusius* thinke to be *Mungo* (which is vsed in the East Indies about Guzarat and Decan for prouender for horses) is a small fruit of the bignesse of Pepper, crested, very like Coriander seed, but that it is bigger and blacke, it is of a hot taste.

5 *Buna* is a fruit of the bignesse of *Fagara*, or somewhat bigger or longer, of a blackish ash colour, couered with a thin skin, furrowed on both sides longwise, whereby it is easily diuided into two parts, which containe each a kernell longish and flat vpon one side, of a yellowish colour, and acide taste. They say that in Alexandria they make a certaine very cooling drinke hereof. *Rauwolfius* in his iournal seemes to describe this fruit by the name of *Bumu*: and by the appellation, forme, and faculties, he thinke it may be the *Buncho* of *Auicenna*, and *Buncha* of *Rhasis*, to *Almansor*. *Clusius*.

6 This is a kind of Cardamome: and by diuers it is thought to be the true *Amomum* of the Antients, and to this purpose *Nicholas Marogna*, a Physitian of Verona, hath written a treatise which is set forth at the later end of *Pona's* description of Mount *Baldus*, to which I refer the curious: these cods or berries (whether you please to call them) grow thicke clustering together, they are round, and commonly of the bignesse of a cherry: the outer skin is tough, smother, whiter, and lesse crested than that of the Cardamome: within this filme lye the seeds clustering together, yet with a thin filme parted into three, the particular seeds are cornered, somewhat smother and larger than those of Cardamomes, but of the same aromaticke taste, and of a browne colour. Their temperature and faculties may be referred to those of Cardamomes.

7. 8. This with the next ensuing are by *Clusius* set forth by the names I here giue you them, though (as he saith) neither of them agree with the *Amomum* of *Dioscorides*, they were only branches set thicke with leaues, hauing neither any obseruable smell or taste: they were sent to the learned and diligent Apothecarie *Walarandus Donrez* of Lyons, from Ormuz the famous Mart & port town in the Persian Bay.

9 Those that accompanied the renowned Sir Francis Drake in his voyage about the World, light

11 Cacao. Small Coccoes.

12 Cucciphora. Quince Dates.

14 Guanabans. Tree Melon.

13 Baruce. Arara. Orukoria. Cropiot.

15 Ananas. The Pinia, or Pine Thistle.

The first accompanied the renowned Sir Francis Drake in his voyage about the World.

light vpon a certaine desert Island, wherein grew many very tall trees, and looking for something amongst these to refresh themselves, amongst others they obserued some bigger than Okes, hauing leaues like those of the Bay tree, thicke and shining, not snipt about the edges, their fruit was longish like to the small Acornes of the Ilex or Holme Oke, but without any cup; yet couered with a thin shell of an ash colour, and sometimes blacke, hauing within it a longish white kernell wrapped in a thin peeling, being without any manifest taste; They when they found it, though much oppressed with hunger, yet durst not taste thereof, least it should haue been poisonous: but afterwards comming to the Island Beretina, not far from this, they found it to abound with these trees, & learned that their fruit was not poisonous, but might be eaten. Wherupon afterwards they in want of other victuals, boiled some as they do Pease, and ground others into floure, wherewith they made puddings. They found this tree also in the Moluccoes.

10 The first expressed in this table is the mad Plum, or as *Clusius* had rather terme it the Mad Nut; for he calls them *Kapua lugina*, or *Insane Nuces*. The Hollanders finding them in their return from the East Indies, and eating the kernels, were for a time distracted, and that variously, according to the particular temperature of each that ate of them; as you may see in *Clusius Exot. lib. 2. Cap. 26*. This was round, little more than two inches about, with a shell not thicke, but sufficiently strong, brownish on the out side, and not smooth, but on the inside of a yellowish colour and smooth, containing a membranous stone or kernell couered with a black pulp, in form and bignesse not much vnlike a Bullas or Sloe, hauing a large white spot on the lower part whereas it was fastened to the stalke: vnder the pulpe lay the kernell, somewhat hard, and of an ash colour: the foot-stalke was short and commonly carried but one fruit, yet sometimes they obserued two growing together: the tree wheron this fruit grew was of the bignesse of a Cherry tree, hauing long and narrow leaues like those of the Peach tree: the other fruit figured in the 2. place was of a brownish yellow colour, somewhat bigger, but not vnlike a small Nut, and inch long, and somewhat more about, smaller below, and bigger aboue, and as it were parted into foure, being very hard and follid. Of this see more in the fourteenth place.

11 The *Cocoa* is a fruit well knowne in diuers parts of America, for they in some places vse it in stead of money, and to make a drinke, of which, though bitter, they highly esteeme: the trees which beare them are but small, hauing long and narrow leaues, and will onely grow well in places shadowed from the Sun. The fruit is like an Almond taken out of his husk, and it is couered with a thin blacke skin, wherein is contained a kernell obliquely diuided into two or three parts, brownish, and distinguished with ash coloured veines, of an astringent and vngratefull taste.

12 This which *Clusius* had from *Cortusus*, for the fruit of *Bdelium*, is thought to be the *Cuci* of *Pliny*, and is the *Cuciophera* of *Matthiolus*, and by that name our Author had it in this Chapter. The whole fruit is of the bignesse of a Quince, and of the same colour, with a sweet and fibrous flesh, vnder which is a nut of the bignesse of a large Walnut or somewhat more, almost of a triangular form, bigger below, and smaller aboue, well smelling, of a darke ash colour, with a very hard shell, which broken there is therein contained a hard kernell of the colour and hardnesse of marble, hauing a hollownesse in the middle, as much as may containe a Hasell Nut.

13 In this table are foure seuerall fruits described by *Clusius Exot. lib. 2. c. 21*. The first is called *Baruce*, and is said to grow vpon a high tree in Guyana called Hura: it consisted of many Nuts of some inch long, strongly fastened or knit together, each hauing a hard wooddy shell, falling into two parts, containing a round and smooth kernell couered with an ash coloured filme.

They say the natiues there vse this fruit to purge and vomite.

The second called *Arara* growes in Kaiana, but how, it is not knowne: it was some inch long, couered with a skin sufficiently hard and blacke, fastened to a long and rugged stalke that seemed to haue carried more than one fruit: the kernell is blacke, and of the bignesse of a wilde Oliue.

The natiues vse the decoction hereof to wash maligne vlcers, and they say the kernell will loose the belly.

The third named *Orukoria* is the fruit of a tree in Wiapock, called *Iuruma*, they vse this to cure their wounds, dropping the iuice of the fruit into them. This fruit is flat almost an inch broad, and two long, but writhen like the cod of the true *Cytisus*, but much bigger, very wrinckled, of an ash colour, containing a smooth seed.

The fourth called *Cropiot* is a small and shriuelled fruit, not much vnlike the particular ioints of the *Aethiopian* pepper.

The sauages vse to take it mixed amongst their Tabaco to assuage head-ache: there were diuers of them put vpon a string (as you may see in the figure) the better to dry them.

14 This which by *Clusius* & *Lobel* is thought to be the *Guanabarus* mentioned by *Scaliger Exerc. 281. part. 6*. is a thicke fruit some foot and halfe long, couered with a thicke and hard rinde, freezed ouer with a soft downinesse, like as a Quince is, but of a greenish colour, with some veines, or rather furrowes running along it, as in Melons: the lower end is somewhat sharp: at the vpper end it is fastened

fastened to the boughes, with a firme, hard, and fibrous stalke: this fruit contains a whitish pulpe, which the Ethiopians vse in burning feuers to quench the thirst, for it hath a pleasant tartnesse: this dried becomes friable, so that it may be brought into powder with ones fingers, yet retaineth its aciditie: in this pulp lye seeds like little Kidneis, or the seeds of the true *Anagyris*, of a black shining colour, with some fibres comming out of their middles: these sowne brought forth a plant hauing leaues like the Bay tree, but it dyed at the approach of Winter. *Clus.*

15 *Ananas Pinias*, or Pine Thistle is a plant hauing leaues like the *Aizoon aquaticum*, or water

† 16 *Faba Egyptia affinis.*

† 19 *Fructus tetragonus.* The square Coco.

† 17 *Coxco Cypote.* *Amygdala Peruana.*
Almonds of Peru.

† 20 *Arboris lanifera filiqua.*
A cod of the wooll-bearing tree.

† 18 *Buenos Noches.*

Sengreene, somewhat sharpe and prickly about the edges: the stalke is round, carrying at the top therof one fruit of a yellowish colour when it is ripe, of the bignes of a Melon, couered with a scale-like rinde: the smell is gratefull, so newhat like that of the Malocotone: at the top of the fruit, and sometimes below it come forth such buds as you see here presented in the figure, which they set in the ground and preserve the kind by instead of seed: the meat of this fruit is sweet & very pleasant of taste, & yeelds good nourishment; there are certaine small fibres in the meat thereof, which though they do not offend the mouth, yet hurt they the gums of such as too frequently feed thereon.

16 The forme of this is so newhat strange, for it is like a large Poppy head cut off nigh the top: the substance thereof was membranous and wrinkled, of a brownish colour, very smooth: the circumference at the top is about nine inches, and so it growes smaller and smaller even to the stalke, which seems to have carried a floure whereto this fruit succeeded: the top of the fruit was even, and in it were orderly placed 24. cavities, in each whereof was contained a little Nut like an Acorn almost an inch long, and as much thick: the vpper part was of a brownish colour, & the kernel within was rank and all mouldy. *Clusius* could learne neither whence this came, nor how it grew, but with a great deale of probability thinks it may be that which the Antients described by the name of *Faba Egyptia*.

17 The former of these two *Clusius* received by the name of *Coxco Cypote*, that is the Nut Cypote: It is of a dusky browne colour, smooth, and shining, but on the lower part of an ash colour, rough, which the Painter did not well expresse in drawing the figure. The 2. hee received by the name of *Almendras del Peru*, (i.) Almonds of Peru: the shell was like in colour and substance to that of an almond, and the kernell not unlike neither in substance nor taste: yet the forme of the shell was different, for it was triangular, with a backe standing vp, and two sharp sides, and these very rough.

18 This was the fruit of a large kind of *Convolvulus* which the Spaniards called *Buenas noches*, or Goodnight, because the floures vse to fade as soone as night came. The seeds were of a footy colour as big as large Pease, being three of them contained in a skinny three cornered head. You may see more hereof in *Clusius, Exot. lib. 2. cap. 18.*

19 This is the figure of a square fruit which *Clusius* coniectures to have been some kind of Indian Nut or Coco: it was couered with a smooth rinde, was seven inches long, and a foot and halfe about, being foure inches and a halfe from square to square.

20 About Bantam in the East Indies growes a tall tree sending forth many branches, which are set thicke with leaues long and narrow, bigger than those of Rosemary: it carries cods six inches long, and five about, couered with a thin skin, wrinkled and sharp pointed, which open themselves from below into five parts, and are full of a soft woolly or Cottony matter, wherewith they stuffe cushions, pillowes and the like, and also spin some for certaine vses: amongst the downe lye blacke seeds like those of Cotton, but lesse, and not fastened to the downe.

21 This which *Clusius* calls *Palma saccofera*, or the Bag Date, because it carries the figure of an Hippocras bag, was found in a desert Island in the Antlantick ocean, by certaine Dutch mariners who obserued whole woods thereof: these bags were some of them 22. or more inches long, and some seven inches broad in the broadest place, strongly woued with threds crossing one another, of a brownish yellow colour. These sachels (as they report who cut them from the tree) were filled with fruit of the bignesse of a Walnut huske and all: within these were others, as round as if they had bin tor- ned, and so hard that you could scarce breake them with a hammer: in the midst of these were white kernels, tasting at the first somewhat like pulse, but afterwards bitter like a Lupine.

22 The tree which carries this rough cod is very large, as I haue been told by diuers: some who saw it in Persia, & others that obserued it in Mauritius Island. *Clusius* also notes that they haue bin brought from diuers places: the cod is some three inches long, and some two inches broad, of a duskie red colour, and all rough and prickly: in these cods are contained one, two or more round nuts or seeds of a grayish ash colour, hauing a little spot on one side, where they are fastened to the cod they are exceeding hard, and difficult to breake, but broken they shew a white kernel very bitter and vnpleasant of taste. I haue seen very many and haue some of these, and some haue offered to sel them for East Indian Beazor, whereto they haue some small resemblance, though nothing in facultie like them (if I may credit report, which I had rather do than make tryall) for I haue been told by some that they are poisonous; and by others, that they strongly procure vomit.

23 The long cod expressed in this figure is called in the East Indies (as *Clusius* was told) *Kaye baka*, it was round, the thicknesse of ones little finger, and six inches long: the rinde was thick, black, hard and wrinkled, and it contained a hard pulpe of a sowrish taste, which they affirm was eatable.

The other was a cod of some inch and halfe long, and some inch broad, membranous, rough, and of a brownish colour, sharp pointed, and opening into two parts, and distinguished with a thin film into foure cels, wherein were contained scarlet Peare fashioned little berries, hauing golden spots especially in the middles. This growes in Brasile, and as *Clusius* was informed was called *Daburi*.

24 In the second place of the tenth figure and description in this chapter you may finde the

Other strange fruits.

‡ 26 *Fructus alij Exotici.*
Other strange fruits.

single Nut here figured, described, & set forth; but this figure better expresses the manner of growing thereof: for first it presents to the view the nuts in their outer husks growing close together, then the single nuts in and out of their husks, and lastly their kernell: the shell of this nut contains in it a certaine oilie substance, somewhat resembling the oile of sweet almonds: the tree whereof this nut is the fruit growes in Ginny, and is much used by the people there, for they presse a liquour forth of the leaves, or else boile them in water, & this serves them in stead of wine & beere, or at least for a common drink, of the fruit they make bread of a very sweet and pleasant taste.

25 These scaly fruits are set forth by *Clusius, Exot. l. 2 c. 3.* The first was three inches long and two inches about, and had in it a longish hard solid kernell, with many veines dispersed over it, and such kernels are sometimes polished, whereby they become white, and then their blacke veines make a fine shew, which hath given occasion to some impostors to put them to sale for rare and precious stones.

The second was small, round and scaly, and the scales turned their points downwards towards the stalke.

The third was also scaly, of the bignesse of a Walnut in his huske, with the scales very orderly placed, and of a brownish colour: it had a kernel which rattled in it when it was shaken.

26 The first of the two in the former table was brought from Ginny, it was of the bignesse and shape of a plum, two inches long, and one and halfe broad, of a thicke fungous substance, somewhat wrinkled, and blackish on the outside, and within containing a certaine whitish insipid friable pulpe, wherein lay a few small seeds.

The second was some inch and halfe long, an inch thicke, covered with an ash coloured skin, composed within of many fibres almost like the huske of the Nut Faufell, at the lower end it stood in a double cup, and it was sharp pointed

at the vpper end: in this skin was contained a kernell, or rather nut, blacke, hard, and very wrinckled not much vnlike to that of Faufell, whereto I refer it as a kinde thereof. These two are treated of by *Clusius*, *Exot. lib. 2. c. 23.*

The first of the second table (wherein are contained foure figures) was of a round forme, yet a little flat on one side, distinguished vnder the blacke and shining coat wherewith it was couered, with furrowes running euery way, not vnlike to the Nut Faufell taken forth of his couer: the inner pulpe was hard and whitish, first of a salt, and then of an astringent taste.

The second of these was an inch long, but rather the kernell of a fruit, than a fruit it selfe; it was round except at the one end, and all ouer knobby (though the picture expresse not so much) there was also some shew of a triangular forme at each end.

The third was two inches and a halfe long, and in the broadest part some inch and more broad: it was somewhat crooked, the backe high and rising, the top narrow, and the lower part sharp pointed, of an ash colour, with thicke and eminent nerues running alongst the back from the top to the lower part, exprest with such art, as if they had been done by some curious hand: it seemed to haue bin couered ouer with another rinde, but it was worne off by the beating of the waues of the sea vpon the shore.

The fruit *Cunane* figured in the fourth place of this table, was two inches long, and an inch broad at the head, and so smaller by little & little, with a back standing out, smooth, black, and shining, hauing three holes at the top, one aboue, & two below: they said it grew vpon a smal tree called *Morremor*, and was yet vnripe, but when it was ripe it would be as big again, and that the natiues where it grew (which was as I take it about *Wiapock*) rost it vpon the coles, and eate it against the headache. *Clusius* sets forth these foure in his *Exot. lib. 2. c. 22.* he describes *Cunane* cap. 21. †

CHAP. 160. Of Sun-Dew, Youth moort, Ros Solis. 8

1 *Ros Solis folio rotundo.*

Sun-Dew with round leaues.

2 *Ros Solis folio oblongo.*

Sun-Dew with longish leaues.

The

¶ The Description.

1 **S**Un-Dew is a little herb, and groweth very low, it hath a few leaues standing vpon slender stems, very small, something round, a little hollow, and like an eare picker, hairy and reddish, as be also the stems, hauing dew and moisture vpon them at the driest time of the yeare, and when the Sun shineth hottestt euen at high noone, and a moneth after there spring vp little stalks, a hand breadth high, on which stand small whitish floures: the roots are very slender, and like vnto haire.

2 The second kinde is like vnto the former, in stalks and floures, but larger, and the leaues are longer, and not so round, wherein consisteth the difference.

¶ The Place.

They grow in desart, sandie and sunny places, but yet waterie, and seldome other-where than among the white marish mosse which groweth on the ground and also vpon bogs.

¶ The Time.

Sun-Dew flourisheth in Sommer, it floureth in May or Iune: it is to be gathered when the weather is most dry and calme. The distilled water hereof that is drawne forth with a glasse still, is of a glittering yellow colour like gold, and coloureth siluer put therein like gold.

¶ The Names.

It is called in Latine, *Ros Solis*: of diuers, *Rorella*: it is named of other, *Salsi Rosa*, of the dew which hangeth vpon it, when the Sun is at the hottestt: it is called in high Dutch, *Sondaw*, and *Suidaw*: in low Dutch, *Loopichecrut*, which in English signifieth Lustwoort, because sheepe and other cattell, if they do but onely taste of it, are prouoked to lust. It is called in English, Sun-Dew, *Ros Solis*, Youth-woort: in the Northern parts, Red Rot, because it rotteth sheepe, and in Yorke-shire, Moore grasse.

¶ The Temperature.

It is a searing or causticke herbe, and very much biting, being hot and drie in the fourth degree.

¶ The Vertues.

The leaues being stamped with salt do exulcerate and raise blisters, to what part of the body soeuer they be applied.

The later Physitions haue thought this herbe to be a rare and singular remedie for all those that be in a consumption of the lungs, and especially the distilled water thereof: for as the herbe doth keep and hold fast the moisture and dew, and so fast, that the extreme drying heate of the Sun cannot consume and waste away the same: so likewise men thought that herewith the naturall and radical humidity in mens bodies is preserved and cherished. But the vse therof doth otherwise reach, and reason sheweth the contrarie: for seeing it is an extreme biting herb, and that the distilled water is not altogether without this biting qualitie, it cannot be taken with safety: for it hath also bin obserued, that they haue sooner perished that vsed the distilled water hereof, than those that abstained from it, and haue followed the right and ordinarie course of diet.

Cattell of the female kinde are stirred vp to lust by eating euen of a small quantity: which thing hath greatly increased their vain opinion, without sence or reason, for it doth not moue nor prouoke cattell to lust, for that it increaseth the substance of the seed, but because through his sharp and biting qualitie it stirreth vp a desire to lust, which before was dulled, and as it were asleepe.

It lengthneth and nourisheth the body, especially if it be distilled with wine, and that liquor made thereof which the common people do call *Rosa Solis*.

If any be desirous to haue the said drinke effectuell for the purposes, aforesaid, let them lay the leaues of *Rosa Solis* in the spirit of wine, adding thereto Cinnamon, Cloues, Maces, Ginger, Nutmegs, Sugar, and a few graines of Muske, suffering it so to stand in a glasse close stopt from the aire, and set in the Sun by the space of ten daies, then straine the same, and keep it for your vse.

CHAP. 161. Of Mosse of trees.

¶ The Description.

Tree Mosse hath certaine things like haire, made vp as it were of a multitude of slender leaues, now and then all to be iagged, hackt, and finely carued, twisted and interlaced one in another, which cleaue fast to the barks of trees, hanging downe from the bodies: one of this kinde is more

P P P P P 3

slender

Muscus quernus.

The Mosse of the Oke & of other trees.

slender and thin, another more thicke, another shorter, another longer; all of them for the most being of a whitish colour, yet oftentimes there is a certaine one also which is blacke, but lesser and thinner: the most commendable of them all, as *Pliny* saith, be those that are whitish, then the reddish, and lastly such as be blacke.

¶ *The Place.*

This Mosse is found on the Oke tree, the white and blacke Poplar tree, the Oliue tree, the Birch tree, the Apple tree, the Peare tree, the Pine tree, the wilde Pine tree, the Pitch tree, the Firre tree, the Cedar tree, the Larch tree, & on a great sort of other trees. The best, as *Dioscorides* saith, is that of the Cedar tree, the next of the Poplar, in which kinde the white and the sweet smelling Mosse is the chiefest; the blackish sort is of no account. *Matthioli* writeth, that in Italy that Mosse is sweet which groweth on the Pine tree, the Pitch tree, the Fir tree, & the Larch tree, and the sweetest that of the Larch tree.

¶ *The Time.*

Mosse vpon the trees continueth all the yeare long.

¶ *The Names.*

It is called of the Grecians *μῦσος* of the Latins, *Muscus*: the Arabians and some Apothecaries in other countries call it *Vsnea*: in high Dutch, *Mos*; in low Dutch, *Mosch*: the French men, *Lu Monsch*: the Italians, *Musgo*: in Spanish, *Musco de los arbores*: in English, Mosse, tree Mosse, or Mosse of trees.

¶ *The Temperature.*

Mosse is somewhat cold and binding, which notwithstanding is more and lesse according vnto the nature and facultie of that tree on which it groweth, and especially of his barke: for it taketh vnto it selfe and also retaineth a certaine propertie of that barke, as of his breeder of which hee is ingendred: therefore the Mosse which commeth of the Oke doth coole and very much binde, besides his owne and proper facultie, it receiueh also the extreme binding quality of the Oke barke it selfe.

The Mosse which commeth of the Cedar tree, the Pine tree, the Pitch tree, the Fir tree, the Larch tree, and generally all the Rosine trees are binding, and do moreouer digest and soften.

¶ *The Vertues.*

Serapio saith, that the wine in which Mosse hath been steeped certain daies, bringeth sound sleep; **A** strengtheneth the stomacke, staieth vomiting, and stoppeth the belly.

Dioscorides writeth, that the decoction of Mosse is good for women to sit in, that are troubled **B** with the whites; it is mixed with the oile of Ben, and with oiles to thicken them withall.

It is fit to be vsed in compositions which serue for sweet perfumes, and that take away wearisom- **C** nesse, for which things that is best of all which is most sweet of smell.

CHAP. 162. Of ground Mosse.

¶ *The Kindes.*

THere groweth also on the superficial or vppermost part of the earth diuers Mosses, as also vpon rocks and stony places, and marish grounds, differing in forme not a little.

¶ *The Description.*

THe common Mosse groweth vpon the earth, and the bottome of old and antient trees, but specially vpon such as grow in shadowie woods, and also at the bottom of shadowy hedges;

1 *Muscus terrestris vulgaris.*
Common ground Mosse.

2 *Muscus terrestris scoparius.*
Beefsome ground Mosse.

3. 4. *Muscus capillaris, siue Adiantum aureum maius & minus.*
Goldilockes or golden Maiden-haire
the bigger and lesse.

hedges and ditches, and such like places: it is very well knowne by the softnesse and length thereof, being a mosse most common, and therefore needeth not any further description.

2 Beefsome Mosse, which seldome or neuer is found but in bogs and marish places, yet sometimes haue I found it in shadowie dry ditches, where the Sun neuer sheweth his face: it groweth vp halfe a cubit high, euery particular leafe consisting of an innumerable sort of hairy threds set vpon a middle rib, of a shining blacke colour like that of Maiden-haire, or the Capillare Mosse *Adiantum aureum*, whereof it is a kinde.

3 This kinde of Mosse, called *Muscus capillaris*, is seldome found but vpon bogs and moorish places, and also in some shadowie dry ditches where the Sun doth not come. I found it in great abundance in a shadowie ditch vpon the left hand neere vnto a gate that leadeth from Hampsted heath,

5 *Muscus ramosus floridus.*
Flouring branched Mosse.

† 5 There is oftentimes found vpon old Okes and Beeches, and such like ouer-grown trees, a kinde of Mosse hauing many slender branches, which diuide themselues into other lesser branches; whereon are placed confusedly very many small threds like haire, of a greenish ash colour: vpon the ends of the tender branches sometimes there commeth forth a floure in shape like vnto a little buckler or hollow Mushrom, of a whitish colour tending to yellownes, and garnished with the like leaues of those vpon the lower branches.

6 *Muscus Pyxidatus.*
Cup or Chalice Mosse.

6 Of this Mosse there is another kinde, which *Lobel* in his Dutch Herbal hath set forth vnder the title of *Muscus Pyxidatus*, which I haue Englished, Cup Mosse or Chalice Mosse: it groweth in the most barren dry and grauelly ditch bankes, creeping flat vpon the ground like vnto Liuerwort, but of a yellowish white colour: among which leaues start vp here and there certaine little things fashioned like a little cup called a Beaker or Chalice, and of the same colour and substance of the lower leaues, which vndoubtedly may be taken for the floures: the pouder of which Mosse giuen to children in any liquor for certaine dayes together, is a most certaine remedie against that pe-
trillous malady called the Chin-cough.

7 There is likewise found in the shadowie places of high mountaines, and at the foot of old

and rotten trees, a certaine kinde of Mosse in face and shew not vnlike to that kinde of Oke Ferne called *Dryopteris*. It creepeth vpon the ground, hauing diuers long branches, consisting of many small leaues, euey particular leafe made vp of sundry little leaues, set vpon a middle rib one opposite to another.

7 *Muscus Filicinus*.
Mosse Ferne.

8 *Muscus corniculatus*.
Horned or knagged Mosse.

9 *Muscus denticulatus*.
Toothed Mosse.

8 There is found vpon the tops of our most barren mountaines, but especially were sea Coles are accustomed to be digged, stone to make iron of, and also where ore is gotten for tinne and lead, a certaine small plant: it riseth forth of the ground with many bare and naked branches, diuiding themselues at the top into sundry knags like the forked hornes of a Deere, euey part whereof is of an ouerworne whitish colour.

† Our Author formerly gaue another figure and description of this plant, by the name of *Holostium petraeum*, which I haue omitted, thinking this the better. *Tragus*, *Lonicerus*, and *Bauhine* refferre this to the Fernes; and the last of them calleth it *Filix saxatilis corniculata*: *Pena* and *Lobel* made it their *Holostium alterum*: *Thalys* calls it *Adiantum acrostichon*, seu *furcatum*. †

9 There is found creeping vpon the ground a certaine kinde of Mosse at the bottom of Heath and Ling, and such like bushes growing vpon barren mountaines, consisting as it were of scales made vp into a long rope or cord, disperfing it selfe far abroad into sundry branches, thrusting out
here

here and there certain roots like threds, which take hold vpon the vpper crust of the earth, whereby it is sent and disperfed far abroad : the whole plant is of a yellowish Greene colour.

10 This other kinde of Mosse is found in the like places : it also disperfeth it selfe far abroad, and is altogether lesser than the precedent, wherein consists the difference.

10 *Muscus minor denticulatus.*

Little toothed Mosse.

11 *Muscus clauatus, sine Lycopodium.*
Club Mosse, or Wolfe claw Mosse.

† 12 *Muscus clauatus folijs Cypressi.*
Heath Cypres.

11 There is likewise another kinde of Mosse, which I haue not elsewhere found than vpon Hampsted heath, neere vnto a little cottage, growing close vpon the ground amongst bushes and brakes, which I haue shewed vnto diuers Surgeons of London, that haue walked thither with me for their further knowledge in Simples, who haue gathered this kinde of Mosse, wherof some haue made

13 *Muscus ex cranio humano.*
Mosse growing vpon the skull of a man.

*Muscus
ex Cra-
nio Hu-
mano*

made them hat-bands, girdles, and also bands to tie such things as they had before gathered, for the which purpose it most fitly serued, some pieces whereof are six or eight foot long, consisting as it were of many hairie leaues set vpon a rough string, very close couched and compact together, from which is also sent forth certaine other branches like the first: in sundry places there be sent down fine little strings, which serue in stead of roots, wherewith it is fastened to the vpper part of the earth, and taketh hold likewise vpon such things as grow next vnto it. There spring also from the branches bare and naked stalkes, on which grow certaine eares as it were like the catkins or blowings of the Hassell tree, in shape like a little club or the reede Mace, sauing that it is much lesser, and of a yellowish white colour, very well resembling the claw of a Wolfe, whereof it tooke his name; which knobby katkins are altogether barren, and bring forth neither seed nor flour.

† 14 *Muscus parvus stellaris.*
Small Heath Mosse.

† 12 This, whose figure in the former edition was by our Author vnfitly put for Lauander Cotton (hauing more regard to the title of the figure in *Tabernamontanus*, than to see whether it were that which he there described) is no other than a kinde of *Muscus clavatus*, or Club-Mosse. It is thought to be the *Selago* mentioned by *Pliny*, lib. 25. cap. 11. *Tragus* and some others call it *Sauina sylvestris*: *Turner* and *Tabernamontanus*, *Chamaecyparissus*: but *Baubine* the most fitly nameth it *Muscus clavatus folijs Cypressi*: and *Turner* not vnfitly in English, Heath Cypresse. This is a low plant, and keepes greene Winter and Sommer: the leaues are like those of Cypresse, bitter in taste, but without smell: it carries such eares or catkins as the former, and those of a yellowish colour: it is found growing in diuers woody mountainous places of Germanie, where they call it *Wald Seuenbaum*, or wilde Sauine. †

13 This kinde of Mosse is found vpon the skulls or bare scalps of men and women, lying long in charnell houses or other places, where the bones of men and women are kept together: it groweth very thicke, white, like vnto the short mosse vpon the trunks of old Okes: it is thought to be a singular remedie against the falling Euill and the Chin-cough in children, if it be powdered, and then giuen in sweet wine for certaine daies together.

† 14 Vpon diuers heathy places in the moneth of May is to be found growing a little short Mosse not much in shape different from the first described, but much lesse, and parted at the top into star-fashioned heads. *Lobel* calls this, *Muscus in Ericetis proueniens*. †

¶ The Place.

Their severall descriptions set forth their naturall places of growing.

¶ The Time.

They flourish especially in the Sommer moneths.

¶ The Names.

Goldilocke is called in high-Dutch, *Widertodt*, golden *Widertodt*, *Jung Urauwen har*: in low-Dutch, *Gulden Wederdoot*: *Fuchsius* nameth it *Polytrichon Apuley*, or *Apuleius* his Maiden-haire; neuerthelesse *Apuleius* Maiden-haire is nothing else but *Dioscorides* his *Trichomanes*, called English Maiden-haire; and for that cause wee had rather it should be termed *Muscus capillaris*, or hairy Mosse. This is called in English, Goldilockes: it might also be termed Golden Mosse, or Hairy Mosse.

Wolfes claw is called of diuers Herbarists in our age, *Muscus terrestris*: in high-Dutch, *Beerlay*, *Surtelkraut*, *Seilkraut*: in low-Dutch, *wolfs clauwen*; whereupon wee first named it *Lycopodium*, and *Pes Lupi*: in English, Wolfes foot, or Wolfes claw, and likewise Club-Mosse. Most shops of Germanie in former times did falsly terme it *Spica celtica*: but they did worse, and were very much too blame, that vsed it in compound medicines in stead of *Spica celtica*, or French Spikenard: as touching the rest, they are sufficiently spoken of in their descriptions.

¶ The Temperature.

The Mosses of the earth are dry and astringent, of a binding qualitie, without any heate or cold.

Goldilocks and the Wolfes clawes are temperate in heate and cold.

¶ The Vertues.

- A The Arabian Physitians do put Mosse amongst their cordiall medicines, as fortifying the stomacke, to stay vomit, and to stop the laske.
- B Mosse boiled in Wine and drunke stoppeth the spitting of bloud, pissing of bloud, the termes, and bloody flux.
- C Mosse made into powder is good to stanch the bleeding of greene and fresh wounds, and is a great helpe vnto the cure of the same.
- D Wolfes claw prouoketh vrine, and as *Hieronymus Tragus* reporteth, wasteth the stone, and driueth it forth.
- E Being stamped and boyled in wine and applied, it mitigateth the paine of the gout.
- F Floting wine, which is now become slimie, is restored to his former goodnesse, if it be hanged in the vessell, as the same Author testifieth.

† The figure formerly in the first place was of the *Muscus Montanus* of *Tabern.* being a small kinde of *Muscus denticulatus*. The fifth and sixth were both of one; and so of the two descriptions I haue made one more accurate, and retained the better figure.

CHAP. 163. Of Liuerwort.

¶ The Description.

1 **L**iuerwort is also a kinde of Mosse which spreadeth it selfe abroad vpon the ground, hauing many vneuen or crumpled leaues lying one ouer another, as the scales of Fishes do, greene aboue, and browne vnderneath: amongst these grow vp small short stalkes, spred at the top like a blasing starre, and certaine fine little threds are sent downe, by which it cleaueth and sticketh fast vpon stones, and vpon the ground, by which it liueth and flourisheth.

2 The second kinde of Liuerwort differeth not but in stature, being altogether lesse, and more smooth or euen: the floures on the tops of the slender stems are not so much laid open like a star; but the especiall difference consisteth in one chiefe point, that is to say, this kinde being planted in a pot, and set in a garden aboue the ground, notwithstanding it spitteth or casteth round about the place great store of the same fruit, where neuer any did grow before.

† Of this sort which is small, and oftentimes found growing in moist gardens among Bearescares, and such plants, when they are kept in pots, there are two varieties, one hauing little stalkes some inch long, with a starre-fashioned head at the top: the other hath the like tender stalke, and a round head at the top thereof. †

3 This is found vpon rockes and stony places, as well neere vnto the sea, as further into the land: it groweth flat vpon the stones, and creepeth not far abroad as the ground Liuerwort doth, it only resteth it selfe in spots and tufts set here and there, of a dusty russet colour aboue, and blackish vnderneath: among the crumpled leaues rise vp diuers small stems, whereupon do grow little star-like floures of the colour of the leaues: it is often found at the bottom of high trees growing vpon high

1 *Hepatica terrestris.*

Ground Liuer-wort.

2 *Hepatica stellata & umbellata.*

Small Liuer-wort with starry and round heads,

3 *Hepatica petraea.*

Stone Liuerwort.

high mountaines, especiall in shadowie places.

¶ *The Place.*

This is often found in shadowy and moist places, on rocks and great stones layd by the highway, and in other common paths where the Sun beams do seldome come, and where no traueiler frequenteth.

¶ *The Time.*

It brings forth his blasing stars and leaues oftentimes in Iune and Iuly.

¶ *The Names.*

It is called of the Grecians, *Λιχην*: of the Latines, *Lichen*: and of some, *Βρύον*, that is to say, *Muscus*, or *Mosse*, as *Dioscorides* witnesseth: it is named in shops *Hepatica*, yet there are also many other herbes named *Hepatica*, or *Liuer-worts*, for difference whereof this may fitly be called *Hepatica petraea*, or *Stone Liuer-wort*, hauing taken that name from the Germanes, who call this *Liuerwort*, *Steyn Leberkraut*: and in low-Dutch, *Steen Leuercrypt*: in English, *Liuerwort*.

¶ *The Temperature.*

This Stone Liuerwort is of temperature cold and dry, and somewhat binding.

¶ *The Vertues.*

It is singular good against the inflammations of the liuer, hot and sharpe agues, and tertians which proceed of choler.

Q99999

Dioscorides

Dioscorides teacheth, that Liuer-wort being applied to the place stancheth bleeding, takes away all inflammations, and that it is good for a tetter or ring-worme, called in Greeke, *Αἰς*: and that it is a remedie for them that haue the yellow iaundice, euen that which commeth by the inflammation of the liuer; and that furthermore it quencheth the inflammations of the tongue.

CHAP. 164.

Of Lung-wort, or wood Liuer-wort, and Oister-greene.

1 *Lichen arborum.*
Tree Lung-wort.

2 *Lichen marinus.*
Sea Lung-wort, or Oister-greene.

¶ The Description.

1 **T**O Liuerwort there is ioyned Lung-wort, which is also another kinde of Mofse, drier, broader, of a larger size, and set with scales: the leaues hereof are greater, and diuersly folded one in another, not so smooth, but more wrinckled, rough and thicke almost like a Fell or hide, and tough withall: on the vpper side whitish, and on the nether side blackish or dusty, it seemeth to be after a sort like to lungs or lights.

2 This kinde of sea Mofse is an herby matter much like vnto Liuer-wort, altogether without stalke or stem, bearing many greene leaues, very vneuen or crumpled, and full of wrinkles, and somewhat broad, not much differing from leaues of crispe or curled Lettuce: this groweth vpon rockes within the bowels of the sea, but especially among oisters, and in greater plenty among those Oisters which are called Wall-fleet Oisters: it is very well knowne euen to the poore Oister-women which carry Oisters to sell vp and downe, who are greatly desirous of the said mofse for the decking and beautifying of their Oisters, to make them sell the better. This mofse they doe call Oister-greene.

3 The branches of this elegant plant are some handfull or better high, spred abroad on euerie side, and only consisting of sundry single roundish leaues, whereto are fastned sometimes one, sometimes

sometimes two or more such leaues, so that the whole plant consists of branches made vp of such round leaues, fastned together by diuers little & very small threds: the lower leaues which stick fast to the rockes are of a brownish colour, the other of a whitish or a light Greene colour, smooth and shining. This growes vpon rockes in diuers parts of the Mediterranean. *Clusius* setteth it forth by the name of *Lichen Marinus*; and he receiued it from *Imperato* by the name of *Sertuloria*: and *Cortusius* had it from *Corfica*, by the title of *Corallina latifolia*; and he called it *Opuntia marina*, hauing reference to that mentioned by *Theophrast. lib. 1. cap. 12. Hist. Plant.* ‡

‡ 3 *Lichen marinus rotundifolius.* Round leaued Oister-weed.

4 *Quercus marina.*
Sea Oke or Wracke.

‡ 4 *Quercus marina varietas.*
A varietie of the sea Oke or Wracke.

4 There is also another sort of sea Weed found vpon the drowned rockes, which are naked and bare of water at euery tyde. This sea Weed groweth vnto the rocke, fastned vnto the same at one

Qqqqqq 2

end,

end, being a soft herby plant, very slipperie, insomuch that it is a hard matter to stand vpon it without falling: it rampeth far abroad, and here and there is set with certaine puffed vp tubercles or bladders, full of winde, which giueth a cracke when it is broken: the leafe it selfe doth somewhat resemble the Oken leafe, whereof it tooke his name *Quercus marina*, the sea Oke: of some, Wracke, and Crow Gall. His vse in physicke hath not bene set forth, and therefore this bare description may suffice.

‡ 5 *Quercus marina secunda.*
Sea Thongs.

‡ 6 *Quercus marina tertia.*
The third sea Wracke.

‡ Of this *Quercus marina*, or *Fucus*, there are diuers sorts, whereof I will giue you the figures and a brieue historie: the first of these is onely a varietie of the last described, differing therefrom in the narrowness of the leaues, and largeness of the swolne bladders.

5 This growes to the length of five or six foot, is smooth and membranous, being some halfe fingers bredth, and variously diuided, like wet parchment or leather cut into thongs: this hath no swolne knots or bladders like as the former, and is the *Fucus marinus secundus* of *Dodonaus*.

6 This Wracke or sea weed hath long and flat stalkes like the former, but the stalks are thicke set with swolne knots or bladders, out of which sometimes grow little leaues, in other respects it is not vnlike the former kindes. *Dodonaus* makes this his *Fucus marinus* 3.

7 The leaues of this other Wracke, which *Dodonaus* makes his *Fucus marinus quartus*, are narrower, smaller, and much diuided, and this hath either none or very few of those swollen bladders which some of the former kindes haue.

8 This, which *Lobel* calleth *Alga marina*, hath ioined blacke branched creeping roots of the thicknesse of ones finger, which end as it were in diuers eares, or hairy awnes, composed of whitish hairy threds somewhat resembling Spikenard: from the tops of those eares forth leaues, long, narrow, soft, and grasse-like, first greene, but white when they are dry. It growes in the sea as the former. They vse it in Italy and other hot countries to packe vp glasses with, to keepe them from breaking.

9 Of this Tribe are diuers other plants; but I will onely giue you the history of two more, which I first obserued the last year, going in company with diuers London Apothecaries to finde Simples, as farre as Margate in the Island of Tener; and whose figures (not before extant that I know of) I first gaue in my Iournall or enumeration of such plants as we there and in other places found. The first of these by reason of his various growth is by *Bauhine* in his *Prodromus* distinguished

guished into two, and described in the second and third places. The third he calls *Fucus longissimus*, *latissimus*, *crassoque folio*, and this is marked with the figure 1. The second he calls *Fucus arboreus polyschides*; and this you may see marked with the figure 2. This sea Weed (as I haue said) hath a various face, for sometimes from a fibrous root, which commonly groweth to a pibble stone, or fastened to a rocke, it sendeth forth a round stalke seldome so thicke as ones little finger, and about some halfe foot in length, at the top whereof growes out a single leafe, sometimes an ell long, and then it is about the bredth of ones hand, and it ends in a sharpe point, so that it very well resembles a two edged sword. Sometimes from the same root come forth two such fashioned leaues, but then commonly they are lesser. Otherwhiles at the top of the stalke it diuides it selfe into eight, nine, ten, twelue, more or fewer parts, and that iust at the top of the stalke, and these neuer come to that length that the single leaues do. Now this I iudge to be the *Fucus polyschides* of *Bauhine*. That these two are not seuerall kindes I am certaine; for I haue marked both these varieties from one and the same root, as you may see them here exprest in the figure. At Margate where they grow they call them sea Girdles, and that name well befits the single one; and the diuided one they may call Sea Hangers, for if you do hang the tops downewards, they doe reasonable well resemble the old fashioned sword-hangers. Thus much for their shape: now for their colour, which is not the same in all; for some are more Greene, and these can scarce be dried; other some are whitish, and these do quickly dry, and then both in colour and substance are so like parchment, that such as know them not would at the first view take them to be nothing else. This is of a glutinous substance, and a little saltish taste, and diuers haue told me they are good meate, being boyled tender, and so eaten with butter, vineger, and pepper.

‡ 7 *Quercus marina quarta*.
Tagged Sea Wracke.

‡ 8 *Alga*.
Grasse Wracke.

10 This which I giue you in the tenth place is not figured or described by any that as yet I haue met with; wherefore I gaue the figure and description in the forementioned Iournall, which I will here repeate. This is a very succulent and fungous plant, of the thicknesse of ones thumbe; it is of a darke yellowish colour, and buncheth forth on euerie side with many vnequall tuberofities or knots: whereupon Mr. *Thomas Hickes* being in our companie did fitly name it Sea ragged Staffe. We did not obserue it growing, but found one or two plants thereof some foot long apiece.

‡ 9 *Fucus phaeoideus & polyschides.*
Sea Girdle and Hangers.

‡ 10 *Fucus spongiosus nodosus.*
Sea ragged Staffe.

‡ 11 *Conferua.* Hairy Riuerweed.

11 In some flow running waters is to be found this long Greene hairy weed, which is thought to be the *Conferua* of *Pliny*: it is made up onely of long hairy Greene threds, thicke thrummed together without any particular shape or fashion, but only following the current of the streame. ‡

¶ The Place.

It groweth vpon the bodies of old Okes, Beech, and other wilde trees, in darke & thick woods: it is oftentimes found growing vpon rocks, and also in other shadowie places.

¶ The Time and Names.

It flourisheth especially in the Sommer moneths.

It taketh his name *Pulmonaria* of the likenesse of the forme which it hath with lungs or lights, called in Latine *Pulmones*, of some *Lichen*: it is called in high-Dutch, *Lungenkraut*: in low-Dutch *Longhencruyt*: in French, *Herbe à Poulmon*: in English, Lung-wort, and wood Liuerwort.

¶ The Temperature.

This seemeth to be cold and dry.

¶ The

¶ The Vertues.

It is reported that shepheards and certaine horseleeches do with good successe giue the pouder A hereof with salt vnto their sheepe and other cattell which be troubled with the cough, and be broken winded.

Lungwoort is much commended of the learned Physitions of our time against the diseases of B the lungs, especially for the inflammations and vlcers of the same, being brought into pouder, and drunke with water.

It is likewise commended for bloody and Greene wounds, and for vlcers in the secret parts, and C also to stay the reds.

Moreouer, it stoppeth the bloody flux, and other fluxes and scourings, either vpwards or downe- wards, especially if they proceed of choler: it stayeth vomiting, as men say, and it also stoppeth the belly.

Oyster Greene fried with egges and made into a tansie & eaten, is a singular remedy for to streng- D then the weaknesse of the backe.

CHAP. 165. Of Sea Mosse, or Coralline.

¶ The Kindes.

There be diuers sorts of Mosse, growing as well within the bowels of the sea, as vpon the rocks, distinguished vnder sundry titles.

1 *Muscus marinus, sive Corallina alba.*
White Coralline, or sea Mosse.

† 2 *Muscus marinus albidus.*
White sea Mosse.

3 *Corallina Anglica.*
English Coralline.

¶ The Description.

1 **T**His kinde of Sea Mosse hath many small stalkes finely couered or set ouer with small leaues, very much cut or iagged, euen like the leaues of Dill, but hard, and of a stonie substance.

2 The second is much like vnto the former, yet not stony, but more finely cut, and growing more vpright, branching it selfe into many diuisions at the top, growing very thicke together, and in great quantitie, out of a piece of stone, which is fashioned like an hat or small stonie head, whereby it is fastened vnto the rocks.

3 This third kinde of sea mosse is very well knowne in shops by the name *Corallina*, it yeeldeth forth a great number of shoots, in shap much like vnto Corall; being full of small branches dispersed here and there, diuersly varying his colour, according to the place where it is found, beeing in some places red, in other some yellow, and of an herby colour; in some gray, or of an ash colour, and in other some very white.

4 The fourth kinde of Sea Mosse is somewhat like the former, but smaller, and not so plentiful where it groweth, prospering alwaies vpon shels, as of Oysters, Muscles, and Scallops, as also vpon rolling stones, in the bottome of the water, which haue tumbled downe from the high cliffes and rocks, notwithstanding the old prouerbe, that rolling stones neuer gather Mosse.

4 *Corallina minima.*
The smallest Coralline.

5 *Muscus Corallinus, siue Corallina montana.*
Corall Mosse, or mountaine Coralline.

5 There is found vpon the rocks and mountaines of France, bordering vpon the Mediterranean sea, a certaine kinde of Coralline, which in these parts hath not been found: it groweth in manner like vnto a branch of Corall, but altogether lesser, of a shining red colour, and of a stony substance.

¶ I know not what our Author meant by this description, but the plant which here is figured out of *Tabernamontanus* (and by the same title he hath it) is of a Mosse growing vpon Hampstead heath, and most such places in England: it growes vp some two or three inches high, and is diuided into very many little branches ending in little threddy chiues: all the branches are hollow, and of a very light whitedry substance, which makes it somewhat to resemble Coralline, yet is it not stony at all. ¶

6 There is also found vpon the rocks neere vnto Narbone in France, and not far from the sea, a kinde

6 *Fucus marinus tenuifolius.*
Fenell Coralline, or Fenell Mosse.

7 *Fucus ferulaceus.*
Sea Fenell.

8 *Fucus tenuifolius alter.*
Bulbous sea Fennell.

9 *Muscus marinus Cladius.*
Branched Sea Mosse.

kinde of Coralline. it groweth vp to the forme of a small shrub, branched diuersly; whereon doe grow small grasse-like leaues, very finely cut or iagged, like vnto Fennel; yet are they of a stony substance, as are the rest of the Corallines, of a darke russet colour.

‡ 7 This growes also in the like places, hauing many small long Fennell-like diuided leaues vpon stalks some foot long, with some swelling eminences here & there set in the diuisions of the leaues: this is by *Lobel* called by the name I here giue you it.

8 This also hath fine cut leaues like those of Fennel, but much lesse & shorter, of a faire green colour: these grow vp from round tuberous roots, which together with the fibres they send forth are of a blackish colour: the stalks also are tuberous and swolne, as in other plants of this kind. It growes in the sea with the former. *Dodonæus* calls this *Fucus marinus virens tenuifolius*.

9 This kinde of sea Mosse growes some foure or more inches long, diuided into many branches, which are subdivided into smaller, set with leaues finely iagged, like those of Cammomill; at first soft, flexible, and transparent, Greene below, and purplish aboue; being dried, it becommeth rough and fragile, like as Coralline. It growes in the Mediterranean sea.

10 This Sea Mosse is a low little excrescence, hauing somewhat broad cut leaues growing many from one root: in the whole face it resembles the mosse that grows vpon the branches of Okes and other trees, and is also white and very like it, but much more brittle. This by *Dodonæus* is called *Muscus Marinus tertius*.

‡ 10 *Muscus marinus* 3. *Dod.* Broad leafed Sea mosse.

‡ 11 *Abies marina Belgica*, *Clus.* *Clusius* his Sea Firr.

11 Vpon the rocks and shels of sea fishes are to be found diuers small plants, hauing resemblance to others that grow vpon the land; and *Clusius* saith, vpon the coast of the Low countries he obserued one which very much resembled the Fir-tree, hauing branches growing orderly on both sides, but those very brittle and small, seldome exceeding a handfull in height, and couered as it were with many small scales. He obserued others that resembled Cypresse trees, and other branches that resembled Tameriske or heath. ‡

¶ *The Place.*
These Mosses grow in the sea vpon the rocks, and are oftentimes found vpon Oyster shells, Mus-
kell shells, and vpon stones: I found very great plenty thereof vnder Reculuers and Margate, in the
Isle of Thanet, and in other places alongst the sands from thence vnto Douer.

¶ *The Time.*
The time answereth the other Mosses, and are found at all times of the yeare.

¶ *The Names.*
Sea Mosse is called in Greeke *Βρύση θάλασσης*: in Latine, *Muscus marinus*: of the Apothecaries, Italians,
and French men, *Corallina*: in Spanish, *Malharquiana yerba*: in high Dutch, *Deermos*: in low Dutch,
Zee Mosch: in English, Sea Mosse, and of many *Corallina*, after the Apothecaries word, and it
may be called Corall Mosse. The titles distinguish the other kindes.

¶ *The Temperature.*
Corallina consisteth, as *Galen* saith, of an earthie and waterish essence, both of them cold: for by
his taste it bindeth, and being applied to any hot infirmitie, it also evidently coolerth: the earthie
essence of this Mosse hath in it also a certaine saltnesse, by reason whereof likewise it drieth migh-
tily.

¶ *The Vertues.*
Dioscorides commendeth it to be good for the gout which hath need to be cooled. A
The later Physitions haue found by experience, that it killeth wormes in the belly; it is giuen to B
this purpose to children in the weight of a dram or thereabouts.
That which cleaueth to Corall, and is of a reddish colour, is of some preferred and taken for the C
best: they count that which is whitish, to be the worser. Notwithstanding in the French Ocean, the
Britain, the low countrey, or else in the Germane ocean sea, there is scarce found any other than the
whitish Coralline, which the nations neere adioyning do effectually vse.

CHAP. 166. Of Corall.

1 *Corallium rubrum.*
Red Corall.

2 *Corallium nigrum, sive Antipathes.*
Blacke Corall.

¶ *The*

3 *Corallium album*. White Corall.4 *Corallium album alterum*.

The other white or yellow Corall.

5 *Coralloides albicans*.

Whitish bastard Corall.

¶ The Description.

Although Corall be a matter or substance, euen as hard as stones, yet I thinke it not amisse to place and insert it here next vnto the mosses, and the rather for that the kindes thereof do shew themselves, as well in the maner of their growing, as in their place and forme, like vnto the Mosses. This later age wherein we liue, hath found moe kindes hereof than euer were knowne or mentioned among the old writers. Some of these Coralls grow in the likenesse of a shrub, or stony matter, others in a straight forme, with crags and ioints, such as we see by experience: the which for that they are so well knowne, and in such request for Physicke, I will not stand to describe, only this remember, that there is some Corall of a pale yellow colour, as there be some red, and some white.

1 The blacke Corall groweth vpon the rocks neere to the sea about Massilia, in manner of the former; herein differing from it, in that this is of a shining blacke colour, and very smooth, growing vp rather like a tree, than like a shrub

3 The white Corall is like to the former, growing vpon the rocks neere the sea, and in the West parts of England, about Saint Michaels mount; but the branches hereof are smaller, and more brittle, finelier disperfed into a number of branches, of a white colour.

4 The

‡ 6 *Coralloides rubens.*
Reddish bastard Corall.

7 *Spongia marina alba.*
White Spunge.

‡ 8 *Spongia infundibuli forma.*
Funnell fashioned Spunge.

‡ 9 *Spongia ramosa.*
Branched Spunge.

4 The fourth and last groweth also vpon the Westerne rocks of the sea, and in the place afore named, and varieth his colour, sometimes waxing white, sometimes yellow, and sometimes red.

‡ 5 This growes vp with many branches some two or three handfulls high; the inner part is a hard woody substance, which is couered ouer with a white and hard stony matter, so that it much resembleth white Corall, but that it is neither so thicke, hard, nor smooth, but is rough and

Rrrrr

and bends easily without breaking, which Corall will not do. *Lobel* calls this *Corallina alba*, it growes in the Mediteranian sea, and vpon the Coasts of Spaine.

6 This in all respects is like the last described, the colour excepted, which is a darke red, and therefore better resembles the red Corall. *Clusius* refers both these to the *Quercus marina* mentioned by *Theophrastus*, *Hist. plant. lib. 7. cap. 4.* ‡

7 There is found growing vpon the rockes neere vnto the sea, a certaine matter wrought together, of the some or froth of the sea, which we call sponges, after the Latine name, which may very fitly be inserted among the sea Mosses, whereof to write at large would greatly increase our volume, and little profit the reader, considering we hasten to an end, and also that the vse is so well knowne vnto all: therefore these few lines may serue vntill a further consideration, or a second Edition. ‡ Sponges are not like the *Alcyonium*, that is, an accidentall matter wrought together of the froth of the sea, as our Author affirms, but rather of a nobler nature than plants, for they are said to haue sence, and to contract themselues at the approach of ones hand that comes to cut them vp, or for feare of any other harme-threatening object, and therefore by most writers they are referred to the *Quercus*: which some render *Plant animalia*, that is, such as are neither absolute plants, nor liuing creatures, but participate of both: they grow of diuers shapes and colours vpon the Rockes in the Mediterranean, as also in the Archipelago, or *Ægean* sea.

8 *Clusius* obserued one yet adhering to the stone whereon it grew, which in shape resembled a funnell, but in substance was like another Sponge.

9 There is also to be found vpon our English coast a small kinde of sponge cast vp by the sea, and this is also of different shapes and colour, for the shape it is alwaies diuided into sundry branches, but that after a different manner; and the colour is oft times brownish, and otherwhiles gray or white. *Lobel* makes it *Conserua marina genus.* ‡

¶ The Place.

The place of their growing is sufficiently spoken of in their seuerall descriptions.

¶ The Time.

The time answereth the other kindes of sea Mosses.

¶ The Names.

Corallium rubrum is called in English, red Corall. *Corallium nigrum*, blacke Corall. *Corallium album*, white Corall.

¶ The Temperature.

Corall bindeth, and meanely cooleth: it clenseth the scars and spots of the eies, and is very effectuell against the issues of bloud, and easeth the difficultie of making water.

¶ The Vertues.

- A Corall drunke in wine or water, preserueth from the spleene; and some hang it about the neckes of such as haue the falling sicknesse, and it is giuen in drinke for the same purpose.
- B It is a soueraigne remedy to drie, to stop, and stay all issues of bloud whatsoeuer in man or woman, and the dysentery.
- C Burned Corall drieth more than when it is vnburned, and being giuen to drinke in water, it helpeth the gripings of the belly, and the griefes of the stone in the bladder.
- D Corall drunke in wine prouoketh sleepe: but if the patient haue an ague, then it is with better successe ministred in water, for the Corall cooleth, and the water moistneth the body, by reason whereof it restraineth the burning heate in agues, and represseth the vapours that hinder sleepe.

CHAP. 167. Of Mushrumes, or Toadstooles.

¶ The Kindes.

SOME Mushrumes grow forth of the earth; other vpon the bodies of old trees, which differ altogether in kindes. Many wantons that dwell neere the sea, and haue fish at will, are very desirous for change of diet to feed vpon the birds of the mountaines; and such as dwell vpon the hills or champion grounds, do longe after sea fish; many that haue plenty of both, do hunger after the earthie excrescences, called Mushrumes: whereof some are very venomous and full of poison, others not so noisome; and neither of them very wholesome meate; wherefore for the auoiding of the venomous qualitie of the one, and that the other which is lesse venomous may be discerned from it, I haue thought good to set forth their pictures with their names and places of growth. ‡ Because the booke is already grown too voluminous, I will only giue you the figures of such as my Author hath here mentioned, with some few others, but not trouble you with any more history, yet distinguish betweene such as are eatable, and those that be poysonous, or at least not to be eaten; for the first figured amongst the poysonous ones, is that we call Iewes-eare, which hath no poysonous facultie in it. *Clusius* (all whose figures I could haue here giuen you) hath written a peculiar tract of these bastard plants, or excrescences, where such as desire it may finde them sufficiently discoursed of. ‡

¶ The

Fungi vulgatissimi esculenti. Common Mushrooms to be eaten.

Rrrrrr 2

¶ The Description.

¹ **G** Round Mushrooms grow vp in one night, standing vpon a thicke and round stalke, like vnto a broad hat or buckler, of a very white colour vntil it begin to wither, at what time it loseth his faire white, declining to yellowesse: the lower side is somewhat hollow, set or decked with fine gutters, drawne along from the middle centre to the circumference or round edge of the brim.

² All Mushrooms are without pith, rib, or veine: they differ not a little in bignesse and colour, some are great, and like a broad brimmed hat; others smaller, about the bignesse of a siluer coine called a doller: most of them are red vnderneath, some more, some lesse, others little or nothing red at all: the vpper side which beareth out, is either pale or whitish, or else of an ill fauored colour like ashes (they commonly call it Ash colour) or else it seemeth to be somewhat yellow.

There is another kinde of Mushrooms called *Fungi parui lethales galericulati*: in English, deadly Mushrooms, which are fashioned like vnto an hood, and are most venomous and full of poison.

There is a kinde of Mushroom called *Fungus Clypeiformis letalis*, that is also a deadly Mushroom, fashioned like a little buckler.

There is another kinde of Mushroom, which is also most venomous and full of poison, bearing also the shape of a buckler, being called *Fungus venenatus Clypeiformis*: in English, the stinking venomous Mushroom.

2 *Fungi lethales, aut saltem non esculenti.*

Poyson Mushrooms, or at the least such as are not vulgarly eaten.

The Mushrooms or Toodstooles which grow vpon the trunks or bodies of old trees, very much resembling *Auricula Inda*, that is Iewes eare, do in continuance of time grow vnto the substance of wood, which the Foulers do call Touchwood, and are for the most halfe circuled or halfe round, whose vpper part is somewhat plaine, and sometime a little hollow, but the lower part is plaited or purfed together. This kinde of Mushroom the Grecians do call *εμψυμα*, and is full of venome or poison as the former, especially those which grow vpon the Ilex, Oliue, and Oke trees.

There is likewise a kinde of Mushroom called *Fungus Fanaginosus*, growing vp in moist and shadowie woods, which is also venomous, hauing a thicke and tuberous stalke, an handfull high, of a dusky colour, the top whereof is compact of many small diuisions, like vnto the hony combe.

There

Fungus sambucinus, five Auricula Iudæ. Iewes eares.

Fungi lethales, sine non esculenti. Poysonous Mushrooms.

There is also found another, set forth vnder the title *Fungus virilis penis erecti forma*, which wee English, Pricke Mushrum, taken from his forme.

3 *Fungus orbicularis*, or *Lupi crepitus*, some do call it *Lucernarum fungus*: in English, Fuffe balls, Pucke Fuffe, and Bulfifts, with which in some places of England they vse to kill or smolder their Bees, when they would driue the Hiues, and bereaue the poore Bees of their meat, houses, and liues: these are also vsed in some places where neighbours dwell far asunder, to carry and referue fire from place to place, whereof it tooke the name, *Lucernarum Fungus*: in forme they are very round, sticking and cleauing vnto the ground, without any stalks or stems, at the first white, but afterward of a duskyish colour, hauing no hole or breach in them, whereby a man may see into them, which being trodden vpon do breath forth a most thin and fine powder, like vnto smoke, very noisome and hurtfull vnto the eies, causing a kinde of blindness, which is called Poor-blinde, or Sand-blinde.

Fungi lethales, sive non esculenti. Poisonous Mushrooms.

There is another kinde of *Fungus*, or Mushrum, which groweth in moist medowes, and by ditch sides, fve or six inches high, couered ouer with a skin like a piece of sheepes leather, of a ruslet colour, which being taken away there appeareth a long and white stumpe, in forme not much vnlike to an handle, mentioned in the title, or like vnto the white and tender stalke of Aron, but greater: this kinde is also full of venome and poison.

There is likewise a kinde of Mushrum, with a certaine round excrescence, growing within the earth, vnder the vpper crust or face of the same, in dry and grauelly grounds in Pannonia and the Prouinces adioining which do cause the ground to swel, and be full of hils like Mole-hils. The people where they grow, are constrained to dig them vp and cast them abroad like as we do Mole-hils, spoiling their grounds, as Mole-hils are hurtfull vnto our soile: these haue neither stalks, leaues, fibres nor strings annexed or fastened vnto them, and for the most part are of a reddish colour, but within of a whitish yellow: the Grecians haue called this tuberous excrescence, *Idna*, and the Latines *Tubera*: the Spaniards do call them *Turmas de tierra*: in English wee may call them Spanish Fuffe bals.

¶ *The Place.*

Mushrooms come vp about the roots of trees, in grassie places of medowes, and Ley Land newly turned

Fungus fauiginosus.
Hony-comb'd Mushrome.

Fungus Virilis Penis effigie.
Pricke Mushrome.

Tubera terra.
Fusse-balls, or Puckfists.

turned; in woods also where the ground is sandy, but yet dankish: they grow likewise out of wood, forth of the rotten bodies of trees, but they are vnprofitable and nothing worth. Poisonsome Mushrooms, as *Dioscorides* saith, groweth where old rusty iron lieth, or rotten clouts, or neere to serpents dens, or roots of trees that bring forth venomous fruit. Diuers esteeme those for the best which grow in medowes, and vpon mountaines and hilly places, as *Horace* saith, *lib. ser. 2. satyr. 4.*

pratensis optima fungus
Natura est, alijs male creditur.

The medow Mushrooms are in kinde the best,
It is ill trusting any of the rest.

¶ The Time.

Diuers come vp in Aprill, and last not till May, for they flourish but whilest Aprill continues: others grow later, about August; yet all of them after raine, and therefore they are found one yere sooner, and another later. Mushrooms, saith *Pliny*, grow in shoures of raine: they come of the slime of trees, as the same Author affirmeth.

¶ The Names.

They are called in Latine, *Fungi*: in Greeke, *μυκάρι*: in Italian, *Fonghi*: in Spanish, *Hungos*, *Cummenos*: in French, *Campinion*, which word the low-Country men also vse, and call them *Campernoellen*: in high-Dutch, *Schwemme*, *Differling*: in English, Mushrooms, Toad-stooles, and Paddock-stooles.

The Mushrooms that come vp in Aprill are called in Latine of some, *Spongiola*: of the Italians, *Prignoli*: and in high-Dutch, *Morchel*.

They that are of a light red are called of some *Boleti*, among the later ones which rise and fall away in seven dayes. The white, or those which be somewhat yellow, are called in Latine, *Suilli*: which the later Physicians name *Porcini*, or Swine Mushrooms. *Suilli*, saith *Pliny*, are dried, being hanged vpon rushes, which are thrust through them. The dry ones are in our age also eaten in Bohemia and Austria: they that grow by the roots of Poplar trees are called of the Latines, *Populnei*, Poplar Mushrooms.

Puffes-fits are commonly called in Latine, *Lupi crepitus*, or Wolfes fits: in Italian, *Vescie de Lupo*: in English, Puffes-fits, and Fusse-balls in the North. *Pliny* nameth them *Pezica*, as though he should say, flat.

Tree Mushrooms be called in Greeke, *μυκάρι*: in Latine, *Fungi arborum*, and *Fungi arborei*: in English, tree Mushrooms, or Touch-wood: in high-Dutch also *Schwemme*. They are all thought to be poisonfome, being inwardly taken. *Nicander* writeth, that the Mushrooms of the Oliue tree, the Ilex tree, and of the Oke tree bring death.

¶ The Temperature and Vertues.

- A** *Galen* affirmes, that they are all very cold and moist, and therefore do approach vnto a venomous and murdering facultie, and ingender a clammy, pituitous, and cold nutriment if they be eaten. To conclude, few of them are good to be eaten, and most of them do suffocate and strangle the eater. Therefore I giue my aduice vnto those that loue such strange and new fangled meares, to beware of licking honey among thornes, lest the sweetnesse of the one do not counteruaile the sharpnesse and pricking of the other.
- B** Fusse-balls are no way eaten: the powder of them doth dry without biring: it is fitly applied to merigalls, kibed heeles, and such like.
- C** In diuers parts of England where people dwell farre from neighbours, they carry them kindled with fire, which lasteth long: whereupon they were called *Lucernarum Fungi*.
- D** The dust or powder hereof is very dangerous for the eyes, for it hath been often seen, that diuers haue been pore-blinde euer after, when some small quantitie thereof hath been blowne into their eyes.
- E** The countrey people do vse to kill or smother Bees with these Fusse-balls, being set on fire, for the which purpose it fitly serueth.
- F** ‡ The fungous excrescence of the Elder, commonly called a Iewes eare, is much vsed against the inflammations and all other forenesse of the throat, being boiled in milke, steeped in beere, vinegar, or any other conuenient liquor. ‡

CHAP. 168.

Of great Tooth-wort, or Clownes Lung-wort.

¶ The Description.

THERE is often found among the Mushrooms a certaine kinde of excrescence consisting of a jelly or soft substance, like that of the Mushrooms, and therefore it may the more fitly be here inserted: it riseth forth of the ground in forme like vnto *Orobanche*, or the Broome-Rape, and also in substance, hauing a tender, thicke, tuberous, or mis-shapen body, consisting as it were of scales like teeth (whereof it tooke his name) of a dusky shining colour tending to purple. The stalke riseth vp in the middle, garnished with little gaping hollow floures like those of *Satyrion*; on the outside of an ouerborne whitish colour: the whole plant resembleth a rude forme of that jelly,

gellie, or slimie matter, found in the fields, which we call the falling of stars: the root is small and tender.

2 There is also another sort hereof found, not differing from the precedent: the chiefe difference consisteth in that, that this plant is altogether lesser; and hath a root diuersly diuaricated like Corall, white of colour, full of juice, and without any fibres annexed thereto; in other respects like.

1 *Dentaria maior Mathioli.*

Great Toothwoort, or Lungwoort.

2 *Dentaria minor.*

Little Lungwoort.

¶ The Place.

These plants do grow at the bottome of Elme trees, and such like, in shadowie places: I found it growing in a lane called East-lane, vpon the right hand as ye go from Maidstone in Kent vnto Cockes Heath, halfe a mile from the towne; and in other places thereabout: it doth also grow in the fields about Croidon, especially about a place called Groutes, being the land of a worshipfull Gentleman called M^r. Garth: and also in a wood in Kent neere Crayfoot, called Rowe, or Rough-hill: it groweth likewise neere Harwood in Lancashire, a mile from Whanley, in a wood called Talbot banke.

¶ The Time.

They flourish in May and Iune.

¶ The Names.

There is not any other name extant, more than is set forth in the description.

¶ The Temperature and Vertues.

There is nothing extant of the faculties hereof, either of the ancient or later writers: neither haue we any thing of our owne experience; onely our cuntry women do call it Lungwoort, and do vse it against the cough, and all other imperfections of the lungs: but what benefit they reape thereby I know not; neither can any of iudgement giue me further instruction thereof.

CHAP. 166. Of Saunders.

¶ The Kindes.

The ancient Greekes haue not knowne the sorts of Saunders: *Garcias* and others describe three; *Album*, *Rubrum*, and *Pallidum*: which in shops is called *Citrinum*.

¶ The

¶ The Description.

THe Saunders tree groweth to the bignesse of the Walnut-tree, garnished with many goodly branches; whereon are set leaues like those of the Lentiske tree, alwaies greene; among which come forth very faire floures, of a blew colour tending to blacknesse; after commeth the fruit of the bignesse of a Cherry, greene at the first, and blacke when it is ripe; without taste, and ready to fall downe with euery little blast of winde: the timber or wood is of a white colour, and a very pleasant smell.

2 There is likewise another which groweth very great, the floures and fruit agree with the other of his kinde: the wood is of a yellowish colour, wherein consisteth the difference.

† 3 The third sort which wee call Red-Saunders is a very hard and sollid wood, hauing little or no smell, the colour thereof is very red, it groweth not in those places where the other grow, neither is the forme of the tree described by any that I know of, it is frequently vsed to colour fauces, and for such like vses. †

¶ The Place.

The white and yellow Saunders grow naturally, and that in great aboundance, in an Island called Timor, and also in the East-Indies beyond the riuer Sanges or rather Ganges, which the Indians call *Hanga*, and also about Iaua, where it is of better odour than any that groweth elsewhere.

The red Saunders growes within the riuer Ganges, especially about Tanasarim, and in the marshy grounds about Charamandell: *Auicen*, *Serapio*, and most of the Mauritanians call it by a corrupt name, *Sandal*: in Timor, Malaca, and in places neere adioyning, *Chandama*: in Decan and Guzarate, *Sercanda*: in Latine, *Sandalum* and *Santalum*, adding thereto for the colour *album*, *flauum*, or *Citrinum*, and *rubrum*, that is, white, yellow, and red Saunders.

¶ The Time.

These trees which are the white and yellow Saunders grow greene Winter and Sommer, and are not one knowne from another, but by the Indians themselves, who haue taken very certaine notes and markes of them, because they may the more speedily distinguish them when the Mart commeth.

¶ The Names.

Their names haue been sufficiently spoken of in their descriptions.

¶ The Temperature.

† Yellow and white Saunders are hot in the third degree, and dry in the second. The redde Saunders are not so hot. †

¶ The Vertues.

A The Indians do vse the decoction made in water, against hot burning agues, and the ouermuch flowing of the menses, *Erisipelas*, the gout, and all inflammations, especially if it be mixed with the juice of Nightshade, Housleeke, or Purslane.

B The white Saunders mixed with Rose water, and the temples bathed therewith, ceaseth the paine of the megrim, and keepeth backe the flowing of humours to the eies.

C *Auicen* affirmeth it to be good for all passions of the hart, and maketh it glad and merry, and therefore good to be put in collises, iellies, and all delicate meates which are made to strengthen and reuiue the spirits.

D † Red Saunders haue an astringe and strengthening facultie, but are not cordiall as the other two, they are vsed in diuers medicines and meates both for their facultie and pleasing red colour which they giue to them. †

CHAP. 170. Of Stony wood, or wood made Stones.

¶ The Description.

AMong the wonders of England this is one of great admiration, and contrarie vnto mans reason and capacitie, that there should be a kinde of wood alterable into the hardnesse of a stone called Stonie wood, or rather a kinde of water, which hardneth wood and other things, into the nature and matter of stones. But we know that the workes of God are wonderfull,

Lignum Lapideum, siue in Lapides conuersum.
Stonie wood, or wood made stones.

of that qualitie, that if a stake be driuen into it, that part of the stake which is within the ground will be a firme and hard stone, and all that which is about the ground retaineth his former substance and nature. Also my selfe being at Rugby (about such time as our fantasticke people did with great concourse and multitudes repaire and run headlong vnto the sacred Wells of *Newnam Regis*, in the edge of Warwickshire, as vnto the water of life, which could cure all diseases) I went from thence vnto these Wells, where I found growing ouer the same a faire Ash tree, whose boughes did hang ouer the spring of water, whereof some that were seare and rotten, and some that of purpose were broken off, fell into the water, and were all turned into stones. Of these boughes or parts of the tree I brought into London, which when I had broken in pieces, therein might be seene, that the pith and all the rest was turned into stones; yea many buds and flourings of the tree falling into the said water, were also turned into hard stones, still retaining the same shape and fashion that they were of before they were in the water. I doubt not but if this water were proued about the hardning of some Confections Physicall, for the preservation of them, or other special ends, it would offer greater occasion of admiration for the health and benefit of mankind, than it doth about such things as already haue been experimented, tending to very little purpose.

CHAP. 171.

Of the Goose tree, Barnacle tree, or the tree bearing Geese.

Britannica Concha anatisera.
The breed of Barnacles.

¶ The Description.

HAuing travelled from the Grasses growing in the bottome of the fenny waters, the Woods, and mountaines, euen vnto Libanus it selfe; and also the sea, and bowels of the same, wee are arriued at the end of our Historie; thinking it not impertinent to the conclusion of the same, to end with one of the maruells of this land (we may say of the world.) The historie whereof to set forth according to the worthinesse and raritie thereof, would not only require a large and peculiar volume, but also a deeper search into the bowels of nature, than my intended purpose will suffer me to wade into, my sufficiencie also considered; leauing the historie thereof rough hewen, vnto some excellent men, learned in the secrets of nature, to be both fined and refined: in the mean space take it as it falleth out, the naked and bare truth, though vnpolished. There are found in the North parts of Scotland and the Islands adiacent, called Orchades, certain trees whereon do grow certaine shells of a white colour tending to russet, wherein are contained little liuing creatures: which shells in time of maturitie do open, and out of them grow those little liuing things, which falling into the water do become fowles, which we call Barnakles; in the North of England, brant Geese; and in Lancashire, tree Geese: but the other that do fall vpon the land perish and come to nothing. Thus much by the writings of others, and also from the mouths of people of those parts, which may very well accord with truth.

But what our eyes haue seene, and hands haue touched we shall declare. There is a small Island in Lancashire called the Pile of Foulders, wherein are found the broken pieces of old and bruised ships, some whereof haue been cast thither by shipwracke, and also the trunks and bodies with the branches of old and rotten trees, cast vp there likewise; whereon is found a certaine spume or froth that in time breedeth vnto certaine shels, in shape like those of the Muske, but sharper pointed, and of a whitish colour: wherein is contained a thing in forme like a lace of silke finely wouen as it were together, of a whitish colour, one end whereof is fastned vnto the inside of the shell, euen as the fish of Oysters and Muskles are: the other end is made fast vnto the belly of a rude masse or lumpe, which in time commeth to the shape and forme of a Bird: when it is perfectly formed the shell gapeth open, and the first thing that appeareth is the foresaid lace or string; next come the legs of the bird hanging out, and as it groweth greater it openeth the shell by degrees, til at length it is all come forth, and hangeth onely by the bill: in short space after it commeth to full maturitie, and falleth into the sea, where it gathereth feathers, and groweth to a fowle bigger than a Mallard, and lesser than a Goose, hauing blacke legs and bill or beake, and feathers blacke and white, spotted in such manner as is our Mag-Pie, called in some places a Pie-Annet, which the people of Lancashire call by no other name than a tree Goose: which place afore said, and all those parts adioyning do so much abound therewith, that one of the best is bought for three pence. For the truth hereof, if any doubt, may it please them to repaire vnto me, and I shall satisfie them by the testimonie of good witnesses.

Moreouer, it should seeme that there is another sort hereof; the historie of which is true, and of mine owne knowledge: for travelling vpon the shore of our English coast betweene Douer and Rumney, I found the trunke of an old rotten tree, which (with some helpe that I procured by Fishermens wiues that were there attending their husbands returne from the sea) we drew out of the water vpon dry land: vpon this rotten tree I found growing many thousands of long crimson bladders, in shape like vnto puddings newly filled, before they be sodden, which were very cleere and shining; at the nether end whereof did grow a shell fish, fashioned somewhat like a small Muske, but much whiter, resembling a shell fish that groweth vpon the rockes about Garnsey and Garsey, called a Lympit: many of these shells I brought with me to London, which after I had opened I found in them liuing things without forme or shape; in others which were neerer come to ripenes I found liuing things that were very naked, in shape like a Bird: in others, the Birds couered with soft downe, the shell halfe open, and the Bird ready to fall out, which no doubt were the Fowles called Barnakles. I dare not absolutely auouch euery circumstance of the first part of this history, concerning the tree that beareth those buds afore said, but will leaue it to a further consideration; howbeit that which I haue seene with mine eyes, and handled with mine hands, I dare confidently auouch, and boldly put downe for veritie. Now if any will obiekt, that this tree which I saw might be one of those before mentioned, which either by the waues of the sea or some violent wind had been ouerturned, as many other trees are; or that any trees falling into those seas about the Orchades, will of them selues beare the like fowles, by reason of those seas and waters, these being so probable coniectures, and likely to be true, I may not without preiudice gaine say, or indeauour to confute.

‡ The Barnakle, whose fabulous breed my Author here sets downe, and diuers others haue also

also deliuered, were found by some Hollanders to haue another originall, and that by egges, as other Birds haue: for they in their third voyage to finde out the North-East passage to China, and the Molucco's, about the eightieth degree and eleuen minutes of Northerly latitude, found two little Islands, in the one of which they found aboundance of these Geese sitting vpon their egges, of which they got one Goose, and tooke away sixty egges, &c. *Vide Pontani, Kerum & urb. Amstelodam. Hist. lib. 2. cap. 22.* Now the shells out of which these birds were thought to fly, are a kinde of *Balanus marinus*; and thus *Fabius Columna*, in the end of his *Phytobasanos*, writing *piscium aliquot historia*, iudiciously proues: to whose opinion I wholly subscribe, and to it I refer the Curious. His asseueration is this: *Conchas vulgò Anatiferas, non esse fructus terrestres, neque exijs Anates oriri; sed Balani marina speciem.* I could haue said somthing more hereof, but thus much I thinke may serue, together with that which *Fabius Columna* hath written vpon this point. ‡

¶ The Place.

The borders and rotten planks whereon are found these shels wherein is bred the Barnakle, are taken vp in a small Island adioyning to Lancashire, halfe a mile from the maine land, called the Pile of Foulders.

¶ The Time.

They spawne as it were in March and Aprill; the Geese are formed in May and Iune, and come to fulnesse of feathers in the moneth after.

And thus hauing through Gods assistance discoursed somewhat at large of Grasses, Herbes, Shrubs, Trees, and Mosses, and certaine Excrecences of the earth, with other things

moe, incident to the historie thereof, we conclude and end our present

Volume, with this wonder of England. For the which

Gods name be euer honored and
praised.

FINIS.

AN APPENDIX OR ADDITION OF certaine Plants omitted in the former Historie.

The Preface.

HAuing run through the Historie of Plants gathered by Mr. Gerrard, and much enlarged the same both by the addition of many Figures and histories of Plants not formerly contained in it, and by the amending and encreasing the historie of sundry of those which before were therein treated of; I finde that I haue forgotten diuers which I intended to haue added in their fitting places: the occasion hereof hath beene, my many busineses, the troublesomenesse, and aboue all, the great expectation and hast of the Worke, whereby I was forced to performe this task within the compasse of a yeare. Now being constant to my first resolution, I here haue, as time would giue me leaue, and my memorie serue, made a brieue collection and addition (though without method) of such as offered themselves vnto me; and without doubt there are sundrie others which are as fitting to be added as those; and I should not haue been wanting, if time would haue permitted me to haue entred into further consideration of them. In the meane time take in good part those that I haue here presented to your view.

CHAP. I. *Of the Maracoc or Passion-floure.*

The Description.

HIS Plant, which the Spaniards in the West Indies call *Granadilla*, because the fruit somewhat resembles a Pomegranat, which in their tongue they term *Granadas*, is the same which the Virginians call *Maracoc*. The Spanish Friers for some imaginarie resemblances in the floure, first called it *Flos Passionis*, the Passion floure, and in a counterfeite figure, by adding what was wanting, they made it as it were an Epitome of our Sauours Passion: thus superstitious persons *semper sibi somnium fingunt*. Bauhine desirous to refer it to some stock or kindred of formerly knowne plants, giues it the name of *Clematis trifolia*: yet the floures and fruit pronounce it not properly belonging to their Tribe; but *Clematis* being a certaine genericke name to all woody winding plants, this as a species may come vnder the denomination, though little in other respects participating with them. The roots of this are long, somewhat like, yet thicker than those of *Sarsaparilla*, running vp and downe, and putting vp their heads in seuerall places: from these roots rise vp many long winding round stalkes, which grow two, three, foure, or more yards high, according to the heate and seasonableness of the yeare and soile whereas they are planted: vpon these stalkes grow many leaues diuided into three parts, sharpe pointed, and snipt about the edges: commonly out of the bosomes of each of the vppermost leaues there groweth a clasping tendrell and a floure: the floure growes vpon a little foot-stalke some two inches long, and is of a longish cornered forme, with fve little crooked hornes at the top, before such time as it open it selfe; but opened, this longish head diuides it selfe into ten parts, and sustaines the leaues of the floure, which are very many, long, sharpe pointed, narrow, and orderly spred open one by another, some lying straight, others crooked: these leaues are of colour whitish, but thicke spotted with a Peach colour, and towards the bottome it hath a ring of a perfect Peach colour, and aboue and beneath it a white circle, which giue a great grace to the floure; in the midst whereof rises an vmbone, which parts it selfe into foure or fve crooked spotted hornes, with broadish heads: from

the midst of these rises another roundish head which carries three nailes or homes, biggest above, and smallest at their lower end: this floure with vs is neuer succeeded by any fruit, but in the West Indies, whereas it naturally growes, it beares a fruit, when it is ripe of the bignesse and colour of Pomegranats, but it wants such a ring or crown about the top as they haue; the rinde also is much thinner and tenderer, the pulpe is whitish, and without taste, but the liquor is somewhat tart: they open them as they do egges, and the liquor is supped off with great delight, both by the Indians and Spaniards, (as *Monardus* witnesseth) neither if they sup off many of them shall they find their stomack oppressed, but rather their bellies are gently loosned. In this fruit are contained many seeds somewhat like Peare kernells, but more cornered and rough.

Clematis trifolia, siue Flos Passionis.
The Maracoe or Passion-floure.

This growes wilde in most of the hot countries of America, from whence it hath been brought into our English gardens, where it growes very well, but floures only in some few places, and in hot and seasonable yeares: it is in good plenty growing with *Mistresse Tuggy* at Westminster, where I haue some yeares seene it beare a great many floures.

CHAP. 2. Of Ribes or red Currans.

¶ The Description.

THe plant which carries the fruit which we commonly terme red Currans, is a shrubbie bush of the bignesse of a Gooseberry bush, but without prickles: the wood is soft and white, with a pretty large pith in the middle: it is couered with a double barke, the vndermost, being the thicker, is Greene, and the vppermost, which sometimes chaps and pills off, is of a brownish colour,

colour, and smooth: the barke of the yongest shoots is whitish and rough: the leaues, which grow vpon foot stalkes some two inches long, are somewhat like Vine leaues, but smaller by much, and lesse cornered, being cut into three, and sometimes, but seldomer, into fve parts, somewhat thicke, with many veines running ouer them, greener aboue than they are below: out of the branches in Spring time grow stalkes hanging downe some six inches in length, carrying many little greenish floures, which are succeeded by little red berries, cleare and smooth, of the bignesse of the Whortle berries, of a pleasant tart taste. Of this kinde there is another, onely different from this in the fruit, which is twice so big as that of the common kind.

2 The bush which beares the white Currans is commonly straighter and bigger than the former: the leaues are lesser, the floures whiter, and so also is the fruit, being cleare and transparent, with a little blackish rough end.

1 *Ribes vulgaris fructu rubro.*
Red Currans.

2 *Ribes fructu albo.*
White Currans.

3 Besides these there is another, which differs little from the former in shape, yet grows somewhat higher, and hath lesser leaues: the floures are of a purplish green colour, and are succeeded by fruit as big againe as the ordinary red, but of a stinking and somewhat loathing sauour: the leaues also are not without this stinking smell.

¶ The Place, Time, and Names.

None of these grow wild with vs, but they are to be found plentifully growing in many gardens, especially the two former, the red and the white.

The leaues and floures come forth in the Spring, and the fruit is ripe about Midsummer.

This plant is thought to haue been vknowne to the antient Greekes: some thinke it the *Ribes* of the Arabian *Serapio*: *Fuchsius*, *Matthiolus*, and some other deny it; notwithstanding *Dodonaus* affirms it: neither is the controuersie easily to be decided, because the Author is brieft in the description thereof, neither haue we his words but by the hand of a barbarous Translator. However the shops of late time take it (the faculties consenting thereto) for the true *Ribes*, and of the fruit hereof prepare their *Rob de Ribes*. *Dodonaus* calls it *Ribesum*, *grossularia rubra*, & *Grossularia transmarina*; and they are distinguished into three sorts, *Rubra*, *Alba*, *Nigra* *Ribesia*, red, white, and blacke Currans: the Germans call them *S. Johans traubell*, or *traublin*, and *S. Johans Beerlin*: the Dutch, *Besikins ouer Zee*: the Italians, *Vuetta rossa*: the French, *Groisseles*, *Groisseles d'outre mer*: the Bohemians, *Jahodi S. Jana*: the English, Red Currans: yet must they not be confounded

with those Currans which are brought from Zant, and the continent adioyning thereto, and which are vulgarly sold by our Grocers; for they are the fruit of a small Vine, and differ much from these.

The Temperature and Vertues.

- A The berries of red Currans, as also of the white, are cold and dry in the end of the second degree, and haue some astringion, together with tenuitie of parts.
- B They extinguish and mitigate feuerish heates, repress choler, temper the ouer-hot bloud, resist putrefaction, quench thirst, helpe the deiection of the appetite, stay cholericke vomitings and scourings, and helpe the Dysenterie proceeding of an hot cause.
- C The iuice of these boiled to the height of honey, either with or without sugar (which is called *Rob de Ribes*) hath the same qualities, and conduces to the same purposes.

CHAP. 3. Of Parsley Breake-stone, and bastard Rupturewort.

1 *Percepier Anglorum Lob.*
Parsley Breake-stone.

2 *Polygonū Herniariae facie.*
Bastard Rupture-wort.

The Description.

I Thought it was not altogether inconuenient to couple these two Plants together in one Chapter; first, because they are of one stature; and secondly, taken out of one and the same History of Plants, to wit, the *Aduersaria* of *Pena* and *Lobel*.

The first of these, which the Authors of the *Aduersaria* set forth by the name of *Percepier*, (and rather assert, than affirme to be the *Scandix* of the Antients) is by *Tabernamontanus* called *Scandix minor*: and by *Fabius Columna*, *Alchimilla montana minima*: it hath a small woody yellowish fibrous root, from which rise vp one, two, or more little stalks, seldome exceeding the height of an handfull, and these are round and hairy, and vpon them grow little roundish leaues, like the tender leaues of *Cheruill*, but hairy, and of a whitish green colour, fastned to the stalkes with short foot-stalkes, and hauing little eares at their setting on: the floures are small, Greene, and five cornered, many clustering together at the setting on of the leaues: the seed is small, smooth, and yellowish: the stalks of this plant grow sometimes vpright, and otherwhiles they lean on the ground: it is to be found vpon diuers dry and barren grounds, as in *Hide Parke*, *Tuthill fields*, &c. It floures in May, and ripens the seed in Iune and Iuly. It seemes by the Authors of the *Aduersaria*, that in the West countrey about *Bristow* they call this Herbe *Percepier*; but our herbe women in *Cheapside* know it by the name of *Parsley Breake-stone*.

This is hot and dry, and of subtil parts: it vehemently and speedily moues vrine, and by some is kept in pickle, and eaten as a salad.

The distilled water is also commended to be effectuall to moue vrine, and cense the kidnies of grauell.

2 The historie of this, by the forementioned Authors, *Aduers. pag. 404.* is thus set forth vnder this title, *Polygonum Herniariae folijs & facie, peramplaradice Astragalitidi*: Neither (say they) ought this to be despised by such as are studious of the knowledge of Plants; for it is very little knowne, being a very small herbe lying along vpon the ground, and almost ouerwhelmed or couered with the grasse, hauing little branches very full of ioints: the little leaues and seeds are whitish, and very like those of *Herniaria* or *Rupture-wort*: the whole plant is white, hauing a very small and mossie floure: the root is larger than the smalnesse of the plant seemeth to require, hard, branched, diuersly turning and winding, and therefore hard to be plucked vp: the taste is dry and hottish. It growes vpon a large Plaine in *Prouince*, betweene the cities *Arles* and *Selon*. Thus much *Pena* and *Lobel*. I am deceiued, if some few yeares agoe I was not shewed this plant, gathered in some part of this kingdome, but where, I am not able to affirme.

CHAP. 4. Of Heath Spurge and Rocke Rose

¶ The Description.

I These Plants by right should haue followed the historie of *Thymelaea*, for in shape and facultie they are not much vnlike it. The first is a low shrub, sending from one root many branches of some cubit long, and these bending, flexible, and couered with an outer blackish barke, which comprehends another within, tough, and which may be diuided into fine threds: the leaues are like those of *Chamaelea*, yet lesser, shorter and thicker, a little rough also, and growing about the branches in a certaine order: if you chew them they are gummie, bitter at the first, and afterwards hot and biting: the floures grow amongst the leaues, longish, yellowish, and diuided at the end into foure little leaues: the fruit is said to be like that of *Thymelaea*, but of a blackish colour, the root is thicke and wooddie. It growes frequently in the kingdome of Granado and Valentia in Spaine, it floures in March and Aprill. The Herbarists there terme it *Sanamunda*, and the common people, *Mierda-cruz*, by reason of the purging facultie.

1 *Sanamunda* 1. Clus.
Heath Spurge.

2 *Sanamunda* 2. Clus.
The second Heath Spurge.

2 The other is a shrub some cubit high, hauing tough flexible branches couered with a dense and thick barke, which, the outward rinde being taken away, ouer all the plant, but chiefly next the root, may be drawn into threds like Flax or Hemp: the vpper branches are set with thick, short, fat, rough sharp pointed leaues, of somewhat a saltish taste at the first, afterwards of a hot & biting taste: the floures are many, little and yellow: the root is thicke and wooddie like as that of the former: this growes vpon the sea coast of Spaine, and on the mountaines nigh Granado, where they call it *Sanamunda*, and the common people about Gibraltar call it *Burhalaga*, and they only vse it to heat their ouens with. It floures in Februarie. *Anguillara* called this, *Empetron*: *Cesalpinus*, *Cneoron*, and in the *Historia Lugd.* it is the *Cneoron nigrum* *Myconi*: *Sesamoides minus*: *Dalechampi*, and *Phacoides*, *Oribasis* quibusdam.

3 This is bigger than either of the two former, hauing whiter and more flexible branches, whose barke is vnmeasurably tough and hard to breake: the vpper branches are many, and those very downie, and hanging downe their heads, set thicke with little leaues like Stone-crop, and of the like hot or burning facultie: the floures are like those of the former; sometimes greenish, otherwhiles yellow: *Clusius* did not obserue the fruit, but saith, it floured at the same time with the former, and grew in all the sea coast, from the Straits of Gibraltar, to the Pyrenæan mountaines. *Alfonfus Pantius* called this *Cneoron*: *Lobel* and *Tabernamontanus* call it *Erica Alexandrina*.

3 *Sanamunda* 3. *Clus.*
The third Heath Spurge.

4 *Cneoron Matthioli.*
Rocke Rose.

4 This also may not vnfitly bee ioined to the former, for it hath many tender flexible tough branches commonly leaning or lying along vpon the ground, vpon which without order grow leaues greene, skinny, and like those of the true *Thymelæa*, at first of an vngratefull, and afterwards of a bitter taste, yet hauing none or very little acrimony (as far as may be perceiued by their taste:) the floures grow vpon the tops of the branches six seuen or more together, consisting of foure little leaues of a reddish purple colour, very beautifull and well smelling, yet offending the head if they be long smelt vnto: these are succeeded by small berries, of colour white, containing a round seed, covered with an ash coloured skin. The root is long, of the thickenesse of ones little finger, sometimes blackish, yet most commonly yellowish, tough, and smallest at the top where the branches come forth. It floures in Aprill and May, and ripens the fruit in Iune: it floures sometimes thrice in the yeare, and ripens the fruit twise; for *Clusius* affirms that twise in one yeare he gathered ripe berries from one and the same plant. It growes plentifully vpon the mountainous places of Austria about Vienna; whither the countrey women bring the floures to the market in great plenty to sell them to deck vp houses: it grows also in the dry medowes by Frankford on the Mcene, where there is obserued a variety with white floures. *Matthiolus* would haue this to be the *Cneoron album* of *Theophrastus*: *Cordus* calls it *Thymelæa minor*: it is the *Cneoron alterum Matthioli*, and *Oleander syl. Auicennæ Myconi*, in the *Hist. Lugd.* The Germans call it **Stein Roselin**: and wee may call it **Rocke Rose**, or dwarfe *Oleander*.

5 This plant by *Bauhine* is called *Cneorum album folio oleæ argenteo molli*: and by *Dalechampi*, *Cneorum album*, which hath been the reason I haue put it here, although *Casalpini*, *Imperatus*, and *Plateau*,

5. *Cneorum album folijs argenteis.*
White Rocke Rose.

Chamabuxus flore Colutea.
Bastard dwarfe box.

rean, who sent it to *Clusius*, would have it to be and call it *Dorycnium*: It is a shrubby herb sending from one root many single stalkes some halfe cubit or better high: the leaues which grow vpon the stalkes without order, are like those of the Oliue, but somewhat narrower, and couered ouer with a soft fluer-like downinesse: at the top of the stalks grow many floures clustering together, of the shape of those of the lesser Bindweed, but white of colour. This growes wilde in some parts of Sicily, whence *Casalpinus* calls it *Dorychnium ex Sicilia*.

¶ The Temperature and Vertues.

The three first are very hot, and two first A haue a strong purging facultie, for taken in the weight of a dram with the decoction of Cicers they mightily purge by stoole, both flegme, choller, and also waterish humours, and they are often vsed for this purpose by the Countrey people in some parts of Spaine.

The faculties of the rest are not knowne, nor written of by any as yet.

CHAP. 5. Of Bastard
dwarfe Box.

¶ The Description.

THIS which *Clusius* for want of a name calls *Anonymos flore Colutea*: *Gesner* called *Chamabuxus*: to which *Bauhine* addes *flore Colutea*; and *Besler* in his *hortus Eystettensis*, agreeable to the name I haue giuen it in English, calls it *Pseudochamabuxus*. It is a small plant hauing many creping woody tough roots, here and there sending forth small fibers, from these arise many tough bending branches some span long, hauing thicke sharpe pointed greene leaues, almost like those of Boxe, and these grow vpon the stalks without any order, and when you first chew them they are of an vngratefull taste, afterwards bitter and hot; at the tops of the branches, do come forth amongst the leaues three or foure longish floures, for the most part without smell, yet in some places they smell sweet, like as some of the *Narcisses*; they consist of three leaues apiece; two whereof are white, and spread abroad as wings, a whitish little hood covering their lower ends: the third is wrapt vp in forme of a pipe, with the end hollow & crooked, and
this

this is of a yellow colour, which by age oft times becomes wholly red : after those floures succeed cods, broad and flat, little lesse than those of the broad leaved *Thlaspi*, and greene of colour, rough, and in each of these cods are commonly contained a couple of seeds, of the bignes of little Chichlings, of a blackish ash colour, rough, and resembling a little dug.

This is sometimes found to vary, hauing the two winged leaues yellow or red, and the middle one yellow.

¶ *The Place.*

It floures in Aprill and May, and ripens the seed in Iune ; it growes vpon most of the Austrian and Stirian Alpes, and in diuers places of Hungarie. It is neither vsed in Physicke, nor the faculties thereof in medicine knowne.

CHAP. 6. Of Winged Bind weed, or Quamoclit

Quamoclit, sive Conuoluulus Pennatus.
Winged Windweed.

¶ *The Description.*

THE first that writ of and described this plant was *Cesalpinus*, & that by the name of *Gelsimum rubrum alterum* : after him *Camerarius* gaue a description and figure thereof in his *Hortus Medicus*, by the name of *Quamoclit* : and after him *Fabius Columna* both figured and described it more accurately, whose description is put to the figure of it (we here giue) in *Clus.* his *Cura posteriores*. It is so tender a plant that it will not come to any perfection with vs, vnlesse in extraordinary hot yerres, and by other artificiall helps, wherefore I will borrow the description thereof out of *Fabius Columna*. This exoticke plant, saith he, cannot more fitly be referred to any kinde, than to the family of the *Conuoluuli*, or Bindweeds, for in the nature and whole habit it is almost like them, excepting the shape of the winged leaues : it is stored with lesse milk : the flours are long, hollow, but parted into fve at the top, of a pleasing red colour, with streaked lines or folds, standing vpon long stalkes one or two together comming out of the bosomes of the leaues at each ioint of the branches, and they haue in them fve yellowish pointalls ; then succeeds a longish fruit standing in a scaly cup, ending in a sharp pointall, and couered with a tough skin, as that of the common *Conuoluulus*, but lesser, hauing within it foure longish blacke hard feedes, of a biting

taste. The leaues grow alternately out of the ioints of the purple winding branches, being winged and finely diuided, twise as small as the common *Rheseda*, of a darke greene colour, but the young ones are yellowish, first hauing a few diuisions, but afterwards more, till they come to haue thirteen on a side, and one at the top : but the lower ones are oft times forked : by reason of the great plenty of leaues and flouing stalks or branches, winding themselues about artificiall hoops, crossings, or other fashioned workes of Reeds, or the like, set for winding herbs to clime vpon, it much delights the eie of the beholder, and is therefore kept in pots in gardens of pleasure. The seed sowne in the beginning of the Spring growes vp in Iune, and the first leaues resemble the winged fruit of the Maple : it floures in the end of August, and ripens the seed in the end of September.

CHAP. 7. Of the sensitive Herbe.

Herbami-mosa.

The sensitive berbe.

¶ The Description.

*Etius exactior icon.*

A perfect figure thereof.

THIS which I here call the sensitive herbe, is that which *Christopher a Costa* sets forth by the name of *Herba mimosa*, or the Mocking herbe, because when one puts his hand thereto it forthwith seemes to wither and hang downe the leaues; but when you take it away againe it recovers the pristine greenesse and vigor. I wil here giue you that which *Acosta* writes thereof, & the figure & historie which *Clusius* giues in his notes vpon him; and also another figure better expressing the leaues and manner of growing. There is found (saith *Acosta*) in some Gardens another plant some fve handfuls long, resting vpon the neighbouring shrubs or walls, hauing a slender stalke of a fresh Greene colour, not very round, set at certaine spaces with small and pricking thornes: the leaues are not vnlike the former, [That is, the *Herba viua*, which in condition is little different from this] being somewhat lesser than those of the female Ferne. It loues to grow in moist and stony places, and is called *Herbami-mosa*, for the reason formerly giuen. The nature hereof is much different from that of *Arbor tristis* for euery night at Sun-set it as it were withers and dries, so that one would thinke it were dead, but at Sun-rise it recouers the former vigor, and by how much the Sun growes hotter, by so much it becomes the greener, and all the day it turnes the leaues to the Sun.

This plant hath the smell and taste of Li- A quorice, and the leaues are commonly eaten by the Indians against the cough, to clesse the chest, & cleare the voice: it is also thought good against the paines of the kidneies, and to heale Greene wounds. Thus much *Acosta*.

Now, saith *Clusius*, the leaues of many plants, especially pulses, vse to contract or shrinke vp their leaues in the night time. Now I receiued a dry plant, which was sent to me by the name of *Herba mimosa*, by *James Garret* in the end of Octo-

ber, 1599, which he writ he had of the right Honourable the Earle of Cumberland, who returning from Saint Iohn de Puerorico in the West Indies, brought it put in a pot with some earth, but could not preferue it alieue. But I caused the figure of that dried plant to be expressed as well as it might, so to fit it to the description following, made also by the dried plant. This plant which was wholly drie and without leaues had a single root, and that not thick, but hard and woody, with few fibres, from whence arose three or foure short stalks, which straight diuided themselues into slender branches, which spread themselues round about vpon the ground, at each ioint putting forth many long and slender fibres, like as in the branches of the common Woodbinde, which lye vpon the ground: these branches were a cubit long, and sometimes more, round, tough, with some prickles, broader at their setting on, as you may see in the common bramble, yet lesser, fewer, & lesse firme; these againe were diuided into other more slender branches set with many little prickles, out of whose ioints betwixt two little leaues grew forth foot-stalks, bedeckt with their little leaues, which were many, set in order, with other to answer to them on the other side, but hauing no single leafe at the end: they were tender & green, not vnlike the little leaues of *Acacia*, & these (at their first comming out) couered with a thin whitish hairines, as I gathered by a little branch retaining the foot-stalke and leaues thereon (which he sent with the former) and it had also some fibres comming forth thereof. He also added to the former two little heads, which growing vpon the same plant, he writ he receiued of the forementioned

forementioned right Honorable Earle, with some branches yet retaining the leaues. These little heads consisted of many slender, narrow, and as it were prickly little leaues, amongst which lay hid round seeds, smooth, blacke, and somewhat swoln in the middle: the floures I saw not, neither know I whether they were brought with the rest: but whether the leaues of this plant being green, & yet growing on the ground, do wither at the approach of ones hand, as *Christopher A Costa* writes, and for that cause imposes the name thereon, they best know who haue seene the Greene and yet growing plant: for the faculties you may haue recourse to that which *A Costa* hath set downe. Thus much out of *Clusius*.

Novemb. 7. 1632. I being with Mr. *Job Best* at the Trinity house in Ratcliffe; among other varieties, he shewed me a dry plant hereof, which I heedfully obserued, and carefully opening out some of the fairest leaues, which (as also the whole plant besides) were carelessly dried, I found the leaues grew vsually some dozen or more on a foot-stalke, iust as many on one side as on the other; & they were couered ouer with a little downines, which standing out on their edges made them look as if they had bin snipt about the edges, which they were not: also I found at euery ioint two little hooked prickles, & not two little leaues or appendices at the setting on of the foot-stalks, but three or foure little leaues, as the rudiment of a yong branch, comming forth at the bosom of each foot-stalk: the longest branch (as far as I remember) was not aboue a span long; I then drew as perfect a figure as I could of the perfectest branch therof, drawing as neere as I could the leaues to their full bignesse, the which I here present you withall. There are two figures formerly extant, the one this of *Clusius*, which I here giue you, and the other in the 18. booke, & 144. chap. of the *Hist. Lug.* which is out of *A Costa*, and this seems to be so far different from that of *Clusius*, that *Bauhine* in his *Pinax* saith, *Clusius notis suis in Acostam diuersam plane figuram proposuit, herbam minusam nominans*: but he did not wel consider it, for if he had, he might haue found these so much different, thus far to agree; they both make the branches prickly & weak: the leaues many on one rib, one opposite to another without an odde one at the end: but *Clusius* figures the leaues so close together, that they seem but one leafe, and *Acosta* makes them too far a sunder, and both of them make them too sharp pointed; *Clus.* made his be taken from a dried plant, and *Acosta* I iudg made his by the *Idæa* thereof which he had in his memorie, and after this manner, if my iudgement faile me not, are most of the figures in him exprest: but of this enough, if not too much.

CHAP. 8. Of the Staffe tree, and euer-greene Priuet.

1 *Celastrum Theophrasti.*
The staffe tree.

2 *Phillyrea* 1. *Clus.*
Clusius his 1. Mocke-Priuet.

¶ The Description.

THe history and figure of this tree are set forth in *Clusius* his *Cura poster.* and there it is asserted to be the *κλάστος*, or *κλάστος* of *Theophrastus*; for by diuers places in *Theophrastus* there collected, it is euident, that his *Celastus* was euer greene, grew vpon very high and cold mountaines, yet might be transplanted into plaine and milder places, that it floured exceeding late and could not perfect the fruit by reason of the nigh approach of winter, and that it was fit for no other vse but to make staues on for old men.

Now this tree growes but to a small height, hauing a firme and hard body, diuiding it selfe at the top into sundry branches, which being yonge are couered with a greene barke, but waxing old with a brownish one; it hath many leaues, growing alwaies one against another, and thicke together, of a deepe shining greene aboue, and lighter vnderneath, keeping their verdure both Winter and Sommer: they are of the bignesse of those of *Alaternus*, not snipt about the edges, but onely a little nickt, when they are yet yong; at the top of the tenderest branches among the leaues, vpon footstalkes of some inch long, grow fve or six little floures consisting commonly of fve little leaues of a yellowish greene colour, and these shew themselues in the end of Autumne, or the beginning of Winter, and also in the beginning of the Spring; but if the Sommer be cold and moist it shewes the buds of the floures in October; the fruit growes on a short stalke and is a berry of the bignesse of the Myrtle, first green, then red, of the colour of that of *Asparagus*, and lastly blacke when it is withered: the stone within the berry is little, and as it were three cornered, conteining a kernell couered with a yellow filme. Where this growes wilde I know not, but it was first taken notice of in the publike Garden at the Vniuersitie of Leyden, from whence it was brought into some few gardens of this Kingdome.

2 The first *Phylliria* of *Clusius*, may fitly be refer'd to the rest of the same tribe and name described formerly in the 59. chapter of the the third booke. It growes somewhat taller than the Scarlet Oke, and hath branches of the thicknesse of ones thumbe or somewhat more, and those couered with a greene barke marked with whitish spots; the leaues somewhat resemble those of the Scarlet Oke, but greater, greener, thicker, somewhat prickley about the edges, of an astringent taste, but not vngratefull. The floure thereof *Clusius* did not see, the fruit is a little blacke berry, hanging downe out from the bosome of the leaues, and conteining a kernell or stone therein. It growes wilde in many wilde places of Portugale, where they call it Azebo.

The temperature and vertues are refer'd to those set downe in the formerly mentioned chapter.

CHAP. 9. Of Mocke-Willow.

Speirea Theophrasti, Clus.
Mocke-Willow.

¶ The Description.

THis Willow leaued shrub, which *Clusius* coniectures may be refer'd to the *Speirea* mentioned by *Theophrastus*, lib. 1. cap. 23. hist. plant. I haue named in English, Mocke-Willow, how fitly I know not, but if any will impose a fitter name I shall be well pleased therewith; but to the thing it selfe. It is a shrub, (saith *Clusius*) some two cubits high, hauing slender branches or twigs couered ouer with a reddish barke, whereon grow many leaues without order, long, narrow, like those of the Willow, snipt about the edges, of a light green aboue, and of a blewish greene vnderneath, of a drying taste conioyned with some bitternes. The tops of the branches for some fingers length carry thicke spikes of small floures clustering together, and consisting of fve leaues apiece, out of whose middle come forth many little threds of a whitish red or flesh colour, together with the floure, hauing no peculiar smell,

T t t t t

smell, but such as is in the floure of the Oliue tree; these floures fading there succeed small five cornered heads, which comming to full maturitie containe a small and yellowish dusty seed: it floures in Iuly, and ripens the seed in the end of August. *Clusius* had this plant from *Fredericke Sebizius* Phyfition to the Duke of Briga, and that from Briga in Silesia, and he (as I said) refers it to the *Στροφαία* of *Theophrastus*, which he reckons amongst the shrubs that carry spike fashioned floures.

This is not vsed in medicine, nor the Temperature and faculties thereof as yet knowne.

CHAP. IO. Of the Strawberry-Bay.

Adrachne Theophrasti.
The Strawberry-Bay.

¶ The Description.

THE figure and history of this were sent by *Honorius Bellus* out of Candy to *Clusius*, from whom I haue it. It is that which *Theophrastus* calls *Adrachne* or (as most of the printed bookes haue it) *Andrachne*, but the former seemes the righter, and is the better liked by *Pliny*, lib. 1. cap. 22. At this day in Candy where it plentifully growes, it is called *Adracla*. It is rather a shrub than a tree, delighting in rockie and mountainous places, and keeping greene VVinter and Sommer, hauing leaues so like those of Bayes, that they are distinguishable only by the smell, which these are destitute of. The barke of the bole and all the branches is so smooth, red and shining, that they shew like branches of Corall, this barke crackes or breakes off in Sommer, and pills off in thinne fleakes, at which time it is neither red nor shining but in a meane betweene yellow and ash-colour. It hath floures twice in a yeere like as the *Arbutus*, or Strawberry tree, and that so like it, that you can scarce know the one from the other; yet this differs from it in that it growes onely in the mountaines, hath not the leaues jagged, neither a rough barke; the wood hereof is very hard, and so brittle that it will not bend, and they vse it to burne and to make whorles for their womens spindles. *Theophrastus* reckons vp this tree amongst those which die not when their barks are taken off, and are

alwaies greene, and retaine their leaues at their tops all winter long: which to be so *Honorius Bellus* obserued. *Bellonius* also obserued this tree in many places of Syria.

The fruit in Temperature, as in shape, is like that of the Stawberry-tree.

CHAP. II. Of the Cherry-Bay.

¶ The Description.

THE Cherry-bay is one of the euergreen trees: it rises vp to an indifferent height, and is diuided into sundry branches, couered ouer with a swart green barke: that of the yonger shoots is wholly greene.

green, the leaues alternately ingirt the branches, & they are long, smooth, thick, green and shining, snipt also lightly about the edges: when the tree is growne to some height, at the tops of the branches amongst the leaues of the former yeares growth, vpon a sprig of some fingers length, it puts forth a great many little white floures, consisting of five leaues a piece, with many little chiues in them: these floures quickly fall away, and the fruit that succeeds them is a berry of an ovall figure, of the bignesse of a large Cherry or Damson, and of the same colour, and of a sweet and pleasant

Laurocerasi flos.

The Cherry-bay in floure.

Laurocerasi fructus.

The Cherry-bay with the fruit.

taste, with a stone in it like to a Cherry stone. This floures in May, and ripens the fruit in August or September: it was first sent to *Clusius* from Constantinople, and that by the name of *Trabison curmasi*. *i. Trapezuntina dactylus*, the Date of Trapezon; but it hath no affinitie with the Date. *Dalechampsius* refers it to the second *Lotus* mentioned by *Theophrastus*, *hist. plant. lib. 4. cap. 4.* but therewith it doth not agree. *Clusius* and most since, call it fitly *Laurocerasus*, or *Cerasus folio Laurino*. It is now got into many of our choise English gardens, where it is well respected for the beauty of the leaues and their lasting or continuall greenenesse.

The fruit hereof is good to be eaten, but what physicall vertues the tree or leaues thereof haue, it is not yet knowne.

CHAP. 12. Of the Euer-greene Thorne.

THIS plant which *Lobel* and some other late writers haue called by the name of *Pyracantha*, is the *Oxyacantha* mentioned by *Theophrastus*, *lib. 1. cap. 15. lib. 3. cap. 4. hist. plant.* amongst the euer green trees, and I thinke rather this than our white Thorne to be the *Oxyacantha* of *Dioscorides*, *lib. 1. c. 123.* and certainly it was no other than this Thorne which *Virgil* makes mention of by the name of *Acanthus*, *lib. 2. Georg.* in these words, *Et baccas semper frondentis Acanthi*. That is, And the berries of the Eue-greene Thorne.

Oxyacantha Theophrasti.
The Ever-greene Thorne.

¶ The Description.

This growes vp like a bush, vnlesse you keepe it with pruning, and then it will in time grow to the height of a smal tree, as the Hawthorne, whereto it is of affinitie, for the wood is white and hard, like it, and couered ouer with the like barke, but the leaues are somewhat like those of the Damson tree, longish, sharp pointed, and snipt about the edges: & they grow alongst the branches, without any order, yet sometimes they keep this maner of growing: at each knot, where commonly there is a sharpe prickle, growes out one of the larger leaues, which may be some inch and halfe long, and some three quarters of an inch broad: then vpon the prickle, and at the comming out therof are three or foure, more or lesse, much smaller leaues: now these leaues are of a faie and shining green above, but paler vnderneath, and they keep on al the yeare: At the ends, and oft times in the middles of the branches come forth clusters or vmbels of little whitish bluish coloured floures, consisting of fise leaues apiece, with some little chiues in their middles: then follow clusters of berries, in shape, taste, and bignesse like those of the Hawthorne, and of the same, but much more orient and pleasing colour, and containing in them the like seed: now these berries hang long vpon the tree, & make a gallant shew amongst the greene leaues, and chiefly then, when as the Au-

tumne blasts haue depriued other trees of their wonted verdure. This floures in May and Iune, and ripens the fruit in September and October: it growes wilde in sundry places of Italy, and Prouince in France, but is kept in gardens with vs, where it is held in good esteeme for his ever greenesse and pliablennesse to any worke or forme you desire to impose vpon him.

The fruit haue the same faculties that are formerly attributed to Hawes, in the foregoing booke, pag. 1328. and therefore I will not here repeat them.

CHAP. 13. Of the *Aegyptian Nap*, or great *Iuibes* tree.

¶ The Description.

This tree, which for his leaues and manner of growing I thinke may fitly be referred to the Iuibes tree, is of two sorts; that is, the one prickly, and the other not prickly, in other respects they are both alike, so that one figure and historie may serue for them both, which I will giue you out of *Clusius*, who receiued this figure together with a description thereof from *Honorius Bellus*, and also added therto that which *Prosper Alpin*. hath written of it in his 5. chap. de Plant. *Aegypt*. It grows to the height of an indifferent Peare-tree, and the bodie and branches thereof are couered with a whitish ash coloured barke: the leaues are like those of the Iuibes tree, two inches long, and one broad, with three nerues running alongst them; of a deepe shining greene above, and more whitish vnderneath: and they grow alternately vpon the branches: and at their comming forth grow tufts of little white floures hanging vpon single long foot-stalks: after these followes the fruit like vnto a small Apple, of the bignesse for the most part of a large Cherry, and sometimes as big as a VValnut, of a sweet taste, containing therein a kernell or stone like that of an Oliue. It beares fruit twise a yeare, for it hath ripe fruit both in the Spring and fall; yet the vernall fruit seldom comes to good,

by

Oenoplia non spinosa.

The great Iuiubes tree.

by reason of the too much moisture of the season, which causes it to become worme-eaten. The Thorny kinde is described by *Alpinus*, who rightly iudges it the *Connarus* of *Athenens*, but the figure he giues is not very accurate. That which wants prickles growes (as well as the prickly one) in *Egypt* and *Syria*, as also in the city *Rhetimo* in *Candy*, whither it was brought out of *Syria*.

The historie of both these trees is in *Serapio* by the name of *Sadar*: but he, according to his custome confounds it with the *Lotus* of *Dioscorides*, from which it very much differs. *Bellonius* in his second booke, and 79. chap. of his *Observations*, reckons vp *Napeca* amongst the trees that are alwaies greene: which is true, in those that grow in *Egypt* and *Syria*; but false in such as grow in *Candy*. That tree in *Egypt* and *Syria* is called *Nep*, or *Nap*. *Alpinus* calls it *Paliurus Athenai*, or *Nabeca Egyptiorum*, thinking it (as I formerly said) the *Connarus* mentioned in the 14. booke of *Athenens* his *Deipnosophists*.

¶ The Vertues out of *Alpinus*.

The fruit is of a cold and dry facultie, and the vnripe ones are frequently vsed to strengthen the stomacke, and stop lasks: the iuice of them being for this purpose either taken by the mouth, or injected by clyster: of the same fruit dried and macerated in water, is made an infusion profitable against the relaxation and vlceration of the guts.

The decoction or infusion of the ripe dried fruit, is of a very frequent vse against all pestilent feuers: for they affirme that this fruit hath

a wonderfull efficacie against venenate qualities, and putrifaction, and that it powerfully strengthens the heart.

Also the iuice of the perfectly ripe fruit is very good to purge choler forth of the stomacke and first veines: and they willingly vse an infusion made of them in all putride feuers to mitigate their heate or burning.

CHAP. 14. Of the Persian Plum.

¶ The Description.

THIS tree is thought by *Clusius* (to whom I am beholden for the historie and figure) to be the *Persea arbor* mentioned by *Pliny* and *Plutarch*, but he somewhat doubts whither it be that which is mentioned by *Theophrastus*. *Dioscorides* also, *Galen* and *Strabo* make mention of the *Persea arbor*, and they all make it a tree alwaies greene, hauing a longish fruit shut vp in the shell and coat of an Almond: with which how this agrees you may see by this description of *Clusius*.

This tree (saith he) is like to a Peare tree, spreading it selfe far abroad, and being alwaies green, hauing branches of a yellowish green colour. The leaues are like those of the broadest leaued Bay-tree, greene aboue, and of a grayish colour vnderneath, firm, hauing some nerues running obliquely, of a good taste and smell, yet biting the tongue with a little astringtion. The floures are like those of the Bay, growing many thicke together, and consist of six small whitish yellow leaues. The fruit at the first is like a Plum, and afterwards it becomes Peare fashioned, of a blacke colour, and pleasant taste: it hath in it a heart fashioned kernell, in taste not vnlike a Chesnut, or sweet Almond. I found it flourishing in the Spring, and I vnderstood the fruit was ripe in Autumne, by the relation of *Sig.*

Persea arbor.
The Persian Plum.

Cotonaster Gesneri.
Gesners wilde Quince

John Placa, Physition and Professor of Valentia, who shewed me the tree growing in the garden of a Monasterie a mile from Valentia, brought thither, as they say, out of America, and he said they called it *Mamay*: but the Spaniards who have described America giue this name to another tree. But diuers yeares after, I vnderstood by the most learned *Simon de Tovar*, a Physition of Ciuil, who hath the same tree in his garden, with other exoticke plants, that it is not called *Mamay*, but *Aguacate*. Thus much out of *Clusius*; where such as are desirous, may finde more largely handled the question, whether this be the *Persea* of the Antients or no? *Rariorum plan. Hist. l. 1. c. 2.*

CHAP. 15. Of Gesners wilde Quince.

¶ The Description.

THE shrub which I here figure out of *Clusius*, is thought both by him and others, to be the *Cotonastrum* or *Cidonago*, mentioned by *Gesner* in his *Epistles*, lib. 3. pag. 88. It hath branches some cubit long, tough, and bare of leaues in their lower parts, couered with a blacke barke: and towards the tops of the branches grow leaues somewhat like those of Quinces: of a darke greene aboue, and whitish vnderneath, snipt about the edges: at the tops of the branches grow vsually many floures, consisting of five purplish coloured leaues a piece, with some threddes in their middles: these decaying, vnder them grow vp red dry berries without any pulp or iuice, each of them containing foure triangular seeds. *Clusius* found this flourishing in Iune vpon the tops of the Austrian Alpes, and he questions whether it were not this which *Belonius* found in the mountains of Candy, and called *Agriomalea*, lib. 1. cap. 17. This is not vsed in Physicke, nor the faculties thereof knowne.

CHAP.

CHAP. 16. Of Tamarindes.

Tamarindus.
The Tamarinde.*Tamarindi siliqua.*
The cod of the Tamarinde.

¶ The Description.

Tamarinds, which at this day are a medicine frequently vsed, and vulgarly knowne in shops, were not knowne to the antient Greekes, but to some of the later, as *Aetnarius*, and that by the name of *Oxyphœnica*, that is, soure Dates, drawne as it may seeme from the Arabicke appellation, *Tamarindi*, that is, Indian Date: but this name is vnproper, neither tree nor fruit being of any affinitie with the Date, vnlesse the Arabicke *Tamar* be a word vsed in composition for fruits of many kindes, as the Greeke *μήλον*, the Latine *Malum*, and Apple with vs in English; for we call the Cone of the Pine, and excrecence of the Oke leafe, by the name of Pine Apple, and Oke Apple. But how soeuer it be, it is no matter for the name, whether it be proper or no, if so be that it serue to distinguish the thing from others, and we know what is denoted by it. In Malauar they call it *Puti*: in Guzarat, *Ambili*, by which name it is knowne in most parts of the East Indies. This tree is thus described by *Prosper Alpinus*, de Plant. *Aegypti*, cap. 10. The Tamarind (saith he) is a tree of the bignesse of a Plum tree, with many boughes and leaues like those of the Myrtle, many standing vpon one rib [one against another, with a single one at the end:] it carrieth white floures very like those of the Orange tree: out of whose middle comes forth foure white and very slender threds: after these come thicke and large cods, at first greene, but when they are ripe of an ash colour; and within these are contained thicke, hard, brownish, cornered seeds, and a blacke acide pulpe. These trees grow in some few gardens of Egypt, whither they haue bin brought out of Arabia and Ethiopia. This plant hath this strange qualitie that the leaues alwaies follow the Sun, and when it sets they all contract themselues, and open out themselues againe at the rising thereof; and there is obserued to be such force in this motion, that they closely shut vp and hold their cods (if any be on the tree) and then at the rising of the Sun they forgoe them againe. But I haue obserued this folding vp of the leaues to be common to diuers other Egyptian plants, as *Acacia*, *Abrus*, *Abfus*, and *Sesban*. Thus much out of *Alpinus*.

The

The figure I here giue in the first place, out of *Lobel*, is of a plant some six moneths old, arisen of a seed: and such by sowing of seeds I haue seene growing in the garden of my deceased friend Mr. *Tuggy*, but they still died at the first approach of Winter. The other figure expresse the cods, and some of the seeds apart, taken forth of the cods: now the cods are neuer brought whole to vs, but the vtter rindes are taken off, and the strings or nerues that runne alongst the cods: the pulpe and seeds in it are close thrust together, and so are brought to vs in pots and such like vessels.

¶ *The Temperature and Vertues.*

- A The fruit or pulpe of Tamarindes is cold and dry in the third degree: it is of good vse in cholericke diseases, as burning Feuers, Tertians, and the like: it is a lenitiue and very gently purging medicine and therefore vsed to be put into medicines seruing to that purpose.
- B They vse (saith *Alpinus*) the leaues of Tamarindes to kill wormes in young children; and also their infusion or decoction to loosen the belly: the leaues are acide, and not vnpleasant vnto the taste.
- C The Arabians preserue the small and yet greene cods of this tree, as also the ripe ones, either with sugar, or the honey boiled out of the fruit of the Carob tree: they also mix the pulpe with sugar, which traouellers carry with them in their iournies through the desert places of Africk, where-with they being dry or ouerheated, may quench their thirst, coole and refresh themselves, and also euacuate many hot humors by stooles.
- D In pestilent and all other burning putrid feuers they drinke the water with sugar, wherein a good quantitie of Tamarinds haue been infused; for it is a drinke very pleasant to such as are thirsty by reason of too much heate, for it powerfully cooles and quenches thirst.
- E They are also vsed in all putrid feuers caused by cholericke and adust humors, and also against the hot distempers and inflammations of the liuer and reines, and withall against the Gonorrhæa.
- F Some also commend them against obstructions, the dropsie, iaudice, and the hot distempers of the Spleene: they conduce also to the cure of the itch, scab, leprosie, tetters, and all such vlcérations of the skin which proceed of adust humors.
- G They are not good for such as haue cold stomachs, vnlesse their coldnesse be corrected by putting to them Mace, Anise seeds, Squinanth, or such like.

CHAP. 17.

Of the Mamoera, the Male and Female.

¶ *The Description.*

THE historie of these two trees, together with the figures I here giue you, are in the *Cura Posterior* of *Clusius*, from whence I will take as much as concernes their history, and briefly here giue it you.

That of the Poet (saith he) is most true, *Non omnis fert omnia tellus*: for I thinke there is no prouince to be found, which produces not some peculiar plant not growing in other regions, as they can testifie who haue trauelled ouer forrein countries, especially if they haue applied themselves to the obseruation of plants. Amongst such I thinke I may reckon that honest and courteous man *John Van Vfele*, who returning out of that part of America called Brasile, shewed me in the yeare 1607. a booke, wherein he in liuely colours had exprest some plants and liuing creatures: for as he told me, when he purposed to trauell he learned to paint, that so he might expresse in colours, for his memorie and delight after he was returned home, such singularities as he should obserue abroad. Now amongst those which hee in that booke had exprest, I obserued two very singular, and of a strange nature, whose figures without any difficultie he bestowed vpon me, as also the following historie.

These two trees, whose figures you see here exprest, are of the same kinde, and differ only in sex; for the one of them, to wit the male, is barren, and only carries floures, without any fruit; but the female onely fruit, and that without floure: yet they say they are so louing, and of such a nature, that if they be set far asunder, and the female haue not a male neere her, shee becomes barren, and beares no fruit: of which nature they also say the Palme is.

Now the bole or trunke of that tree which beares the fruit is about two foot thicke, and it groweth some nine foot high before it begin to beare fruit; but when it hath acquired a iust magnitude, then shall you see the vpper part of the tree laden with fruit, and that it will be as it were thicke

girt

girt about therewith for some nine foot high more: the fruit is round and globe-fashioned, of the shape and magnitude of a small gourd, hauing when it is ripe a yellowish pulpe, which the inhabitants vse to eate to loosen their bellies: this fruit contains many kernels of the bignes of a smal pease, blacke and shining, of no vse that he could learne, but which were cast away as vnneccessary: the leaues come forth amongst the fruit, growing vpon long foot-stalkes, and they in shape much resemble the Plane tree or great Maple.

Mamoera mas.
The male Dug tree.

Mamoera femina.
The female Dug tree.

What name the Brasilians giue it he could not tell, but of the Portugals that dwelt there it was called *Mamoera*, and the fruit *Mamaon*, of the similitude I thinke they haue with dugs, which by the Spaniards are called *Mamas* and *Tetas*.

There is no difference in the forme of the trunke or leaues of the male and female, but the male only carries floures hanging downe, clustering together vpon long stalks like to the floures of Elder, but of a whitish yellow colour, and these vnprofitable, as they affirme.

Both these trees grow in that part of America wherein is scituate the famous Bay called by the Portugals, *Baya de todos los santos*, lying about thirteene degrees distant from the Equator towards the Antarticke pole.

CHAP. 18.

Of the Cloue-Berry Tree.

¶ The Description.

I Must also abstract the historie of this out of the Works of the learned and diligent *Clusius*, who sets it forth in his *Exoticks*, lib. 1. cap. 17. in the next chapter after Cloues.

I put (saith he) the description of this fruit next after the historie of Cloues, both for the affinitie

Amomum quorundam, forte Garyophyllon Plinij.
The Cloue-berry tree.

colour, of a sufficient acride taste: the branches which were added to the rest were slender, quadrangular, covered with a barke of an ash colour, and those were they of a yeares growth; for those that were of an after growth were brownish, and they had yet remaining the prints where the leaues had growne, which for the most part were one against another, and these also were of an acride taste, as well as the leaues, and of no vngratefull smell.

I receiued the same fruit some yeares before, but without the stalks, and with this question propounded by him which sent it, *An Amomum?* And certainly the faculties of this fruit are not very much vnlike those which *Dioscorides* attributes to his *Amomum*; for it hath an heating astringe and drying facultie, and I thinke it may performe those things whereto *Dioscorides*, *Lib. 1. Cap. 14.* saith his is good; yet this wanteth some notes which he giues vnto his, as the leaues of *Bryonie*, &c.

But I more diligently considering this Exoticke fruit, finde some prime notes which do much moue me (for I will ingenuously professe what I thinke) to iudge it the *Garyophyllon* of *Pliny*; for he, *Hist. Nat. lib. 12. cap. 7.* after he hath treated of Pepper addes these words: [There is besides in the Indies a thing like to the Pepper corne, which is called *Garyophyllon*, but more great and fragil: they affirme it growes in an Indian groue; it is brought ouer for the smells sake.] Though this description be brieue and succinct, neither contains any faculties of the fruit it selfe, yet it hath manifest notes, which, compared with those which the fruit I here giue you possesse, you shal find them very like; as comparing them to Pepper cornes, yet bigger and more fragile, as for the most part these berries are: their smell is also very pleasing, and comming very neere to that of Cloues, and for the smells sake only they were brought ouer in *Plinies* time. I found, this fruit being chewed made the breath to smell well: and it is credible, that it would be good for many other purposes, if triall were made.

CHAP. 19. Of Guaiacum, or Indian Pock-wood.

Guaiac arboris ramulus.

A branch of the Guaiacum tree.

¶ The Description.

Guaiacum, which some call *Lignum Sanctum*: others, *Lignum vite*, is a well known wood, though of a tree unknown, or at least not certainly knowne; for this figure which I here giue you out of *Clusius*, was gotten, and the historie framed as you shall heare by his own words, taken out of his *Scholiavpon* the 21 Chapter of *Monardus*. About the beginning (saith he) of the yeare 1601. I receiued from *Peter Garret* a branch of a foot long, which he writ was giuen him by a certaine Surgeon lately returned from America, for a branch of the tree Guaiacum: which if it be a branch of the true *Guaiacum*, then hath *Nicolas Monardus* sleightly enough set downe the historie of this tree. I thus described this branch which was sent me.

This branch was a foot long, very writhen, and distinguished with many knots, scarce at the lower end equalling the thicknesse of a writing pen or goose quill, hauing an hard and yellowish wood, and a wrinkled barke of an ash colour: at the vpper end it was diuided into slender branches, whereof some yet retained their leaues, and other some the floures and the rudiment of the fruit: the leaues, or more truly the wings or foot-stalkes of the leaues grew vpon slender branches one against another, each winged leafe hauing foure or sixe little leaues, alwaies growing by couples one against other, as in the Masticke tree; and these were thickish, round, and distinguished with many veines, which by reason of their driness (as I obserued) would easily fall off, leauing the footstalks naked, and onely retaining the markes whereas the leaues had beene. In the knots of the vpper branches there grew as it were swellings, out of which together grew six, eight, ten, or more slender foot-stalkes, some inch long, each carrying a floure not great, consisting of six little leaues (but whether white, yellow, or blew, I could not by reason of the driness iudge:) out of the middle of the floure grew many little threds, and in some the rudiment of the fruit began to appeare, hauing two cels, almost shaped like the seed-vessell of the common Shepheards purse.

Thus much *Clusius*, who afterwards receiued the fruit from two or three, but the most perfect from the learned Apothecarie *Iohn Pona* of Verona: they are commonly parted into two parts or cels, yet he obserued one with three: he found longish stones in them almost like those of *Euonymus*, and they consisted of a very hard and hairy substance like to that of the Date stones, containing a smooth kernel of a yellowish colour.

Now will I giue you the descriptions of *Monardus*: then, what I haue obserued my selfe of this wood, which I must confesse is very little, yet which may giue some light to the ignorant. Of this wood (saith *Monardus*) many haue written many waies, saying that it is either Ebonie, or a kinde of Box, or calling it by some other names. But as it is a new kinde of tree, not found in these regions, or any other of the whole world described by the Antients, but only those of late discovered; so this shall be a new tree to vs: howeuer it be, it is a large tree of the bigues of the *Ilex*, full of branches, hauing a great matrix or blackish pith, the substance of the wood being harder than Ebonie: the barke is thicke, gummie or fat, and when the wood is dry falleth easily off: the leaues are smal and hard: the floure yellow: the which is followed by a round sollid fruit, containing in it seeds like those of the Medlar.

It growes plentifully in the Isles of *Sancto Domingo*.

Another

Another kinde of this was afterwards found in the Island of S. Iohn de Puerto rico, neere to the former: it is also like the last described, but altogether lesse, and almost without matrix or pith, smelling stronger, and being bitterer than the former; which being left, this is now in vse, and of the wondrous effects it is called *Lignum sanctum*; neither without desert, being (experience giuing testimonie) it excells the other: yet both their faculties are admirable in curing the French disease, and therefore the water or decoction of both of them are drunke, either mixed together, or severally, both for the cure of the forementioned disease, as also against diuers other affects. Thus much for *Monardus* his description.

The wood which is now in vse with vs is of a large tree, whose wood is very heavy, solid, and fit to turne into bowles or the like, and all that I haue yet seene hath been wholly without matrix or pith, and commonly it is of a darke brownish colour, somewhat inclining to yellow, hauing a ring of white ingirting it next to the barke; I haue obserued a tree whose diametre hath been two foot and a quarter, to haue had as little or lesse of this white wood as one whose diameter was thirteene inches; and this which was thirteene inches had only a white circle about it of one inch in bredth: I thinke the yonger the tree is, the bigger the white circle is: the best wood is dense, heavy, brownish, leauing a quicke and biting taste in the decoction, as also his smell and colour. The barke of this wood is also dense and heavy, of a hard substance and yellowish colour within, but rough and greenish, or else grayish without, and of somewhat a bitterish taste. Thus much for the description of the wood and his barke. Now let me say somewhat briefly of the temperature and qualities.

The Temperature and Vertues.

- A It is iudged to be hot and dry in the second degree: it hath a drying, attenuating, dissoluing, and clensing facultie, as also to moue sweat, and resist contagion and putrefaction.
- B The decoction of the barke or wood of Guajacum, made either alone or with other ingredients, as shall be thought most fit for the temper and age of the Patient, is of singular vse in the cure of the French Poxes, and it is the most antient and powerfull antidote that is yet known against that disease. I forbear to specifie any particular medicine made thereof, because they are wel enough knowne to all to whom this knowledge belongs, and they are abundantly set downe by all those that haue treated of that disease.
- C It also conduceth to the cure of the dropisie, Asthma, Epilepsie, the diseases of the bladder and reines, paines of the ioints, flatulences, crudities, and lastly all chronicall diseases proceeding from cold and moist causes: for it oftentimes workes singular effects whereas other medicines little preuaile.
- D It doth also open the obstructions of the liuer and spleene, warms and comforts the stomacke and all the intrals, and helps to free them of any grosse viscous matter which may be apt to breed diseases in them.

CHAP. 20.

Of the Guayana, or Orange-Bay.

¶ *The Description.*

Simon de Tour sent *Clusius* a branch of the tree which the Spaniards call *Guayanas*, from which he drew this figure, and thus describes it. This branch (saith *Clusius*) whose vpper part together with the fruit I caused to be drawne, was some foot long, foure square, alternately set with leaues growing by couples, being foure inches long, and one and a halfe or two broad, of the forme of Bay leaues, very firme, hauing a swelling rib running alongst the lower side, with veins running obliquely from thence to the sides, of an ash or grayish colour beneath, but smooth aboue, with the veines lesse appearing; which broken, though old, yet retained the smell of Bay leaues, and also after some sort the taste: the fruit was smooth, yet shrieled, because peraduenture it was vnripe, of the bignesse of a small apple, longish, blackish on the out side like a ripe plum, but within full of a reddish pulpe, of an acide taste; and in the middle were many whitish seeds of the bignesse of Millet, or those that are in Figs.

Nicolas Monardus (as he is turned into Latine by *Clusius*) thus giues vs the historie of *Guayanas*, in his sixty fourth Chapter. It is a tree, saith he, of an indifferent bignesse, and hath spreading branches, the leafe of the Bay, and a white floure, like that of the Orange, yet somewhat bigger, and

Guayava arboris ramus.

The Orange-Bay.

and well smelling, it easily growes, wherefoever it be sowne, and so spreads and creeps that it is accounted as a weed, for it spoiles the grasse of many pastures, with the too much spreading as brambles do; the fruit is like to our apples, of the bignesse of those the Spaniards call *Camuesas*, green at the first, and of a golden colour when they be ripe, with their inner pulpe white, and sometimes red; diuided: it hath foure cells, wherein lie the seeds, like those of the Medlers, very hard, of a brownish colour, wholly stony, without kernell and taste.

The fruit is vsually eaten, the rinde being first taken off; it is pleasing to the palate, wholesome and easie of concoction; being greene it is good in fluxes of the belly, for it powerfully bindes; and ouer, or thoroughly ripe it looseth the belly; but betweene both, that it is neither too greene, nor ouer-ripe, if roasted, it is good both for sound and sicke; for so handled it is wholesomer, and of a more pleasing taste; that also is the better which is gathered from domesticke and husbanded trees. The Indians profitably bathe their swolne legges in the decoction of the leaues; and by the same they free the spleene from obstruction. The fruit seemes to be cold, wherefore they giue it roasted to such as are in feuers. It growes commonly in all the VVest Indies. Thus much *Monardus*.

CHA. 21. Of the Corall tree.

¶ The Description.

THE same last mentioned *Simon de Touar* a learned and prime Physition of Ciuill sent *Clusius* three or foure branches of this tree, from whence he framed this history and figure. He writ (saith *Clus.*) that this tree grew in his garden, sprung vp of seeds sent from America, which had the name of Corall imposed on them, by reason the floures were like Corall, but he did not set downe there shape; writing onely this in his letter: That he had two little shrubs, which had borne floures, and that the greater of them bore also cods full of large beanes, but in the extreme Winter, which they had the yeere before, he lost not onely that tree, and others sprung vp of Indian seed, but also many other plants. Now seeing that this tree carries coddies, I coniecture the floures were in forme not vnlike to those of Pease, or of the tree called *Arbor Indæ*, but of another colour, to wit, red like Corall, especially seeing that in the catalogue of his garden which hee sent me the yeere before, he had writ thus [*Arbor Indica dicta Coral, ob eius florem similem Corallo, &c.* that is, An Indian tree called Corall, by reason of the floure like to Corall, whose leaues are very like those of the *Arbor Indæ*, but this hath thornes, which that wants.] And verily the branches which he sent (for he writ he sent the branches with the leaues, but the tree brought out some twice or thrice as bigge) had leaues not much vnlike those of *Arbor Indæ*, but fastened to a shorter footstake and growing one against another, with a single one at the end of the branch, which was here and there set with sharpe and crooked prickles; but whether these branches are onely the stalkes of the leaues, or perfect branches, I doubt, because all that hee sent had three leaues apiece; I could easily perswade my selfe, that they were onely leaues, seeing the vpper part ended in one leafe; and the lower end of one among the rest, yet shewed the place where it seemed it grew to the bough. But I affirme nothing, seeing there was none whereof I could inquire, by

Vuuuuu

reason

Coral arboris ramus.

A branch of the Corall tree.

in the midst of the floure vnder the vpper leafe that was folded, but open at the top; there came forth a smooth pointall, diuided at the top into nine parts or threds, whose ends of what colour they were, as also the threds, I know not; because I could not gather by the dry floure, whose colour was quite decayed, and the picture it self expressed no separation of the leaues in the floure, no forme of threds, but onely the floures shut, and resembling rather cods than floure, sand those of a deepe red colour. But if I could haue seen them fresher, I should haue been able to haue giuen a more exact description: wherefore let the reader take in good parr that which I haue here performed. Thus much *Clusius*.

CHAP. 22. Of the sea Lentill.

¶ The Description.

SOME call this *Vna marina*, and others haue thought it the *Lenticula marina* of *Serapio*, but they are deceiued, for his *Lenticula marina* described in his 245. chapter, is nothing else than the *Muscus marinus* or *Bryon thalassion*, described by *Dioscorides*, lib. 4. cap. 99. as any that compares these two places together may plainly see.

1 The former of these hath many winding stalkes, whereon grow short branches set thick with narrow leaues like those of *Beluidere*, or *Besome* flax, and among these grow many skinny, hollow, empty round berries of the bignesse and shape of *Lentills*, whence it takes the name: this growes in diuers places of the *Mediterranian* and *Adriaticke* seas.

2 This differs little from the former, but that the leaues are broader, shorter, and snipt about the edges. But this being in probabilitie the *Sargazo* of *Acosta*, you shall here what he saies thereof. In that famous and no lesse to be feared nauigation del *Sergazo* (for so they which saile into the *Indies* call all that space of the Ocean from the 18. to the 34. degree of *Northerly* latitude) is seen a deepe and spacious sea couered with an herbe called *Sargazo*, being a span long, wrapped with the tender branches as it were into balls, hauing narrow and tender leaues some halfe inch long, much

reason of his death who sent them me, which hapned shortly after; yet I haue made the forme of the leaues with the manner as I coniectured they grow, to be delineated in the figure which I here giue you. Whether *Matthiolum* in his last edition of his *Commentaries* vpon *Dioscorides* would haue exprest this, by the Icon of his first *Acacia*, which is prickly, and hath leaues resembling those of *Arter Indae*, I know not; but if he would haue exprest this tree, the painter did not well play his part.

After that *Clusius* had set forth thus much of this tree in his *Hist. rariorum plant.* the learned Dr. *Castaneda* a *Physition* also of *Ciwill* certified me, saith he, that the floures of this tree grow thicke together at the tops of the branches, ten, twelue, or more hanging vpon short foot-stalkes, growing out of the same place: whose figure he also sent, but so rudely drawne, that I could not thereby haue come to any knowledge of the floures, but that he therewith sent me two dried floures, by which I partly gathered their form. Now these flours were very narrow, 2. inches long or more, consisting of three leaues, the vppermost of which much exceeded the 2. narrow ones on the sides both in length and breadth, and it was doubled; but before the floure was opened it better resembled a horne or cod, than a floure, and the lower end of it stood in a short green cup,

1 *Lenticula marina angustifolia.*
Narrow leaved Sea Lentill.

2 *Lenticula marina serratis folijs.*
Cut leaved Sea Lentill.

much snipt about the edges, of colour reddish, of taste insipide, or without any sensible biting, but what is rather drawne from the salt water, than naturally inherent in the plant. At the setting on of each leafe growes a seed round like a pepper corne, of a whitish colour, and sometimes of white and red mixed, very tender when as it is first drawne forth of the water, but hard when it is dried, but by reason of the thinnesse very fragile, and full of salt water: there is no root to be obserued in this plant, but only the marks of the breaking off appeares; and it is likely it growes in the deepe and sandy bottome of the sea, and hath small roots; yet some are of opinion that this herb is plucked vp and carried away by the rapide course of waters that fall out of many Islands into the Ocean. Now the Master of the ship wherein I was did stiffely maintaine this opinion; and in the sailing here we were becalmed; but as far as euer wee could see wee saw the sea wholly couered with this plant, and sending down some yong Sailers which should driue the weeds from the ship, and clense the water, we plainly saw round heapes thereof rise vp from the bottom of the sea where by sounding we could finde no bottome.

This plant pickled with salt and vineger hath the same tast as Sampier, and may be vsed in stead thereof, and also eaten by such as saile, in place of Capers. I willed it should be giuen newly taken forth of the sea, to Goats which we carried in the ship, and they fed vpon it greedily.

I found no faculties thereof; but one of the Sailers troubled with a difficultie of making water, casting out sand and grosse humors, ate thereof by chance both raw and boiled, onely for that the taste thereof pleased him: after a few dayes hee told to me that he found great good by the eating thereof, and he tooke some of it with him, that so he might vse it when he came ashore. Hitherto

A Costa.

Vuuuuu 2

CHAP.

CHAP. 23. Of the Sea Feather.

Myriophyllum marinum.
The Sea Feather.

¶ The Description.

THIS elegant plant, which *Clusius* received from *Cortusus* by the name of *Myriophyllum Pelagicum*, is thus described by him: As much (saith hee) as I could coniecture by the picture, this was some cubit high, hauing a straight stalke, sufficiently slender, diuided into many branches, or rather branched leaues, almost like those of *Ferne*, but far finer, bending their tops like the branches of the *Palme*, of a yellowish colour: the top of the stalk adorned with lesser leaues, ended in certaine scales or cloues framed into a head; which are found to containe no other seed than tender plants already formed, in shape like to the old one: which falling, sinke to the bottome of the sea, and there take root and grow, and so become of the same magnitude as the old one from whence they came. The stalke is fastned with most slender and more than capillarie fibres, in stead of a root, not vpon rocks and Oyster shells, as most other sea plants are, but vpon sand or mud in the bottome of the sea: this stalke when it is drie is no lesse brittle than glasse or *Coralline*, but greene and yet growing it is as tough and flexible as *Spartum* or *Matweed*.

¶ The Place.

It groweth in the deepest streames of the *Illyrian* sea, whence the Fishermen draw it forth with hooks and other instruments which they call *Sperne*. The whole plant, though dried, retains the faculties.

¶ The Names.

The Italian Fishermen call it *Penachio delle Ninfe*, and *Palma de Nettuno*: some also, *Scettro di Nettuno*.

¶ The Vertues.

- A They say it is good against the virulent bites of the Sea serpents, and the venomous stings or prickles of Fishes.
- B Applied to small greene wounds it cures them in the space of 24 houres.
- C *Cortusus* writ, that he had made triall thereof for the killing and voiding of wormes, and that he found it to be of no lesse efficacie than any *Coralline*, and that giuen in lesse quantitie.

CHAP. 24. Of the Sea Fan.

¶ The Description.

THIS elegant shrub groweth vpon the rockes of the sea (where it is sometimes couered with the water) in diuers places; for it hath been brought both from the East and West Indies, and as I haue been informed it is to be found in great plenty vpon the rocks at the *Burmuda Isles*. *Clusius* calls

Frutex marinus reticulatus.

Sea Fan.

calls it *Frutex Marinus elegantissimus*, and thinkes it may be referred to the *Palma Marina* of Theophrastus. Bauhine hath referred it to the *Corallina's*, calling it *Corallina cortice reticulato maculoso purpurascete*. It growes vp sometimes to the height of three foot, hauing a stalke some handfull or two high before it part into branches: then is it diuided into three, foure, or more branches, which are subdiuided into infinite other lesser strings, which are finely interwouen and ioyned together as if they were netted, yet leauing sometimes bigger, otherwhiles lesser holes: and these twiggy branches become smaller and smaller, the farther they are from the root, and end as it were in small threads: these branches grow not vp on euerie side, as in other plants, but flat one besides another, so that the whole plant resembles a fan, or a cabbage leafe eaten full of holes, yet sometimes vpon the sides come forth other such fanne-like branches, some bigger, some lesse, sometimes one or two, otherwhiles more. The inner substance of this Sea-Fan is a blackish tough, and hard wood, and it is all couered ouer with a rough Coral-like stony matter, of a reddish or purplish colour, and this you may with your naile or a knife scrape off from the smooth and blacke wood.

I know no vse of this, but it is kept for the beauty and raritie thereof, by many louers of such curiosities, amongst which for the rarenesse of the structure this may hold a prime place.

CHAP. 25.

Of China, and Bastard China.

¶ The Description.

THIS root which is brought from the remotest parts of the world, and is in frequent vse with vs, hath not been knowne in Europe little aboue fourescore and ten yeares: for *Garcias ab Orta* the Portugall Physition writes, That he came to the first knowledge thereof in the East Indies, in the yeare 1535, and that by this meanes, as he relates it: It hapned (saith he) that about that time a merchant in the Isle *Diu* told the noble gentleman *S^r. Mart. Alfonso de Sousa* my Patron, by what meanes he was cured of the French Poxes, which was by a certaine root brought from China; whose faculties he much extolled, because such as vsed it needed not obserue so strict a diet as was requisit in the vse of *Guajacum*, but should onely abstaine from Beefe, Porke, Fish, and crude fruits; but in China they do not abstaine from fish, for they are there great gluttons. When the report of this root was divulged abroad, euery man wonderfully desired to see and vse it, because they did not well like of the strict dyet they were forced to obserue in the vse of *Guajacum*. Besides, the inhabitants of these countries, by reason of their idle life are much giuen to gluttony. About this time the China ships arriue at Malaca, bringing a small quantitie of this root for their owne vse. But this little was sought for with such earnestnesse, that they gaue an excessiue rate for it; but afterwards the Chinois bringing a greater quantitie, the price fell, and it was sold verie cheape. From this time *Guajacum* began to be out of vse, and banished the Indies, as a Spaniard that would famish the Natiues. Thus much *Garcias* concerning the first vse thereof in the East Indies.

1 The China now in vse is a root of the largeness of that of the ordinarie Flag, or *Iris palustris*, and not much in shape vnlike thereto, but that it wants the rings or circles that are imprinted in the other: the outer coat or skin of this root is thin, sometimes smooth, otherwhile rugged, of a brownish red colour, and not to be separated from the substance of the root, which is of an indifferent firmness, being not so hard as wood, but more solid than most roots which are not of shrubs or trees: the colour is sometimes white, with some very small mixture of redness; otherwhiles it hath a greater mixture of red, and some are more red than white: it is almost without taste, yet that it hath is dry, without any bitterness or acrimony at all. The best is that which is indifferently ponderous, new, firme, not worme-eaten, nor rotten, and which hath a good and fresh colour, and that either white, or much inclining thereto. The plant whose root this is (if we may beleue *Christopher A Costa*) hath many small prickly and flexible branches, not vnlike the *Smilax aspera*, or the prickly Binde-weed: the biggest of these exceedeth not the thicknesse of ones little finger. The leaues are of the bignesse of those of the broad leaued Plantaine: the roots are as large as ones hand, sometimes lesse, solid, heauy, white, and also sometimes red, and many oft times growing together.

1 *China vulgaris Officinarum.*
True China.

2 *Pseudo-China.*
Bastard China.

It groweth abundantly in the territorie of China, and is also found in Malabar, Cochin, Cranganor, Coulan, Tanor, and other places.

The Chinois call it *Lampatan*: in Decan they call it *Lampatos*: in Canarin, *Bouti*: the Arabians, Persians, and Turks terme it *Choph-China*.

2 This other root, whose figure you see here exprest, was sent from London to *Clusius* in the yeare 1591, by *James Garret*, being brought out of *Wingandecaow*, or Virginia, with this inscription, *China species*, A kinde of China. *Clusius* caused this figure thereof to be drawne, and thus describeth it. This root (saith hee) was very knotty, and formed with out-growings, or bunches standing out, of a reddish colour, and it yet retained at the top some part of the stalke, being somewhat like vnto that of *Smilax aspera*, or common rough Binde-weed, hard, woody, and full of veines, as the stalks of *Smilax aspera*: the substance of the root was also reddish, as the root of the common Flagge, at the first of a saltish taste, it being old, (for so it was when I receiued it)

and

and then drying. Now I iudge this the same that the writer of the Virginian Historie mentions in his chapter of roots, and saith, it was brought into England for China, though the Natiues knew no vse thereof: but they vse another root very like China, which they call *Tsinaw*, of which beeing cut, beaten, and pressed out with water, they draw a iuice wherewith they make their bread. Thus much *Clusius*, to whose words I thinke it not amisse to adde that which *M^r. Thomas Hariot* (who was the writer of the Virginian historie, here mentioned by *Clusius*) hath set downe concerning this thing.

Tsinaw (saith he) is a kinde of root much like vnto that which in England is called the China root, brought from the East Indies. And we know not any thing to the contrarie but that it may be of the same kinde. These roots grow many together in great clusters, and doe bring forth a Brier stalk, but the leafe in shape is far vnlike: which being supported by the trees it groweth neereft vnto, wil reach or clime to the top of the highest. From these roots whilest they be new or fresh, being chopt into small pieces and stamp't, is strained with water a iuice that maketh bread, and also beeing boiled, a very good spoonemeat in manner of a gelly, and is much better in taste, if it be tempered with oyle. This *Tsinaw* is not of that sort which by some was caused to be brought into England for the China root, for it was discovered since, and is in vse as is aforesaid; but that which was brought hither is not yet knowne, neither by vs, nor by the inhabitants, to serue for any vse or purpose, although the roots in shape are very like. Thus much *Hariot*.

¶ The Temperature and Vertues.

China is thought to be moderately hot and drie: the decoction thereof made alone or with other things, as the disease and Symptomes shal require, is much commended by *Garcias*, for to cure the French pox, but chiefly that disease which is of some standing: yet by most it is iudged lesse powerfull than *Gnajakum*, or *Sarsaparilla*. A

It attenuates, moues sweat, and dries, and therefore resists putrifaction: it strengthens the liuer, helps the dropsie, cures maligne vlcers, scabbes, and leproy. It is also commended in Consumptions. B

The decoction of this root, saith *Garcias*, besides the diseases which haue communitie with the Poxe, conduces to the cure of the Palsie, Gout, Sciatica, schirrous and cedematous tumours. It also helps the Kings-euill. It cureth the weakenesse of the stomacke, the inueterate head-ache, the stone and vlceration of the bladder, for many by the vse of the decoction hereof haue beene cured, which formerly receiued help by no medicine. C

CHAP. 26. Of *Costus*.

¶ The Description.

THIS simple medicine was briefly described by *Dioscorides*, who mentions three kinds thereof, but what part of a plant, whether root, wood, or fruit, he hath not exprest: but one may probably coniecture it is a root, for that he writes toward the end of the Chapter where he treats thereof, lib. 1. cap. 15. that it is adulterated by mixing therewith the roots of *Helenium commagenum*; now a root cannot well be adulterated but with another. Also *Pliny*, lib. 12. cap. 12. calls it a root; but neither any of the antient or moderne Writers haue delineated the plant, whose root should be this *Costus*. *Dioscorides* makes three sorts, as I haue said: the Arabian being the best; which was white, light, strong, and well smelling: the Indian, which was large, light, and blacke: the Syrian, which was heauie, of the colour of Box, and strong smelling. Now *Pliny* makes two kinds, the blacke, and the white, which he saith is the better, so I iudge his blacke to be the Indian of *Dioscorides*, and his white, the Arabian. Much agreeable to these (but whether the same or no, I do not determine) are the two roots whose figures I here present to your view, and they are called by the names of *Costus dulcis* (I thinke they should haue said *odoratus*) and *Costus amarus*.

The first of these, which rather from the smell, than taste, is called sweet, is a pretty large root, light, white, and well smelling, hauing the smell of Orris, or a violet, but somewhat more quick and piercing, especially if the root be fresh, and not too old: it is oft times diuided at the top into two, three, or more parts, from whence seuerall stalks haue growne, and you shall sometimes obserue vpon some of them pieces of these stalks some two or three inches long, of the thicknesse of ones little

little finger, crested, and filled with a soft pith, like as the stalks of Elder, or more like those of the Bur-dock: the taste of the root is bitter, with some acrimonie, which also *Dioscorides* requires in his, for he saith, the taste should be biting and hot; thus much for the first, being *Costus dulcis* of the shoppes.

1 *Costus Indicus sive odoratus.*
Indian or sweet smelling Costus.

2 *Costus Officinarum Lobelij.*
Bitter Costus.

2 The second, which is the *Costus amarus*, and it may be the Indian of *Dioscorides*, and *Niger* of *Pliny*, is a root blacke both within and without, light, yet very dense. It seemes to be of some large root, for that it is brought over cut into large pieces, of the bignesse of ones finger, sometimes bigger sometimes lesse, which it seemes is for the more conuenient drying thereof, for a large root, vnlesse it be cut into pieces can scarcely be wel dried: the taste of this is bitter, somewhat clammy and ingrate: the smell is little or none.

There are some other roots which haue been set forth by late writers for *Costus*, but because they are neither in vse, knowne here with vs, nor more agreeable to the descriptions of the Antients, I hastening to an end, am willing to passe them over in silence.

¶ The Temperature and Vertues out of the Antients.

A It hath a heating and attenuating facultie, and therefore was vsed in oile to annoint the bodie against the cold fits of Agues, the Sciatica, and when it was needfull to draw any thing to the superficies of the body.

B It is also conuenient to moue vrine, to procure the termes, to help strains, convulsions, or cramps and paines in the sides; and by reason of the bitterneffe it kills wormes.

C It is good to be drunke against the bite of the viper: against paines of the chest, and windineffe of the stomacke taken in Wine with Worme-wood: and it is vsed to be put into sundrie Antidotes.

CHAP. 27. Of Drakes root, or Contra-yerua.

¶ The Description.

That root which of late is knowne in some shops by the Spanish name *Contra-yerua*, is the same which *Clusius* hath set forth by the title of *Drakena radix*: wherefore I will giue you the historie of *Clusius*, and thereto adde that which *Monardus* writes of the *Contra-yerua*. For though *Bauhine*, and the Author of the *Historia Lugdunensis* seeme to make these different, yet I finde that both *Clusius* his figure and historie exactly agree with the roots sent vs from Spaine by that title, wherefore I shall make them one, till some shall shew me how they differ: and *Clusius* seemes to be of this minde also, who desired but the degree of heate which *Monardus* giues these, and that is but the second degree: now these haue no taste at the first, vntill you haue chewed them a pretty while, and then you shall finde a manifest heate and acrimonie in them, which *Clusius* did also obserue in his.

In the yeare (saith *Clusius*) 1581. the generous Knight Sir *Francis Drake* gaue me at London certain roots, with three or foure Peruvian Beazor stones, which in the Autumne before (hauing finished his voyage, wherein passing the Straights of Magellan, he had encompassed the World) he had brought with him, affirming them to be of high esteeme amongst the Peruvians: now for his sake that bestowed these roots vpon me, I haue giuen them the title *Drakena radix*, or *Drakes root*, and haue made them to be expressed in a table, as you may here see them.

1 *Drakena radix.*

Contra-yerua.

2 *Radix Drakenae affinis.*Another sort of *Contra-yerua*.

These roots were for the most part some halfe inch thick, longish, now and then bunching out into knots and vnequall heads, and their tops looked as if they were composed of thicke scales, almost like those of the *Dentaria enneaphyllos*; blackish without, wrinckled, and hard, because dried: their inner part was white; they had slender fibres here and there growing out of them, and some more thicke and large, hard also and tough, at which hung other knots: I obserued no manifest smell they had, but found them to haue a taste somewhat astringent, & drying the tongue at the first; but being long chewed, they left a quicke and pleasing acrimonie in the mouth.

It seemed to haue great affinitie with the *Radix S. Helene*, whereof *Nic. Monardus* speakes in his booke of the Simple Medicines brought from the West Indies: but seeing *N. Eliot* (who accompa-

nied

nied S^r. *Fran. Drake* in that voyage, said, that the Spaniards in Peru had them in great request; and they could not easily be got of them, and that he had learned by them, that the leaues were present poison, but the root an antidote, and that not only against the same poison, but also against other; and that it strengthened the heart and vitall faculties, if it were beaten to powder, and taken in the morning in a little wine; and given in water, it mitigated the heat of Feuers. By reason of these faculties it should much agree with the *Radix Contra-yerua*, whereof *Monardus* writes in the same booke: yet in these I required the aromaticke taste and degree of heate, which he attributes vnto these roots. Thus much *Clus.*

A From Charcis a Prouince of Peru, saith *Monard.* are brought certaine roots very like the roots of *Iris*, but lesse, and hauing the smell of Fig leaues. The Spaniards that liue in the Indies call them *Contra-yerua*, as if you should say an Antidote against poison, because the powder of them taken in white Wine is a most present remedy against all poison of what kinde soeuer it be (only sublimare excepted, whose malignitie is onely extinguished by the drinking of milke) it causes them to bee cast vp by vomite, or euacuated by sweat. They also say that Philtres or amorous potions are cast forth by drinking this powder. It also killeth wormes in the belly. The root chewed hath a certain aromaticke taste ioined with acrimony; wherefore it seemes hot in the second degree. Thus farre *Monardus.*

2 *Clusius Exot. l. 4. c. 11.* being the next after *Drakenaradix*, describes this root, whose figure I giue you in the 2. place, & that by the same title as it is here set forth. These roots, saith he, seemed somewhat like the *Drakenaradix* which were found in the great ship which brought backe the Viceroy from the East Indies, and was taken by the English: for they were tuberous, and as much as one may gather by their forme, crept vpon the surface of the earth, hauing vpon them many haire and fibres, and being of a sooty colour, yet somewhat inclining to yellow, dying the spittle in chewing them, and being bitter: they as yet retained foot-stalks of the leaues, but of what fashion they were no man can easily guesse. But it was likely they were of great vse among the Indians, seeing that the Vice-roy brought them together with other precious medicines growing in the East Indies; *James Garret* sent this to *Clusius* with the little plant dried, whose figure you see exprest by it.

CHAP. 28. Of Lignum Aloes.

Lignum Aloes vulgare.

¶ The Description.

IT is a question whether the *Agallochum* described in the 21. c. l. 1 of *Dioscorides* be the same which the later Greeks and shops at this time call *Xyloaloe*, or *Lignum Aloes*, many make them the same: others, to whose opinion I adhere, make them different, yet haue, not the later, shew what *Agallochum* should bee, which I notwithstanding will do; and though I doe not now giue you my arguments, yet I will point at the things, & shew positiuely my opinions of them.

The first and best of these is that which some call *Calumbart*: others, *Calumba*, or *Calambec*: this is of high esteem in the Indies, & seldom found but amongst the Princes, and persons of great qualitie; for it is sold oft times for the weight in gold; I haue not seen any therof but in beads; it seemes to be a whiter wood than the ordinary, of a finer graine, not so subiect to rot, and of a more fragrant smell, and but light.

The second sort, which is vsually brought ouer, and called in shops by the name of *Lignum Aloes*, is also a precious and odoriferous wood, especially burnt: the stickes of this are commonly knotty & vnfightly: some parts of them being white, soft, and doted: other some, dense, blackish,

blackish, or rather intermixt with blacke and white veines, but much more blacke than white, and this put to the fire will sweat out an oily moisture, and burnt, yeeld a most fragrant odour. This I take to be the true *Xyloaloe* of the late Greekes; and the *Agalugen* of *Auicen*, and that they call *Palo d'Agula* in the Indies.

The third is a wood of much lesse price than the former: and I coniecture it might well be substituted for *Thus*: and this I take to be the *Agallochum* of *Dioscorides*; the *Lignum Aloes sylvestre* of *Garcias*; and *Agula brava* of *Linscoten*. It is a firme and sollid wood, somewhat like that of the Cedar, not subiect to rot or decay: the colour thereof is blackish, especially on the out-side; but on the in-side it is oft times brownish and speckled, containing also in it an oilie substance, and yeelding a sweet and pleasing smell when it is burnt, but not like that of the two former: the taste also of this is bitterer than that of the former: and the wood (though dense and sollid) may be easily cleft long-waies; it is also a farre handsomer and more sightly wood than the former, hauing nor many knots in it.

Garcias ab Orta thus describes the tree that is the *Lignum Aloes* (I iudge it's that I haue set forth in the second place:) it is (saith he) like an Oliue tree, sometimes larger: the fruit or floure I could not yet see, by reason of the difficulties and dangers which are to be vndergone in the accurate obseruation of this tree (Tigers frequently there seeking their prey.) I had the branches with the leaues brought me from Malaca. Now they say that the wood new cut downe hath no fragrant odour, nor till it be dried: neither the smell to be diffused ouer the whole matter of the wood, but in the heart of the tree; for the barke is thicke, and the matter of the wood without smell. Yet may I not denie, but the barke and wood putrifying that oilie and fat moisture, may betake it selfe to the heart of the tree, and make it the more odoriferous: but there is no need of putrification to get a smell to the *Lignum Aloes*: for there are sundry so expert and skilfull in the knowledge thereof, that they will iudge of that which is new cut downe, whither it will be odoriferous or no. For in all sorts of wood some are better than othersome: thus much out of *Garcias*; where such as are desirous may see more vpon this subiect.

¶ The Temperature and Vertues.

It is of temperature moderate ly hot and dry, and also of somewhat subtile parts. Chewed it makes the breath smell sweet, and burnt it is a rich perfume. A

Taken inwardly it is good to helpe the stomack that is too cold and moist, as also the weak liuer. B

It is commended likewise in dysenteries and pleurifies: and put also into diuers Cordiall medicines and Antidotes as a prime ingredient. C

CHAP. 29. Of Gedwar.

1 Gedwar aut, Geiduar.

2 Zedoaria exactior icon. A better figure of Zedoary.

¶ The Description.

IN the Chapter of Zedoarie (which I made the 28. of the first booke) I might fitly haue given you this historie of Gedwar, which is thought to be that described by *Anicen*, lib. 2. c. 734. and a kinde of Zedoarie: *Garcias* saith, Gedwar is at a high rate, and not easily to be found, vnlesse with the Indian Mountibanks and juglers, which they call *Iogues*, which goe vp and downe the countrey like Rogues, and of these the Kings and Noblemen buy *Geiduar*: it is good for many things, but chiefly against poisons, and the bites and stings of venomous creatures. Now *Clusius* in his *Auctarium* at the end thereof giues this figure, with the following historie.

1. Because *Garcias*, saith he, cap. 42. l. 1. *Aromaticum hist.* treating of Zedoarie writes, that *Anicen* calls it Gedwar; and saith that it is of the magnitude of an Acorne, and almost of the same shape, I in my notes at the end of that chapter affirmed that it was not knowne in Europe, and hard to be knowne. But in the yeare 1605, *John Pona* sent me from Verona together with other things two roots written on by the name of *Gedwar verum*. They were not much vnlike a longish Acorne, or (that I may more truly compare them) the smaller bulbs of an *Asphodil*, or *Anthora*: the one of them was whole and not perished: the other rotten and broken, yet both of them very hard and sollid, of an ash colour without, but yellowish within, which tasted, seemed to possesse a heating facultie and acrimonie.

But although I can affirm nothing of certaintie of this root, yet I made the figure of the wholler of them to be exprest in a table, that so the forme might be conceiued in ones minde more easily, than by a naked description. Let the Studious thanke *Pona* for the knowledge hereof. Thus much *Clusius*.

2. In the 28 chapter of the first booke I gaue the figure of Zodoarie out of *Clusius*, hauing not at that time this figure of *Lobel*, which presents to your view both the long and the round, with the manner how they grow together, being not seuerall roots, but parts of one and the same.

CHAP. 30. Of Rose-wood.

Aspalathus albicans torulo citreo.
White Rose-wood.

Aspalathus rubens.
Reddish Rose-wood.

¶ The Description.

BOth these as also some other woods are referred to the *Aspalathus* described by *Dioscorides*, l. 1. c. 19. But the later of these I take to be the better of the two sorts there mentioned. The first of them is whitish without, having a yellowish or citrine coloured round in the middle: the taste is hottish, and smell somewhat like that of a white-Rose.

The other hath also a small ring of white, next the thicke and rugged barke, and the inner wood is of a reddish colour, very dense, solid and firme, as also indifferent heavy: the smell of this is also like that of a Rose, whence they vulgarly call it *Lignum Rhodium*, Rose-wood, rather than from Rhodes the place where the later of them is said to grow.

¶ The Faculties out of Dioscorides.

It hath a heating facultie with astringtion, whence the decoction thereof made in wine is convenient to wash the vlcers of the mouth, and the eating vlcers of the priuities and such vnclean sores as the *Oxana* (a stinking vlcer in the nose so called.)

Put vp in a pessarie it drawes forth the childe, the decoction thereof stayes the loosenesse of the belly, and drunke it helps the casting vp of blood, the difficultie of making water, and windinesse.

AT the end of this Appendix I haue thought good to giue you diuers descriptions of Plants, which I receiued from my often mentioned friend M^r. *Goodyer*, which also were omitted in their fitting places, partly through haste, and partly for that I receiued some of them after the printing of those chapters wherein of right they should haue been inserted. They are most of them of rare and not written of plants, wherefore more gratefull to the curious.

Hieracium stellatum Boelij.

THis plant is in round, hairy, straked, branched stalks, and long, rough, blunt indented leaues like to *Hieracium falcatum*, but scarce a foot high: the floures are also yellow three times smaller: which past, there succeed long crooked slender sharpe pointed cods or huskes, neere an inch long, spreading abroad, star-fashion, wherein a long seed is contained: this hath no heads or woolly down like any of the rest, but onely the said crooked coddies which doe at the first spread abroad. The root is small, threddie, full of milkie iuice, as is also the whole plant and it perissheth when the seed is ripe.

Hieracium medio nigrum flore maiore Boelij.

This hath at the first spreading vpon the ground many long, narrow, green, smooth leaues bluntly indented about the edges, like those of *Hieracium falcatum*, but smaller: amongst which rise vp three, foure, or more, small, smooth, straked round stalks, diuided into other branches, which grow longer than the stalks themselues leaning or trayling neere the ground: the floures grow on the tops of the stalks, but one together, composed of many pale yellow leaues, the middle of each floure being of a blackish purple colour.

Hieracium medio nigrum flore minore Boelij.

This is altogether like the last before described in stalkes and leaues: the floures are also of a blackish purple in the middle, but they are three times smaller.

Hieracium lanosum

There groweth from one root three, foure or more round vpright soft cottonie stalks, of a reasonable bignesse, two foot high, diuided into many branches, especially neere the top, whereon groweth at each diuision one broad sharpe pointed leafe, diuided into corners, and very much crumpled, and also very soft cottonie and woolly, as is the whole plant: the floures are small, double, of a pale yellow colour, very like those of *Pilosella repens*, growing clustering very many together at the tops of the stalkes and branches, forth of small round soft cottonie heads: these foure plants grew from

XXXXXX

feed

seed which I received from Mr. Coys, 1620. and I made these descriptions by the Plants the 22. of August, 1621.

Blitum spinosum: est *Beta Cretica* semine aculeato Bauhini Matth. pag. 371.

This sendeth forth from one root many round Greene strailing, ioyned, small branches, about a foot long: the leaues are of a light Greene colour, and grow at every ioint one, somewhat like the leaues of great Sorrell, but they are round topped without barbes or eares below, or any manifest taste or smell, very like the leaues of Beets, but much smaller: the floures grow clustering together about the ioints, and at the tops of the branches small and greenish, each floure containing five or six very small blunt topped leaues, and a few dustie chiues in the middle: which past, there cometh great prickly shruelled seed, growing euen close to the root, and vpwards on the ioints, each seed hauing three sharpe prickles at the top growing side-waies, which indeed may be more properly called the huske, which huske in the in-side is of a darke reddish colour, and containeth one seed in forme like the seed of *Flos Adonis*, round at the lower end, and cornered towards the top, and sharp pointed, couered ouer with a darke yellowish skin, which skin pulled away, the kernell appeareth yellow on the outside, and exceeding white within, and will with a light touch fall into very small powder like meale.

Geranij Batia species Boelij.

This hath at the beginning many broad leaues, indented about the edges, somewhat diuided, like those of *Geranium Creticum*, but of a lighter Greene colour, and smaller: amongst which grow vp many round hairy kneed trailing branches, diuided into many other branches, bearing leaues like the former, but smaller, and no more diuided. The floures are smal like those of *Geranium Moschatum*, but of a deeper reddish colour, each floure hauing five small round topped leaues: after followeth small long hairie seed, growing at the lower end of a sharpe pointed beak like that of *Geranium Moschatum*: the whole plant perisheth when the seed is ripe.

Boelius a Low-countrey-man gathered the seeds hereof in Batia a part of Spaine, and imparted them to Mr. William Coys, a man very skilfull in the knowledge of Simples, who hath gotten plants thereof, and of infinite other strange herbes, and friendly gaue me seeds hereof, and of many other, Anno, 1620.

Antirrhinum minus flore Linaria luteum inscriptum.

This hath at the first many very small, round, smooth branches from one root, trayling on the ground, about foure or five inches long, set with many small Greene short sharp pointed leaues, like those of *Serpillum*, but that these are longer, smooth, and three or foure growing opposite one against another: amongst which rise vp five or six, sometimes ten or twelue vpriht round smooth little stalks a cubit high, diuided into branches bearing small long smooth Greene leaues, growing without order, as narrow as the vpper leaues of *Oenanthe Angustifolia*: at the toppes of the stalks and branches grow clustering together five six or more small yellow floures, flouing vpwards, leauing a long spike of very small huskes, each huske hauing a small line or chinke as though two huskes were ioined together, the one side of the huske being a little longer than the other, wherein is contained exceeding small blackish seed. The root is very short, small, and white, with a few threds, and perisheth at winter.

This plant is not written of that I can finde. I received seed thereof from Mr. William Coys often remembred.

Linaria minor aestiua.

The stalkes are round, smooth, of a whitish Greene colour, a foot high, weake, not able to stand vpriht: whereon grow long narrow sharpe pointed leaues, most commonly bending or turning downwards. The floures grow in spikes at the toppes of the branches, yet not very neere together, and are verie small and yellow, with a small tayle: the seed of this plant is small, flat, and of a blackish gray colour, inclosed in small round huskes, and you shall commonly haue at one time floures and ripe seed all on a stalke. The whole plant is like to the common *Linaria*, but that it is a great deale lesser, and the floures are six times as small, and perish at Winter. I also received seeds thereof from Mr. William Coys.

Scorp.

Scorpioides multiflorus Boelij.

This Plant is in creeping branches and leaues like the common *Scorpioides bupleuri folio*: the floures are also alike, but a little bigger, and grow foure or five together on one foot-stalke: the cods are rougher, and very much turned round, or folded one within another: in all things else alike.

Scorpioides filiqua crassa Boelij.

This is also like the other in creeping branches and leaues: the floures are something bigger than any of the rest, and grow not aboue one or two together on a foot-stalk: the cods are crooked, without any rough haire, yet finely checkquered, and seuen times bigger than any of the rest, fully as big as a great Palmer-worme, wherein is the difference: the seed is almost round, yet extending somewhat in length, almost as big as small field Peason, of a browne or yellowish colour. This also perisheth when the seed is ripe.

Sept. 1. 1621.

Silibum minus flore nutante Boelij.

This Thistle is in stalkes and leaues much smaller than our Ladies Thistle, that is to say, The stalkes are round, straked, somewhat woolly, with narrow skinny prickly edges three or foure foot high, diuided into many branches, whereon grow long leaues, deeply diuided, full of white milke-like streakes and sharpe prickles by the edges: the floures grow on the tops of the stalks and branches, forth of small heads, commonly turning downwards, of the bignesse of an Oliue, set with very small slender sharpe pricks, containing nothing but small purple chiues, spreading abroad like those of *Lacea*, with some blewish chiues in the middle: the seed followeth, inclosed in downe, and is small and grayish like the seed of other Thistles, but it is as clammy as Bird-lime. The whole plant perisheth at Winter, and reneweth it selfe by the falling of his seed. I finde not this written of. It was first gathered by *Boelius* in Spaine, and imparted vnto M^r. *William Coys*, who friendly gaue me seeds thereof.

Aracus maior Baticus Boelij.

It hath small weake foure square streaked trailing branches, two foot high, lesser, but like those of *Fetches*; whereon grow many leaues without order, and euery seuerall leafe is composed of six, seuen, or more small sharpe pointed leaues, like those of *Lentils*, set on each side of a middle rib, which middle rib endeth with clasping tendrels: the floures grow forth of the bosomes of the leaues, but one in a place, almost without any foot-stalkes at all, like those of *Vetches*, but of a whitish colour, with purple streakes, and of a deeper colour tending to purple towards the nailes of the vpper couering leaues: after which follow the cods, which are little aboue an inch long, not fully so big as those of the wilde beane, almost round, and very hairy: wherein is contained about 4 peason, seldom round, most commonly somewhat flat, and sometimes cornered, of a blackish colour, neere as big as field peason, and of the taste of *Fetches*: the whole herbe perisheth when the seed is ripe. This plant *Boelius* sent to M^r. *William Coys*, who hath carefully preserued the same kind euer since, and friendly imparted seeds thereof to me in Anno 1620.

Legumen pallidum Vlisiponense, Nonij Brandonij.

This plant is very like, both in stalks, leaues, and cods, to *Aracus maior Baticus*, but the floures of this are of a pale yellow or Primrose colour, and the whole herbe smaller, and nothing so hairy. It perisheth also when the seed is ripe. I receiued the seeds likewise from M^r. *Coys*.

Vicia Indica fructu albo. Pisum Indicum Gerardo.

This Vetch differeth not in any thing at all, either in stalkes, leaues, cods, fashion of the floures, or colour thereof, from our common manured Vetch, but that it groweth higher, and the fruit is bigger and rounder, and of a very cleare white colour, more like to peason than *Vetches*. M^r. *Gerard* was wont to call this Vetch by the name of *Pisum Indicum*, or Indian Pease, gotten by him after the publishing of his Herball, as M^r. *Coys* reported to me. But the said M^r. *Coys* hath in my iudgment more properly named it *Vicia fructu albo*: which name I thought most fit to call it by, onely adding *Indica* to it, from whence it is reported to haue been gotten. Jul. 30. 1621.

Astragalus marinus Lusitanicus Boelij.

This hath five, six, or more round straked reddish hairy stalks or branches, of a reasonable bignesse, proceeding from one root, sometimes creeping or leaning neere the ground, and sometimes standing vpright, a cubit high, with many Greene leaues, set by certaine distances, out of order like those of *Glaux vulgaris*, but lesser, euery leafe being composed of fourteen or more round top-

ped leaues, a little hairy by the edges, set on each side of a long middle rib, which is about nine or ten inches in length, without tendrels: the floures grow forth of the bosomes of the leaues, neere the tops of the stalkes, on long round streaked hairy foot-stalkes, of a very pale yellow colour, like those of *Securidaca minor*, but bigger, growing close together in short spikes, which turne into spikes of the length of two or three inches, containing many small three cornered cods about an inch long, growing close together like those of *Glaux vulgaris*, each cod containing two rowes of small flat foure cornered seeds, three or foure in each row, of a darke yellowish or leadish colour, like to those of *Securidaca minor*, but three or foure times as big, of little taste: the root is small, slender, white, with a few threds, and groweth downe right, and perisheth when the seed is ripe. I first gathered seeds of this plant in the garden of my good friend M^r. *Ioh. Parkinson* an Apothecary of London, Anno 1616.

Faba veterum serratis folijs Boelij.

This is like the other wilde Beane in stalks, floures, cods, fruit, and clasping tendrels, but it differeth from it in that the leaues hereof (especially those that grow neere the tops of the stalks) are notched or indented about the edges like the teeth of a saw. The root also perisheth when the seed is ripe. The seeds of this wilde Beane were gathered by *Boelius* a Low-country man, in *Bætica* a part of Spaine, and by him sent to M^r. *William Coys*, who carefully preferued them, and also imparted seeds thereof to me, in Anno 1620. Jul. 31. 1621.

Pisum maculatum Boelij.

They are like to the small common field Peason in stalks, leaues, and cods; the difference is, the floures are commonly smaller, and of a whitish Greene colour: the Peason are of a darke gray colour, spotted with blacke spots in shew like to blacke Veluet; in taste they are also like, but somewhat harsher. These peason I gathered in the garden of M^r. *Iohn Parkinson*, a skilfull Apothecarie of London; and they were first brought out of Spaine by *Boelius* a low-Country man.

Lathyrus estivus flore luteo. Iuly. 28. 1621:

This is like *Lathyrus latiore folio Lobelij*, in stalks, leaues, and branches, but smaller: the stalks are two or three foot long, made flat with two skins, with two exceeding small leaues growing on the stalks, one opposite against another: between which spring vp flat foot-stalks, an inch long, bearing two exceeding narrow sharpe pointed leaues, three inches long: betweene which grow the tendrels, diuided into many parts at the top, and taking hold therewith: the floures are smal, and grow forth of the bosomes of the leaues, on each foot-stalk one floure, wholly yellow, with purple strakes. After each floure followeth a smooth cod, almost round, two inches long, wherein is contained seven round Peason, somewhat rough, but after a curious manner, of the bignesse and taste of field Peason, and of a darke sand colour.

Lathyrus estivus Beticus flore caruleo Boelij.

This is also like *Lathyrus latiore folio Lobelij*, but smaller, yet greater than that with yellow flours, hauing also adioining to the flat stalks, two eared sharpe pointed leaues, and also two other slender sharpe pointed leaues, about foure inches long, growing on a flat foot-stalke, betweene them, an inch and a halfe long, and one tendrel between them diuided into two or three parts: the floures are large, and grow on long slender foure-square foot-stalkes, from the bosomes of the leaues, on each foot-stalk one: the vpper great couering leafe being of a light blew, & the lower smaller leaues of a deeper blew: which past there come vp short flat cods, with two filmes, edges, or skins on the vpper side, like those of *Ernilia Lobelij*, containing within foure or fve great flat cornered Peason, bigger than field Peason, of a darke sand colour.

Lathyrus estivus edulis Beticus flore albo Boelij.

This is in flat skinny stalks, leaues, foot-stalks, and cods, with two skins on the vpper side, and in all things else like the said *Lathyrus* with blew floures, only the floures of this are milk white: the fruit is also like.

Lathyrus estivus flore miniato.

This is also in skinnie flat stalks and leaues like the said *Lathyrus latiore folio*, but far smaller, not three foot high: it hath also small sharp pointed leaues growing by couples on the stalke, between which grow two leaues, about three inches long, on a flat foot-stalk half an inch long: also between those leaues grow the tendrels: the floures are coloured like red lead, but not so bright, growing on smoorh

smooth short foot-stalks, one on a foot-stalke: after which follow cods very like those of the common field peason, but lesser, an inch and a halfe long, containing foure, fve, or sixe cornered Peason, of a sand colour, or darke obscure yellow, as big as common field peason, and of the same taste.

Lathyrus palustris Lusitanicus Boelij

Hath also flat skinnie stalks like the said *Lathyrus latiore folio*, but the paire of leaues which grow on the stalke are exceeding small as are those of *Lathyrus flore luteo*, and are indeed scarce worthie to be called leaues: the other paire of leaues are about two inches long, aboue halfe an inch broad, and grow from betweene those small leaues, on flat foot-stalks, an inch long: betweene which leaues also grow the tendrels: the floures grow on foot-stalks which are fve inches long, commonly two on a foot-stalke, the great vpper couering leaues being of a bright red colour, and the vnder leaues are somewhat paler: after commeth flat cods, containing seuen or eight small round peason, no bigger than a Pepper corne, gray and blacke, spotted before they are ripe, and when they are fully ripe of a blacke colour, in taste like common Peason: the stalks, leaues, foot-stalkes and coddies are somewhat hairy and rough.

Lathyrus aestiuus dumetorum Baticus Boelij

Hath also flat skinnie stalks like the said *Lathyrus latiore folio*, but smaller, and in the manner of the growing of the leaues altogether contrarie. This hath also two small sharp pointed leaues, adioyning to the stalke: betweene which groweth forth a flat middle rib with tendrels at the top, hauing on each side (not one against another) commonly three blunt topped leaues, sometimes three on the one side, and two on the other, and sometimes but foure in all, about an inch and a halfe long: the floures grow on foot-stalks, about two or three inches long, each foot-stalk usually bearing two floures, the great couering leafe being of a bright red colour; and the two vnder leaues of a blewish purple colour: after which follow smooth cods, aboue two inches long, containing, fve, sixe, or seuen smooth Peason, of a browne Chestnut colour, not round, but somewhat flat, more long than broad, especially those next both the ends of the cod, of the bignesse and taste of common field peason.

Iuniperus sterilis.

This shrub is in the manner of growing altogether like the Iuniper tree that beareth berries, only the vpper part of the leaues of the youngest and tenderest bowes and branches are of a more reddish Greene colour: the floures grow forth of the bosoms of the leaues, of a yellowish colour, which neuer exceed three in one row, the number also of each row of leaues: each floure is like to a small bud, more long than round, neuer growing to the length of a quarter of an inch, being nothing else but very small short crudely chiues, very thicke and close thrust together, fastened to a very small middle stem, in the end turning into small dust, which flieth away with the winde, not much vnlike that of *Taxus sterilis*: on this shrub is neuer found any fruit. 15. May. 1621.

When the last sheets of this worke were on the Presse, I receiued a Letter from from Mr. Roger Bradshaghe, wherein he sent me inclosed a note concerning some plants mentioned by our Author which I haue thought fitting here to impart to the Reader: he writes not who it was that writ them, wherefore I cannot acquaint you with his name, but thanke him, though vnknowne, for his desire to manifest the truth, and satisfie our doubts in these particulars.

Because you write that *Gerards Herbal* is vpon a review, I haue thought good to put you in mind what I haue obserued touching some plants which by him are affirmed to grow in our Northern parts: first the plant called *Pirola*, which he saith groweth in Lansdale, I haue made search for it the space of twentie yeares, but no such is to be heard of. *it groweth in y^e roppes aboue Beaudley*

Sea Campion with a red floure was told him groweth in Lancashire: no such hath euer bin seen by such as dwell neere where they should grow.

White Fox-gloues grow naturally in Lansdale, saith he, it is very rare to see one in Lansdale.

Garden Rose he writes groweth about Leiland in Glouers field wilde: I haue learned the truth from those to whom this Glouers field did belong, and I finde no such thing, only aboundance of red wilde poppie, which the people call Corne-rose is there seene.

White Whortles, as he saith, grow at Crosby in Westmerland, and vpon Wendle hill in Lancashire: I haue sought Crosbie very diligently for this plant and others which are said to grow there, but none could I finde, nor can I heare of any of the countrey people in these parts, who daily are labouring vpon the mountains where the VVortle berries abound, that any white ones haue beene

been seene, sauing that those which *Gerard* calls red Whortles, and they are of a very pale white green till they be full ripe, so as when the ripe ones looke red, the vnripe ones looke white.

Cloud-berrie assuredly is no other than Knout berrie.

Hesket's Prim-rose groweth in Clap-dale. If *Mr. Hesket* found it there it was some extraordinary luxurious floure, for now I am well assured no such is there to be seene, but it is onely cherished in our gardens.

Gerard saith many of these Northerne plants do grow in Cragge close. In the North euery town and village neere any craggie ground both with vs & in Westmerland haue closes so called, whereby *Gerard's* Cragge close is kept close from our knowledge.

Chamemorus, seu Vaccinia nubis. Knot, or Knout-berrie, or Cloud-berrie.

THis Knot, Knout or Cloud-berrie (for by all these names it is knowne to vs in the North, and taketh these names from the high mountaines whereon it groweth, and is perhaps, as *Gerard* saith, one of the brambles, though without any prickles) hath roots as small as packe thred, which creepe far abroad vnder the ground, of an ouerworne red colour, here and there thrusting more fastly into the mossie hillockes tufts of small threddie strings, and at certaine ioints putting vp small stalks rather tough than woody, halfe a foot high, something reddish below: on which do grow two or three leaues of a reasonable sad green colour, with foot-stalkes an inch long, one aboue another without order: the highest is but little, and seldome well spread open; they are something rugged, crispie, full of nerues in euery part, notched about the edges, and with some foure gashes a little deeper than the rest, whereby the whole leafe is lightly diuided into five portions. On the top of the stalk commeth one floure consisting of foure, sometimes of five leaues apiece, very white and tender, and rather crumpled than plaine, with some few short yellow threds in the midst: it standeth in a little Greene husk of five leaues, out of which when the floure fades, commeth the fruit, composed of diuers graines like that of the bramble, as of eight, ten or twelue, sometimes of fewer, and perhaps through some mischance but of three or two, so ioined, as they make some resemblance of a heart, from whence (it may be) hath grown that error in *Gerard* of diuiding this plant into 2 kinds: the fruit is first whitish Greene, after becommeth yellow, and reddish on that side next the Sun.

It groweth naturally in a blacke moist earth or mosse, whereof the countrie maketh a fewel we call Turfe, and that vpon the tops of wet fells and mountains among the Heath, mosse, and brake: as about Ingleborow in the West part of York-shire, on Graygreth a high fell on the edge of Lancashire, on Stainmor such a like place in Westmerland, and other such like high places.

The leaues come forth in May, and in the beginning of Iune the floures: the fruit is not ripe till late in Iuly.

The berries haue a harsh and something vnpleasant taste.

THis worke was begun to be printed before such time as we receiued all the figures from beyond the Seas, which was the occasion I omitted these following in their sitting places: but thinking it not fit to omit them wholly, hauing them by me, I wil giue you them with their titles, and the reference to the places wherto they belong.

* In August last whiles this worke was in the Presse, and drawing to an end, I and *Mr. William Broad* were at Chiffel-hurst with my oft mentioned friend *Mr. George Bowles*, and going ouer the heath there I obserued this small *Spartum* whose figure I here giue, and whereof you shall find mention, in the place noted vnder the title of the figure, but it is not there described, for that I had not seen it, nor could finde the description therof in any Author, but in Dutch, which I neither had nor vnderstood. Now this little Matweed hath some small creeping stringy roots: on which grow somewhat thick heads, consisting of three or foure leaues, as it were wrapt together in one skin, biggest below, and so growing smaller vpwards, as in *Schananth*, vntill they grow vp to the height of halfe an inch, then these rushie Greene leaues (whereof the longest scarce exceeds two inches) breake out of these whitish skins wherein they were wrapped, and lye along vpon the ground, and amongst these growes vp a small grassie stalke, some handfull or better high, bending backe the top, which carries two rowes of small chaffie seeds. It is in the perfection about the beginning of August.

NOMINVM ET OPINIONVM HAR- monia & consensus.

A	
Abel, id est, Populus alba.	
Abhel, i. Sauina.	
Abrono Serapionis, i. Pisum cor- datum.	
Abrotanum fœmina, id est, Chamæcy- parissus.	
Abrugi, i. Pisum cordatum.	
Acanthophora, i. Iacca.	
Acanthus Germanica, i. Sphondylium.	
Acanthium, i. Onopordon.	
Acarna Theoph. i. Scolymos.	
Acetabulum, i. Cotyledon.	
Acciputrina, i. Hieracium, vel Sophia.	
Acinaria palustris Gesneri, i. Vaccinia palustris.	
Acinus, i. Clinopodium.	
Achillea, i. Millefolium.	
Aconitum bacciferum, id est, Christo- phoriana.	
Aconitum Pardalianches Dodonai, i. Doronicum.	
Acrocorion, i. Crocus vernus.	
Acutella, i. Restia bonis.	
Acus pastoris, i. Geranium.	
Adiantum album, id est, Capillus Ve- neris.	
Adiantum album Plinii, id est, Ruta muraria.	
Ador est quoddam frumenti genus.	
Ageratum, i. Balsamina minor.	
Agnus castus, i. Vitex.	
Agilensz, i. Auellana.	
Aglaophotis, i. Pœonia.	
Agilops Plinii, id est, Cerris maior Lobel.	
Agilops, i. Avena sterilis.	
Agopogon Tragi, i. Ulmaria.	
Agelethron, i. tota bona.	
Eschinomenen Plinii, i. noli me tan- gere, vel potius herba mimosa.	
Aizoon, i. Semperuium.	
Ainga, i. Chamæpitys.	
Alaseleti Anicenne, i. Medica.	
Alaternus Dalechampii, i. Phillyrea Lobel.	

Alektorophos Plinii, i. Fistularia.	
Alleluia, i. Trifolium acetosum.	
Alchilel Serapionis, i. Polemonium.	
Alcibiadion, i. Echium.	
Alchimelech, i. Melilotus.	
Alfas fasa Anicenne, i. Medica.	
Algosarel Anicenne, i. Daucus.	
Alkakengi, i. Halicacabum.	
Alimonia, i. Trifolium acetosum.	
Alnam, i. Pulegium.	
Alnus nigra, i. Frangula.	
Althea, i. Ibisus.	
Albucus, i. Asphodelus albus.	
Altercum Plinii, i. Hyoscyamus.	
Alphesera Arabibus, id est, Bryonia nigra.	
Alsharateia, i. Parthenium.	
Alsebran, i. Ezala.	
Alsenes, i. Absinthium.	
Aluesen, i. Peucedanum.	
Amaracus, i. Maiorana.	
Amellus Virgilii, i. Aster Aticus.	
Amellus, i. Calcha palustris.	
Ambubeia, i. Cichorium sylvestre.	
Ampelos Plinii, i. Bryonia nigra.	
Amyrberis, i. Berberis.	
Anapallus Bellonii, i. Ficus Indica.	
Anas, i. Prunus.	
Anablatur Cordi, i. Dentaria maior Mathioli.	
Anblatur Dodonai, i. Nidus anis.	
Anchusa, i. Buglossum sylvestre.	
Andrian Rhafis, i. Fabago.	
Andrion Auerois, i. Peucedanum.	
Androsenum Dodonai, i. Clymenum Italarum.	
Anetum tortuosum, i. Meum.	
Anguria, i. Pepo oblongus.	
Anonis, i. Restia bonis.	
Apiastellum Apuleii, i. Bryonia nigra.	
Apiastellum Dodonai, i. Melissa.	
Apocinum Dios. i. Periploca.	
Apolinaris, i. Hyoscyamus.	
Apronia, i. Brionia nigra.	
Aprus, i. Pisum rubrum.	
Argentina, i. Potentilla.	
Aria Theophrasti, i. Sorbus Alpina Gesneri.	

Arcium, i. Bardana.	
Argentina, i. Ulmaria.	
Arbitrica, i. Primula veris.	
Arcemisia marina, i. Cineraria.	
Arrhenogonon, i. Parietaria.	
Armoracia, i. Rhabdanthus rusticus.	
Arornas, i. Iuniperus.	
Arzi, i. Oriza.	
Astrantia, i. Imperatoria.	
Asterion, i. Aster Atticus.	
Astergis Rhafis, id est, Azaradach Anicenne.	
Aspalathus, i. Acatia Math.	
Asplenium sylvestre, i. Lonchitis.	
Asplenium, i. Ceterach.	
Astorca, i. Stachas.	
Athanasia, i. Tanacetum.	
Aulitica, i. Camamelum.	
Aureum olus, i. Atriplex.	
Anornus Petri Placentii, i. Frangula.	
Azabaser, i. Meum.	
Azez, i. Lichen.	

B	
Baccaris, id est, Peonia.	
Baccaris, i. Conyza maior Math.	
Baccaris officinarum, i. Asarum.	
Bamia, i. Althea palustris.	
Baptifecula, i. Cianus.	
Barba hirci, i. Tragopogon.	
Barba Iouis, i. Semperuium.	
Barba Aren, i. Semperuium.	
Barbarea, i. Pseudobunium.	
Batis Plinii, i. Crithmum.	
Baton, i. Terebinthus.	
Bazari Chichen, i. Linum.	
Bazara Cantona, i. Psyllium.	
Becabunga, i. Anagallis aquatica.	
Bechion, i. Tussilago.	
Bedoara arabibus, i. Spina alba.	
Bedeguar Math. Syluat. i. Spina alba.	
Bederangi, i. Melissa.	
Beluidere Italica, i. Scoparia.	
Beihalalen, i. Aizoon.	
Betonica Pauli, i. Veronica.	
Bihar, i. Buphtalmion.	
Bisaria, i. Dracunculus.	
Bisactum, i. Gingidium.	
Basatrahagi,	

Nominum quorundam interpretatio.

Basiatrabagi, id est Polygonum.
Bismalva, id est Ibisus.
Bislingua, id est Hippoglossum.
Bombax, id est Gossipium.
Botonaria, id est Aphyllanthus.
Boutomon, i. Platanaria.
Branca ursina, id est Scambus.
Britannica, i. Bistorta quorundam.
Brassica Cavina, i. Cynocrambe.
Broeggia Plinij, id est Helxine Cissampelos.
Bruscus, id est Ruscus.
Bulbus agrestis, i. Colchicum.
Buboninum, id est Aster Atticus.
Buccinum, i. Consolida regalis.
Bugia, id est Cortex Berberis.
Butomon Theophrasti, i. Iris palustris.
Bulef, id est Salix.

C

Cachrys maritimum, i. Crithmum.
Cachrisera, id est Libanotis.
Cabade, id est Polium.
Cafal, i. Agrimonia.
Calabrina, id est Lonchitis.
Calchochrum, id est Fumaria.
Calcifraga, i. Crithmum.
Caltha, id est Calendula.
Caltha Poetarum, i. Calendula.
Callionymum Gesn. id est Lilium con-
vallium.
Callitricum, i. Capillus Veneris.
Callion Plinij, i. Alkakengi.
Calicularis, id est Hyoscyamus.
Calogogia, id est Galanga.
Camphoratam, i. Abrotanum magnum.
Candelaria, i. Tapsus Barbatus.
Cania Plinij, id est Vrtica.
Cancem Anicenna, id est Chelidonium
minus.
Cantabrica Plinij, i. Rapunculus.
Cantabrica Turneri, id est Caryophyl-
lus.
Capillaris, i. Capillus Veneris.
Capnos, id est Fumaria.
Capnitis, id est Fumaria.
Caprificus Plinij, i. Ezula Tragi.
Caranfal, i. Caryophyllos.
Cardamum, id est Pseudobunium.
Cardopatum, id est Carlina.
Carduus fullonum, i. Dipsacus.
Carobia Attuarij, id est Ceratia siliqua.
Carica, id est Apios.
Carnabadien Simeonis Sethi, i. Carni.
Cartamus sylvestris, i. Atractylis.
Carpentaria, i. Pseudobunium.
Carpesium, i. Cubebe.
Carpesium Galeni, i. Ruscus.
Carnabadien Simeonis Sethi, id est Ca-
rum.
Cardel, id est Sinapis.
Cassebar, i. Coriandrum.
Cassilago Martij. Syl. id est, Hyoscy-
amus.
Cassutha, id est Cuscuta.
Castoris trifolium, id est Trifolium pa-
ludosum.
Cassignete, id est Pimpinella.
Castrangula, i. Scrophularia.

Calcitrapa Marthioli, id est Carduus
Stellatus.
Catef, i. Atriplex.
Cachrisera Rosmarinus, id est Liba-
notis.
Cathsum, id est Abrotanum.
Cataputia maior, i. Ricinus.
Causon Plinij, i. Equisetum.
Canda Vulpium, i. Alopecuros.
Caliros, i. Gramen manna.
Caciliana Plinij, id est Androsamum
Dodo.
Centummorbia, i. Nummularia.
Centrum Galli, i. Horninum.
Centunculus, i. Gnaphalium.
Cepes, id est Anagallis Aquatica.
Ceratonia, i. Ceratia siliqua.
Cercis Theophrasti, id est Arbor Indes.
Cesis, id est Daucus.
Cerva maior, i. Ricinus.
Ceraunia, i. Crassula.
Cervicaria, i. Trachelium.
Cichorium verrucarium, id est Hedy-
nois.
Circea Gracis, i. Mandragora.
Cinninalis, i. Capillus Veneris.
Cicerbita, i. Sonchus.
Cnicus, i. Carthamus.
Cnicum supinum Cordi, id est Carduus
benedictus.
Cnicus sylvestris, i. Atractylis.
Citrage, i. Melissa.
Cidromela, i. Malus Medica.
Cinetaria, i. Iacoea Marina.
Charantia, i. Balsamina mas.
Chamaecissus, i. Hedera Terrestris.
Chamaleuce, i. Tussilago.
Chamaepence, id est Rosmarinum sylve-
stre.
Chamaxylon Plinij, i. Gnaphalium.
Chamalea Germanica, id est, Meze-
reon.
Chamedaphne, i. Laureola.
Chamedaphne Plinij, id est Vinca per-
vinca.
Chamaepium, i. Erysimum.
Chamaerhiphes, i. Palmistes.
Chamaeleagnus, id est Myrtus Braban-
tica.
Chamaerops plinij, i. Palma humilis.
Chamuba, i. Ceratia siliqua.
Charfi, i. Apium.
Chastara, i. Betonica.
Chathe, i. Cucumer.
Chironia, i. Bryonia nigra.
Chitini, i. Althea.
Choeradolethron, i. Xanthium.
Chubece, i. Malva.
Chiliodynamis, i. Ben album.
Chrysolachanon Plinij, i. Atriplex sa-
tiva.
Chrysanthemum Peruvianum, i. Flos
Solis.
Chrysocome Gesn. Linaria.
Chrysogonon, i. Blattaria.
Chrysomela Athenai, i. Malus Medica.
Citrage, i. Melissa.
Clavum Veneris, i. Nymphaea.
Clavicula, i. Hedera Helix.
Clematis Peregrina, i. Flammula Iovis.

Z z z z z 2

Clematis Daphnoides, id est Vinca per-
vinca.
Clematis altera Marthioli, i. Viorna.
Cleome Horatij, i. Erysimum.
Colabrina, i. Arum Egyptianum.
Coctior, i. Foeniculum.
Colocasia, i. Faba Egyptia.
Columnaris, i. Campana Lactescens.
Columbina Attuarij, i. Verbena.
Combul, i. Nardus.
Condis, i. Saponaria.
Condurdam Plinij, i. Vaccaria.
Consolida media Fuchsij, id est, Bellis
maior.
Consolida media, i. Bugula.
Consolida minor Marthioli, i. Prunella.
Consolida minor Ruellij, id est Bellis
minor.
Conzambuch Turcor, i. Hemerocallis
Valentina.
Connarus Athenai, i. Inula species ma-
ior.
Concordia, i. Agrimonia.
Conila, i. Myrrhis.
Consecratrix, i. Iris nostras.
Coralloides Cordi, i. Dentaria Mar-
thioli.
Corcorus Melochia, id est Olus Iuda-
cum.
Corcorus Marcelli vet. id est Anagallis
mas.
Corydalis, i. Radix Cana.
Cor Indum, i. Pisum Cordatum.
Corizola Rhasij, i. Scamonea.
Corona fratrum, i. Carduus Eriogon-
phalus.
Corion, i. Coriandrum.
Coronopus, i. Cornu Cerui.
Corigiola, i. Centummodia.
Corona monachi, i. Dens Leonis.
Corona Regia, i. Pomum spinosum.
Coroneola, i. Lysimachia.
Corydalis, i. Fumaria.
Corylus, i. Avellana.
Costus spurius, Matth. i. Panax Chiro-
nium.
Costus Hortorum, i. Balsamita maior.
Costa Canina, i. Quinquenervia.
Corydalopodium, i. Consol. Regalis.
Cotinus Dodo, i. Coccygia Plinij.
Cot Anicenna, i. Medica.
Crepanella, id est Dentillaria Rondeletij.
Creta Marina, i. Crithmum.
Crinita, i. Capillus Veneris.
Cucullata, i. Pinguicula.
Cucurda, i. Dentillaria Rondeletij.
Cuminum Ethiopicum, i. Ammi.
Cunilago, i. Conyza.
Cunegundis, herba, i. Eupatorium An-
cenna.
Cunila Columella, i. Satwreia.
Cunophoron, i. Nux Indica.
Cunder Anicenna, i. Saponaria.
Curcuma, i. Cyperus Indus.
Curcas Clusij, i. Ricinus.
Cusbar, i. Coriandrum.
Cyanus Hierosolymitana, i. Psarmitia
Austriaca.

G 56

Nominum quorundam interpretatio.

Cyfo, id est, Hyssopus.
Cyminalis, id est, Gentiana.
Cynanthemis, i. Cotula foetida.
Cynospastus, i. Paeonia.
Cynosorchis, i. Satyrium.
Cynocephalus Apuleii, id est, Antirrhinum.
Cynocephalus, i. Anetum.
Cynobatos Diosc. id est, Rosa sylvestris.
Cynobatos Tragi, i. Oxyacanthus.
Cynobatos Ruellii, i. Rubus.
Cynobatos Dalei, i. Capparis.
Cyprus, i. Ligustrum. Lobelii.
Cyprus Dod. i. Phillyrea.

D

Damedris, i. Chamedrys.
Danebalchil, i. Equisetum.
Darach, i. Palma.
Daracht mous, i. Musa.
Datura, i. Stramonium perigrina.
Debonigi, i. Chamomilla.
Defta, id est, Beta.
Delphinium, i. Consolida Regalis.
Diapensa, i. Sanicula.
Didar Arab. i. Vlmus.
Digitus Veneris, i. Nymphaea.
Dili, id est, Isatis.
Diocallia Apulei, i. Chamomelum.
Diospiron, i. Milium solis.
Diospiros Plinii, i. Lacryma Iob.
Diosanthos Theop. i. Saperba Fuchsi.
Dochon, id est, Panicum.
Dolichus Theophr. id est, Phascolus Lobelii.
Draco herba, i. Tarcón.
Dracosylvestris, i. Ptarmica.
Drositum, i. Haliabbi Anisum.
Drosion Cordi, i. Alohimilla.
Drypis Guilandini, i. Tragon. Mat.
Drypis Theop. i. Eryngium Marinum.
Dryopteris Tragi, id est, Pteridion Cordi.
Dryopteris, i. Adiantum nigrum.
Dryophoron Plinii, id est, Arabis Dodon.
Dulb Arab. i. Platanus.
Dulcamara, i. Amara Dulcis.
Dulcisida, i. Paeonia.
Dulcichinum Guilandini, i. Cyperus dulcis Tragi.
Dumbebe, i. Endivia.

E

Echinum Palustre Cordi, i. Scorpionides Dodon.
Eghelo, Dodon. id est, Laburnum Lobelii.
Eleagnus Mat. i. Ziziphus alb. Lobel.
Eleoselinum, i. Paludapium.
Ellisiphacos, i. Salvia.
Elkiageber, i. Rosmarinus.
Empetron Dod. i. Kali.
Empetron Rondeletii, i. Crithmum.
Empetron Tragi, i. herba Turca.

Empetron, i. Herniaria.
Encephalus, i. Chamarrhiphes.
Enephyllum, Lobelii, i. Dentaria.
Encaphyllum, i. Lingua Serpentina.
Enneadynamen Gesneri, i. Gramen Parnassi.
Ephatium, i. Ranunculus.
Euphrosynum Plinii, i. Borago.
Epilobion Gesn. i. Chamenerium Lobel.
Epimetron, i. Epimedium.
Epipetron, i. Epimedium.
Epipactis Recentiorum, i. Helleborine.
Epipactis Rondeletii, i. Herniaria.
Eranthemum, i. Flos Adonis.
Ericoides, i. Euphrasia lutea, Dod.
Eringium Vegetii, i. Acarna Theop.
Eringium Guilan, i. Carduus Stellatus.
Erinus, i. Corcoros Plinii.
Eruum sylvestre, i. Catanance.
Erythion Apulei, i. Ruta.
Erysimum Theop. i. Camelina.
Erythrodanum, i. Rubia tinctorum.
Exupera, i. Verbena.

F

Farfara, i. Tussilago.
Farfugium, i. Tussilago.
Farsum Auicenne, id est, Thora Valdensis.
Farfrugum, i. Caltha palustris.
Farantum, i. Tussilago.
Fandegeni, i. Origanum.
Fel Terra, i. Centaureum minus.
Feniculus Porcinus, i. Pencedanum.
Ferulacoli, i. Thapsia.
Ferraria, i. Agrimonia.
Ferraria Lobelii, i. Scrophularia.
Festuca Plinii, i. Avena Sterilis.
Flammula Ionis, id est, Clematis Peregriana.
Filicestrum, i. Osmunda Regalis.
Filix palustris, i. Osmunda Regalis.
Filix Florida, i. Osmunda Regalis.
Filix Latifolia Cordi, i. Osmunda Regalis.
Ficaria, i. Chelidonium minus.
Flos Regius, i. Consolida Regalis.
Flos Ambarualis, i. Polygala.
Fontalis, i. Potamogeton.
Folium Indum, id est, Malabatrum Garcia.
Fuga Demonis, i. Hypericum.
Fusus, i. Atractylis.
Fumaria Corydalis, i. Radix Cava.

G

Galedragon Plinii, i. Dipsacus.
Garosmus, i. Atriplex Olida.
Gallitricum, i. Horminum.
Gelselinum Indicum, i. Mirabilia Peruviana.
Genitura, id est, Anetum.
Genicularis, i. Phumagnum.
Genecanthe, i. Bryonia nigra.
Genum, i. Caryophyllata.
Giezar, i. Dancus.
Giezar Aridras, i. Bellunen.
Gith, i. Nigella.

Githago Plinii, i. Lolium.
Gladiolus Aquatilis, i. Iuncus Floridus.
Globularia, i. Aphyllanthes.
Glossographe, Auicenna, i. Fumaria.
Gossypium, i. Xylon.
Granum Regium Mesue, i. Ricinus.
Gromphena Plinii, i. Calendula.
Grossularia, i. Ribes.
Grossularia, i. Fva crispa.

H

Habonog Auer, i. Chamamela.
Habal Nil Serapionis, i. Convolvulus caruleus.
Halcafmeg Aueronii, i. Feniculus.
Halgazar Aueronii, i. Pastinaca.
Halicacabum Vesicarium, id est, Alkakenki.
Halicacabum Peregrinum, i. Pisum Cordatum.
Hamestices, i. Chamapitys.
Hanab. Althaleb, i. Solanum.
Haraba, i. Cucurbita.
Harbatum, i. Pencedanum.
Harenaria, i. Cornu Cerui.
Haronigi, id est, Doronicum.
Hasmisen Syriacum, id est, Convolvulus caruleus.
Hastula Regia, i. Asphodelus albus.
Hasee, i. Thymus.
Handacocha Plinii, i. Trifolium bituminosum.
Haur Arab. i. Populus alba.
Hebene, i. Xylaloe officinarum.
Herculanica, i. Verbena.
Hederatis Ruellii, i. Asclepias.
Hedera spinosa, i. Smilax Aspera.
Hedera Cilicia, i. Smilax Aspera.
Helxine, i. Parietaria.
Helice, i. Hedera Helix.
Hemen, i. Serpillum.
Hepatica alba Cordi, i. Gramen Parnassi.
Herba Scythica, i. Glycyrrhiza vulg.
Herba Casta, i. Paeonia.
Herba Leonis, i. Palma.
Herba Lucis, i. Chelidonium maius.
Herba Impetiginaria, i. Chelidonium maius.
Herba Vulcani, i. Ranunculus.
Herba Scelerata, i. Ranunculus.
Herba Viceraria, i. Ranunculus.
Herba Caustica, i. Ranunculus.
Herba Dineotilia, i. Consolida Regalis.
Herba Stella, i. Cornu Cerui.
Herba Cancrui, i. Heliotropium.
Herba Radioli Apulei, id est, Polypodium.
Herba Leonis Dodon. id est, Aquilegia.
Herba S. Anthony, i. Dentillaria Rondeletii.
Herba Coxendicum, i. Coryledon.
Herba Benedicta, i. Caryophyllata.
Herba Fortis, id est, Solidago Saracenica.
Herba Paralysis, i. Primula veris.
Herba Clauellata, i. Violatricolor.

Herba

Nominum quorundam interpretatio.

Herba Laffilata, id est Balsamita maior.

Herba Pinnula, id est, Hyoscyamus.

Herba Turca, i. Herniaria.

Herba Hungarica Dodon. i. Alcea.

Herba Simeonia Dodon. id est, Alcea.

Herba Urbana, i. Acanthus.

Herba Tunica Gordonij, id est Ocy-mastrum.

Herba Tunica Dodon. id est, Caryo-phyllata.

Herba Gallica Fracastorij, i. Galega.

Herba Rutinalis, i. Sphondylium.

Herba Sarda, id est Ranunculus aqua-ticus.

Herba Sacra, i. Tabaco.

Herba Sacra Agrippa, i. Melissa.

Hermodactylus Dodon. id est Colchi-cum.

Hermodact. Italarum, i. Iris tuberosa.

Hesperis Clusij, i. Leucoium marinum.

Hippia, i. Alfine.

Hirundinaria, i. Asclepias.

Hortus Veneris, i. Cotyledon.

Horminum Tridentinum, id est Colus-Iouis.

Humadh, i. Lapathum.

Hunen, i. Iuube.

Huniure, i. Vrtica.

Hydroselinum, i. Paludarium.

Hydroselinum Camerarij, id est Laner-maius.

Hyoscyamus Peruvianus, i. Tabaco.

Hippoglossum Bonifacia, id est Laurus-Alex.

Hyosfris Plinij, i. Iacea nigra.

Hyopthalmon, i. Aster Atticus.

Hypecon Dodon, id est Cuminum syl-vestre.

Hypecon Clusij, i. Alcea Veneta.

Hipposelinon, i. Olus atrum.

I

Iarus, id est, Arum.

Iackaiak, i. Anemone.

Iasione, i. Campanula.

Iasin, i. Emula.

Ianatri, i. Nux Moscata.

Ibiga, i. Chamapitys.

Iezar Serapionis, i. Pastinaca.

Imperatrix, i. Meum.

Inula Rustica Scribonij Largi, i. Conso-lida maior.

Inguinalis, i. Aster atticus.

Intybus, i. Cichorium.

Iouis Fabia, i. Hyoscyamus.

Iouis Glans, i. Castanea.

Iouis Flos, i. Lychnis.

Iouis Arbor, i. Quercus.

Iorgir, i. Eruca.

Irio, i. Erysimum.

Iuncus quadratus Celsi, i. Cyperus.

Iua Muscata, i. Chamapitys.

Iusacti, i. Sambucus.

Iusquiamus, i. Hyoscyamus.

Ixopus Cordi, i. Chondrilla.

K

Kanturion, i. Centaureum.

Kanz, i. Amygdalus.

Kaper, i. Capparis.

Kauroch, i. Chelidonium maius.

Keikengij, i. Ranunculus.

Keiri, i. Leucoium.

Kemetri, i. Pyrus.

Kemum, i. Cuminum.

Kenne, i. Ligustrum.

Kernagh, i. Ricinus.

Kerugha, i. Ricinus.

Kermes, i. Coccus insectoria.

Kulb, i. Milium solis.

Kusbera Auerron, id est Coriandrum.

Kusbor, i. Coriandrum.

L

Labrufca, i. Bryonia nigra.

Labrum Veneris, i. Dipsacus.

Laburnum, i. Anagris.

Lactaria, i. Thymalus.

Lactuca leporina, i. Sonchus.

Lactucella, i. Sonchus.

Lanata Cordi, i. Aria Theoph.

Lancea Christi, id est, Lingua Serpen-tina.

Lantana, i. Viburnum.

Lanaria, i. Radicula.

Lanceola, i. Quinqueneruia.

Laudata Nobilium, i. Veronica.

Lathyrus, i. Cataputia.

Lathyrus, i. Pisum sylvestre.

Laner Lanacrum, i. Dipsacus.

Laurus Alexandrina, id est, Hippo-glossum.

Laurus rosea, i. Oleander.

Laurus sylvestris, id est, Laurus Ti-nus.

Laurentina Mathiali, i. Bugula.

Leo Columella, i. Aquilegia.

Leontostomium Gesneri, id est, Agni-legia.

Leo Herba Dodon, i. Aquilegia.

Lepidium Plinij, i. Piperitis.

Lesen Arthaur, i. Buglossum.

Leucacantha, i. Carlina.

Leucanthemum, i. Chamamelum.

Libadon Plinij, i. Centaureum.

Libanum Apulei, i. Borago.

Limodoron Dodon, i. Orobanche.

Lingua anis, i. Fraxini semen.

Lingua Pagana, i. Hippoglossum.

Liliago Cordi, i. Phalangium Lobel.

Lisen, i. Plantago.

Lotus Urbana, i. Trifolium odoratum.

Lobelij.

Longina, i. Lanchitis.

Lichen, i. Hepatica officinarum.

Lunaria Arthritica Gesneri, i. Auricu-la Vrsi.

Luciola, i. Lingua serpentina.

Lunaria Graca, i. Bolbonac.

Lunaria maior Dioscor. id est, Alys-son.

Luph Cordi, i. dracuncul.

Lunula, i. Trifolium Acetosum.

Z z z z z z

Lycostaphylos Cordi, id est, Sambucus-aquatica.

Lycopsis, i. Buglossum sylvestre.

Lycopersicum, i. Pomum Amoris.

M

Machla, id est, Palma.

Madon Plinij, id est, Bryonia-alba.

Mahaleb Auicenna, id est, Pseudoligu-strum.

Mahaleb, i. species Phillyrea.

Magdalis Theoph. i. Lascerpitium.

Malacocissos, id est, Hedera Terre-stris.

Malinathalla Theoph. i. Mala insana vel-potius, Cyperus Esculentus.

Malaccissus Cassani Bassi, i. Caliba pa-lustris.

Maluaniscus, i. Ibiscus.

Manus Martis, i. Quinquefolium.

Marana, i. Stramonium.

Marathrum, i. Foeniculum.

Maru herba Dodon. id est, Cerintho-Plinij.

Marinella, i. Phu magnum.

Marmarites, i. Fumaria.

Marmorella, i. Agrimonia.

Mastates, i. Lascerpitium.

Maston Plinij, i. Scabiosa.

Mater Herbarum, i. Artemisia.

Materfilon, i. Iacea nigra.

Mattisaluia, i. Horminum.

Murisslua, i. Periclymenum.

Maurobebra Caput, id est, Anthriscu-num.

Medium Dioscor. id est, Viola Marti-ana.

Medium Lobelij, i. Iris maritima Nar-bonensis.

Melochia, i. Corcorus.

Melampodium, i. Helleborus niger.

Mel frugum Dioclis, i. Panicum.

Melampyrum, id est, Tricicum Vacci-num.

Melasperrum, i. Nigella.

Melich Arab, id est, Trifolium frutis-cans.

Meleagris Flos, i. Frutillaria.

Melanthium, i. Nigella.

Melospinum, i. Pomum Spinosum.

Memiran Andr. Bellunensis, i. Chelido-maius.

Memiresin Auicen. idem.

Mend Heudi Arabibus, id est, Scamon-nea.

Memitha Arabibus, id est, Papaner-Cornutum.

Memasylum, i. Arbutus.

Menogenion, i. Paeonia.

Mentha Saracenic, id est Balsamita-maior.

Men, id est Meum.

Memiren Serapionis, i. Chelidonium-minus.

Methel, i. Stramonium.

Merzenius, i. Maiorana.

Mescatremfir, id est, Diſtam-num.

Nominum quorundam interpretatio.

Mille grana, i. Herniaria.
 Menianthe Theop. id est Trifolium
 palustre.
 Militaris, i. Millefolium.
 Miha, i. Styrax.
 Millemorbia, i. Scrophularia.
 Mixa, i. Sebesten.

 Henbell, Henbane.
 Helthow, Hedera terrestris.
 Herbe Bennet, Benilocke.
 Herbe Peter, Cowslip.
 Herba martis, Martagon.
 Hertelowe, Chamadryos.
 Hertwort, Fraxinus.
 Hiltwort, Pullos montaine.
 Hippia maior, common Pimpernel.
 Holy rope, wilde Pemp.
 Houndberry, Solanum.
 Horewort, Filago.
 Horechtre, Germander.
 Horecheale, Elecampane.
 Hore thistle, wilde Lettuce.

Honesty, Bailbondack.
 Horelder, Enula campana.
 Horemint, Watermint.
 Hultwort, Polium.
 Hyndheale, Ambrosia.

I Acea alba, wilde or white Tanse.
 Imbrecke, Honslake.
 Joane silver pin, double Poppy.

K Andlegotts, Golegrasse.
 Kings crowne, Melilotus.
 King cob or King cup is Crowfoot.
 Kisse me ere I rise, Pandes.
 Kidney wort, Ranelwort.

L Lyngwort, Helleborus albus.
 Little Gate is Gionell.
 Lichwort is Pellitory of the wall.
 Longwort, Pellitory of Spaine.
 Lilly lake, Moly.
 Lilly riall, Pennyroyall.
 Lobewort, Water Crowfoot.
 Loufwort, Staphisacra.
 Lustwort is Sundew.
 Lyngwort, Helleborus albus.

M Mas Motherwort, Palma Christi.
 May blossomes, Conial Lilies.
 Maywill, White Horehound.
 Mauthen or Mathes, Comula torrida.
 March, Smallage.
 March beetle, Cats tail.
 Medles Brage.
 Meretrop, Pimpernel.
 Movel Nightshade.
 Mouspeale, Orobis.
 Mugwort, Woodroofs.

N Ele, Lollum.
 Nespitte, Calamint.
 Nep, Cats mint.
 Nosebled, Varrow.

O Oual, Opin.
 Oran, Cruciata.
 Oxtongue, Lingua bouis.

P Pagle, Stitchwort.
 Palme de Dieu, Palma Christi.
 Papwort, Mercury.
 Pastell, Moade.
 Pedellon Helleborus niger.
 Peters staffe, Tapus barbatus.
 Peuterwort, Horelalle.
 Pimentary, Baulme.
 Potwknadie, Stozks bill.
 Pismrose, Ligustrum.
 Pygite, Gramen Leucanthemum.

A Table of obsolete and lesse vfed English Names.

R
 Rms foot is water Crowfoot.
 Red knees is Hydropiper.
 Robin in the hofe is Lychais syl-
 vestris.
 Rods gold is Marigold.

S
 Sabwort is Enula Campana.
 Sea Docke is Brankes vaine.
 Seggrom is Ragwort.
 Selfe heale was sometimes called Dm-
 pernel.
 Sheep killing is Cotyledon aquatica.
 Sleepewort is Lettuce.
 Staggerwort and Stannerwort is Iaco-
 bea.
 Stanmarch is Alifander.
 Standelwelks is Satyrion.
 S. Maries seed is Sow thistle seed.
 Small honesty is Pinks.
 Somerwort is Aristolochia.

Strike pile is Storaks bill.
 Stridfall is Palma Christi.
 Strobwort is Oxy.
 Sparrow tongue is Knot grasse.
 Strenozd and Stenchore is Stone-
 crop.
 Stubwort is Wood Sorrell.
 Swines grasse is Knot grasse.
 Swine Earle is Knot grasse.
 Swichen is Groundswell.
 Sowdwort is Columbine.

T
 Tlewort is wilde Bozage.
 Tanke is wilde Parsnep.
 Tetterwort is great Celandine.
 Tothwort is Shepheards purse.
 Tutlane is Clymenum Italorum.

W
 Wlwort is Ebulus, which was
 sometime called Filipendula.
 Warence is Madder.

Warmot is Wormwood.
 Waywort is Impernell.
 Waybread is Plantago.
 Waywort is Hippia maior.
 Waterwort is Waldenhatre.
 Weythernop is fenestew.
 White Bothen is great Daffy.
 Wilde Banager is Cockle.
 Wilde Pardons is Alarum.
 White Golds is great Daffy.
 Wood march is Sanctel.
 Wood tower is Oxy.
 Woodbzonep is Fraxinus.
 Woodnep is Amcos.
 Wlofes thistle is Chamalcon.
 Wyneberry is Vaccinea.
 Wymot is Ibficus.
 Wit is Hyofcyamus luteus.

Y
 Yron head is Knapweed.

Z
 Zekes was counted Satyrion minor, and
 is that which Apol calleth Scapias
 formina pratensis.

A Table of Brittish Names.

A Catalogue of the Brittish Names of Plants, sent me by Master Robert Dauyes of Guiffaney in Flint-Shire.

A Net. Dill.
Aurddanadl. Red Archangel Nettle.
Ahrvanadl. vide Hwb yr ychen.

B Anadyl. Broome.
Banatlos. Farze.
Berm yr Frengie. Cressies.
Berm yr dwr. water Cressies.
Bedwen. a Birch tree.
Biattus. Beets.
Blaen yr Ywreb. Mercury.
Blaen y gwaym. Spearwort.
Bleidd dug. Wolfesbane.
Brialbu Mair. Cowslips.
Brynyen. a Rush.
Brywg. Cockle, or field Nigella.
Bust y Ddayar. Centoric.

C Carn yr ebol. Folefoot.
Cas gan gythrel. Veruaine.
Cacawneej. Burre.
Calimlyn y mel. Agrimonie.
Cancwlm. Knot grassie.
Camamill. Camomil.
Ceirch. Oats.
Cennin. Leekes.
Cennin Pedr. Daffodill.
Gedor y wrach. Hotstailie.
Cegid. Hemlocke.
Celynen. Holly.
Chmerwyls yr kithin. Wood Sage.
Chst yr ewic. Laurell.
Cloflops. Gillofloures.
Clustieu yr Derw. vide Galladr.
Clust llygoden. Mouse earc.
Claiarllys y dwr. Brookelime.
Coed Ceri. Seruice tree.
Cowarch. Hempe.
Cower y laeth. Calimlyn y mel.
Coed kirin. Plum trees.
Cosen. a Poolereed.
Cride y Bleiddieu. v. Cacawneej.
Craib unnos. Prunel or Selse heale.
Crasank y wran. Crowfoot.
Cride san Fraid. Betony.
Cynelennydd. white Mullen.
Cynson y Celloc. Setwell.

D All y gwaed. Penny royall.
Danadl. Nettles.
Danadlen wenn. White Archangel Nettle.
Danit y llew. Dandelion.
Danadlen ddall. dead Nettle.

E Bolgarn yr ardd. Asarabacca.
Efrew. Darnell.
Eiddem. Iuy.
Eiddem y ddayar. } ground Iuy.
Eidral.
Eithin yr ieir. v. Hwb yr ychen.
Erienlys. S Johns wort.
Erbin. Calamint.
Eulw persli. bastard Parsley.

F A. Beanes.
Fenich y Cwn. wild Cammomil.
Fenich. Fenell.
Fettes. Fitches.

G Alladr. Lungwort like Liucwott.
Garlic. Garlicke.
Glesyn y Coed. Bugle.
Gladyn. Gladiol or Corne Flag.
Geleudrem. v. Lysie Ewffas.
Gold Mair. Marigold.
Gruc. v. Banatlos.
Grayanlls y dwr. Brookelime.
Gwlydd. small Chickweed.
Gwlydd Mair. Pimpernell.
Gwenyddail. Gwenynoc. Balmes.
Gwyddfyd. Woodbind or Honisuckie.
Gwden y Coed. Smooth Bindewood.
Gwallt gwener. Venus haire.
Gwallt y formys. Maiden haire.
Gwam yr Brenbin. Daffodil.
Gwenith. Wheat.
Gwinnydden. Vine.

H Ad y gramandi. Gromel.
Haid. Barly.
Hesc melfedoc. Water Torch, of Typha palust.
Hoccs. Mallows.
Hoccs y gors. Marsh Mallows.
Hwb yr ychen. Camock, or rest harrow

L Laeth bron Mair. Sage of Ierusalem.
Llanlys. Staueface.
Llanwyls. Borage.
Llewic ychwanen. v. y Benfelen.
Llewic yr iav. Henbane.
Llewpar dŵg. Aconitum.
Llysie Iwan. Mugwort.
Llysie llwydion. v. Llysie Iwan.
Llysie llwelyn. Pauls Betony.
Llysie y wennol. Celandine.
Llyn y llygaid. v. Llysie y wennol.
Llysie Effras. Eyebright.
Llysie yr Crymman. v. Gwlydd Mair.
Llysie Iwan. vide Dyars weed.
Llysie pen tŷ. Houflecke.
Llysie yr gwadlin. Yarrow or Milfoile.
Llysie Mair. vide Gold mair.
Llysie Amor. Floure gentle.
Llygaid y Dydd. Daisies.
Llysie yr prwdin. v. Dail y gwaed.
Llysie yr gath. v. Erbin.
Llysie y Blaid. v. Bleid dŵg.
Llysie y moch. Nightshade.
Llysie y Cribew. Teasell.
Llysie Simion. v. Cas gan gythrel.
Llysie yr Cyrph. Periwinkle.
Llysie Eva.
Llysie y mor. } Sea banke horne.
Llysie yr meddyglyn. wilde Carrot.
Llysie. Elme tree.
Llysie y Scuruy grassie.

M Afon. Raspis.
Marchalan. Elecampane.
March rhedyn y derw. Polypody, Oxeye Forne.
Maip. Turneps.

A Table of Brittish Names.

March ysgal y gerddi. Artichoke.
Mefys. Strawberries.
Menig ellyllion. Foxgloves.
Meirw. luniper tree.
Meillionen y meirch. Right Trefoile.
Mintas. Mints.
Moron. Parsneps.
Moron y maes. wilde Parsneps.
Mwog y ddayar. Fumetory.
Mwssogl. Mofse.
Mynawyd y bigail. Storks bill.

N
Nyddoes. Spinage.
O
Onnen. an Ash tree.

P
Pawen yr Arth. Beares breech.
Padere Mair. Cresswort.
Persli y dwr. water Parsley.
Persli Frengeic. Smallage.
Phion ffwrth. v. Menic jellyllion.
Pidni y goc. Aron, or Cuckow pinto.
Pcerlys. v. y lailys.
Poplys. a Poplar.
Pwrs. y Bigail. Shepheards purse.
Pys y Ceirw. Tarcs.

R
Rhedyn. Ferne.
Rhedegat y derw. v. Galladr.
Rhg. Ric.
Rhosyn. a Rose.

S
Saeds gwylt. v. Chwerwyls.
Siwdrmwt. Sothernwood.
Siacked y melnydd. v. Cynffon llwynoc.
Sirian. Cherries.
Snoden Fair. English Galingall.
Sowdl y Crydd. v. Blaen yr ymrech.
Swan y goc. wood Sorrell.
Swan. Sorrell.
Syf. v. Mefys.

T
Tafod y ki. Dogs tongue.
Tafod y neidr. Adders tongue.
Tafod yr bydd. Harts tongue.

Tafol. a Docke.
Tafol Mair. Bistort.
Tagaradr. v. Hwb yr ychen.
Tafod yr edn. Birds tongue.
Tafod yr ych. Bugloss.
Telephin. Orpin.
Tormach. Filipendula.
Tryw. v. Calwlyn y mel.
Troed y glomen. Columbine.
Triact y tyllodion. Tormentilla.
Troed y dryw. Parsley Breakstone, or smal Saxifrage.
Triact y Cymro. Germander.
Troed yr bedydd. Larke heelc.

W
Wilffraev. v. Llysie yr gwaelid.
Winnwr. Onions.

Y
Yewfelen. Fleabane.
Y beulas wenn. v. Claflys.
Y bengaled. red Scabious.
Y beulas. Blewbottle, or Cornflower.
Y bengoch. Horchound.
Y claflys. Scabious.
Y Dorsagl. medow three leaved grass.
Y Droedrydd. Herbe Robert.
Y Drwynsawr. Calwlyn y mel.
Y Ddwy gennier. herb Twopence, or Moneywort.
Y Dorlwyd. wild ransy or Silverweed.
Y derw bannoc. v. Cynffon Llwynoc.
Y Dinboeth. Arsmar.
Y Ddayerlys. Peony.
Y Ddeddige wenn. Pilewort.
Y fendiged. Tutfan or Parke leanes.
Y Fabgob. Poppy.
Y folud. Violet.
Y fylfen. T frowys. small Celandine.
Y feidioc las. v. Llysie luan.
Y fyddarllys. Prickmadam.
Y fyddygyr. v. Craib yn nos.
Y fyw syth. Llysieu penth.
Y gauri goch. v. Bysl y Ddayar.
Y gyna. v. Llysie yr biad.
Y gloria. wilde Rose, or Spargwort.
Y gds wennyn. Diuels bit.
Y gysog. a kinde of Spurge.
Y glaiarlys. T grevlus. Groundswell.
Y gysgadur. Nightshade or Morell.
Y gingroen. Todeflax.
Y llew gwynn ddf. Garden Orach.
Y llew gwynn gwylt. wilde Orach.
Y llwyls. v. Llysieu llw.
Y llwynbidydd. Ribwort.
Y lindro. Doder.
Y llysiwyr bendigedig. Valerian.
Y lleadlys. Lunaria.
Y Mbr gelyn. Sea Holly.
Y Mdrlys. Pellitory of the wall.
Y Papi coth. v. red Poppy, or corne Rose.
Tr Escarlys { Hir } Aristolochia, { long }
 { geon } or Birthwort, { round }
 { bychan } or Hartwort, { small }

 To increase milke in womens *Wreaths*, see *Milke & Purles*.
 Against vicerations of the *Wreaths*, 255, b.
 To dissolve the hardnesse of womens *Wreaths*, 28, c. 527, b. 1226, h.
 To assuage great *Wreaths* and dry vp the milke, 883, l.
 Good to amend a stinking *Wreath*, 31, c. 508, b. 1035, b. 1097, e. 1177, h. 1294, d. 1433, c. 1465, g. 1525, c. 1529, a. 1533, a. 1537, a. 1541, a. 1623, a.
 Good for such as cannot *Breath* vntill they sit or stand vp right, and hold their neckes straight vp. 688, d. 692, h. 708, c. 793, a. 1024, d. 1107, a.
 Good for shortnesse of *Breath*, 174, d. 245, b. 350, f. 580, b. 657, a. 725, a. 792, c. 793, a. 813, d. 849, f. 874, b. 878, k. 892, a. 913, c. 1035, b. 1051, a. 1109, a. 1116, d. 1145, i. 1170, a. 1257, q. 1303, k. 1408, c. 1437, c. 1446, o. 1511, b. See *Shoutnesse*.
 Good for those that are *Wroken* or hurt inwardly, 632, a. 774, c.
 For *Wroken* winded catell, 434, c.
 For inward *Wruiles*, 64, c. h. 688, d. 715, i. 782, a. 794, h. 807, a. 849, c. 870, i. 906, c. 1047, h. 1121, i. 1158, d.
 Good for *Wruiles* gotten by stripes or falls, 239, h. 632, a. 637, c. 756, b. 759, f. 849, c. 870, i. 906, b. 1078, d. see *Falls*.
 To ripen venereous *Bubos* in the flanke or share, 60, c. 490, a.
 To keale *Burnings*, 46, a. 99, c. 133, b. 195, b. 308, g. 310, c. 349, a. 356, a. 419, c. 541, a. 544, b. 768, a. 783, g. 811, i. 857, k. 1128, a. 1148, a. 1360, a. 1426, c. see *Scalding*.
 For all *Burllings*, 64, a. 95, f. 363, a. 395, c. 403, a. 434, b. 524, a. 546, a. 622, a. 661, a. 662, a. 671, a. 483, a. 714, a. 793, d. 507, a. 849, b. 909, b. 932, c. 1078, d. 1116, a. 1148, a. 1373, b. 1413, f. 1451, k. See *Enterocoele* and *Ruptures*.

Good for exulcerated *Cankers*, 1015, b.
 Good for the *Cankers* in the eyes, called in Greeke *Carci-noma*, 317, k.
 Good for the *Cankers* in the mouth, 450, a. 458, b. 766, c. 825, a. 993, c.
 To stay *Cankers* from increasing or creeping farther, 79, d. 837, b.
 To cure *Cankers*, 373, d.
 Good for *Carbuncles*, 360, y. 1369, d. 1393, c. 1441, h.
 To ripen & breake pestilentiall *Carbuncles*, 317, d. 1226, h.
 To take away *Carbuncles*, 1378, d.
 Against the *Catalephie*, 580, a. 820, h.
 To cure *Catarthes*, 175, c. 360, n. 370, c. 649, d. 1053, b. 1333, a. 1526, a. see *Rheumes*.
 To make a faire *Carnation* colour, 1419, d.
 To knit together broken bones in *Cattell*, 90, 6c.
 To cure certaine diseases of *Cattell*, 705, d. 977, 1571, a.
 To cure *Cattell* of the cough of the lungs, 434, c. 774, f. 1571, a.
 To helpe *Cattell* being chap-fallen, 3, c.
 For *Chaps* of the fundament, 1169, b. 1333, a. 1362, c. see *Fundament*.
 For *Chaps* in hands and feet, 1134, d. 1362, c. 1373, k.
Chaps of the lips, 1333, a. 1444, a.
 To make one *Chalk*, 821, c. 1388, a.
 Good for the *Chell*, 586, a. 694, a. 756, f. 779, c. 877, h. 1170, a. 1194, a. 1356, a. 1373, b. 1511, o. 1620, c.
 To cleanse the *Chell* of ill humors, 239, c. 250, c. 574, b. 694, a. 714, b. 725, a. 776, a. 779, a. 791, b. 793, b. 794, i. 833, g. 835, a. 881, d. 1035, c. 1187, o. 1356, d. 1511, b.
 To concoct raw humors of the *Chell*, 245, b. 714, b. 791, b. 793, b. 833, g. 1206, c. 1408, c.
 For *Childbianes*, 174, f.
 To drive forth the dead *Childe*, 458, f. 527, c. 653, a. 672, a. 756, c. 796, a. 801, b. 870, d. 1048, b. 1051, a. 1055, b. 1218, d. 1257, a. 1378, a. 1625, a.
 To nourish the *Childe* in the wombe, 1517, b.
 For the red gum and freers in *Chiliden*, see *Gums & freers*.
 To repress *Choler* in the stomacke, 1465, i. 1595, b.
 To purge *Choler*, 868, 1423, f.
 Against *Choler*, 71, a. 395, c. 852, a. 914, a. 993, g. 1420, a. 1501, f.
Cholerike passion, see *Fellony*.
 To dye *Cloath*, 491, b. 1211, f. 1477, b.
 To keepe *Cloathes* from Moths, 644, a. 645, a. 1097, c. 1100, f. See *Garments & Moths*.

The Table of Vertues.

To abate the swelling of the **Cords**. 64, d.
 Good against **Cold** and hoarsenesse 360, n. see **Hoarsenesse**.
 Against **Cold** diseases of the inward parts. 434, e. 441, a. 683, a. See **Diseases**.
 Good against the **Coldnesse** of the sinewes. 891, c. See **Sinewes**.
